10 “Administrator”, the following: “, the Secretary of  
11 the Army”;

12 (3) in subsection (a) in the matter following  
13 paragraph (2) by inserting after “under section  
14 309(d)” the following: “and section 404(s)”;

15 (4) in subsection (b)(1)(A) by striking “and  
16 (iii)” and inserting the following: “(iii) to the Sec-  
17 retary of the Army (if the alleged violation is under  
18 section 404); and (iv)”;

19 (5) in subsection (b)(1)(B) by inserting after  
20 “if the Administrator” the following: “, the Sec-  
21 retary of the Army,”;

22 (6) in subsection (c)(2) by inserting after “the  
23 Administrator” the following: “(and the Secretary of  
24 the Army, if the alleged violation is under section  
25 404)”;

## 17

1 (7) in subsection (c)(3) by inserting after "At-  
2 torney General" each place it appears the following:  
3 " , the Secretary of the Army (if the alleged violation  
4 is under section 404 of this Act),";

5 (8) in subsection (e) by inserting after "Admin-  
6 istrator" the following: " , the Secretary of the  
7 Army,";

8 (9) in subsection (h) by inserting after "Admin-  
9 istrator" each place it appears the following: "or the  
10 Secretary of the Army";

11 (10) in paragraph (2) of subsection (a) and in  
12 the matter following that paragraph by inserting  
13 after "Administrator" each place it appears the fol-  
14 lowing: "or the Secretary of the Army"; and

15 (11) in subsection (b)(2) by inserting after  
16 "Administrator" the following: "or the Secretary of  
17 the Army".

18 **TITLE II—IMPROVED WETLANDS**  
19 **PERMITTING; REVISIONS TO**  
20 **WETLANDS DELINEATION**  
21 **PROCEDURES**

22 **SEC. 201. IMPROVEMENT OF ADMINISTRATION OF WET-**  
23 **LANDS PERMITTING.**

24 (a) NEEDS ANALYSIS.—

1           (1) IN GENERAL.—Not later than 90 days after  
2           the date of the enactment of this Act, the Comptrol-  
3           ler General of the United States shall submit to the  
4           Congress an analysis of the needs of the Corps of  
5           Engineers and the Environmental Protection Agency  
6           for additional personnel, administrative resources,  
7           and funding to improve implementation of section  
8           404 of the Federal Water Pollution Control Act (33  
9           U.S.C. 1344).

10           (2) CONTENTS.—The analysis submitted under  
11           this subsection shall—

12                   (A) give particular emphasis to the needs  
13                   of the Corps of Engineers and the Environ-  
14                   mental Protection Agency with respect to im-  
15                   proving and expediting wetlands delineation and  
16                   wetlands permitting generally;

17                   (B) include recommendations regarding  
18                   additional appropriations necessary for that im-  
19                   provement and expedition; and

20                   (C) identify the Corps of Engineers district  
21                   offices and Environmental Protection Agency  
22                   regions that have the greatest need for those  
23                   additional appropriations.

24           (b) FUNDING FOR TRAINING AND CERTIFICATION  
25           PROGRAM FOR WETLANDS DELINEATORS.—Of amounts

1 appropriated for each fiscal year beginning after the date  
2 of the enactment of this Act for administration of section  
3 404 of the Federal Water Pollution Control Act (33  
4 U.S.C. 1344) by the Corps of Engineers, the Secretary  
5 of the Army (hereinafter in this title referred to as the  
6 "Secretary") shall use such amounts as are necessary to  
7 carry out the program for training and certification of in-  
8 dividuals as wetlands delineators authorized by section  
9 307(e) of the Water Resources Development Act of 1990  
10 (Public Law 101-640).

11 (c) FUNDING FOR IMPROVEMENT OF SECTION 404  
12 EDUCATION AND OUTREACH PROGRAMS.—Of amounts  
13 appropriated for each fiscal year beginning after the date  
14 of the enactment of this Act for administration of section  
15 404 of the Federal Water Pollution Control Act (33  
16 U.S.C. 1344) by the Corps of Engineers or the Environ-  
17 mental Protection Agency, the Secretary or the Adminis-  
18 trator of the Environmental Protection Agency, respec-  
19 tively, shall use such amounts as are necessary to improve  
20 existing education and outreach programs of the Corps of  
21 Engineers or the Environmental Protection Agency re-  
22 garding requirements of that section.

23 (d) FUNDING FOR EXPEDITING AND COMPLETING  
24 WETLANDS MAPPING.—

1           (1) COMPLETION OF MAPPING.—Of amounts  
2           appropriated for each fiscal year beginning after the  
3           date of the enactment of this Act for programs of  
4           the United States Fish and Wildlife Service, the Di-  
5           rector of the United States Fish and Wildlife Service  
6           shall use—

7                   (A) such amounts as are necessary to com-  
8                   plete the existing wetland mapping program of  
9                   the Service by not later than 1 year after the  
10                  date of the enactment of this Act;

11                  (B) such amounts (in addition to amounts  
12                  used pursuant to subparagraphs (A) and (C))  
13                  as are necessary to conduct mapping under that  
14                  program in areas where there is the potential  
15                  for delineating particularly large areas of wet-  
16                  lands; and

17                  (C) such amounts as may be necessary (in  
18                  addition to amounts used pursuant to subpara-  
19                  graphs (A) and (B)) to delineate wetlands  
20                  under that program in watersheds and  
21                  ecosystems for which the need for delineation is  
22                  particularly acute, such as where wetlands are  
23                  particularly difficult to identify or where pres-  
24                  sure for development of wetlands is intense, by

1 as soon as practicable after the date of the en-  
2 actment of this Act.

3 (2) UPDATING MAPS.—The Director of the  
4 United States Fish and Wildlife Service shall update  
5 each map prepared under the existing wetlands map-  
6 ping program at least once—

7 (A) in the 15-year period beginning on the  
8 date of the completion of the map, and

9 (B) in every 15-year period thereafter.

10 (e) FUNDING TO ASSIST SMALL LANDOWNERS WITH  
11 WETLANDS DELINEATION.—Of amounts appropriated for  
12 each fiscal year beginning after the date of enactment of  
13 this Act for administration of section 404 of the Federal  
14 Water Pollution Control Act (33 U.S.C. 1344), the Sec-  
15 retary of the Army shall use such amounts as are nec-  
16 essary, but not to exceed \$5,000,000, to assist landowners  
17 who lack the financial capacity to do wetlands delineations  
18 needed to apply for permits under that section. The Sec-  
19 retary may provide such assistance either by providing  
20 technical assistance or by performing delineations. Within  
21 180 days after the date of the enactment of this Act the  
22 Secretary shall issue regulations defining which land-  
23 owners are eligible for such assistance.

1 **SEC. 202. REVISIONS TO FEDERAL WETLANDS DELINEA-**  
2 **TION PROCEDURES.**

3 After the date of the enactment of this Act, no revi-  
4 sions to or clarifications of any Federal manual for identi-  
5 fying and delineating jurisdictional wetlands shall be  
6 adopted, and no guidance or regulations related to the def-  
7 inition, delineation, or identification of wetlands shall be  
8 issued, until the National Academy of Sciences has com-  
9 pleted the study of wetlands authorized by Public Law  
10 102-389. All subsequent revisions to any Federal manual  
11 for the identification and delineation of wetlands shall take  
12 into consideration the scientific and technical rec-  
13 ommendations of the National Academy of Sciences.

14 **TITLE III—WETLANDS**  
15 **RESTORATION PROGRAM**

16 **SEC. 301. WETLANDS RESTORATION PILOT PROGRAM.**

17 The Secretary, in cooperation with the Administrator,  
18 the Director of the United States Fish and Wildlife Serv-  
19 ice, and appropriate State and local government entities,  
20 shall initiate, with opportunity for public notice and com-  
21 ment, a pilot program of wetlands restoration. The pur-  
22 poses of the pilot program are—

23 (1) to identify areas where the restoration of  
24 significant wetland acreage and functions, including  
25 fish and wildlife habitat, water quality protection,  
26 and natural hydrologic functions, could contribute

1 substantially to preserving the quantity and quality  
2 of the Nation's wetlands;

3 (2) to test methods and techniques for wetlands  
4 restoration in such areas, and in areas previously  
5 identified as suitable for restoration; and

6 (3) to develop a means of evaluating the success  
7 over the long term of such wetlands restoration ef-  
8 forts.

9 **SEC. 302. SENSE OF CONGRESS CONCERNING WETLANDS**  
10 **RESERVE PROGRAM.**

11 It is the sense of Congress that the Wetlands Reserve  
12 Program authorized by the Food, Agriculture, Conserva-  
13 tion and Trade Act of 1990 is an effective wetlands con-  
14 servation and restoration program which has the potential  
15 to benefit agriculturalists, rural communities, and the Na-  
16 tion's wetlands resource base. Further, it is the sense of  
17 Congress that the Wetlands Reserve Program should be  
18 fully funded to achieve its acreage enrollment goals, and  
19 should be actively promoted by the Department of Agri-  
20 culture to achieve full subscription.

21 **TITLE IV—TAX INCENTIVES FOR**  
22 **WETLANDS CONSERVATION**

23 **SEC. 401. WETLANDS STEWARDSHIP TRUSTS.**

24 (a) DESIGNATION.—The Secretary of the Interior  
25 shall designate a nonprofit organization to be a Wetlands

1 Stewardship Trust for purposes of this section if the  
2 organization—

3           (1) includes among its primary purposes the ac-  
4           quisition of private interests in wetlands, former  
5           wetlands, and associated real property for the pur-  
6           pose of restoring or preserving such property, and

7           (2) meets such other requirements as may be  
8           established in regulations issued under subsection  
9           (c).

10          (b) APPLICATION.—A nonprofit organization seeking  
11 to be designated a Wetlands Stewardship Trust for pur-  
12 poses of this section may submit to the Secretary of the  
13 Interior an application for that designation, in accordance  
14 with procedures established in regulations issued under  
15 subsection (c).

16          (c) REGULATIONS.—Not later than 180 days after  
17 the date of the enactment of this Act, the Secretary of  
18 the Interior, acting through the Director of the United  
19 States Fish and Wildlife Service, in consultation with the  
20 Secretary of the Army, acting through the Corps of Engi-  
21 neers, and the Administrator of the Environmental Pro-  
22 tection Agency shall issue regulations establishing require-  
23 ments for being designated a Wetlands Stewardship Trust  
24 under this section.

1 **SEC. 402. TAX TREATMENT OF DONATIONS OF WETLANDS.**

2 (a) **TAX TREATMENT.**—Subsection (e) of section 170  
3 of the Internal Revenue Code of 1986 (relating to chari-  
4 table, etc., contributions and gifts) is amended by adding  
5 at the end thereof the following new paragraph:

6 “(6) **SPECIAL RULES FOR CONTRIBUTIONS OF**  
7 **WETLANDS.**—

8 “(A) **IN GENERAL.**—In the case of a chari-  
9 table contribution by a taxpayer of wetlands (or  
10 any interest therein) to a Wetlands Stewardship  
11 Trust or to a governmental unit referred to in  
12 subsection (c)(1) for the purpose of preserving  
13 the property in its natural state—

14 “(i) **50 PERCENT LIMITATION TO**  
15 **APPLY TO INDIVIDUALS.**—Such a contribu-  
16 tion by an individual shall be treated for  
17 purposes of this section as described in  
18 subsection (b)(1)(A).

19 “(ii) **20-YEAR CARRYFORWARD.**—Sub-  
20 section (d)(1) shall be applied by substitut-  
21 ing ‘20 years’ for ‘5 years’ each place it  
22 appears and with appropriate adjustments  
23 in the application of subparagraphs (A)(ii)  
24 and (B)(ii) thereof.

25 “(iii) **EXTENSION OF PERIOD FOR EX-**  
26 **CHANGES.**—If such contribution is made

1 as part of an exchange to which section  
2 1031 applies, paragraph (3) of section  
3 1031(a) shall be treated as met if the  
4 property to be received in the exchange is  
5 received by the taxpayer not later than the  
6 date which is 3 years after the date on  
7 which the taxpayer transfers the property  
8 relinquished in the exchange.

9 “(B) PROPERTY MUST BE PROTECTED IN  
10 PERPETUITY.—A contribution shall not be  
11 treated as for the purpose referred to in sub-  
12 paragraph (A) unless such purpose is protected  
13 in perpetuity.

14 “(C) CERTAIN PROPERTY INELIGIBLE.—  
15 Subparagraph (A) shall not apply to any con-  
16 tribution of property if—

17 “(i) the property is required (as of the  
18 date of the contribution) to be preserved in  
19 perpetuity in its natural state other than  
20 by reason of the terms of contribution, or

21 “(ii) the property is required to be re-  
22 stored or preserved as compensatory miti-  
23 gation as a condition of a permit issued  
24 under section 404 of the Federal Water  
25 Pollution Control Act (33 U.S.C. 1344).

1                   “(D) UNUSED DEDUCTION CARRYOVER AL-  
2                   LOWED ON TAXPAYER’S LAST RETURN.—In the  
3                   case of an individual, if—

4                   “(i) the taxpayer dies before the close  
5                   of the last taxable year for which a deduc-  
6                   tion for a contribution to which subpara-  
7                   graph (A) applies could have been allowed  
8                   under subsection (d)(1), and

9                   “(ii) any portion of the deduction for  
10                  such contribution has not been allowed for  
11                  any taxable year before the taxable year in  
12                  which such death occurs,

13                  then such portion shall be allowed as a deduc-  
14                  tion under subsection (a) for the taxable year in  
15                  which such death occurs without regard to sub-  
16                  section (b), or the unused portion may be used  
17                  against the estate taxes of the taxpayer.

18                  “(E) DEFINITIONS.—For purposes of this  
19                  paragraph—

20                  “(i) Wetlands.—The term ‘wetlands’  
21                  means any area that is inundated or satu-  
22                  rated by surface or groundwater at a fre-  
23                  quency and duration sufficient to support,  
24                  and which under normal circumstances  
25                  does support, a prevalence of vegetation

1 typically adapted for life in saturated soil  
2 conditions.

3 “(ii) WETLANDS STEWARDSHIP  
4 TRUST.—The term ‘Wetlands Stewardship  
5 Trust’ means any entity designated by the  
6 Secretary of the Interior under section 401  
7 of the Wetlands Reform Act of 1993.”

8 (b) EFFECTIVE DATE.—The amendment made by  
9 this section shall apply to contributions and gifts made  
10 after the date of the enactment of this Act in taxable years  
11 ending after such date.

12 **SEC. 403. EXCLUSION FROM GROSS INCOME FOR AMOUNTS**  
13 **RECEIVED FROM COMPATIBLE USES OF WET-**  
14 **LANDS.**

15 (a) IN GENERAL.—Part III of subchapter B of chap-  
16 ter 1 of the Internal Revenue Code of 1986 (relating to  
17 items specifically excluded from gross income) is amended  
18 by redesignating section 137 as section 138 and by insert-  
19 ing after section 136 the following new section:

20 **“SEC. 137. INCOME FROM COMPATIBLE USES OF WET-**  
21 **LANDS.**

22 “(a) GENERAL RULE.—Gross income shall not in-  
23 clude any amount received by the owner of wetlands for  
24 allowing any person to use such wetlands in a compatible  
25 use.

1       “(b) DEFINITIONS.—For purposes of this section—

2               “(1) WETLANDS.—The terms ‘wetlands’ has  
3       the meaning given such term by section  
4       170(e)(6)(E)(i).

5               “(2) COMPATIBLE USE.—The term ‘compatible  
6       use’ has the meaning given such term in the regula-  
7       tions prescribed under the following sentence. The  
8       Secretary of the Interior, acting through the Direc-  
9       tor of the Fish and Wildlife Service, shall prescribe  
10       regulations identifying those activities which con-  
11       stitute compatible uses for purposes of this section,  
12       including any pertinent restrictions on such activi-  
13       ties. Such activities may include fishing, hunting,  
14       and occasional and prudent managed haying, if  
15       deemed appropriate by the Secretary of the Interior,  
16       but shall not include any activity which degrades the  
17       functions or values of wetlands.”

18       (b) CLERICAL AMENDMENT.—The table of sections  
19       for such part III is amended by striking the last item and  
20       inserting the following new items:

      “Sec. 137. Income from compatible uses of wetlands.

      “Sec. 138. Cross references to other Acts.”

21       (c) EFFECTIVE DATE.—The amendments made by  
22       this section shall apply to amounts received after the date  
23       of the enactment of this Act in taxable years ending after  
24       such date.

○

Congresswoman Marcy Kaptur  
Summary of Recommendations  
Clean Water Act Reauthorization

**GREAT LAKES**

- 1) A second phase of the Assessment and Remediation of Contaminated Sediments (ARCS) program. This program demonstrates sediment remediation technologies on the pilot scale at five Great Lakes Areas of Concern. A second phase should authorize more sediment treatment technology demonstrations at the pilot and full scale. Program should also include some form of technical and financial assistance and outreach to communities which have contaminated harbors.
- 2) Requirement of the Corps of Engineers to work through the Environmental Protection Agency to develop Tributary Transport Models of soil run-off for each major river system feeding a Great Lakes harbor. This will identify high priority watersheds for intensive non-point pollution abatement work.
- 3) Continued and expanded incentives to encourage the agricultural community to practice conservation tillage, and reduce its use of fertilizers and pesticides.

**WASTEWATER TREATMENT/COMBINED SEWER OVERFLOWS (CSOs)**

- 4) Enhance financial assistance for small communities sewerage facilities.
- 5) CSO problems should be addressed in a manner that employs site-specific, flexible standards that balance environmental and economic considerations.

**PLANNING AND COORDINATION**

- 6) Preserve the Planning Set-Aside from the Revolving Loan Fund Capitalization Grants (Section 604(b)) The mandatory pass-through of funds to regional planning agencies should remain in place at a reasonable level of funding.
- 7) Establish a similar Planning Set-Aside from Non-Point Source (Section 319) funds. These Planning funds should also have a mandatory pass-through to regional planning agencies at a reasonable level of funding.

## Testimony of Congresswoman Marcy Kaptur

## Clean Water Act Reauthorization

## Subcommittee on Water Resources

April 21, 1993

Thank you, Mr. Chairman, and members of the Subcommittee, for the opportunity to testify before the Subcommittee today. The Clean Water Act is a critical piece of legislation for the Great Lakes region. Twenty years ago, when the Clean Water Act was first enacted, Lake Erie's condition was so bad that it was given up for dead. The Clean Water Act with its sewage treatment standards and grants, and water quality standards and permit requirements effectively resuscitated this irreplaceable resource. But Lake Erie, as the rest of our nation's large fresh water bodies, is still far from healthy and self-sustaining. We have not met the goal of "fishable and swimmable" waters in many areas. More work needs to be done.

In addition, we have learned much along the way about environmental protection, and what works and what does not work. That is why I am particularly pleased that we will be working on reauthorizing the Clean Water Act in this Congress. From my position on the subcommittee that determines the appropriations for the Environmental Protection Agency (EPA), I am aware of how limited our resources are for tackling this huge problem. However, we cannot afford to have anything less than the most up-to-date and effective water quality protection in our country.

Today, I would like to draw your attention to the specific challenges of the Great Lakes as well as provide some examples of clean water needs in my district and provide some options for change.

The Great Lakes comprise the world's largest fresh water system, and contain 95% of this nation's fresh surface water. That's a big resource and a big responsibility. The Great Lakes are also fragile. They sustain extensive use by manufacturers, the maritime industry and recreational users. The Great Lakes are the repository for water that runs-off a huge area of land; the basin as a whole is roughly the size of the former West Germany. In addition, the Great Lakes system has an exceedingly slow flush rate. That is, it takes centuries for water to move from Lake Superior through the system to the St. Lawrence River and ultimately to the Atlantic Ocean. The flushing rate of Lake Superior alone is some 200 years. Lake

Michigan's retention time is 100 years. Lakes Erie's rate is shorter because it is so shallow, at 3 years.

I would like to present some priority areas that need to be addressed in the Clean Water Act to continue the process of restoring and protecting the waters of the Great Lakes and specifically designate Great Lakes initiatives in the Clean Water Act.

#### WASTEWATER TREATMENT/COMBINED SEWER OVERFLOWS (CSOs)

We have not heard the last of sewage as an environmental issue. Many communities, if not most, in the Midwest, and specifically in Northwest Ohio, have combined sewers. These sewers overflow whenever it rains, spewing raw sewage into our rivers and streams. Villages and small cities in my district are separating their sewers, one small piece at a time, because that is all they can afford. Most towns will need ten or twenty years to raise the money to separate all sewers.

In central Toledo the problem is acute. Toledo has already spent some \$47 million on combined sewer abatement for part of downtown and one major stream. About two-thirds of the combined sewers are left, to say nothing of a century's worth of sludge on the bottom of the streams. If we are going to see "fishable and swimmable" streams in the inner cities in our lifetime, the federal government must provide both leadership and funding.

Small communities have special problems. Many small towns have no sewage treatment system at all. EPA and the local health departments have been ordering these communities to build sewers, and with good reason. However, how can a town of 200 or 300 families afford \$2 million or more for a treatment system? There are agencies that can help, but there are gaping holes in the safety net. My district has several examples, one of which I will mention briefly to illustrate the problem.

The area includes two Toledo suburbs, the City of Oregon and the Village of Harbor View, which need sewers. There is no way the residents, with median household incomes of around \$13,000, can afford the sewers. The Farmers' Home Administration is helping Harbor View, because it is a village. Across the street in the City of Oregon, residents' incomes are not much higher, but Farmers' Home cannot help, because it is a city. EPA has offered them a loan at 2% interest. It was not enough, considering 250 families were being asked to pay off a \$3 million debt. Previously, EPA construction grants paid 55% to 75% of the cost of these type of projects.

Even moderate income villages fall through the hole in the safety net. It is more the rule than the exception, that small towns are too poor to pay for sewers, but not poor enough to qualify for help.

Farmers' Home has been the one source of assistance for many towns but they do not have the funding to help everyone who needs it. I would urge that the Subcommittee re-examine the current Construction Grant loan program to the extent that the low-interest loans it provides are often not even affordable for communities of moderate means. I know that the Chairman is aware of the problem small and rural communities have in meeting their wastewater treatment needs and that he has held a hearing on this subject.

I testified in 1990 before this Subcommittee on the financial problems the Village of Delta was having in correcting its combined sewer overflow problem. I stand by my testimony then which urged that EPA address CSO problems in a manner which employs site-specific, flexible standards that balance environmental and economic considerations. This language was included in the VA, HUD and Independent Agencies Conference Report for FY 1993 and I would urge this Subcommittee to work with EPA to ensure that any CSO regulations address the financial impediments for many localities.

#### NON-POINT SOURCE POLLUTION

As for the rest of our nation's fresh waters, the EPA estimates that a full 75% of the new loadings of certain contaminants into the Great Lakes is from diffuse sources of pollution. These sources include, broadly speaking, atmospheric deposition of toxic substances, leachate from contaminated sites and runoff. Fortunately, a provision in the 1990 Clean Air Act, entitled the Great Waters program, will go a long way toward identifying impacts of and abatement needs for atmospheric deposition of toxicants into the Great Lakes. However, leachate of contaminants from polluted sites and runoff fall very much under the jurisdiction of the Clean Water Act, and in both cases, more needs to be done.

Contaminated sediments and other in-place pollutants are gaining increasing attention as sources of contaminants into the Great Lakes. Contaminated sediments are one of the largest pollutants in the western basin of Lake Erie. They introduce contaminants into the food chain that accumulate to dangerous levels in fish and other wildlife. These polluted sites impede harbor uses and redevelopment of old industrial sites. In short, the sooner we get a handle on cleaning these areas up, or effectively containing the contaminants, the better. We are already overdue in our efforts to take care of this public health, environmental and economic problem.

The Clean Water Act should contain a second phase of the Assessment and Remediation of Contaminated Sediments program, otherwise known as ARCS. As you know, this program demonstrates sediment remediation technologies on the pilot scales at 5 Areas of Concern. In Ohio, this program has been demonstrated at the Ashtabula Area of Concern. The second phase should authorize more sediment treatment technology demonstrations at the pilot and full scale. It should

also include some form of technical and financial assistance and outreach to communities beset with contaminated harbors around the basin, and perhaps even include a jobs program that could be conducted in cooperation with the region's universities to assist students in entering the field of pollution remediation.

Agricultural run-off is the number one water quality problem in northwest Ohio. Conservation tillage has gained acceptance in part due to the federal cost share funds (Section 319 non-point source pollution grants) that were made available for the purchase of conservation tillage equipment, and due to profitability of no-till farming. The program has worked extremely well in my district. Water quality testing has shown some reduction in phosphorus levels but the sediment, nitrate, and pesticide loads remain high. To achieve these necessary reductions, additional incentives are needed to encourage the agricultural community to practice conservation tillage, and reduce its use of fertilizers and pesticides. Stream bank buffers, windbreaks, cover crops, wetlands, and practices such as crop rotations that result in reduced chemical applications improve our environment. The federal government must continue to help the states and regional agencies solve these problems.

With respect to run-off, I am extremely gratified that Congressman Oberstar has been devoting his talents to developing a national non-point source proposal. I know he fully appreciates how important this focus is to the Great Lakes basin, and I look forward to working with him to gain enactment of an aggressive and effective non-point source provision. Much of our contaminated sediments began as soil and contaminant runoff upstream.

The Clean Water Act non-point source provision should include language similar to Mr. Oberstar's Great Lakes Sediment Reduction Act, included in last year's House Water Resources Development Act, but dropped from the final version. That measure would have required the Corps of Engineers to work through the EPA to develop Tributary Transport Models of soil run-off for each major river system feeding a Great Lakes harbor. The task of developing models is not as monumental as it may sound since the Corps, the Soil Conservation Service and the United States Geological Survey already have substantial data on some rivers. However, a further development and compilation of this is exactly what the Great Lakes basin needs to identify high priority watersheds for intensive non-point pollution abatement work. We also need this information for our Lakewide Management planning process. Bedload material from rivers is a major transport medium for pollutants entering the Lakes, yet currently it is not accounted for in our lakewide mass balance efforts.

**POLLUTION PREVENTION**

Another priority area for the Great Lakes is assisting our manufacturing industry and municipalities in making the transition to pollution prevention. Last year, Senators Metzenbaum and Glenn included language in their Great Lakes Protection Act which would have given Great Lakes manufacturers incentives under the Clean Water Act to install in the near term modernizing pollution prevention technology on their factory floors. This program would have served the dual purpose of helping to demonstrate new environmental technologies, and to increase the extent to which our Best Available Control Technology standards incorporate pollution prevention techniques. Such a program is especially important to the Great Lakes because our industry soon will be going the extra mile in environmental protection in compliance with the Great Lakes Water Quality Initiative Guidance.

Pollution prevention is often the most efficient way for industry to achieve the water quality standards that are necessary to protect the Great Lakes but the initial investment and technical uncertainties can create difficult initial barriers. I hope that the Clean Water Act will include language to facilitate our overcoming these obstacles and the transition to sustainable manufacturing in the Great Lakes basin.

**PLANNING AND COORDINATION**

Monitoring and oversight is an important part of our continuing environmental clean-up. Water pollution does not respect political boundaries, whether city, village, county, state or nation. Water quality must be managed on a watershed basis, bringing the various affected parties -- neighbors, business persons, environmentalists, farmers -- and Federal, State and local agencies together.

Regional planning agencies have filled this coordinating role, and should continue to do so. Their funding has come from a set-aside from Section 604(b), the Construction Grant/State Revolving Loan Fund. This provision should be preserved in the new Clean Water Act, with its mandatory pass-through to ensure that a consistent funding level will be achieved at the local level.

In my district, the International Joint Commission (IJC) recognized the Maumee River as an Area of Concern largely because of agricultural run-off. The Toledo Metropolitan Area Council of Governments (TMACOG) is the responsible water quality planning agency, in cooperation with the Ohio EPA, for the development and the monitoring of the implementation of the Maumee River Remedial Action Plan (Maumee RAP). We should add a similar set-aside as Section 604(b) with a mandatory pass-through from the Section 319 non-point source funds.

These areawide water quality planning agencies have helped communities get sewer systems built, and assisted local governments in securing the necessary funding. Through the Maumee RAP, they have called for cleaning up abandoned dumps, a long-ignored environmental hazard, and promoted soil and water conservation across the entire Maumee River basin.

By calling attention to this problem, in my district, we have received support from Federal and State agencies. We have received increased conservation from the farm community. And, we have established the "High School Stream Monitoring Program," bringing water quality into the classroom so that future generations may do more than we have to keep our environment clean.

Our local planning organizations play an important role in coordinating water quality initiatives and, thus, must be given adequate planning funding to do their job.

As you move to reauthorize the Clean Water Act, I hope that you will consider initiatives that will benefit the Great Lakes region. I look forward to working together in this endeavor.

Thank you, Mr. Chairman, for consideration of my testimony.

STATEMENT OF

WILLIAM O. LIPINSKI  
Member of Congress

3rd Congressional District, Illinois

Regarding

The Reauthorization of the Federal Water Pollution Control Act

April 21, 1993

Before the United States House of Representatives  
Committee on Public Works and Transportation  
Subcommittee on Water Resources and Environment

Good Morning,

Mr. Chairman and members of the subcommittee, thank you for this opportunity to present my views on behalf of the Metropolitan Water Reclamation District of Greater Chicago. I would like to express my appreciation for the many years of support this subcommittee has shown for Chicago's water pollution control programs. I would also like to provide you with a progress report of the District's landmark plan to provide flood and pollution control benefits to the people of Chicago, the Great Lakes states, and our Canadian neighbors. This is also the opportunity for me to make a request of continued federal involvement in addressing the combined sewer overflow problems faced by my constituents.

Over two decades ago, in an effort to meet the water quality goals of the Clean Water Act, to prevent backflows into Lake Michigan, and to provide an outlet for flood waters, the District designed the innovative two-phase Tunnel and Reservoir Plan, or TARP. Phase One is a combined sewer overflow elimination system, while Phase Two will provide containment reservoirs. Both elements of TARP will bring flood control relief to hundreds of thousands of residents and businesses in the Chicagoland area.

TARP Phase One is an intricate system of drop shafts, tunnels, and pumping stations. These are designed to capture combined sewer overflows from a service area of 375 square miles, containing 13,500 miles of sewers. Of the 110 miles of tunnels comprising TARP Phase One, the largest is the Mainstream Tunnel. To give you some idea of TARP's capacity, the completed portion of the Mainstream consists of 31 miles of tunnels 13 to 33 feet in diameter and 240 to 300 feet below ground.

The Mainstream portion of TARP was funded through the Construction Grant Program and placed in operation in 1985. I am pleased to point out that Mainstream was completed on schedule and under budget. Frankly, this accomplishment is extraordinary, considering TARP's scale and the engineering complexity involved.

On October 18, 1985, the first operational filling of the tunnel occurred. This happened when a 12-hour duration rainfall generated 3 inches of rain in the Chicago Metropolitan area. A rainfall of this magnitude normally causes health-threatening water pollution and backflows of raw sewage into Lake Michigan. However, as a direct result of TARP over 1 billion gallons of combined raw sewage was prevented from being discharged into the Chicago waterways. This also prevented the direct release of 85 million gallons of combined sewage into Lake Michigan. Additionally, flooding in the areas adjacent to the Mainstream tunnel was virtually non-existent. I would suggest that this proven effectiveness of TARP serves as a model of how federal dollars can be well-spent.

On November 2, 1985, a 30-hour rainstorm filled the tunnel for the second time and on November 19, 1985, the tunnel was filled for the third time as a result of another heavy rain, thus preventing the exposure of citizens of

the Chicagoland area to possible health risk. Since it has been in operation, the Mainstream TARP pumping station alone has pumped over 181 billion gallons of captured combined sewage for complete treatment. During treatment of this polluted water, an estimated 195,000 tons of sewage solids were removed.

What the Water Reclamation District is most proud of is the contribution this plan has made to the health and the environment of the adjoining Great Lakes states. By preventing these backflows into Lake Michigan, this plan has proven to the region and to the nation that we are serious about improving the quality of our international waters for generations to come. I am convinced that continuing the federal involvement in the combined sewer overflow problems in our area is necessary to protect the investment already made through the Construction Grants program.

What has been most rewarding to myself and my constituents has been the return of our most precious resource, Lake Michigan, and our Illinois waterways back to a fishable, swimmable state. I am pleased to report that our local waterways are once again supporting a native fish population. TARP stands as an example to the nation that environmentally-wise and cost-effective solutions need not be mutually exclusive.

The Mainstream system has proven to be a highly successful venture. Indeed, others have recognized its success as well. In 1986, the Mainstream Tunnel project was judged by the American Society of Civil Engineers to be the Outstanding Engineering Achievement of that year.

Mr. Chairman, in the first eight years of operation, TARP has eliminated 75 percent of the combined sewage pollution problems throughout most of Chicago and 15 nearby suburbs. However, the program faces uncertainty today because as you know, funding authority for the Construction Grant program has elapsed, and the State revolving fund program is under-financed.

If this situation is not corrected soon, TARP's construction will not continue on schedule. While the District has 85 miles of tunnel completed or under construction, it still has about 25 miles to complete, along with a pumping station and some additional elements. If the Construction Grant Program is not reauthorized, I would suggest to you that we jeopardize losing the very benefits District engineers have worked so hard to achieve.

Throughout TARP's development, the District has worked closely with the State of Illinois and local authorities. However, the financial scope of this program has always been beyond the capability of local resources. Fortunately for the people of Chicago, Congress has remained committed to making up the difference. This continued federal involvement is necessary if TARP is to be completed. Obviously, the job is not yet finished.

EPA has consistently found TARP to be the most cost-effective solution for reducing storm impact on Chicago and the surrounding metropolitan area. What is important to the District, and to the citizens of Chicago, is to protect the investment already made through the Construction Grants program.

Mr. Chairman, TARP stands as a tribute to our nation's Clean water goals. In an effort to protect this investment, I request that the Subcommittee continue federal involvement through the Construction Grants program. The program should be authorized at or near, its pre-1986 level of \$2.4 billion. Of this amount, the District will require \$500 million to complete Phase One.

Again, I appreciate this opportunity to testify, I am confident that with adequate funding of projects like TARP, we can achieve the goals of the Clean Water Act. I make this request on behalf of the District, the entire Great Lakes region, and the people of Chicago.

Thank you.

**HEARING ON REAUTHORIZATION OF THE**  
**FEDERAL WATER POLLUTION CONTROL ACT**

April 21, 1993

Chairman Applegate, members of the Subcommittee, I appreciate the opportunity to testify today. I am particularly pleased to be a member of this Subcommittee and proud of the work it is doing under our able Chair.

Just yesterday, American Rivers named a river within sight of the Capitol the "Most Endangered River in Urban America." The Anacostia River ranked high and dirty on what I call the "Dirty 10," the 10 most endangered rivers in America. The Anacostia was number four. Today I want to propose that the Clean Water Act we are reauthorizing include an Urban Watershed Program similar to the National Estuary Program that protects smaller tributaries of larger waterways. Given the size and importance of these watersheds, they need and deserve new and separate funding. Minimally, jurisdictions should have the option to use existing funds for urban watershed restoration. If the new program were to become a part of an existing program under the Act, such as section 319 nonpoint source program, then every effort should be made to increase those funds.

The watersheds that would be covered are parts of the great cities of America. In a very real sense these "working rivers" built America. They have been central to industry and commerce. They have provided drinking water, food, and recreation. We have mightily used these rivers and nearly used them up. I believe that it should be unthinkable to reauthorize the Clean Water Act today without including a more comprehensive approach to the restoration of the great urban rivers.

The rivers I refer to deserve a lot of the credit for building a strong industrial America. Among them are the Detroit River, the Los Angeles River, the Platte River in Denver, the Chicago River, the Hudson River in New York and the Lackawanna in Pennsylvania.

Statement of Congresswoman Norton  
Hearing: Reauthorization of the Clean Water Act  
April 21, 1993  
Page 2

The experience that leads to my interest in city rivers is, of course, the Anacostia. In 1991 former Congressman Henry Nowak, who was Chair of this Subcommittee then and Congressman Robert Petri, who was Ranking Member, held a field hearing about the Anacostia in a Washington, D.C. neighborhood bordering the river. The hearing documented extraordinarily strong regional, local, citizen, and organizational activity and support. For years the Anacostia has attracted successful efforts and cooperation from elected leaders, regional officials and organizations and from this region's devoted and untiring environmentalists. This rejuvenation activity needs and deserves an appropriate framework under the Clean Water Act if it is to become even more effective.

The survival of city rivers is indeed a miracle of nature when we consider the enemies that plunder their shores everyday. The Anacostia is typical. Nonpoint source pollution from surface runoff from streets, parking lots and other impervious surfaces, construction sites and lawns is one of the river's most serious problems. Municipal storm sewer systems collect runoff from streets, parking lots, lawns and industrial facilities and discharges them into the Anacostia. As a result pesticides and urban and industrial wastes wash into the river. Point source pollution by individual polluters discharges into the river and its tributaries without complying with the clean up requirements of the Clean Water Act. Manmade alterations to the river and surrounding areas, much of it done by the Corps of Engineers before we knew better, have taken a heavy toll. The dredging, straightening, and riprapping of the river, combined with the clearing of the riverbanks, has resulted in sedimentation and erosion and destroyed habitats. Many of the activities which caused these problems are no longer conducted, but the damage which has resulted remains and worsens.

Rivers like the Anacostia cannot fully recover even with the admirable and energetic mix of approaches that surround river restoration today. The starting point, I believe in this year of reauthorization, is to focus on these rivers through special urban watershed restoration programs, and not simply through a series of often unconnected grants to states, jurisdictions, and organizations. The Urban Watershed Program would have major roles for the federal government, the states, and local government and citizen groups. Urban watersheds of national significance could be nominated by Governors with the concurrence of urban watershed citizen advisory councils and local officials. EPA's role would be to (a) channel grant money; (b) oversee the program; (c) coordinate with other agencies ( e.g. National Park Service, U.S. Fish and Wildlife Service); and provide technical and financial assistance to the urban watershed projects.

Statement of Congresswoman Norton  
Hearing: Reauthorization of the Clean Water Act  
April 21, 1993  
Page 3

States would (a) administer the federal grant money; (b) provide additional state grant money; (c) help to train citizens to do water quality monitoring and other project components; and (d) commit to revising and enforcing urban run off NPDES permits to reflect watershed restoration requirements (e.g. combined sewer overflow, and stormwater permits). Local governments and local citizens groups would work as equal partners in the restoration effort to design the individual watershed restoration projects, hire and train inner city youth and others to do the on-the-ground work, and conduct the watershed surveys, restoration projects, and public education activities.

Central to my proposal is citizen involvement. Citizen river restoration efforts already underway along the Anacostia are proof positive that just as "all politics is local" virtually all successful river restoration efforts are also local. It is the people who live near the river who care most deeply and personally about their waterways. All they need are the tools.

Just as the F.B.I. has its "ten most wanted" list, my home town river has gotten the dubious honor of the most endangered urban river in America. However, the Anacostia is but a proxy for all of Americas endangered urban rivers. It runs along the banks of the showcase Nation's Capital, just far enough from the great tourist attractions to be forgotten. The Potomac, which runs through the heart of this city, however, became a national embarrassment and got a special cleaning with Clean Water Act funds beginning 20 years ago. The Anacostia, the "Peoples River," the river of the neighborhoods, was ignored as have the other urban rivers of America. This year when we are reauthorizing the Clean Water Act, the "working rivers" of our large metropolitan areas deserve attention. This is the year to give citizens and state and local governments the tools to reclaim the city rivers which have worked overtime for our country.

STATEMENT OF REPRESENTATIVE PALLONE  
WATER RESOURCES AND ENVIRONMENT SUBCOMMITTEE

APRIL 21, 1993

Mr. Chairman, thank you for welcoming me back to the Public Works Subcommittee. I am enjoying my work at Energy and Commerce but as your Committee staff knows, I continue to rely on their expertise and assistance.

The Clean Water Act has not attained its goal because dischargers of toxic and other harmful substances, even when they have vastly exceeded permit levels, have not been sufficiently penalized for their actions. In far too many cases they have not been penalized at all because the Environmental Protection Agency has misused its wide discretion to set -- or not to set -- penalties for violations of the Act.

With agonizing consistency, EPA has either ignored violations altogether or compromised on fines and penalties to such a degree that violators have been able to derive economic benefit from polluting our waterways. That is, industry has found that paying lenient fines for Clean Water violations is cheaper than investing in proper pollution control equipment and complying with the law. Simply put, without a mandate for strong enforcement, industry has found that it pays to pollute.

The United States General Accounting Office confirmed this in 1991:

Enforcement of our nation's water quality laws continues to be weak and sporadic. Despite serious and longstanding violations, most enforcement actions are mild, informal 'slaps on the wrist' rather than formal actions such as administrative orders or fines and penalties. Further, even in the relatively few cases where penalties have been assessed, they are often significantly reduced or dropped without adequate documentation.

In 1989, the EPA Inspector General analyzed penalty provisions under all EPA programs, including water and reported that:

Appropriate penalties were either not calculated and assessed at all, or were inadequately calculated. Also, calculated penalties were reduced during negotiations, in some cases in excess of 90 percent and amounting to millions of dollars, with little or no documentation to support the reductions. In many cases the financial benefits the violator received from delayed or avoided costs were not recovered.

Inadequate enforcement of the Clean Water Act undermines our advances in improving water quality. We must do better. I maintain that unless we create incentives by 1) enacting mandatory minimum penalties 2) removing the economic incentive for industries to remain out of compliance 3) adding stronger reporting and inspection provisions and 4) empowering citizens, we will continue on this downward trend.

Last session, I introduced H.R. 3429, the Clean Water Enforcement and Compliance Improvement Act. In a matter of weeks, I intend to introduce a slightly more expanded version of this legislation which seeks to implement the above changes.

It is modeled upon a New Jersey law which I had authored in the State Legislature and which subsequently passed in 1991. New Jersey has found that there is an economic benefit in pollution prevention. Since enacting the New Jersey Clean Water Enforcement Act, the State has heralded its success in its annual reviews.

In March, the State reported that the 1992 data concerning inspections show a trend toward compliance by more facilities. The number of facilities which inspections found "unacceptable" decreased from 792 in 1991 to 505 in 1992.

Moreover, in 1992, permit holders moved toward more substantial compliance with the Discharge Monitoring Requirements. The number of violations for failure to submit

discharge monitoring reports decreased from 59 for a six month period in 1991 to 38 for all of 1992.

These self-reporting requirements are at the heart of the State and proposed federal legislation because they provide up-to-date information on violations and deter violators from masking the severity of their violations through the continued practice of averaging data.

Frequent inspection has led to quicker action and in turn the average penalty assessed in each formal enforcement action has decreased.

The State has increased its permit action by nearly 140%. They have eliminated duplicative permits, issued new permits, renewed, modified or terminated permits. These up-to-date permits will undoubtedly yield great environmental benefits.

My legislation, like the New Jersey Clean Water Enforcement Act requires mandatory minimum penalties of \$1,000 per violation, per day for "serious violators". For polluters meeting the statutory definition of "significant non-compliance", a mandatory minimum penalty of \$5,000 per violation, per day would be set.

To effectuate these mandatory minimum penalties, EPA will no longer have the discretion to not calculate "economic benefits". Penalties won't be compromised below the economic gain for remaining out of compliance. And, punitive damages shall not be reduced by more than 25%.

Over the last twenty years, Congress has invested billions of dollars in upgrading and improving water treatment facilities. However, because industrial discharges to publicly owned treatment works (POTWs), are largely unregulated, industries have in effect been granted a "license to pollute" as long as their discharges "pass through" a POTW. Untreated waste passing

through these facilities exposes plant workers to dangerous fumes or the threat of explosion, damages plant infrastructure and contaminates sewage sludge, making beneficial reuse impossible.

No longer will monitoring and reporting requirements be less stringent for indirect discharges to POTW's. Under my legislation all facilities discharging to ground waters, surface waters or treatment works must submit discharge monitoring reports monthly.

As the New Jersey law demonstrates, record keeping and increased inspection targets problems and avoids lingering, unattended harm to the environment. Serious violations are caught early on.

The Department of Justice has credited citizen groups for their "valuable public service...in seeking compliance with a host of environmental statutes, particularly the Clean Water Act." Over a four-year period, New Jersey Public Interest Research Group (PIRG) has recovered nearly \$6 million for the United States Treasury. Nationwide, nearly \$9.7 million in penalties and interest have accumulated because of citizen suits.

Congress intended for citizen suits to have a deterrent effect. My bill seeks to remove the obstacles which are clearly contrary to Congressional intent. Congress has provided that any citizen may commence a civil action against any person "alleged to be in violation of" the Act.

The Supreme Court in Chesapeake Bay Foundation v. Gwaltney of Smithfield, Ltd. 484 U.S. 49 (1987), undermined this provision when it brazenly decided this meant citizens cannot sue for "wholly past" violations.

The chilling result is that industry, rather than coming into compliance once they have broken our environmental laws, waits until citizens file notice of intent to sue. The company then comes into compliance within the prescribed 60 day period. This clever modis operandi means that they avoid citizen actions, penalties and that they retain economic benefit for polluting our resources.

This is not a bold legislative change, Congress made a similar change to the Clean Air Act last session.

My legislation adapts an EPA recommendation clarifying that State enforcement actions may not bar the imposition of federal civil judicial penalties. Again, this is consistent with Congressional intent.

Additionally, my bill seeks to clarify the definition of citizen standing and includes a finding and definition which seeks to end any preemptive barring of citizen access to the courts.

I mentioned that New Jersey PIRG has been a leader in citizen suit enforcement. Much of these penalties have gone to mitigation projects. My legislation expands the use of penalty funds and allows the court in its discretion to order that civil penalties collected by the government or through citizen actions be used for carrying out mitigation projects which are consistent with the CWA and which enhance the public health or environment.

In my mind, citizens should have access to as much public information as possible where public health and safety is at issue.

For this reason, I am including language to require posting at waterways which do not meet water quality standards or where fish and shellfish consumption is banned. Posting provisions will apply wherever a facility discharges into a waterway and in quarterly utility bills. Moreover, EPA must develop standards for posting and for developing fishing advisories.

The State of New Jersey should be proud of its leadership in Clean Water Enforcement. Congress should move quickly to reauthorize the Clean Water Act with a strong enforcement program which mirrors the New Jersey law.

Following are key components of my legislation:

- \* Eliminates agencies' discretion in the issuance of penalties -- they must impose fines whenever serious or chronic violations are discovered;
- \* Creates mandatory minimum civil penalties for violations which must be at least high enough to cancel out the "economic benefit of polluting";
- \* Penalties grow stronger for serious violations, and for repeat violators. The minimum fine for "serious violators" will be \$1,000 per violation per day. For "significant noncompliers" the minimum fine will be \$5,000 per day per violations;
- \* Doubles the maximum penalty from \$10,000 to \$20,000 per violation;
- \* Makes criminal penalties uniform nationwide and requires state enforcement authorities to conduct regular inspections of generators. Today there is no such requirement;
- \* Mandatory inspection at the facility upon designation as a significant non-complier.
- \* All state and EPA compliance and enforcement reports will be made available to the press so that the biggest polluters will be exposed;
- \* Expands citizens' ability to bring actions for pretreatment and all other violations -- including past violations. Changes current

law by enabling citizens to sue for recovery of damages caused by violations which occurred in the past, but may have been only recently uncovered.

- \* Clarifies definition of citizen standing to include any person who uses the water system (or associated natural resources) into which the discharge occurs or who would use that system if it were less polluted or was otherwise adversely affected by the discharge.
- \* Eliminates bar that State administrative action precludes citizen suits.
- \* Greater flexibility to the courts in ordering mitigation projects.
- \* Posting provisions.

Recently, I learned that 80% of the EPA's agenda is determined by court orders. The bad news is that the agency's proposed budget includes significant cuts. This means that enforcement will suffer. We must enact stronger enforcement provisions which will empower the POTW and local designated authority to step in and wager a battle for enforcement of our environmental laws.

The reasoning of the Clean Water Enforcement and Compliance Improvement Act is simple. If it becomes plain that violators will be held accountable and that it is no longer safe to assume EPA will either ignore violations or assess tacit penalties, then industry will begin to see an economic benefit in pollution prevention.

This is the true goal of the Clean Water Act and a goal that could have been met 20 years ago but for the lack of mandatory minimum penalties and sufficient oversight.

**STATEMENT OF THE HONORABLE ED PASTOR**  
**Arizona - Second District**

before the

**SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT**  
**House Committee on Public Works and Transportation**

April 21, 1993

Mr. Chairman, I want to thank you for the opportunity to speak today and commend the Subcommittee for giving high priority to the reauthorization of the Clean Water Act. The Act has served as the primary mechanism for us to clean up surface waters throughout the United States since its inception in 1972. And while we can be justly proud of what we have achieved during these past twenty one years, much remains to be done. In that regard, we must determine what still needs to be done, and amend the Act to provide us with the tools necessary to achieve even greater successes in the context of regional economic and environmental realities.

#### THE CLEAN WATER ACT: "FISHABLE-SWIMMABLE" GOALS

My purpose in testifying today, Mr. Chairman, is to seek your support for the establishment of a regional Water Quality Research Project (WQRP) in Pima County, Arizona to deal with a major problem faced by 17 states throughout the arid West. As you know, in 1972, Congress passed the Clean Water Act to "restore and maintain the chemical, physical and biological integrity of the nation's waters." The purpose of the Act was to promote, "wherever attainable," water quality which protected and encouraged the propagation of fish, shellfish, and wildlife and allowed recreational activities in and on the water. People soon began referring to this goal, in short hand, as "fishable-swimmable." Later, in 1987, the Act was amended to require States to establish comprehensive narrative and numeric water quality standards. These were admirable goals and they have served the nation well in some, but not all, cases.

Congress has charged the EPA with responsibility for enforcing the Act and developing appropriate water quality criteria for navigable waters of the United States. The States use such criteria as federal guidance in establishing State water quality standards. Over time, the EPA has adopted national water quality criteria based on scientific research performed on biota native to "wet ecosystems" in an attempt to satisfy the "fishable-swimmable" objectives established in the 1987 amendments.

The EPA's policy based on "fishable-swimmable" objectives threatens to impose a great financial burden on people and institutions in the west who live in "arid ecosystems." These areas are being faced with the very real threat of having to construct new, or retrofit existing, wastewater treatment facilities to treat stormwater and wastewater to meet water quality standards which are simply not "attainable" at a reasonable cost. In addition, even with the expenditure of the billions of dollars needed to treat such waters, there is little indication that such measures will result in any significant net environmental benefit to the area.

#### ARID ECOSYSTEMS: THE NEED TO "PROTECT WHAT IS THERE"

Arid ecosystems throughout the west are laced with ephemeral and effluent-dependent streams. Ephemeral streams are streams that have a dry channel that is above the water table. The streams are classified as effluent-dependent when they owe their water flows primarily to discharges from wastewater treatment facilities. In reality, these streams are really nothing more than "dry washes" most of the year. The only time they are not dry is when the area experiences a rainstorm or the local wastewater plant discharges in to the wash.

Mr. Chairman, it simply doesn't make any sense to set water quality standards designed to protect biota (e.g. fish) normally found in a wet ecosystem, when such biota are incapable of surviving in a dry wash under normal circumstances. Unfortunately, that is exactly what we in the West are being asked to do.

Congress can remedy this dilemma by enabling the EPA to fulfill the intent of the Clean Water Act and giving the Agency the resources to develop water quality criteria for arid regions designed to "...accurately reflect[ing] the latest scientific knowledge.." of that region's ecosystem.

Governmental and private entities throughout the arid West have urged the EPA for some time to commission the conduct of appropriate on-site, scientific research to determine what should be protected in arid environments. The objective should be to protect the existing ecosystem, not some arbitrary standard established on the basis of national water quality criteria.

I would like to add, Mr. Chairman, that during the past year, the EPA has made statements in support of the need to develop water quality criteria for the arid West based on accurate science. For example, in June 1992, EPA Region 9 published a document entitled Guidance for Modifying Water Quality Standards and Protecting Effluent-Dependent Ecosystems, (Interim Final). The document recognized "...that EPA's national uses, water quality criteria and resulting effluent limits may not always be appropriate when applied to the conditions that exist in effluent-dependent water bodies in the arid West."

The document concludes with the statement:

EPA Region 9 is committed to working with regulatory agencies, impacted dischargers and the public to resolve the issues concerning effluent-dependent streams in the arid West. EPA Region 9 recognizes that it may be necessary to modify water quality criteria, uses, and their water quality-based permits to accurately reflect the conditions in the arid West. This guidance offers a possible framework for striking the balance between protection of designated uses, preservation of valuable ecosystems, and the benefits of water reclamation.

#### THE WQRP

Pima County, Arizona has developed a proposal to establish a regional WQRP in Southern Arizona to conduct the needed research. The regional WQRP would be operated in cooperation with the EPA and would provide researchers with a centralized site to conduct on-site research to deal with common water quality problems throughout the arid West. Governmental and private entities from outside Arizona might want to conduct some additional "specific site" analysis in their own area of operations, and the WQRP would give them an opportunity to share scientific knowledge with scientists dealing with similar problems as well as take advantage of economies of scale which come from operating out of a central research facility.

The County is seeking authorization for an appropriation of monies to construct a WQRP in Pima County, Arizona to conduct laboratory, ephemeral stream, and field research on the impact of effluent and stormwater discharges on the flora and fauna of arid ecosystems. Initially, the County seeks \$5 million in federal funds to: (1) begin planning and design of the WQRP, (2) establish a biological laboratory to conduct the research, and (3) establish a program to begin monitoring the water quality of stormwater flows. The County is prepared to contribute up to \$500,000 in matching funds in the form of land, effluent, analytical laboratory testing services, and staff support to the project.

The Pima County proposal has the support of various entities, for example:

- The Tucson Audubon Society
- The Western Coalition of Arid States
- The Association of Metropolitan Sewerage Agencies
- The International Boundary and Water Commission
- Eastern Municipal Water District; Riverside, California
- The Arizona Department of Environmental Quality
- The City of Albuquerque, New Mexico,
- Southern Arizona Water Resources Association.

I would like to submit two documents for the Subcommittee's review: Rationale for a Program of Research to Develop Water Quality Criteria for Effluent-Dependent Ephemeral Streams and Riparian Habitats in the Arid West and Regional Water Quality Research Project. These documents outline, in greater detail, the need for regional water quality criteria and the functions and scope of the proposed WQRP.

Mr. Chairman, I ask that the Subcommittee honor the County's request to proceed with its study and construction of the WQRP. The authors of the Clean Water Act recognized that water quality criteria and water quality standards should be established on the basis of accurate scientific research. There is only one true way one can achieve that degree of accuracy and that is to conduct the research in the affected ecosystem.

Thank you Mr. Chairman for allowing me to speak before the Subcommittee today, and for your consideration of my request.

## RATIONALE FOR A PROGRAM OF RESEARCH TO DEVELOP WATER QUALITY CRITERIA FOR EFFLUENT-DEPENDENT EPHEMERAL STREAMS AND RIPARIAN HABITATS IN THE ARID WEST

### I. EXECUTIVE SUMMARY

This report recommends a program of research to develop water quality criteria for the arid regions of the western United States. The recommendation flows from an analysis of the problems created when criteria developed for national use are applied to the streams in this environment. National criteria have been developed for aquatic species that are not representative of the species important to the preservation of riparian habitats of ephemeral and effluent-dependent streams. The methods provided by the U.S. Environmental Protection Agency (EPA) to modify national numerical values for use in effluent-dependent and ephemeral streams are not readily applicable because of deficiencies in the methodology, inefficient use of resources, and the lack of basic data on organisms of importance in the region.

Support for a region-wide approach to development of regionally applicable criteria has been growing within national, state, and local regulatory authorities. The ecological importance of wastewater reuse and effluent-supported riparian habitats in the west has demonstrated the need for criteria appropriate specifically for this region, as has been initiated for the Great Lakes and for coastal marine waters.

Ephemerality historically characterizes most waterways of the arid and semiarid west. Generally they are dry except following storm events. In many cases, the only water present in a stream is treated wastewater effluent. Effluent-dependent streams are those ephemeral or perennial streams in which either the wastewater flow or its constituents, e.g., nutrients, exert an appreciable beneficial impact on the stream and riparian ecosystem. A major portion of the western United States, approximately  $1.34 \times 10^6$  square miles, would benefit from research to develop more appropriate water quality criteria for this region.

A large body of technical literature exists on the hydrology and geomorphology of ephemeral streams of the west, however, less is known about the organisms of importance in the riparian ecosystems and their sensitivity to constituents in treated wastewater effluents. The uncertainty about water quality criteria needed to protect important organisms exposed to treated wastewater is magnified when stormwater flows need to be taken into account. No techniques have been developed to evaluate the effects of stormwater flows on the biota, nor to measure the enhancement or degradation of riparian resources associated with stormwater flows.

The report recommends a regional research facility be established at a conveniently accessible and representative location within the arid west to develop scientifically credible water quality criteria data and methodology. A central facility could effectively incorporate the rigor demanded by the EPA for region-wide laboratory dose-response studies whereas many local studies conducted in the past have been rejected by the EPA for methodological

faults. This facility could also incorporate experimental devices such as large mesocosms and simulated streams that from operational and economic considerations could not reasonably be created for each site study. Because of rather large uniformity throughout much of the west, an holistic approach to criteria development would offer scientific and economic advantages. Flexibility would be a design consideration for the central facility with a view to accommodating research needs of other less-generalized situations.

There are, however, some geographical, climate, and wastewater discharge considerations that would require studies at unique locations in addition to criteria development work that could be conducted at a central regional facility. For verification purposes, and to provide feedback for laboratory experiments, field studies are recognized as an important component of the research plan. For example, irrespective of the uniformity of some features between northern and southern extremes of the arid west, there would be non-uniformities in species and response sensitivity that could be adequately studied only at the site. Situations such as this could represent 10 to 20 percent of the effort needed to generate appropriate criteria, while 80 to 90 percent could more efficiently be conducted at the central facility.

The Pima County Wastewater Management (PCWWM) agency in southern Arizona (near Tucson) has made significant contributions to the development of this initiative and has proposed a major contribution of land for the development of the regional facility. Serious consideration should be given to their offer to operate the central facility. Tucson's climate represents a major portion of the climate range in the region, providing exploitable opportunities for experimentation under natural conditions.

Several activities are recommended to be initiated to begin data collection, methods development, and additional planning details:

- Develop a database on biological resources of the Santa Cruz River below the Tucson wastewater treatment plant.
- Determine ammonia concentration effects on species important in EDE stream ecology in relation to nitrogen fate and municipal effluent discharges.
- Develop a model "eco-benefit analysis" for evaluation of alternative criteria for EDE streams including water reuse options.
- Develop an approach to evaluate impact of major stormwater events on EDE stream quality and appropriate criteria.
- Review and evaluate mesocosm and simulated stream approaches for the types of data needed for EDE stream criteria.
- Assemble scientific advisory council for continuing planning effort.

## II. INTRODUCTION

### A. OBJECTIVE

The objective of this proposed program is to improve the scientific basis for regulation of treated municipal wastewater discharges and stormwater to effluent-dependent ephemeral (EDE) streams in the arid western part of the country. This report describes the nature of the problem, a summary of available information, and recommendations for a regional research facility to develop water quality criteria that would be appropriate for protecting the important biological components of ecosystems in these environments.

### B. NATURE OF THE PROBLEM

**Clean Water Act:** A goal of the federal Clean Water Act (U.S. Congress, 1987) is that all of the nation's waters, where attainable, should provide for the protection and propagation of fish, shellfish, and wildlife, and for recreation in and on the water. Over time, the federal agency responsible for the implementation and enforcement of the Act, the EPA, began to interpret this specific goal to mean that all of the nation's waters shall be "fishable and swimmable." While this is an admirable goal, it could impose important societal, ecological, and financial ramifications on various geographical segments of the country, due to their differing aquatic and riparian ecosystems. For example, the climatic and geomorphic conditions of the Great Lakes, the coastal zone, and the arid southwest have generated naturally different fauna and flora and, as a result, local governments have vastly different water resources to manage.

Recognizing this disparity, the Congress and the EPA have responded to initiatives from state and local regulatory agencies, including Pima County, to consider, at least implicitly, regulating discharges on the basis of environmental situations at a specific site (Carlson et al., 1984; Atkins, 1990; Brungs et al., 1992) or in a certain region, for example, the Great Lakes and the arid west (Reilly, 1991; Tuden et al., 1992). This approach has been endorsed by professional water quality and pollution control organizations in Arizona (AWPCA, 1991; Tubbs, 1992; Wiley, 1992) and nationally (AMSA, 1992). While this recognition of regulatory agencies that ecosystems can be protected by environmental criteria and effluent controls matched to the sensitivity and resiliency of organisms exposed to specific discharges is laudatory, the scientific basis for establishing the necessary standards is not yet firmly established. Both data and methods for acquiring data are lacking.

The need for appropriate data can be met through research using existing technologies, although methodologies may need to be modified to meet emerging regulatory constraints. Additional research facilities may be required to accurately represent conditions in arid regions because these ecosystems may not have been incorporated in water quality studies previously used for development of receiving water criteria and effluent controls. The technical approaches to improve the scientific basis for regulations should allow researchers to conduct a broad range of studies, involving naturally existing riparian habitats influenced to varying degrees by municipal effluent and stormwater discharges, a system of simulated stream environments, and laboratory dose-response experiments.

While primary attention should be directed to municipal wastes, which generally include wastes from industries connected to the sewer system, the methods, if not the results, would be useful for criteria development for individual industrial as well as stormwater discharges. Both treated municipal effluents and stormwater runoff are critical components of the available water resource in the arid west, especially in relation to preservation and replenishment of groundwater aquifers. In this region of ephemeral and effluent-dependent streams, the beneficial uses of these components of the water resource are markedly different than in many other regions of the country.

### C. METHODS USED TO GENERATE APPROPRIATE WATER QUALITY STANDARDS

**Gold Book:** The most recent compilation of data (U.S. EPA, 1986a) and rationale (Stephan et al., 1985) for development of national water quality criteria is referred to as the "gold book." Many engineering, science, and regulatory actions are guided by the numerical data and calculation methods in these documents. Absent any other data that might be desired, for example, for a wastewater treatment plant design objective, an engineer would likely specify performance criteria based on gold book values for specific chemical constituents in the waste stream. Scientists studying the quality of a stream similarly could have in mind the gold book values in assessing causal relationships. Unless a state regulatory agency justifies other values, the U.S. EPA will impose these values on the state's waters.

The EPA rationale recognizes that, ideally, criteria should be developed through field tests, however, that was determined to be an infeasible approach, and consequently laboratory studies on aquatic species, primarily in vitro, constitute the bulk of data used to compute the gold book values. The intent is to protect a large number of appropriate taxa, e.g., about 95 percent. Protection of aquatic species is expected to provide an appropriate degree of protection to other animals and plants as well. It is important to note that the rationale also recognizes that in developing regulatory standards from these numerical criteria, it may be important "... to take into account such additional factors as .... hydrological .... environmental chemistry of the material .... and species in the body of water of concern." Thus the EPA's 1985 national guidance for the use of the criteria documents supports the idea of modifying national criteria to reflect local conditions.

The quotation above includes the phrase "in the body of water," probably quite innocently, but it demonstrates a possible narrow view of the value of any water resource in the arid west. In the arid west, even small and ephemeral water resources are of great value to riparian animal and plant communities, and their value to the local environment may be much greater than the value of aquatic species "...in the water body." The EPA focus on aquatic species has been recognized as a limited view before (U.S. EPA, 1989) and efforts to provide methods for wildlife criteria have been proposed in the EPA Great Lakes Water Quality Initiative (U.S. EPA, 1991), as well as more generally (Thomann and Parkerton, 1991).

National criteria have not been derived for all contaminants of concern. The EPA rationale (Stephan et al., 1985) points out that "... the available data ..." may not be sufficient to develop a best estimate for a national criterion. "If all the required data are not available,

usually a criterion should not be derived." [Emphasis added]. This is a scientifically responsible recommendation, but it evidently is not always followed by regulatory agencies. Perhaps regulatory agencies should adopt narrative standards until the necessary data are available. Otherwise, numerical standards derived from data on inappropriate species and imposed on streams harboring different species could turn out to be ineffective.

**Basis for Gold Book Values:** An extensive body of scientific research has contributed to the development of national ambient water quality criteria documents for the United States. Hundreds of pollutants and their effects on dozens of species of aquatic and marine organisms, including plants, have been studied. Research has been conducted by individuals representing a wide range of applied and theoretical sciences; freshwater and marine biologists, wildlife managers, water resource researchers, aquacultural researchers, limnologists, environmental managers, waste managers, toxicologists, biochemical physicists and physiologists, mathematical community theoreticians, plant physiologists, phycologists, fish pathologists, vertebrate and invertebrate physiologists, and oceanographers.

In the development of water quality criteria, scientists at the EPA review tests of acute and chronic toxicity of a wide range of pollutants. Data that are utilized must meet certain basic scientific requirements before they are included in the EPA's decision-making processes that lead to recommended water quality criteria under Section 304(a)(1) of the Clean Water Act. Many factors have led the EPA to reject studies proposed, for example, for the promulgation of criteria for copper, silver, and pentachlorophenols (PCPs).

**Copper:** In the case of ambient water quality criteria for copper, the EPA did not utilize data from studies in which copper was tested as part of a mixture. Data were also not used if research did not clearly provide interpretable concentration-time relationships or if data could not be interpreted in terms of acid-soluble copper. Other work was not included in the data sets used to derive copper criteria because artificial test media were used, results of studies showed relative effects among a group of test organisms, or research was aimed at documenting selection, adaptation, or acclimation of organisms to increased resistance to copper. Lack of adequate reporting of ambient copper concentrations or inadequate controls in field studies precluded use of some research. Studies in which mortality rates in controls were too high were, similarly, not used in criteria development (U.S. EPA, 1985a).

**Silver:** The EPA rejected studies involving the chronic and acute effects of silver for several reasons: test procedures not adequately described; test results not reported in terms of acid-soluble silver; silver used as a component of an effluent or mixture; and organisms exposed to silver by injection or gavage, or tests only exposed enzymes, excised or homogenized tissue, or cell cultures. Other studies conducted without controls were not used and studies in which cultured organisms were raised and tested in different waters were not used. A variety of other studies were rejected for other reasons, primarily related to lack of controls, documentation of dilution water constituents, and lack of measurements of silver in ambient waters from which field studies were conducted (U.S. EPA, 1987).

Another interesting facet of the issue as it relates to criteria for silver revolves around water hardness. The U.S. EPA (1987) acknowledges a lack of information on silver toxicity at

higher hardness levels and, further, points out that there is poor agreement between the few data sets available for harder waters. Consequently, the criteria for silver are weighted toward acute toxicity observations of silver in soft water and criterion concentrations ".....might be overly protective of aquatic organisms in hard waters". Within Pima County and, undoubtedly, in other areas of the arid west, average water hardness probably exceeds 150mg/l and may exceed 1,000mg/l during storm events (F.P. LaSala, Pima County, Personal Communication to E.L. Smith, February 1993). Harding Lawson Associates (1986) measured hardness values between 144mg/l and 362mg/l in effluent flows on the Santa Cruz River in Tucson. They indicated a hardness value of 96mg/l for natural flow in the Santa Cruz. These values are much higher than those that characterize soft water tests upon which the silver criteria are based. The U.S. EPA (1987) value for high hardness is  $>75\text{mg/l}$  as  $\text{CaCO}_3$ .

**Pentachlorophenol (PCP):** Results of studies documenting the effects of PCPs were not used if test procedures or materials were not adequately described, if PCPs were part of a test mixture or if they represented less than eight percent of a test mixture, if PCP was a component of a sediment, if test organisms were exposed by injection, or if PCP exposure was to enzymes, excised or homogenized tissue, cell cultures, or sewage bacteria. Other studies were not used because tests were conducted with too few organisms or concentrations of PCP used in tests fluctuated widely, no replicate test chambers were utilized, or if studies were characterized by high mortality of control organisms (U.S. EPA, 1986b).

**Appropriate Species:** One of the factors in the rejection of research data for inclusion in analyses leading to development of ambient water quality criteria for each of the pollutants reviewed above is that studies related to species that were not resident in North America (U.S. EPA, 1987, 1986b, and 1985a). This is a valid reason for not including study results, but its use demonstrates that this acceptance test may need to be expanded within North America. Virtually all factors that may preclude use of European data, for example, for North American criteria are pertinent with respect to criteria that affect the eastern and western United States. The disparity in climatology, geologic history and related organismic speciation, and presently existing environmental conditions is probably less between the European Continent and the eastern United States than it is between the arid western United States and areas east of the Great Plains in this country.

For example, within the State of Arizona, of the aquatic vertebrate species most often cited as research subjects in water quality criteria documents (rainbow trout, fathead minnow, goldfish, common carp, bluegill, mosquitofish, and guppy) none are native species (see Miller and Lowe, 1964; Minckley, 1973). In fact, of the ambient water quality criteria documents reviewed above (U.S. EPA, 1987, 1986b, and 1985a), with few exceptions none of the vertebrate species is indigenous to the arid southwestern and western United States. Exceptions are the speckled dace *Rhinichthys osculus*, and members of the genus *Salmo* as represented by highly localized populations of native trouts in high elevation, montane habitats (Miller and Lowe, 1964; Minckley, 1973, Lee et al., 1980). The fathead minnow and mosquitofish occur as native species as far west as the Rio Grande system in New Mexico, but are not native elsewhere in the western United States (Lee et al., 1980).

Of 82 studies deemed acceptable by the EPA and involving 29 vertebrate species for determining ambient life criteria for copper (U.S. EPA, 1985a), not one of the 29 species is native to most of the arid western United States. Only the mosquitofish approaches being a native species of the arid west (see Lee et al., 1980, pg. 538 and pg. 341). Similarly, of 18 studies of 7 vertebrate species cited in the draft ambient life criteria document for silver (U.S. EPA, 1987), only the mottled sculpin, *Cottus bairdi* and speckled dace are native to the arid western United States. The speckled dace, as a species, is composed of a large number of disjunct populations, some representing identified subspecies, that are Pleistocene relicts of formerly more widespread ichthyofaunas associated with inland lake systems in the Great Basin (e.g., Lake Bonneville)(Hubbs, et al., 1974). The evolutionary history and causal factors associated with disjunct populations of *Cottus bairdi* in southwestern Utah and northern New Mexico are unclear.

Ambient water quality criteria studies that have been included in the EPA's (1986b) technical document for PCPs also do not include any vertebrate species (52 separate studies of 15 species) that are characteristic of the arid west and southwest. Fathead minnow and mosquitofish are the only two species whose known historic distribution reaches the eastern edge of arid western regions. Both of these species are, notably, historically associated with one of the major, perennial river systems of the southwest, the Rio Grande.

Chadwick and Associates (1992) have raised questions about the efficacy of single-species toxicity tests relative to native faunas of receiving waters. In addition to the inadequacies raised above relative to some vertebrate species, they also examine some of the invertebrates that are used in acute and chronic studies of pollutants. For example, *Ceriodaphnia dubia* (cf. *reticulata*?) a commonly studied Cladoceran species is a planktonic lake-dwelling organism. Not only is *Ceriodaphnia* a planktonic, lake-dwelling organism, it is also likely to be of European origin as is *Daphnia magna*, one of the EPA "standard" test organisms.

Other invertebrate studies cited in the ambient water quality criteria documents for copper, silver, and PCPs include several genera and species of snails; a total of 13 studies combined are cited in the three documents involving 9 snail species. Of this group of snails, only one, *Gyraulus circumstriatus*, has been recorded from the State of Arizona and that record is doubtful (Bequaert and Miller, 1973).

Notwithstanding the disparities in distribution and origin of species often used in research to support water quality criteria decisions, it is noteworthy that most of the groups of organisms (e.g., fish, mollusks, crustaceans, and aquatic insects) are not present in ephemeral streams of the western United States, and many do not occur in effluent-dependent streams.

**Use Attainability & Site Specific Studies:** Use Attainability Analyses (UAA) or Site Specific Studies (SSS) are frequently mentioned as the methods of choice to develop criteria applicable to special situations (Carlson et al., 1984; Stephan et al., 1985; Tuden et al., 1992). While these methods do provide opportunities for modification of national criteria, two major concerns exist in conjunction with the issue of a broadly applicable method for the general situation in the arid west.

The SSS method is fundamentally a proper environmental approach to regulation of a discharge, however, as currently implemented, it is keyed to an individual site. The burden of developing appropriate water quality standards is borne by the individual discharger and, if successfully developed, will apply only to that discharger. If that approach has to be taken by every discharger in the state and region, there may be far greater expenditures of public and industrial funds than would be necessary if a broader approach were possible. Furthermore, there is a need for state, regional, and federal regulatory agencies to become involved in the criteria development process to guard against the creation of inconsistent standards for ecologically similar environments throughout the arid west.

The UAA and SSS methods carry negative stigmata along with their successful application. The implied public image, if not the official regulatory attitude, is that a discharger is not able to meet water quality standards that have been developed. In fact, many dischargers are able to do so, but only with unnecessary cost and without being able to demonstrate commensurate environmental benefit. As with SSS, UAA is a fundamentally-sound environmental approach to discharge regulation, but it too needs to be applied on a broader basis to the expanse of rather uniform stream environments subjected to similar discharges in the arid west. It is not a case of a discharger seeking special consideration, but rather that many dischargers are proposing appropriate consideration for their regional environment and their local ratepayers.

**Ecological Benefit Comparison:** A significant advance in the rationale for developing water quality standards to protect effluent-dependent ecosystems has been proposed by the EPA Region 9 (Tuden et al., 1992). The fundamental idea is to incorporate an ecological benefit comparison in the UAA analyses. This approach allows for the preservation of ecologically valuable riparian habitats, recognizing that in arid lands the use of treated effluent may provide greater benefit than could be realized with standards based on the EPA's national criteria. Furthermore, the approach encourages and enhances the realization of water reclamation and reuse.

As proposed, the approach is to be applied on a case-by-case, site-specific basis. As such, it suffers the disadvantage of not being as applicable to the broad range of common problems faced by a large number of dischargers in the arid west.

**Water-Effect Ratio:** Brungs et al., (1992) provide an analysis of site-specific studies conducted to determine adjustments to national water quality criteria for certain metals. The concentration causing acute toxicity using site water and species divided by the metal concentration based on indicator species data (for the national criterion) is the water-effect ratio (WER). The WER approach allowed use of surrogate species, if necessary, to represent appropriate species at the site. Many of the studies produced data that were judged to be unacceptable. With the exception of zinc, for data judged to be acceptable, there was considerable variation in the WER from site to site for each metal studied. Results for cadmium presented the strongest case for modification of national criteria. The copper data indicated potential utility, but the chromium, lead, and nickel data were too sparse to allow generalization. While the approach is considered appropriate for chronic toxicity studies, the studies included in the evaluation did not produce sufficient data to warrant discussion.

The U.S. EPA subsequently (1992) issued an interim guidance document on site specific modification of national metal criteria, endorsing the WER for criteria derived from laboratory toxicity data. Specific exceptions are the chronic mercury criterion and the field based selenium freshwater criterion. Recommendations for conducting the on-site toxicity studies do not give sufficient consideration to effluent-dependent streams containing more than 50 percent effluent. Some of the recommendations relating to chemical fate and methods to relate toxicity to the exposure regime are presented without citation of technical reports and seem to be open to continuing question. The conclusions and recommendations from the Brungs et al., (1992) report are not discussed and appear not to be reflected in the guidance document.

**Constructed Stream Segments:** In the mid 1970s, the EPA built eight, 1700-foot channels at Monticello, Minnesota to provide a testing facility for development of water quality criteria. The objectives were to add a greater degree of realism to the exposure regime experienced by organisms challenged by various concentrations of chemicals for which criteria were desired. An EPA/University of Minnesota report (Johnson et al., 1991) lists 52 reports of work in the channels between 1977 and 1990. Results were used to verify laboratory exposure data and to provide guidance for better design of laboratory dose-response experiments. The water quality criterion for selenium, for example, was influenced by results from studies using the Monticello channels. The results showed that the field observations on selenium toxicity in North Carolina reservoirs were more representative than laboratory experimental results. In this case, the numerical criterion was more restrictive than would have been indicated by the laboratory data alone.

### III. EPHEMERAL AND EFFLUENT-DEPENDENT STREAMS

#### A. GENERAL DESCRIPTION

Ephemeral streams historically characterize most waterways of the arid west. Ephemeral river and stream channels are dry for most of the year. Literally meaning "for the day", ephemeral streams are more technically defined as streams in which the channel is at all times above the water table, flowing only in direct response to precipitation events. There are unique plant and animal assemblages associated with ephemeral stream conditions that depend on the cyclical presence of water to reach their fullest ecological potential. Indeed, some species, especially vertebrates, are dependent on cyclic moisture events for survival. Some of these species are commonly found associated with ephemeral waterways. Any type of flow alteration project, for example, the construction of retention dams, water diversion projects, and water treatment plants, may have a direct effect on the plants and animals living downstream. This report focuses on the effects of treated wastewater effluent and stormwater discharge into ephemeral streams.

The key characteristic of the majority of streams in the west is ephemeralism, although flow alterations as a result of human intervention have complicated this situation. Streams which were once free-flowing and perennial are now regulated or experience little or no flow throughout much of the year, that is, they are essentially ephemeral streams. The historic conversion of perennial to ephemeral streams has occurred primarily as a result of diversion for agriculture, groundwater pumping for agricultural, industrial, and municipal uses.

On the other hand, many historically ephemeral streams in the arid western United States have been changed into intermittent or perennial streams due to treated municipal sewage or other discharges (e.g., agricultural irrigation run-off). An effluent-dependent stream is one in which flows consist primarily of effluent. Effluent-dependent streams, depending on a variety of hydrologic and other factors, could be considered to be perennial, intermittent, or ephemeral.

To define effluent-dependent streams in terms of the percentage of flow which is effluent is too limiting. The focus of concern is the relationship between ephemeral streams and their associated biotic communities, and the effects of effluent, specifically, treated municipal sewage effluent. Research on this relationship would result in scientific documentation for setting appropriate water quality criteria for ephemeral and/or intermittent streams in the arid western United States. For generality, the term EDE streams is used throughout this report, although regulatory agencies may designate separate and distinct classifications for these stream types.

#### IV. THE ARID WEST

##### A. GEOGRAPHY

The arid west is, in part, a desert encompassing over  $1.34 \times 10^6$  square miles within the United States borders (Figure 1). This area, including parts of 17 western states, is many times greater than the drainage basin for the Great Lakes. Similar geographic and climatic conditions extend northward into Canada, and in the south, into Mexico.

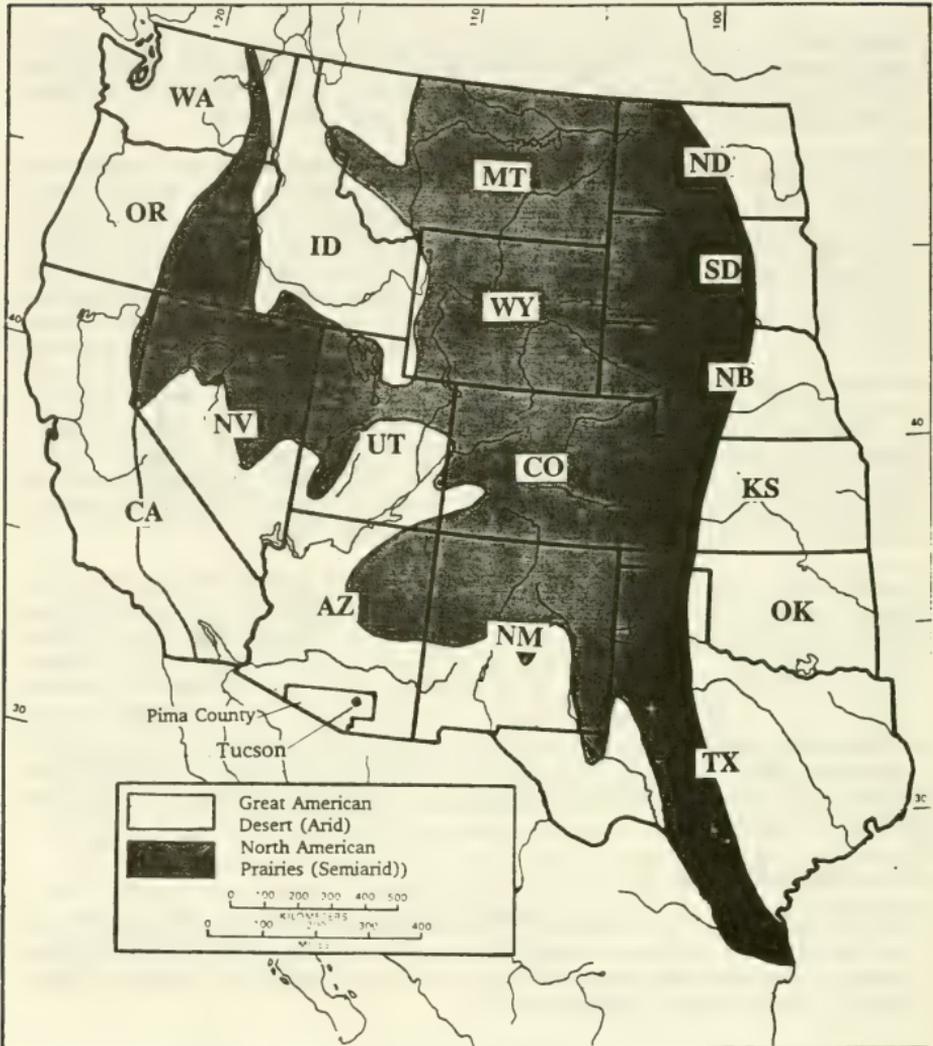

The area includes the Great American Desert, i.e., the southwestern corner of Texas west of El Paso, the southern half of New Mexico, nearly all of Arizona, except the northeastern corner and central plateaus, a small portion of western Colorado, the southern half of Utah and Nevada, plus the portion of southern California east of the Sierra Nevada mountains. It is largely drained by the Colorado, Pecos, and Rio Grande river systems. According to the Koppen climate classification, this area is designated "BWh" which is defined as a tropical and subtropical desert (U.S. Air Force, 1965). Typically in this region, there is less than 15 inches (380mm) of annual precipitation that normally occurs in 60 days or less. The mean daily solar radiation exceeds 450 Langley's per day for most of the region, making it the area within the United States with the greatest amount of sunshine. The summers are hot, with daytime temperatures often exceeding 95°F in July. Winters are mild, with typical January temperatures reaching a low of 25°F (U.S. Department of Commerce, 1972). Biogeographically, the arid west contains parts of the Sonoran, Madrean, Chihuahuan, Mojavian, and Great Basin provinces within which are located parts of the Sonoran, Chihuahuan, and Great Basin deserts and all of the Mojave Desert.

In addition to this truly desert region, the arid and semiarid portion of the western United States extends northward through western Utah, the northern half of Nevada, and into Oregon and Washington on the east side of the Cascade Range, including part of the North American Prairies. While not classified as tropical or subtropical due to freezing temperatures that are characteristic of the winter season, a major portion of the western United States can be classified as being arid or semiarid; some of it typically hot and dry, other portions warm-to-cool and relatively dry. In all regions, aridity results, in part, from rain shadow effects caused by the Cascade and Sierra Nevada ranges and, in part, by the location of the western United States in relation to the major global weather-producing high and low pressure systems.

##### B. CLIMATOLOGY

Pima County, Arizona is representative of the environment in the Great American Desert and is similar to the conditions in major cities the North American Prairies (Table 1). Also, it would closely match the environment of some cities in Mexico (After Green and Sellers, 1964; U.S. Department of Commerce, 1972).

Figure 1. Areal extent of Great American Desert and North American Prairies within the United States. (From: Rand McNally, 1985; The Times, 1980; Trewartha, 1954; U.S. Air Force, 1965.)

**TABLE 1**  
**Environmental Conditions in Selected Western Cities in Comparison to Tucson**

Region	Mean January Temperature (°F)	Mean July Temperature (°F)	Annual Precipitation (in.)
<b>ARID WEST</b>			
Barstow	46	84	4.0
El Paso	43	72	8.0
Kingman	43	82	10.6
Las Vegas	43	90	3.8
Phoenix	52	91	7.7
Yuma	55	91	3.4
<b>TUCSON</b>	50	86	10.9
<b>SEMIARID WEST</b>			
Albuquerque	35	78	8.4
Amarillo	37	78	21.0
Billings	23	73	13.0
Denver	30	73	14.0
Reno	30	67	7.2
Spokane	25	70	17.2
Yakima	28	70	7.0

Tucson, Pima County's largest city, is located in the heart of the Great American Desert region at an elevation of 2430 feet above mean sea level. It has 10.9 inches (277 mm) of precipitation annually. The mean daily maximum temperature in July is 99.6°F and the mean daily minimum in January is 35.2°F.

These climatological conditions match conditions at other locations in the arid west and even some in the Great Basin, although for shorter segments of time, even though the winter extremes of the northern prairies are not reached.

### C. VEGETATION

Although thought of by many as being a vast wasteland with endless miles of scrubby, uninteresting vegetation, the arid west is floristically diverse. Even the non-mountainous lowlands support a wide array of plant communities and associated wildlife species. The evolutionary history of western arid land plant communities is a subject of considerable interest, especially when one considers that true desert scrubland vegetation types are among the youngest plant communities in North America.

These arid lands developed synchronously during the last 10,000 years as apparently the Aleutian low and winter storm tracks migrated northward (Turner and Brown, 1982). During the Tertiary, North American vegetation was made up of three great Geoflora; to

the north was the mixed conifer and deciduous Arcto-Tertiary Geoflora, to the south the mesophytic broad-leafed evergreen Neotropical-Tertiary Geoflora, and sandwiched between the emerging sclerophyllous and microphyllous Madro-Tertiary Geoflora which appeared on drier sites within the Neotropical-Tertiary Geoflora. As climatic changes progressed, the more mesic woodland species of genera such as *Juniperus*, *Artemisia*, and *Pinus* shifted their occurrence both latitudinally and elevationally, while other genera such as *Atriplex* and *Artemisia* underwent extensive species radiation. Creosotebush (*Larrea tridentata*) spread rapidly to colonize large expanses of the arid west. While the affinities of much of the vegetation in Pima County are with species from the south, representative species derived from the north may be found. Indeed, the vegetation of the Tucson Basin is a mix of species derived from both northern and southern floras.

Western riparian and deciduous forests are considered to be modern, water-controlled relicts from these late Tertiary forests (Lowe and Brown, 1982). Cottonwood-willow forests and mesquite bosques occur throughout the southwest in each of the three great southern deserts as do the emergent aquatic species such as cattail (*Typha* sp.) and reeds (*Phragmites* sp. and *Arundo* sp.). Species of *Acacia*, *Cercidium*, *Prosopis*, and *Baccharis* occur from southern Texas to southern California. The similarity of the riparian vegetation has led to similarities in the vertebrate and invertebrate fauna using these areas. Fish genera such as the chubs (*Gila*) and suckers (*Catostomus*) occur in streams from the Rio Grande basin to the Colorado (Minckley and Brown, 1982). The Sonoran Mud Turtle (*Kinosternon sonoriense*) occurs in permanent waters from west Texas to the lower Colorado River.

#### D. RIPARIAN PLANT COMMUNITIES IN THE TUCSON BASIN

Riparian plant communities are defined by Lowe (1961, 1964) as any plant association that occurs in or adjacent to drainageways and/or their floodplains, and which is further characterized by species and/or life-forms different from that of the immediately surrounding non-riparian climax. In the Tucson Basin, indeed, throughout the arid west and southwestern United States, riparian woodlands are characterized by a complex of tree species and their associated plant and animal forms that are restricted to major drainageways that cross the arid, lowland landscapes upward into forest habitats.

Riparian habitats and their unique and highly diverse assemblages of plants and animals exist solely because of the greater availability of water, present as either surface or shallow subsurface flow. Human use of water in the arid western United States has resulted in the demise or significant alteration of most riparian habitats in the region. Some authors suggest that as much as 90 percent of the riparian habitats that occurred in Arizona during pre-settlement times have been destroyed or altered (Jakle, 1992; State of Arizona, 1991). While controversy exists whether 90 percent is an accurate estimate, the fact remains that virtually all authors acknowledge a serious diminution of healthy riparian habitats in the west, particularly in the lowlands. Conservation of existing riparian areas and rejuvenation of damaged ones is a high priority with many agencies, groups, and individuals.

The riparian habitats of the Tucson Basin are used as examples of the kinds of plant communities that occur on drainageways. Variations on the theme occur throughout the west, but the distinguishing characteristics of riparian habitats regionwide are similar.

**Mixed Broadleaf Associations:** On upland sites below about 1500m elevation, a riparian community composed of as many as five winter-deciduous broadleaf trees may occur. This mixed broadleaf association may contain walnut (*Juglans major*), sycamore (*Platanus wrightii*), velvet ash (*Fraxinus pennsylvanica*), Fremont cottonwood (*Populus fremontii*), and willow (*Salix gooddingii*, *S. bonplandiana*, and others). The association usually occurs where stream channel gradients are steeper, deposition of alluvium is patchy, bedrock (or components thereof) is exposed, and flood events are characterized by higher velocity downslope movement of water. In the Tucson Basin, this type, or elements of it, occur in most mountain canyons and in stream channels that dissect the upper bajadas at the foot of mountain ranges like the Santa Catalinas, Rincons, and Santa Ritas. In Arizona and New Mexico, this community type may have escaped some of the negative impacts that have befallen the lowland cottonwood-willow associations simply because of its position in the regional landscape (e.g., on more upland, rocky sites). Significant pieces of this type have, however, probably been lost to inundation resulting from dams and most are presently degraded due to livestock grazing and, in some locales, severely affected by human recreational use.

**Cottonwood-Willow Associations:** Cottonwood-willow (*Populus-Salix*) gallery forests as described here include the *Populus fremontii*, *Populus fremontii-Fraxinus pennsylvanica*, and the *Populus fremontii-Salix gooddingii* community types of Szaro (1989). These represent the classic Fremont cottonwood-Goodding willow, and Fremont cottonwood-velvet ash communities that occur along the lower reaches of major drainageways in southern and central Arizona. Riparian habitats in which Fremont cottonwood is a dominant species are also present in New Mexico, Texas, Nevada, and California. Cottonwood-willow forests occur on alluvial sands, clays, and gravels along drainageways where perennial surface flows are characteristic. The type also occurs (persists) in situations where surface flow is not perennial, but the alluvial water table is shallow thereby providing the plants with readily available water throughout the year. This type is characterized by large, winter deciduous trees and is highly dependent on periodic flood events for seed germination, seedling establishment and, therefore, population recruitment.

Many cottonwood forests in the west that are situated on streams where flooding has been eliminated are decadent and in decline. In the Tucson Basin, examples of this association can be found on Sabino Creek, Cienega Creek, Tanque Verde Creek, locally on Rillito Creek, and along some reaches of the Santa Cruz River downstream from Tucson.

**Mesquite Bosque or Woodland:** Mesquite bosques are xeroriparian or pseudoriparian communities in the sense of Campbell and Green (1968). Mesquite (*Prosopis* sp.) is considered to be a pseudoriparian or facultative riparian species because it is able to complete its life cycle on dry, upland sites. The species does, however, attain greater stature and density along drainageways where it may occur in dense woodlands with a high degree of canopy closure. It is common for mesquite bosques to occur on terraces immediately above stream channels that are occupied by cottonwood-willow or cottonwood-velvet ash associations. In areas where stream flow is intermittent and/or subsurface water is not readily available, the dominant drainageway species is often mesquite with few or no individuals of cottonwood, willow, or ash. Mesquite occurs on virtually all drainageways,

regardless of size, in the Tucson Basin and throughout the lowlands of New Mexico, Texas, southern Nevada, and parts of southern California.

**Desert Wash Communities:** At the lower end of the water availability scale in the Tucson Basin and in other areas in the arid west, are the normally dry wash or arroyo communities that carry water only for brief periods during rainfall events or, in the case of larger washes, during a few weeks in the spring when snowmelt from surrounding mountain ranges is present.

The plant communities that occur along such washes are not riparian in the true sense. However, vegetation growing along washes is usually taller in stature and more dense, and wash communities appear clearly different from the surrounding upland plant communities. The species that occupy wash margins are usually the same as those occurring on adjacent uplands. Their larger stature and greater density is simply a matter of water availability. Species such as blue paloverde (*Cercidium floridum*), ironwood (*Olneya tesota*), catclaw (*Acacia greggii*), and white-thorn (*A. constricta*) are common wash species, but none is an obligate riparian species. One species, desert willow (*Chilopsis linearis*), that occurs in normally dry wash channels probably approaches being a riparian obligate, but is well adapted to survival in the dry, sandy soils of washes.

#### **E. THE SANTA CRUZ RIVER AS AN EXAMPLE**

The Santa Cruz River of southern Arizona drains the Santa Cruz Basin north to the Gila River. Streams draining the Canelo Hills, Patagonia Mountains, the eastern slope of the Sierrita Mountains, the Santa Rita Mountains, and a limited watershed in northern Sonora, Mexico enter the Santa Cruz River channel south of Tucson. Historically, water in this portion of the river disappeared underground in the vicinity of Tucson. The Rillito River, draining the south slope of the Santa Catalina Mountains and the Rincon Mountains, also had perennial flow historically and enters the Santa Cruz north of Tucson. There is no evidence that perennial surface flows in the Santa Cruz River extended to its confluence with the Gila River, some 100 miles north-northwest of Tucson (Hendrickson and Minckley, 1984). Indeed, most historic accounts of the river indicate that it was intermittent through and north of Tucson.

The history of habitation and agricultural use along the Santa Cruz predates the 17th century. Irrigation has occurred since at least 1689 and continues today. Livestock grazing, agricultural developments, alterations to floodplains, and other human activities have been features of the Santa Cruz basin throughout recorded history. Many of the changes wrought by human endeavors are reflected in riparian communities and relicts thereof that currently exist along the river.

Perennial flow in the main channel south of Tucson from the United States-Mexican border to Tubac has been historically documented and now exists in only a few stretches on creeks within the Santa Cruz basin. Intermittent conditions historically existed downstream as far as Tucson; flow in the Tucson vicinity is now ephemeral. Marshlands, cienegas, and cottonwood-willow forests with associated mesquite bosques which flourished in the 1800s are no longer evident due to a number of factors, probably acting synergistically, including

groundwater draw-down, diversion of flow for agricultural use, livestock overgrazing, flooding and increased erosion at man-made structures (Hendrickson and Minckley, 1984; Hastings and Turner, 1965). The disappearance of extensive riparian and wetland vegetation along the Santa Cruz immediately south of Tucson has occurred since the 1950s. Remnants of the cottonwood-willow forests and mesquite bosque habitats were still present near the Mission San Xavier del Bac in the middle 1960s.

#### **F. EFFLUENT DISCHARGE CHARACTERISTICS IN THE SANTA CRUZ RIVER**

As in many other effluent-dependent streams, the flow of effluent in the Santa Cruz River downstream from Tucson approximates 100 percent of the flow for over 90 percent of the year. During the dry part of the year, the stream flows for only several miles before the channel becomes dry due to irrigation withdrawals, evaporation, and groundwater recharge. Immediately upstream of the Tucson area wastewater treatment plant discharges, the river bed is dry, containing running water only after significant rainfall events. There are no resident fish populations in this environment, either upstream or downstream of effluent discharge points. There are abundant bird, amphibian, and mammal species that depend on the aquatic and riparian habitat created by the discharge of treated effluent to this segment of the naturally ephemeral stream. As a component of the riparian habitat that is supported by effluent flows, there are numerous species of semi-aquatic and terrestrial plants that would not be present in the absence of effluent flows. Above and below this effluent-dependent reach, streamside habitat is composed primarily of desert species in relatively low abundance.

The Santa Cruz River is representative of EDE streams regionally. EDE streams exist throughout the arid west and many support regionally sensitive and valuable assemblages of plants and wildlife.

#### **G. EFFLUENT UTILIZATION IN PIMA COUNTY**

Facility planning projections for the metropolitan Tucson area show the volume of wastewater effluent to double by the year 2010. In 2010, it is estimated that 100 million gallons per day (MGD) of wastewater will be available to maintain riparian habitats, support agriculture, provide for turf irrigation and park land development, and recharge the groundwater for future use.

Metropolitan Tucson and the surrounding areas are dependent, in part, on groundwater. As a result, groundwater conservation is a high priority. There is an aggressive water conservation program in place to achieve reductions in overall per capita consumption rates. One component of water conservation is the use of effluent or reclaimed water for irrigation that would otherwise deplete drinking water sources. The use of effluent or reclaimed water preserves groundwater supplies for the future.

#### **H. STORMWATER CHARACTERISTICS IN THE SANTA CRUZ RIVER**

The hills and mountains east and south of Tucson have high runoff coefficients due to the steepness of the terrain and the rocky character of the slopes. Flash floods are common in

the July monsoon season when torrential rains occur almost every afternoon, especially in the mountains. Winter rains are less regular and less abrupt, still there are commonly bank-full flows as the ground in the valleys become saturated and high rainfall events occur in rapid succession. Both above and below Tucson, the flow in the river can reach flood levels within days of first rainfall as flows dramatically increase from zero to over 60,000 cubic feet per second, summer or winter.

There is significant direct overland flow on the lower part of the watershed from the base of the foothills to the main channel. The general absence of separate stormwater sewers in the area also allows storm flows carried on paved streets to overflow the gutters and flow over residential yards and parks on the way to the river. In addition to the usual contamination of stormwater runoff by street washings, additional stormwater contamination occurs from overland flow across the very large number and acreage of golf courses in Pima County. Pesticides and fertilizers would be expected in stormwater entering the channels near irrigated lands and residential areas.

Stormwater flows are typically also very turbid. The vast majority of low relief terrain in the watershed below the foothills is fine grained, low organic content soil with sparse vegetation due to the absence of irrigation and the naturally arid climate. Although this soil type allows for rapid and effective recharge, the process quickly becomes rate-limited and overland shear flow is sufficient to cause particle transport. Similarly, tributary and main channel bank erosion carries off enormous soil quantities. Turbidity in even modest storm flows typically reduces water column visibility to a few inches.

Riparian and in-stream habitats are severely stressed by storm events in arid environments, both by the force and turbidity, and possibly by the chemical contamination carried in storm flows. Water quality criteria for EDE streams should take this into account. Research to develop the criteria needs to be done in environments where these events can be reproduced in proper scale, and in actual environments such as segments of the Santa Cruz River.

Additional examples of EDE streams in the west are provided in Appendix A. Some of these examples contain information on the benefits of effluent discharges and the absence of environmental problems associated with treated wastewater discharges.

## V. LITERATURE REVIEW ON TREATED WASTEWATER DISCHARGES IN RELATION TO EDE STREAM SYSTEMS

Published reports, scientific articles, and theses on the topics of riparian habitats, ephemeral streams, and sewage effluent management have been reviewed. The formal literature catalogued in standard databases<sup>1</sup> was searched most thoroughly, due to the availability of computer searchable databases. The gray literature has been accessed less comprehensively due to the greater time required to obtain listings and selected reports.

These were searched for the topics of: ephemeral streams or water, water quality and southwest or Arizona, riparian habitats and species and sewage effluent. Organizations that were contacted for additional information included the Southern Arizona Water Resource Association, (SAWARA); the Center for Environmental Studies at Arizona State University; the Southwest Technology Development Institute (Las Cruces, NM); the Arizona Riparian Council; U.S. Geological Survey, and the Water Resources Research Center at the University of Arizona. Only papers specifically cited in this report are listed in the **REFERENCES** section.

Articles by the Agricultural Research Service (ARS) on the well-instrumented Walnut Gulch Experimental Watershed, near Tombstone, Arizona, represent the most comprehensive body of literature on ephemeral streams in the arid southwest, e.g., Keppel and Renard (1962), Renard et al. (1964), Osborn and Renard (1973), Wallace and Lane (1978), and Lane (1982). The history of arroyo cutting, particularly of the Santa Cruz River, is well documented e.g., Hastings (1959), Hastings and Turner (1965), Betancourt and Turner (1988), Bryan (1925), Condes de la Torre (1970), and Cooke and Reeves (1976).

Other studies focus on groundwater recharge from ephemeral streams e.g., University of Arizona (1979), Abdulrazzak (1982), Burkham (1970), Flug et al., (1980), Heggen (1988), and Stephens (1988).

Although these studies do not directly address the primary topic of consideration, they may be essential to understanding the nature of ephemeral streams in general.

Most of the water quality literature is composed of reports on the constituents of perennial streams e.g., Collins and Love (1942), Love (1957), and USGS (1972) in the United States

or the Colorado River Basin; the quality of irrigation water e.g., USGS (1969), Love (1954), Kister (1970), and Love (1961); and the impact of agriculture on surface water quality e.g., Spencer et al. (1985), Gillion et al. (1985), and Barnum (1984).

There have been a considerable number of studies on sewage effluent recharge in the Santa Cruz River e.g., Herbert (1976), Ince et al. (1980), Sebenik et al. (1972), and Miller (1990). Some have reached the conclusion that the quality of water in the aquifer may be improved by the infiltration of these waters (Sebenik, 1972; Wilson, 1975). Tinney (1987), however, expressed concerns about the increased salinity that may result from recharge of Central Arizona Project (CAP) water directly or as a component of sewage effluent. CAP water is carried by uncovered surface aqueducts from the Colorado River and began replacing groundwater as Tucson's municipal water supply in late 1992. This water has more than twice the total dissolved solids as the previous water supply.

#### **A. WATER QUALITY CRITERIA TO PROTECT ECOSYSTEMS OF EDE STREAMS**

Only a few publications were found on the specific topic of developing water quality criteria for the discharge of sewage effluent into ephemeral streams, such as the Zander and Jennings (1986) site-specific water quality criteria study for the Santa Cruz River in Pima County, Arizona. They concluded that the riparian habitat and animal community was dependent on the effluent flow and that water quality criteria to protect agricultural livestock were attainable and appropriate.

Several studies border on the topic of appropriate water quality criteria, such as: Ince et al. (1980), and Rea (1988). The emphasis of the former study is on the quality of recharged groundwater and the latter on the restoration of a riparian habitat by the introduction of treated sewage effluent into a stream. Neither considers the benefits or drawbacks of specific constituents of the effluent. Rea's paper clearly demonstrates the benefits to the riparian habitat gained by discharging effluent into an ephemeral stream.

Sullivan (1991) determined that roots of *Tamarix chinensis*, *Salix goodingii*, and *Typha domingensis* irrigated with secondary effluent in a riparian community downstream from a municipal discharge into the Salt River near Phoenix, Arizona accumulated metals, suggesting that these species might be useful for removal of metal contaminants prior to other uses of the water.

#### **B. RIPARIAN HABITATS**

The spectrum of flora and fauna in riparian habitats is broader than might be expected at first glance e.g., Best et al. (1979), Brown et al. (1981), Carothers et al. (1977), Hendrickson and Minckley (1984) and Medina (1986). The literature demonstrates that these habitats in the arid west of the United States are themselves endangered. Development of water resources for municipalities or agriculture has led to arroyo cutting and lowering of water tables transforming tranquil perennial brooks into ephemeral streams which have dry beds most of the year except during periodic and often torrential floods e.g., Brock (1987), McGlothlin et al. (1988), Betancourt and Turner (1988), Cooke and Reeves (1976), Rhoads (1990), and Hastings (1959).

Some of the existing perennial streams in Arizona and their associated riparian vegetation and wildlife may be preserved via establishment of "instream water rights" to these waters (Kulakowski and Tellman, 1990), otherwise, the outlook for these endangered habitats looks bleak, with the exception of where sewage effluent has restored some of the original habitat (Zander and Jennings, 1986; Rea, 1988). Thus the benefits of effluent creating or recreating these habitats must be an essential element in the development of water quality criteria for the discharge of sewage effluent into ephemeral streams.

### C. SPECIES OF INTEREST FOR DEVELOPMENT OF APPROPRIATE CRITERIA

Every species mentioned in reviewed papers was entered into a master list of those that might be appropriate for criteria development. Copies were provided to the EPA laboratories in Corvallis, Oregon and Duluth, Minnesota to solicit their guidance in narrowing the list to a more manageable size. Of the mammals, none presents a particularly compelling case for inclusion in potential research lists. While some species may have direct contact with effluent and a diet which includes prey having similar contact, most species of mammals living in the southwest lowlands are likely to be relatively unaffected by effluent contaminants due to minimal contact.

A tentative short list of vertebrates (Table 2) excludes those species which would be unlikely to exhibit response to water quality variables, all non-native species, and many of those which can be found in a wide variety of habitats or environments. Species with broad tolerances to environmental conditions will be unlikely to be useful in developing water quality criteria. To be included in this list a species must have fairly widespread distribution in the region and not be vulnerable to variations in hydrological conditions (able to withstand periodic flooding, etc.). Species most likely to be affected by contaminants in effluent would be those species with direct contact with the effluent and effluent-contaminated sediment and those which consume material contaminated by effluent constituents.

Among the fish species listed in Table 2, the longfin dace (*Agosia chrysogaster*) would be a strong candidate for toxicological testing. Other potential candidates would include the chubs (*Gila* sp.) or suckers (*Catostomus* sp.). Of the reptiles and amphibians, two of the most attractive species are the leopard frogs (*Rana yavapaiensis* or *R. chiricahuensis*). Populations of these two frogs are considered to be in some jeopardy: *R. yavapaiensis*, the lowland leopard frog, is a candidate for listing among the threatened native wildlife of Arizona, and *R. chiricahuensis*, the Chiricahua leopard frog, is currently listed as a threatened species (Arizona Game and Fish Department, 1988). Despite the attractiveness of these aquatic frogs as potential research organisms, there are several other native amphibian species that may be of equal, or greater, value. Common, indigenous amphibians that offer good research potential include the group of semi-aquatic toads in Table 2. Relative to this group of fairly common toads, investigations of larval (tadpole) responses to various contaminants and toxics might be particularly illustrative. Of the reptiles, the Sonoran Mud Turtle should be included. Other potential reptiles could include garter snakes, which are semi-aquatic.

**TABLE 2**  
**Species of Potential Use in Water Quality Criteria Development**

Longfin Dace	<i>Agosia chrysogaster</i>
Gila Chub	<i>Gila intermedia</i>
Roundtail Chub	<i>G. robusta</i>
Suckers	<i>Catostomus spp.</i>
Couch's Spadefoot Toad	<i>Scaphiopus couchii</i>
Western Spadefoot	<i>S. hammondi</i>
Plains Spadefoot	<i>S. bombifrons</i>
Great Basin Spadefoot	<i>S. intermontanus</i>
Great Plains Toad	<i>Bufo cognatus</i>
Woodhouse Toad	<i>B. woodhousei</i>
Red-spotted Toad	<i>B. punctatus</i>
Sonoran Desert Toad	<i>B. alvarius</i>
Lowland Leopard Frog	<i>Rana yavapaiensis</i>
Chiricahua Leopard Frog	<i>R. chiricahuensis</i>
Sonoran Mud Turtle	<i>Kinosternon sonoriensis</i>
Garter Snakes	<i>Thamnophis spp.</i>
Mallard	<i>Anas platyrhynchos</i>
Black-bellied Whistling Duck	<i>Dendrocygna autumnalis</i>
Ring-necked Duck	<i>Aythya collaris</i>
Wood Duck	<i>Aix sponsa</i>
Coot	<i>Fulica americana</i>

Of the bird species listed, it is primarily the ducks, shorebirds, and coots which are likely to have sufficient contact with effluent water to be examined as possible research species.

Invertebrate groups that might be of interest and value as research subjects include members of the insect families Gyrinidae (whirligig beetles), Dytiscidae (diving beetles), Hydrophilidae (water scavenger beetles), Belostomatidae (giant water bugs), Corixidae (water boatmen), and Notonectidae (backswimmers). Many of these forms are opportunistic in their life cycles and occur in intermittent and ephemeral waterways in the western United States. Other invertebrates that could be utilized include local populations of crayfish, Tubificid worms, Amphipods, and mollusks.

In addition to species of vertebrates and invertebrates, species of algae may be of value in water quality research efforts. At present, the information on algal species is not sufficient to allow a selection of those that might be valuable for experimental use. The existing literature on algae found in the southwestern United States, and Arizona, in particular, is neither large nor impressive. Inclusion on the list was dependent upon the alga being macroscopic or occurring in macroscopic formations, aquatic (species characteristic of hot springs and soil algae not included), and known to occur in Arizona. Cameron (1963) notes that the algae of Arizona are representative of species found throughout the southwest. Species listed by Cameron (1961, 1963, and 1964) were checked against those found in Utah (Rushford and Merkle, 1988) and a broad convergence of genera and species was apparent.

A survey of algae of the Santa Cruz River should be undertaken during the early stages of any water quality criteria work to assist in reducing the list of candidate species. Table 3 presents a listing of genera and species that may occur in the Santa Cruz River Basin.

#### **D. THE FATE OF EFFLUENT CONSTITUENTS IN EPHEMERAL STREAMS**

Only a small sample of the abundant literature that could be tapped to assess the polishing of the quality of effluent discharged into ephemeral streams by riparian vegetation has been reviewed. Nutrient removal from effluent streams is well documented in this literature, however, most citations relate to areas of the country that have considerably more precipitation and, therefore, different habitats. A great deal of information is available on the transformation of nitrogen in municipal effluents known to occur in natural streams and wetland settings, e.g., Seidal (1976); Spangler et al. (1976); Tilton et al. (eds.), (1976); Boyt et al. (1977); Sloey et al. (1978); Kadlec and Tilton (1979); Rogers (1985); and Rogers et al. (1991). The modification of the nitrogen content of the recharged effluent by the soil has been the subject of several studies, some in the Santa Cruz River (Herbert, 1976; Ince et al., 1980; Lance, 1975; Osborn, 1987).

Until recently, the inference that nitrogen was removed by plants was based on nitrogen balance measurements in constructed wetlands while more direct experimental studies indicated that microbial metabolism, facilitated by the plant's ability to transport oxygen to the root zone, was responsible for nitrogen removal (Rogers et al., 1991). It must be assumed, however, that especially in nutrient-poor soils typical of the arid southwest, the plants would utilize available nitrate, given other environmental factors conducive to growth. Recent experimental work by Rogers et al. (1991), and work they cite by Breen (1990), demonstrates that plants play an active role in direct removal of effluent nitrogen in

simulated wetlands. Research needs to be conducted in the arid west to verify the importance of nutrient-rich effluents in protecting riparian habitats.

## VI. DEVELOPING THE RESEARCH PLAN

### A. DATA AND METHODS NEEDED

Although it has been recognized for the last decade that there is sound justification for modification of national water quality criteria to apply to local situations, it is only fairly recently that recognition of area-wide rather than site by site considerations began to warrant attention. Water hardness as a characteristic of streams was one of the first considerations for a general class or type of modification. Then saltwater criteria were considered to replace the application of freshwater criteria in marine settings. Recently, the Great Lakes were considered as requiring separate attention, and now there is growing support not just in the west, but nationwide, for criteria to protect environments associated with conditions in the arid west.

As described above, methods available to develop appropriate criteria, including by modification of national criteria, suffer from several shortcomings:

- The EPA methods and criteria focus on aquatic species, whereas non-aquatic riparian species have a higher ecological value to EDE streams. Thus the EPA's national criteria may not represent even an approximate starting point as a basis for modification.
- Site-by-site studies are difficult to conduct, frequently producing data unacceptable to the EPA.
- Site-by-site studies require the expenditure of significant funds at each site that warrants attention, even along the same stream.
- A potential exists for inconsistent criteria to result from individual site-by-site studies at different locations within environmentally similar habitats.
- Consideration of stormwater impacts and water reuse potential have not been woven into the fabric of lab and field studies needed to generate criteria data.
- Dose response data for wildlife and riparian species representative of the arid west have not been reported in scientific papers and may not be available.

A research plan to improve the database and methods to develop appropriate criteria and standards for EDE habitats in the arid west should attempt to overcome these impediments. Research results would include scientifically credible dose-response data acceptable to regulatory agencies for establishment of criteria and standards for EDE streams, as well as permit controls for discharges to EDE streams. As uniform as conditions are in many parts of the arid west, it is likely that within the two major geographic regions shown in Figure 1 there will be differences associated with specific discharges and local habitats. Certainly, between arid lands in eastern Washington and southern Arizona, there would be differences that may or may not be important to consider in developing criteria. Thus to develop the data, these differences may require the use of several methods.

The central thrust of a research plan to address the problem effectively and minimize the overall cost is to concentrate a major portion of the technical effort at a central location, and to conduct supplementary and confirmatory investigations at field locations. A centrally-located facility in the arid west would optimize the use of funds for specialized experimental equipment that could not reasonably be replicated at all the sites where data would need to be collected. The facility could be developed to meet the strict quality assurance/quality control standards demanded by the EPA, thus reducing the problem of the EPA rejecting the results of studies as has occurred in the past. The facility should represent exposure conditions and environmental settings of a wide range of sites in the arid west, and some capability for modification to handle new or unusual challenges. The premise is that there are many very similar situations throughout the region and a central facility, working on the most generalized types of problems, could generate data that would be useful for criteria at many if not most locations.

Some fine tuning of generalized results may be necessary, however, for final standards. Field observations at some locations could be conducted, but they should be less expensive to do than if a complete study had to be conducted at each site. Alternatively, or additionally, fine tuning could be conducted at the central facility, taking advantage of specialized equipment that might be modified.

For confirmation of actual environmental effectiveness and to provide data on emerging problems, field studies would likely be required by local regulatory authorities. Results of these studies should provide a valuable feedback loop for maintaining and improving the regional value of the central facility. A key design factor for the facility and for the experiments conducted over time should be to maximize the potential for region-wide application of results. A secondary, but nearly equally important factor, should be flexibility of the facility so that many locally important but less generally-applicable problems can be researched in the facility. If only 10 to 20 percent of the study effort needs to be done on-site that previously was required by the EPA site-specific guidelines, there would be great economies for the region as a whole. In this way, the research effort conducted at the central facility would replace the 80 to 90 percent of effort that would otherwise have to be done at each site and it could be applicable at all the sites.

The types of studies and kinds of equipment and facilities that should be considered at a central location are discussed in more detail below.

#### **B. IDENTIFICATION OF KEY SPECIES OF REPRESENTATIVE ECOSYSTEM COMPONENTS**

In addition to information obtained from national, state, local, and scientific organizations regarding species to be protected, and candidate species for study, a series of field observations could be conducted specifically for this purpose. A survey of effluent-dependent sections and similar sections of streams without effluent may highlight the effluent induced species. A comparison of the whole spectrum of potential species with those found in effluent-dependent streams (this would include those that would occur

naturally in ephemeral streams plus those induced by the effluent) might turn up some differences that might be explained by the following (not necessarily comprehensive):

1. Species are not in the area.
2. Species do not use a stream frequently.
3. Insufficient water to support species.
4. Concentration of some constituent of effluent is toxic to species.

Focus could then be given to studying species that may not be found due to option 4. Toxicity studies could then be conducted on those species whose growth or presence is suspected of being inhibited by the effluent discharge.

Selection of species for acute and chronic dose response studies may require consideration of surrogate species needed due to protocol restrictions and ecological concerns.

### C. RESEARCH METHODS

**Lab-Scale Dose-Response Studies:** Most of the extant water quality criteria have been developed on the basis of laboratory dose-response experiments. Results of lab studies and other relevant information are evaluated according to criteria development guidelines established by the EPA (Stephan et al., 1985). While these guidelines are currently being revised, they are not likely to include methods or data specifically applicable to EDE streams (G.A. Chapman, pers. comm., July 31, 1992). The list of species used in exposure studies that will be updated in the revised guidelines report may be useful to consider for selection of appropriate dose-response study organisms, either for purposes of demonstrating quality assurance, or for generation of directly applicable data. The data for the revised report are expected to be available to scientists for use in designing appropriate experiments in advance of a final report.

A central, arid west research facility would likely include laboratory dose-response experiments in its repertoire of methodologies (either in-house or through contracts) to develop water quality criteria for the arid west. Laboratory dose-response studies are expected to be a primary source of data the EPA would rely on to develop or endorse water quality criteria for aquatic species for the near future. Protocols are fairly well established (Peltier and Weber, 1985; Weber et al., 1989), and regulatory agencies are likely to have a high degree of confidence in data generated by standard protocols. Many university and commercial laboratories are able to conduct large numbers of experiments with substantial replication using these protocols and can turn out results rather quickly and economically. Aside from logistics, laboratory dose-response studies can be closely controlled so that biological responses can be more clearly related to unique chemical concentrations and species. Since as many replicates as may be required for statistical analysis of hypotheses can generally be provided, the power of experimental designs can be matched to the importance of the question being addressed.

**Microcosms and Mesocosms:** Data obtained from many laboratory experiments are limited because of the absence of natural exposure features that are known to affect the temporal and spatial behavior of the contaminant being tested and the biological resource at risk.

Recognizing the need for more realistic exposure scenarios the EPA and other environmental scientists began constructing model ecosystems, commonly referred to as microcosms and mesocosms, to generate data that might be more representative than previous *in vitro* studies, yet preserving some of the control features that are important in establishing causal relationships. Frequently, these model ecosystems incorporate a sediment layer and representative plant species even though the target organism might be a nektonic or planktonic aquatic animal. While these experimental chambers may still be small enough to be bench-top units, they usually have monitoring and control features that limit the number of replicates that can be provided compared to simpler dose-response systems.

At this stage of research planning, no definite conclusion to use laboratory scale model ecosystems or to discount their use should be made. Rather, the plan of action should be to describe the need for data on environmental impacts for certain contaminants and target organisms, and consider all avenues of investigation to acquire the data most relevant for regulatory management. It is thus quite likely that microcosms and mesocosms could be considered.

The words microcosm and mesocosm by themselves convey no information about the size of the experimental units. The EPA has supported research work aimed at regulatory improvement using experimental ecosystems varying in size from several liters to several thousand gallons (University of Rhode Island Narragansett Bay Mesocosms). The larger they are, of course, the more expensive it becomes to provide multiple units for substantial replication in rigorous experimental designs. Expense is not the only consideration as scale-effects also may influence chemical and biological effects (Perez et al., 1991).

The appearance of model ecosystems used in generating data is generally not as important as is the effective mimicry of the exposure regime experienced in nature by the experimental organism. Thus a model of Narragansett Bay may have the appearance of a metal grain silo and the vertical mixing of contaminants from the sediments throughout the water column that occurs in nature may be appropriately accomplished by motor driven mixing paddles, rather than the wind and tides. Other models of natural processes may more closely resemble the appearance of the natural system under investigation, such as the EPA experimental streams at Monticello, Minnesota.

**Experimental Streams:** Large ecosystem models, such as the experimental streams at Monticello, play an important role in the scope of studies that need to be conducted to generate regulatory criteria appropriate for real-world situations. The major advantage of experimental streams over laboratory studies is the order of magnitude improvement in realistic representation of natural processes that influences the results. A disadvantage is that the range of natural variations in environmental parameters results in a low signal to noise ratio so that subtle impacts may not be readily seen. Consequently, it is necessary to have as many replicates as possible in experimental stream segments to increase the power of statistical analysis of results. It is also necessary to include laboratory dose-response studies at some point in the study of pollutant effects in order to reduce the variance and improve the chances of inferring subtle impacts.

Experimental streams also offer the opportunity to investigate the combined impact of several independent variables, such as certain metal and nutrient concentrations on one or more ecosystem components. While conceptually these experiments could be simulated in lab settings, they very seldom are. The fundamental basis of the EPA water quality criteria is, at least tacitly, that the effects of individual pollutants are non-interactive, or if there is interaction, the effect is presumably incorporated in the magnitude of application factors associated with each criterion value. For this reason alone, it would seem that experimental streams could justify the expense for construction and operation to define realistic water quality criteria for effluent constituents for situations where combined effects are likely to be either strongly additive or antagonistic (U.S. EPA, 1985b).

The rationale and design for a simulated stream system that is envisioned as a major feature for the generation of criteria data for the arid west should include a review and evaluation of operational and experimental results obtained at similar facilities (Monticello, Minnesota; University of Rhode Island, Savannah River; etc.). Selected facilities should be visited, and discussions should be arranged with scientists familiar with the pros and cons of research results from these facilities. Their critical review and constructive suggestions regarding the needs of the arid west communities and approaches to achieving the desired results would be a useful adjunct to design of a central facility.

The essential conceptual features of a series of experimental streams that would serve many of the needs in the arid west, and most of the ones in the southwest, include channels representative of four basic habitat types: xeric riparian, mesquite bosque, cottonwood-willow gallery, and cienega. Operational features would include the ability to add secondary effluents and pilot plant effluents treated to varying degrees at variable flow rates, as well as stormwater runoff. An ability to amend effluents with supplemental chemical constituents would be consistent with the EPA's 1992 guidance on modifying metal criteria. A critical element in the planning discussions is the need to provide substantial flexibility so that a variety of experiments can be accommodated including possibly studies of bioaccumulation, sediment interactions, long-term response of large plants, and short-term response of small aquatic organisms. The number of stream section replications that should be basic, built-in features of a research facility must be balanced with other demands for flexibility.

**Natural EDE Stream Experimental Areas:** The ultimate test of the effective regulatory control of treated wastewater discharges is measurable environmental benefit in the stream ecosystem receiving the effluent. In the long run, this must be addressed by empirical observation and measurement programs in order to demonstrate that the environment is being protected, and that public funds are not being needlessly expended, irrespective of compliance with permit conditions based on derived water quality criteria. A program of stream observations at several sites downstream of municipal secondary discharges on arid southwest EDE streams should be implemented as part of the overall effort. The primary focus of the observations would be to assess the status of communities and ecosystems in relation to the spatial and temporal distribution of effluent constituents. These data will be used to aid in the design of lab and model ecosystem experiments to partition causal relationships among the many contaminants in the effluent. Field data of this type would also be useful for design of many features of an experimental stream facility. Over time, the

accumulation of field biomonitoring data would be the most valuable resource in demonstrating effective environmental assessment and pollution control.

Field data to be collected will depend on the specific objectives to be addressed in a given timeframe. Some measurement protocols would likely be carried through a wide variety of programs. While considerable information is available on the effects of potential toxicants on species occurring in more mesic ecosystems and habitats, very little information is available for species found in the arid southwestern United States. Some data has been collected on the occurrence of potential toxicants in relevant southwestern species Eisler (1985a, 1985b, 1986, 1988). This information would be utilized in the development of the experimental designs for acute and chronic effect exposures in the laboratory and for selecting biomonitoring programs at field sites.

Effects of environmental contaminants on populations, communities, and ecosystems are difficult to quantify. Potential impacts include changes in population density of both the primary and secondary producer species in the stream ecosystem, changes in predator-prey ratios, and alterations in food web complexity. These changes could have considerable impact on the community structure and stability. Variations in system photosynthesis and respiration may be diagnostic of the successional status of effluent-dependent streams and assist in predicting the ultimate fate of these ecosystems (Odum, 1969; Fisher, et al., 1982).

Changes in community structure might impact the ecosystem's ability to recover from large environmental fluctuations such as floods or extended periods of drought (Fisher et al., 1982). Recovery from naturally occurring perturbations such as flash floods could be simulated in experimental stream facilities, and measurements at field sites would be useful for design of simulation studies. Also, the field and experimental stream data would be used to demonstrate that some adverse impacts may be strongly related to stormwater contaminants, such as mercury, rather than treated wastewater discharges.

The available literature on actual stream quality assessment is expanding rapidly, providing many examples of useful results and methods that might be employed on EDE streams (Isom, 1992). Isom (1992) reports an interesting concept of streamside macrocosms (Hall et al., 1991) as an adjunct to in situ biomonitoring.

## VII. CASE STUDIES

The EPA streams at Monticello, Minnesota provide a good case study for planning discussions related to the design of a large-scale system to simulate EDE streams. In the early years of its operation, the eight channels provided for replication of one control and three levels of a chemical stressor, such as copper. Four of the channels contain a wetland segment at the terminal end of the stream. Subsequently, the channels were modified so that there was a series of eight riffles and nine ponds in each channel. This would allow for hierarchical experimental designs that could improve the confidence in assessing the impact of a chemical on stream ecosystem components. Still, the one improvement the current scientific staff at Monticello would like to have (R. Hermanutz, pers. comm. May 3, 1992) is twice the number of channels! A detailed review of all the studies conducted at Monticello to determine the similarity to the types of questions of concern in the arid west and the implications for design of a facility to address them would be useful. Although the system at the Savannah River facility has a quite different purpose, the operational and scientific experience there should also be evaluated with respect to design recommendations for a facility for EDE stream simulation.

As an adjunct to the design process, it would be useful to prepare two scenarios on the potential use of a system of simulated streams to address the questions of the proper value of the nitrogen criterion and a metal, for example, cadmium. Nitrogen is suggested because it is an essential element for biological productivity and thus has a recognized beneficial role in aquatic and terrestrial systems, and in some forms and concentrations is capable of adversely impacting some aquatic species and humans. Additional rationale for a nitrogen study is provided in Appendix B.

Cadmium has no known beneficial role and can serve as a model for determining adverse impacts of at least some of the other metals of concern. The environmental behavior and analytical chemistry of cadmium is fairly well established, and would be easier to handle than mercury and lead, for example. The scenarios would also describe how available lab and field data would be used to generate a balanced research plan using bench-top dose-response studies, microcosms, simulated streams, and empirical studies at natural stream sites.

## VIII. RESEARCH SITE

### A. PCWWM SUPPORT OF RESEARCH ON WATER QUALITY

PCWWM has supported and continues to support research on water quality to improve understanding of basic scientific relationships in treating wastewaters and protecting the environment receiving the treated effluent. See EBASCO, 1990 and Karpisak et al., 1992, for example. PCWWM has modern, analytical chemistry laboratory capability that can be made available to support experimental research.

PCWWM has proposed to support and conduct an integrated program of research and development, including experimental stream channels, to produce criteria data, contributing significant resources to the effort, such as approximately 50 acres of land at the Roger Road Plant in Tucson (Brinsko, 1992). PCWWM has prepared a five-year plan which includes the construction of the research center and a program of research to produce papers for publication in peer reviewed scientific journals, and for use by regulatory agencies to aid in formulating appropriate criteria and standards. The PCWWM data and facilities would be available to all scientific participants and collaboration with established laboratories of other institutions would be sought. A research advisory committee made up of scientists, regulatory agency representatives, and dischargers would be set up to assist in preparing and evaluating research.

### B. TUCSON AS AN APPROPRIATE LOCATION FOR A REGIONAL FACILITY

In terms of climate, the Tucson area represents the climate of a major portion of the region likely to benefit from the results of this research effort. This is important for simulation of natural environments throughout the arid west, even for summer conditions in the most northern sections. A favorable climate also allows year-round study in outdoor sites which may not be possible in more northern climates. The proximity and interest of the University of Arizona, a "Research-1" university, enhances the opportunity for day-to-day collaboration with PCWWM staff and visiting scientists. In addition, Tucson is a readily-accessible city with all the amenities of a major metropolitan area.

## IX. CONCLUSION

Regulatory agencies have now recognized that a balance can be struck between the national goals of the Clean Water Act and the realities of regional environmental differences. This is being done on a site-by-site basis at many locations and trial methods are underway for coastal discharges. Similar efforts are being pursued for the Great Lakes as a regional effort and now there is support for an EDE stream initiative. Hundreds of research projects and millions of federal dollars have been allocated to develop national standards based on fish and related species living in perennial streams, lakes, and coastal waters, but very little data has been developed on the flora and fauna thriving in arid or semi arid conditions. Pima County and other governmental units in the southwest are putting resources into the development of appropriate standards for this region, and it is in the broader interest of the nation for federal support to be added to the effort.

Research results will provide better water quality criteria for the protection of valuable riparian habitats of EDE streams, more specific effluent criteria for efficient and effective waste treatment and discharge practices, and will demonstrate through biomonitoring the benefits of water reclamation. Impacts associated with discharge of treated wastewater and its constituents are known to range from beneficial to inconsequential to adverse, consequently, a series of experiments might need to be conducted to establish both the quality and the magnitude of impacts under a variety of natural conditions. A multi-year program is required to investigate the wide range of arid ecosystem components that may be impacted by the variety of effluent constituents in treated municipal discharges.

A modern research facility capable of simulating natural conditions in the arid west needs to be developed in a site central to the region to provide a major portion of the necessary data and methods. Useful results for major problems in the area could be available within the first year or two of study. The PCWWM's Roger Road Wastewater treatment facility in Tucson, Arizona should be seriously considered as a site for the research facility.

## X. RECOMMENDATIONS

Several activities are recommended to be initiated to begin data collection, methods development, and additional planning details. These are activities that will add to the database for developing appropriate criteria and standards for PCWWM and other similar dischargers in the arid west, and will contribute to the timely development of a research facility plan. These will not be wasted efforts if the central research facility is brought on-line in the near future, but will be useful if there are unfortunate delays in realization of the facility. Since these activities can be of substantial benefit to a large class of discharges, they should merit attention from the EPA and other research grant organizations for joint funding.

- Begin development of a database on biological resources currently extant on the Santa Cruz River downstream from the Roger Road outfall because of its potential for use as a representative research site for the region. This work could be undertaken for \$120,000 per year and completed within three years.
- Additional laboratory space would be needed to conduct dose-response studies in typical bioassay arrangements and in microcosms of moderate size. About 6,000 square feet of modern experimental laboratory and computer data links would provide approximately 12 lab units of 15 feet by 20 feet. A proper cost estimate has not been made for a facility of this size and type, however, using \$200 per square foot as a unit cost, this laboratory would cost about \$1,200,000. Operational costs would be on the order of \$200,000 per year. These facilities would be needed in addition to outdoor mesocosms and experimental streams.
- Determine ammonia concentration effects on species important in EDE stream ecology in relation to nitrogen fate and municipal effluent discharges. These data would be useful to communities facing inappropriate nitrogen removal requirements, and would add substance to verification of existing and proposed standards that recognize the ecological value of nitrogen contributions to stream ecology. Nitrogen removal problems are possibly the most uniform across the region and research results are more likely to be universally applicable than any other study that could be conducted in the region, if not the nation. The study could cost \$180,000 per year for three to four years.
- Develop a model "eco-benefit analysis" for evaluation of alternative criteria for EDE streams including water reuse options. This activity would be responsive to the new, but untested, method proposed by the EPA Region 9. This could be a regionally applicable result. It might be conducted for \$120,000 and completed in a year.
- Develop an approach to evaluate the impact of major stormwater events on EDE stream quality and appropriate criteria. The EPA and major municipalities are currently struggling with development of stormwater criteria and it would be important to have an approach that considers the characteristics of the arid west before final the EPA regulations are promulgated. Depending on how specific this

approach needs to be and whether it would be entirely conceptual or partially quantitative, the cost could range from \$100,000 per year for two years to \$200,000 per year for four years.

- Review and evaluate mesocosm and simulated stream approaches for the types of data needed for EDE stream criteria. While this information would be especially useful for design of the central research facility, it would be directly useful for studies PCWWM would be interested in pursuing to develop appropriate criteria for their discharge permits. This study could be completed in slightly more than a year for about \$180,000. A significant portion of the cost would be for travel of expert consultants.

- Assemble a scientific advisory council for the continuing planning effort. This activity also is primarily related to design of the central facility, however, at least on some scale it would bring together the current scientific guidance on developing data to support appropriate criteria applicable to PCWWM's own situation. A continuing program over several years could be conducted for \$75,000 the first year by combining the work with the above review study and \$75,000 per year for the out-years. Regulatory agencies need to be an active part of the planning process on two different levels: first, as a partner in recognizing the validity of the approach to generate criteria that in concept will result in regulatory controls; and second, to participate in the design of research studies and the evaluation of results that on their merit may be accepted.

- In conducting the more detailed planning for research, it will be important to focus on the design of experiments (and equally importantly, the design of facilities) to examine the inter-relationships of sensitivity of regionally appropriate species and the exposure regime appropriate for the arid west. In this report, both have been mentioned as different than used for the development of national criteria, and both factors need to be taken into account in acquiring new data. If the exposure regime emerges as a significantly greater factor, there may be less need to research a new set of species to find acceptable experimental subjects. If some of the currently-accepted species can be used along with the appropriate exposure regime, considerable time and effort will be saved. However, with the current state of knowledge, it is not possible to say which of these two general factors is the more important in developing appropriate criteria.

- Although planning should focus primarily on the development of criteria, planners and operators of the program should emphasize the value to the nation in developing data and knowledge that will also be applicable to the protection of groundwater quality. Research studies designed to follow the fate of treated wastewater constitute a step beyond the determination of species response, but this step could well attract funding from a broader base and thus optimize the payoff to the public.

## XI. ACKNOWLEDGEMENTS

This report was prepared with financial support from the PPWM and the technical support of their staff. The authors appreciate the guidance and advice of PCWWM staff, especially Mr. Francis P. LaSala, Jr., and the loan of many reports and data for review. The literature review and the preparation of the references in this report were facilitated by the expert assistance of the Environmental Research Laboratory scientific librarian, Nancy R. Sprague.

The critique of an earlier draft of this report by our colleagues Dr. Donald I. Mount, AScI, Inc., and Dr. Neil B. Carmony, USGS, is appreciated, and many sections of the report were improved by their suggestions.

**APPENDIX A**

**ADDITIONAL EXAMPLES OF  
EDE STREAMS**

APPENDIX A  
ADDITIONAL EXAMPLES OF EDE STREAMS

**Fountain Creek, Colorado**

Fountain Creek is located between Pueblo and Colorado Springs, and receives 32 MGD of treated municipal wastewater from Colorado Springs. During dry months, the flow is composed entirely of effluent. Major storm events result in a vastly elevated water velocity in the stream channels. Such events result in sand scouring of streambed shales which, in turn, limit aquatic species diversity and probably inhibit establishment of aquatic flora. Fish species that persist in Fountain Creek include fathead minnows and dace which survive flood events in tributaries and backwaters. Biomass and diversity indices above and below the point of effluent discharge are not significantly different, despite elevated levels of ammonia downstream. It is likely that the physical characteristics of the stream, rather than the presence of effluent, limit the ability of aquatic life to flourish in Fountain Creek.

**Santa Fe River, New Mexico**

The Santa Fe River is located in the upper Rio Grande basin and drains the southernmost western slope of the Sangre de Cristo Mountains. Historically, the mouth on the Santa Fe River on the Rio Grande was located downstream from the present site of the Cochiti Reservoir. Construction of the dam blocked the original channel and created a marsh. Presently, three water supply dams upstream from Santa Fe impound runoff from the river's upper basin. Flow between the lowermost reservoir and the Santa Fe wastewater treatment facility occurs only during spring runoff and storm events. Thus the channel is usually dry in this reach and the Santa Fe Wastewater Treatment Facility (WWTF) is the major source of water in this reach of the river.

Intensive water quality surveys began in 1984 during the initial operation of Santa Fe's reconstructed WWTF. During 1984, several violations of standards were documented and attributed to deficiencies in design, equipment, and operation of the WWTF (Potter and Jacobi, 1984). In 1985, all standards were attained, except nitrogen, again due to equipment failure (Potter, 1985). Effluent flow in 1986 averaged 3.0 MGD during the survey period (Potter and Tague, 1986). No water quality standard violations were caused by effluent quality.

**Rio San Jose, New Mexico**

The Rio San Jose originates near the Continental Divide flowing southeasterly past the Bluewater and Grants-Milan areas, through Acoma and Laguna land grants, emptying into the Rio Puerco. The Rio San Jose is generally dry upstream of the Grants wastewater treatment facility, except following rainstorm events. The main tributary in this upper reach is Bluewater Creek, which is controlled by Bluewater Dam, built in 1927. Water released from the dam is entirely used for irrigation prior to the confluence of Bluewater Creek with the Rio San Jose (Tague, 1984). The Grants WWTF discharges effluent to the river averaging 1.2 MGD. Eight miles downstream from Grants WWTF, the stream traverses an

area of groundwater discharge known as Horace Springs. Flow increases to 3.6 MGD at this point.

#### Las Vegas Wash, Nevada

Las Vegas Wash, an ephemeral stream, receives wastewater from the city of Las Vegas and Clark County which then flows into Las Vegas Bay on Lake Mead. Prior to floods in 1987, there was a wetland area through which effluent moved, effectively reducing ammonia levels in the effluent. As a result of flooding, the wetlands have been eliminated and channelization in the wash initiated (Alderson, pers. comm., July 22, 1992).

The Clark County Sanitation District operates an advanced wastewater treatment (AWT) plant to serve the Las Vegas Valley. The plant has the capability of providing additional treatment for sewage treated at the Clark County and City of Las Vegas secondary treatment plants, in addition to providing service to other areas in the Valley.

#### Meadow Valley Wash, Nevada

The Meadow Valley Wash is a small, ephemeral stream which flows to Muddy Creek that empties into the Colorado River. The City of Caliente operates a secondary (activated sludge), package treatment plant which discharges treated domestic wastewater into Meadow Valley Wash. At its upper end, the Meadow Valley Wash does not connect with the lower end due to low flows most of the year. Currently, the Wash has in-stream standards which must be met at its confluence with Muddy Creek approximately 100 miles downstream from the treatment plant. When the standards come up for review, it will be recommended that a portion of the Meadow Valley Wash from the confluence to a designated point will have to meet specific standards whereas the upper reaches of the Wash will have to meet a specific class (A, B, C, or D) allowed under the Nevada Pollution Regulations of the Nevada Administrative Code.

#### Santa Ana River, California

The Santa Ana River, located in southern California, is an example of a river that is ephemeral in portions and perennial in others. Historically ephemeral, the upper segments have perennial flow as a result of effluent from three municipal dischargers. There are no indigenous fish in the system. Mosquitofish are planted as a means of mosquito control. The lack of significant aquatic life in the stream is likely a function of natural habitat characteristics similar to those that characterize those portions of the Santa Cruz River that are effluent-dependent. These characteristics include a sandy streambed, low flow (virtually no flow upstream from discharge points), high temperatures, and periodic flash floods. A lack of shading from riparian vegetation is also characteristic of the Santa Ana River. Man-induced changes to the habitat include vegetation removal for floodway maintenance, non-point source impacts, barriers to fish migration, and stream channelization.

#### Salt River, Arizona

The Salt River, the major tributary of the Gila River which ultimately carries runoff from most of the southern half of Arizona to the Colorado River, was a perennial stream until early in the 20th Century. Completion of Theodore Roosevelt Dam on the Salt River in 1910 began its demise as a perennial stream in its lower reaches. The completion of other dams on the Salt River, Mormon Flat Dam in 1925, Horse Mesa Dam in 1924, and Stewart Mountain Dam in 1930, coupled with construction of Bartlett (1939) and Horseshoe (1946) dams on the Verde River, broke the annual cycle of spring flooding and perennial flow in the Salt River (Brown, 1985). Currently, the Salt River between Granite Reef Dam (an agricultural diversion dam downstream from Stewart Mountain Dam) and Phoenix is essentially an ephemeral stream, flowing only during periods of controlled water release from upstream dams.

The City of Phoenix discharges treated municipal and industrial effluent into the otherwise dry Salt River bed at its 91st Avenue treatment plant. Downstream from the point of discharge are riparian and wetland habitats that are largely effluent-dependent. At one time, prior to severe flooding in the 1970s and early 1980s, the riparian and wetland habitats associated with the effluent discharge were of such high quality and value that the area was a popular waterfowl hunting area (Brown, 1985) and was nominated as a potential Natural Area by the Arizona Academy of Science (Smith and Bender, 1973). At present, riparian and wetland habitats in the area are recovering in response to effluent discharge, even though a significant fraction of the total discharge is being piped to the Palo Verde Nuclear Generating Station west of Phoenix for use at that facility.

**APPENDIX B**

**RATIONALE FOR A NITROGEN STUDY**

## APPENDIX B RATIONALE FOR A NITROGEN STUDY

Nitrogen is an important candidate for study because it is a common, fairly uniform, constituent of municipal wastewaters in communities everywhere, including throughout the arid west. Research results would have a high degree of applicability to many if not all municipal effluent discharges in the region. Overly strict effluent limits would be costly to achieve and there is reason to believe that in many receiving waters the concentration and form of nitrogen species is not a serious problem, if even a minor problem. Thus it would be a waste of resources to remove a constituent of effluent if it is not causing a problem. Furthermore, there is ample evidence to show that riparian habitats in the arid southwest are beneficially impacted if not dependant on the nitrogen contributed by municipal effluents. Consequently, if nitrogen is removed to meet an inappropriate regulatory standard, not only would it be a waste of resources, but it would also adversely impact a socially-acceptable, beneficial use of the watercourse.

Nitrogen concentrations in properly treated municipal effluents can be expected to range from 20 to 40mg/l, due primarily to the domestic wastewaters contributed to a municipal sewerage system. Concentrations could be higher or lower depending on the influence of stormwater drainage and industrial wastes contributed to the system. Nitrogen in treated municipal effluents is primarily in the form of approximately equal portions of ammonia and organic compounds such as amines derived from the breakdown of proteins. Nitrates are generally in low concentration unless the plant is underloaded and the retention time is sufficiently long in aerobic tanks to allow microbial oxidation of the ammonia to nitrate. Total nitrogen is largely conserved in the flow of sewage through a modern, well operated, sewage treatment plant, although some may be volatilized in septic environments in the plant. The ammonia fraction tends to increase and the organic fraction decreases as the waste stream is carried through the treatment processes.

If nitrogen removal becomes necessary to meet effluent limits, removal can be enhanced by additional treatment units combining the creation of microbial mass, the conversion of ammonia to nitrates, and the reduction of nitrates to nitrogen gas. Energy is needed for additional pumping requirements, space is needed for plant structures and, in some systems, additional organic feed stock such as methyl alcohol must be added to generate microbial mass. Overall, the cost would be about \$130,000,000 for a wastewater treatment plant such as in Pima County (F.P. LaSala, pers. comm., July 1992). Some states may have already modified the EPA's national nitrogen standards, but there still is more to be done to establish a strong scientific support base in case environmental concerns are raised and to help other states consider the ecological and economic benefits of a modified standard.

Nitrogen can be a problem in some watercourses. Ammonia, primarily in the un-ionized form, is toxic to many aquatic organisms over a wide range of species-specific values, e.g., 0.0017 to 4.6mg/l (EPA, 1986a). The EPA national criteria for un-ionized ammonia (1986a) for warm water aquatic organisms are approximately in the range of 0.13 - 0.37mg/l as a one-hour average exceeded no more than once in three years, and 0.02 - 0.05mg/l as a four-hour average exceeded no more than once in three years. The Arizona DEQ (1992) has designated 29 effluent-dependent navigable streams for which site specific water quality

standards may be requested. Absent site-specific determinations, the ammonia concentration allowed is dependent on the uses designated for the stream. For some uses, there is no numerical standard (effluent-dependent and ephemeral streams), while for others, the allowable value is similar to the EPA national criterion for a one-hour average once in three years. In terms of total ammonia, as distinguished from un-ionized ammonia, these limits are on the order of 12 to 2mg/l, respectively, depending on the pH and temperature of the water, and in terms of total nitrogen, these ammonia values would represent approximately 10 and 1.6mg/l.

Arizona limits total nitrogen to less than maximum values of 1 to 3mg/l for certain navigable waters, but these standards may be waived on a discharge-specific basis for a discharge to an ephemeral water tributary to the regulated navigable water. Organic nitrogen is not usually regulated except as it represents a component of total nitrogen, although there are restrictive criteria for specific compounds such as nitrosamines and nitrobenzenes that are not ordinarily included in the measurement of organic nitrogen. Organic nitrogen discharged to streams is assimilated by micro and macro organisms and is converted into biomass or ammonia so that in some cases the stream concentration of ammonia could tend to be increased over the amount actually discharged in the effluent. However, the rate of ammonia oxidation to nitrites and nitrates is quite rapid and the net effect is ammonia concentrations decrease with time. Aside from nitrification by microorganisms, some plants also remove dissolved ammonia through metabolic uptake.

Nitrites and nitrates are limited by Arizona (1992) only for streams designated for use as domestic water sources. Nitrate is limited to 1mg/l and nitrates alone or in combination with nitrite is limited to 10mg/l, based on health considerations (EPA, 1986a). The EPA (1986a) does not recommend restrictive criteria for nitrite or nitrate (presumably for other designated uses) recognizing that levels known to cause toxic effects would rarely occur in nature. Their analysis suggests that nitrite below 5mg/l and nitrate below 90mg/l would have no adverse effect on warmwater fish. The major concern with nitrates is the potential for reduction to nitrites and ingestion by infants under three months of age. Since treated wastewater effluent may contribute to groundwater supplies in some areas near EDE streams there may be reasons to investigate the fate of nitrates in relation to active transport into the groundwater. The fact that stream concentrations of nitrates in EDE streams consisting primarily of treated effluent may rarely exceed 10mg/l and that plants readily take up nitrate suggests that nitrate plus nitrite levels in percolating groundwater would not exceed 10mg/l. See also observations by Herbert (1976), Ince et al. (1980), Lance (1975), and Osborn (1987).

Experimental streams have been used by the EPA to investigate the fate and toxicity of ammonia on test organisms in the Minnesota experimental streams e.g., Zischke and Arthur (1987), Arthur et al. (1987), and Hermanutz et al. (1987). Experimental streams in the arid west, or functionally similar mesocosms, could provide data for rational development of criteria for un-ionized ammonia, nitrite, nitrate, and total nitrogen for EDE streams in this biogeographic province. Laboratory and field measurements would be important adjuncts to the design of the studies and interpretation of the results.

**APPENDIX C****BIOGRAPHICAL SKETCHES OF AUTHORS**

**DONALD J. BAUMGARTNER, PH.D., P.E.**

Dr. Baumgartner graduated from the University of Illinois (Urbana) in Sanitary Engineering, took an M. S. at MIT, and earned a Ph. D. at Oregon State University in Civil Engineering, with major emphasis on fluid mechanics and a minor in statistics. Additional coursework was taken at the University of Cincinnati and he served as an instructor in Sanitary Engineering at the University of Alaska (Fairbanks).

Professional employment in the U.S. Public Health Service resulted in assignments in Washington D.C.; Cincinnati, Ohio; Fairbanks, Alaska; and Corvallis, Oregon. He gained certification as a Registered Professional Engineer in Illinois in 1963. From 1967 through 1989, he was in charge of a marine pollution research laboratory of the U.S. Environmental Protection Agency, conducting research and providing technical assistance on the national problem of ocean disposal of wastes. Dr. Baumgartner was responsible for the development of mathematical models used for discharge permits, and for technical assistance to municipalities, industries, and state and local agencies working with the EPA to apply regulations thoughtfully. He traveled to Italy, Poland, Yugoslavia, Sweden, Japan, The Soviet Union, and The United Kingdom to participate in joint oceanographic research projects.

In January 1990, he accepted a position as Associate Director of the University of Arizona Environmental Research Laboratory and became its Acting Director in November 1992. He continues to provide consultation to the EPA through an adjunct appointment with Oregon State University and is on a doctoral candidate's committee there, and through a consulting agreement with Tetra Tech, Inc. He also has an adjunct appointment with Civil Engineering at the University of Arizona. A current research interest is development of appropriate water quality criteria for ephemeral and effluent-dependent streams in the arid west.

**E. LINWOOD SMITH, PH.D.**

Dr. Smith received his undergraduate training at Central Washington State University where he earned a B.A. in zoology in 1965. He completed his M.S. and Ph.D., both in zoology, at the University of Arizona in 1967 and 1971, respectively. He has held faculty positions at both the University of Arizona and Arizona State University, and is currently the Director of the Biological Resources Study Group for the Intermountain Region of Dames & Moore. Prior to joining Dames & Moore in 1987, he owned and operated E. Linwood Smith & Associates, a biological consulting firm, from 1975 to 1987.

Dr. Smith has extensive experience, primarily with terrestrial systems, throughout the western and southwestern United States. He has also completed studies in the southeastern United States, in Nome, Alaska, on the island of Guam, and in the Republic of Mexico. Past experience has included analysis of whole terrestrial and wetland ecosystems, and long-term studies of various project impacts on individual species (e.g., desert bighorn sheep, bald eagle, and Alaska king crab). His current research interests are focused on wetlands, and threatened and endangered species of wildlife and plants. Dr. Smith recently provided expert testimony to the "God Squad" regarding the northern spotted owl, completed studies and analysis on Mexican spotted owl habitat in Arizona and New Mexico, and directed a literature-based analysis of an alternative hypothesis addressing recent, suspected declines in northern goshawk populations on the Kaibab Plateau of northwestern Arizona.

Dr. Smith is the author of one book and has more than 25 peer-reviewed publications in the scientific literature.

**ROBERT JOSEPH FRYE, PH.D.**

Dr. Frye received his undergraduate education at Phoenix College, University of New Mexico, and the University of Arizona where he earned a B.S. in Biology in 1971 and a Ph.D. in Ecology and Evolutionary Biology in 1983. Recent experience has included working at the University of California in San Diego as a programmer and a biometrician, at the University of Arizona as a Systems Ecologist and Biologist, and currently as a Senior Research Scientist with the Environmental Research Laboratory. He also currently holds an Adjunct faculty position with the Department of Ecology and Evolutionary Biology at the University of Arizona. Research interests include both applied ecology and carbon cycling in closed ecological systems, bald eagle nesting surveys in the Rio Bavispe/Rio Yaqui drainage of Sonora, Mexico, and the conservation biology of a rare cactus in Arizona.

**JAMES J. RILEY, PH.D.**

Dr. James J. Riley is a Senior Research Scientist at the Environmental Research Laboratory of the University of Arizona. He received a Bachelor of Science Degree in Mathematics in 1959; a Master of Science in Meteorology in 1963; and a Ph.D. in Hydrology in 1968 --- all from the University of Arizona. His specialties include international agricultural, physiological responses of plants to environmental parameters in tropical and aridland farming systems, and aquaculture. He has spent a large portion of his professional career outside of the United States, with tours of duty in Mexico, Abu Dhabi, Taiwan, Sudan, United Arab Emirates, Kuwait and Saudi Arabia. He served as a consultant to USAID on arid land water conservation and utilization and was a contributor to the National Research Council's publication on "More Water for Arid Lands". His current research focus is on the development of halophytes as agricultural crops and the hydrology of wetlands.

**KIMBERLY A. OTERO, M.E.M.**

Ms. Kimberly Otero earned a Bachelors Degree in Biology from Illinois Wesleyan University in 1978 and a Masters in Environmental Management from Duke University in North Carolina in 1979.

Ms. Otero joined the biology staff at Dames & Moore in April 1989. At Dames & Moore, Ms. Otero is a staff biologist and assists in the preparation of environmental assessments, environmental impact statements, and documents necessary for various permitting processes. Her expertise with the NEPA process and NEPA documentation was enhanced by her participation in a five-day course in 1991 at Duke University on the Implementation of NEPA for Federal Facilities. Current responsibilities include gathering inventory data and developing impact matrices for sensitive habitat types and threatened and endangered plant and animal species for the Affected Environment and Environmental Consequences sections of EISs and EAs for a variety of projects.

Prior to joining Dames & Moore, Ms. Otero worked with the Tennessee Valley Authority developing trophic status surveys for TVA reservoirs. She also worked in Chicago for two years as a consultant to EPA where she prepared 201 studies for wastewater treatment facilities.

## EXECUTIVE SUMMARY

The 1972 Federal Clean Water Act (the Act) requires federal, state and local authorities to protect the water quality of the nation's navigable waters. Pursuant to the Act, the U.S. Environmental Protection Agency (EPA) has established national water quality criteria designed to protect aquatic biota found in wet ecosystems. State governments utilize such criteria as the basis for establishing water quality standards for local water bodies. These policies have created great difficulties for governmental and non-governmental agencies in arid and semiarid ecosystems. Those agencies often discharge effluent and stormwater into dry washes which have been classified as navigable waters of the United States.

State regulators and local dischargers throughout the arid west have consistently supported efforts to develop specific water quality criteria documents for arid ecosystems. In the past, the EPA has been reluctant to commit the resources needed to conduct such regional research. The agency adopted a policy of leaving it to individual states and localities to conduct site specific studies or other measures to justify utilization of other than national criteria to establish local water quality standards.

This attitude on the part of EPA has begun to change. The agency is beginning to support policies which encourage the development of appropriate criteria documents for arid areas just as they have for "wet ecosystems", e.g., ecosystems with lakes, rivers, etc.

To satisfy this critical need, Pima County Wastewater Management (PCWWM) proposes to establish a Regional Water Quality Research Project (WQRP) in Pima County, Arizona, to conduct laboratory, experimental stream, and field research on the impact of effluent and stormwater discharges on the flora and fauna of arid ecosystems. Such research would develop the basic scientific data for water quality criteria needed to establish water quality standards for arid areas.

The basic and applied research conducted at the regional WQRP would benefit federal, Indian, state and local interests in the arid and semiarid portions of 17 western states<sup>1</sup>. The WQRP would also have value and applicability to the water quality issues affecting Mexico's northern and border states, including *Baja California Norte y Sur, Sonora, Chihuahua, Coahuila, Nuevo Leon and Tamaulipas*. Western Canadian provinces could also benefit from the research results.

PCWWM is prepared to operate the WQRP (with the cooperation of the EPA and other agencies) at one of its wastewater treatment facilities. PCWWM would encourage both governmental and private organizations from throughout the arid west to participate actively in conducting scientific research at the WQRP to develop appropriate technical data to satisfy their specific needs.

---

<sup>1</sup>California, Arizona, New Mexico, Texas, Oklahoma, Nevada, Utah, Colorado, Kansas, Oregon, Washington, Montana, Idaho, Wyoming, North Dakota, South Dakota, and Nebraska.

The results of such research would be provided to the states and the EPA as technical data to serve as the basis for establishing appropriate water quality criteria for effluent and stormwater discharges to ephemeral streams and riparian habitats in arid regions.

During 1992, Pima County obtained support from local and regional water and wastewater agencies, state regulators, and environmental groups throughout the arid west to establish the regional WQRP in Pima County. The County has also obtained the commitment of key Members of the U.S. Congress to consider the WQRP in 1993. Pima County officials will pursue federal funding for planning and design of the WQRP and initial laboratory construction in 1993. Monies to complete the construction of any other facilities needed and to implement the total WQRP concept will be sought thereafter.

ESTABLISHMENT OF A REGIONAL WATER QUALITY RESEARCH PROJECT  
TO DEVELOP WATER QUALITY CRITERIA FOR EFFLUENT-DEPENDENT  
EPHEMERAL STREAMS AND RIPARIAN HABITATS  
IN THE ARID WEST

I. INTRODUCTION

PURPOSE

This paper proposes the establishment of a Regional Water Quality Research Project (WQRP) in Pima County, Arizona to conduct basic and applied research on the effects of effluent and stormwater discharges to ephemeral streams and riparian habitats in arid and semiarid ecosystems. The data from such research could be utilized by the U.S. Environmental Protection Agency (EPA) and regulatory agencies throughout the arid west to develop appropriate water quality criteria, sediment standards, and biological indicators for arid and semiarid regions throughout the western United States.

BACKGROUND

The Clean Water Act: The U.S. Congress passed the Clean Water Act of 1972 (the Act) to "restore and maintain the chemical, physical and biological integrity of the nation's waters". The 1987 amendments to the Act required states to establish comprehensive narrative and numeric water quality standards to achieve "fishable-swimmable" waters "where attainable". These water quality standards are enforced by a federal and state National Pollution Discharge Elimination System (NPDES) permit process; violators are being penalized through administrative, civil, and criminal sanctions.

Federal and State Responsibilities: Federal and State authorities were given responsibilities under the Act. The EPA was given responsibility for developing "criteria documents", i.e., summaries of toxicological studies performed by researchers on the effects of toxic pollutants on a variety of aquatic species. The EPA utilizes the research results to develop national criteria documents which it publishes as guidance for state agencies to establish water quality standards for individual water bodies.

The states, in turn, were given responsibility for designating appropriate "beneficial uses" (e.g., drinking water, irrigation, aquatic and wildlife, etc.) for each navigable water within state boundaries and for adopting water quality standards.

This seemed, to federal authorities, like a logical approach to achieve the objectives of the Act. However, as time passed, this approach evolved into a policy of requiring states to utilize the same data to achieve "fishable-swimmable" standards everywhere, regardless of the ecosystem in which the navigable water was located.

## THE PROBLEM

The Arid and Semiarid West: The U.S. arid and semiarid west consists of the Great American Desert and the North American Prairies<sup>1</sup> (Figure 1). The Great American Desert encompasses approximately 378 thousand square miles in the western United States, plus, similar areas in Mexico's northern boundary states (i.e., *Baja California Norte y Sur, Sonora, Chihuahua, Coahuila, Nuevo Leon and Tamaulipas*). Some of Canada's western provinces also experience similar climatic conditions. Typically, the region experiences less than 15 inches of annual precipitation; and that precipitation normally occurs in 60 days or less. Summer daytime temperatures in the region often exceed 95°F.

The North American Prairies include a vast (approximately 958 thousand square miles) "semiarid" region. This region extends northward through western Utah, the northern half of Nevada, and into Oregon and Washington on the east side of the Cascade Range. Henceforth, the term "arid", as used in this paper, shall include these "semiarid" areas.

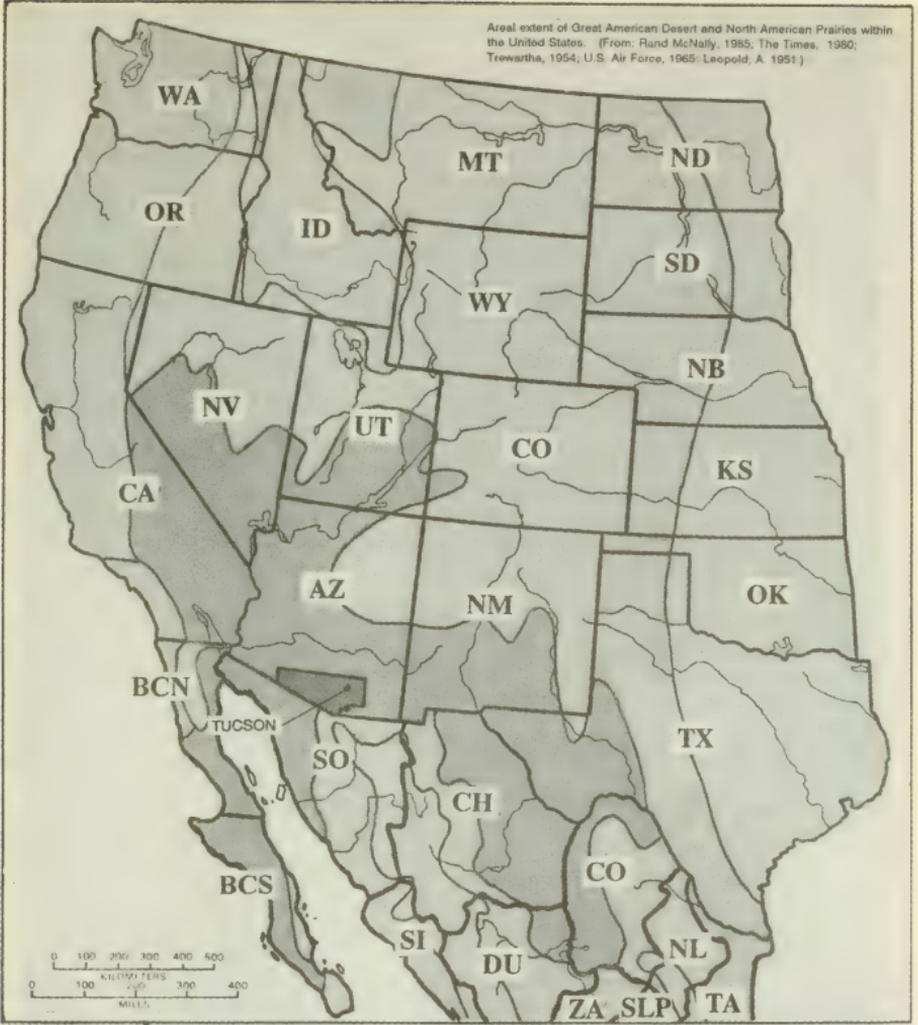

Ephemeral and Effluent-Dependent Streams: The arid west contains countless *arroyos* (or dry washes) which meet the federal definition of navigable waters of the United States. These dry washes are "waters" in name only. They are, primarily, "ephemeral streams" -- streams that have a channel that is at all times above the water table and that flow only in direct response to precipitation. Ephemeral streams that owe their flows primarily to wastewater treatment facility discharges are said to be "effluent-dependent".

The Santa Cruz River in Pima County, Arizona, is a typical effluent-dependent ephemeral stream. Under normal circumstances, the Santa Cruz is a dry wash, as depicted at the center of the photograph shown in Figure 2. This reach of the river would be classified as "ephemeral". At the bottom of the photograph, one can see the farthest extent of effluent flows from Pima County's wastewater treatment facilities. This reach of the Santa Cruz is categorized as effluent-dependent.

Gold Book Criteria: In the past, the EPA developed national criteria documents based on basic scientific research conducted in laboratory experiments representative of "wet area ecosystems", i.e., oceans, lakes and perennial streams. Such criteria were incorporated in a document which came to be commonly known as the "Gold Book". For various reasons, including cost, the EPA did not conduct the research needed to develop a counterpart to the Gold Book for arid ecosystems. Instead, the agency simply adopted a policy of requiring states to (i) utilize the Gold Book Criteria in establishing state water quality standards, or (ii) prove that they should be held to less restrictive water quality standards in certain locations as supported by site-specific and use-attainability studies.

Figure 1

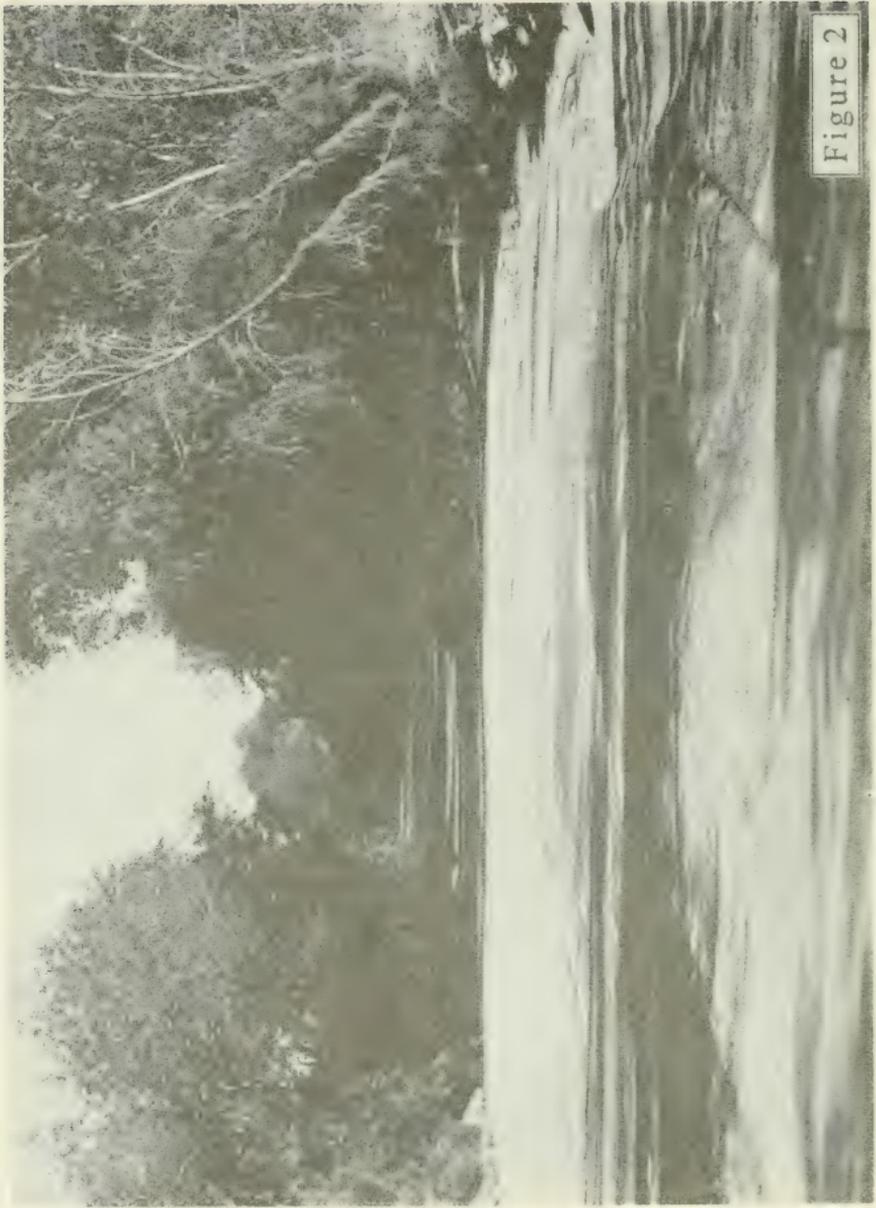

Figure 2

There is, however, clear evidence that the EPA is beginning to change its attitude regarding the need to develop specific criteria documents for arid areas. EPA Headquarters has indicated that it recognizes that the policy has caused undue problems. Recently, EPA Region IX has drafted new policies which call for special consideration of ephemeral streams and encourage the development of specific water quality criteria for arid lands. Governmental and non-governmental entities throughout the arid west have encouraged and applauded such changes in EPA's outlook.

Commitment to "Protect What is There": Local governmental authorities in arid ecosystems recognize their responsibility to comply with the Clean Water Act. The fact is that they, too, are regulators! And they have every desire to protect their surface and groundwater resources from contamination. The question is not whether they are prepared to protect such resources; but rather, is the level of protection appropriate? The answer, they believe, is that they should be required to fully protect what is there i.e., to prohibit discharges which will harm any biota existing (or biota that would reasonably be expected to exist) in their ecosystems. In the arid west, that would mean they want to protect resident plant and animal species.

## II. SPECIAL WATER QUANTITY AND QUALITY ISSUES IN ARID ECOSYSTEMS

### TOTAL WATER UTILIZATION

Policy makers in the arid west who deal with water quantity and quality issues are faced with totally different problems and objectives than their counterparts in wet ecosystems. In those areas, the concern is usually focused on having "too much water". In the west, people worry greatly about preserving water quality--both groundwater and surface water--because it is the lifeblood of their entire environment. However, they are also faced with the challenge of preserving, expanding and utilizing all available water resources in an efficient manner.

As urban areas expand in the west, elected officials are placed under tremendous pressure to make better and more efficient use of potable ground and surface water resources. Those resources are strictly limited, therefore, policy makers must -- out of necessity -- focus on full utilization of effluent and stormwater.

### EFFLUENT AND STORMWATER DISCHARGES TO EPHEMERAL STREAMS

Wastewater effluent and storm water discharges to ephemeral streams present municipalities and regulators with special problems. It is important to note that when a state establishes surface water quality standards, such standards normally apply to "receiving waters". In other words, in wet ecosystems, federal and state authorities take into consideration the dilution factor of a lake or river when establishing permit limitations. That makes abundant sense in such ecosystems where regulators are attempting to protect fish populations. An obvious difficulty arises, however, when one attempts to impose the same water quality standard on one who

discharges effluent or stormwater into a "dry wash" where there is no dilution factor. In such circumstances, the water quality standard, in effect, becomes the end of pipe permit limit.

Dry washes may have some plant and animal life which is dependent on periodic wetness of the wash; but, generally, they do not support aquatic life forms typically used for criteria development. Therefore, water quality standards that protect such life forms are unrealistic in the arid west. The cost to construct new, or retrofit existing, wastewater treatment facilities to meet such standards can be significant with no indication that such improvements will result in any net environmental benefit. In addition, the cost to treat stormwater discharges to dry washes to meet numeric water quality standards could amount to billions of dollars.

### III. REGIONAL INITIATIVE TO DEVELOP APPROPRIATE WATER QUALITY CRITERIA FOR THE ARID WEST

#### THE NEED FOR SCIENTIFIC TECHNICAL DATA

In order for EPA to develop appropriate criteria documents for the arid west, it must have scientific technical data that demonstrate the effects of toxicity on sensitive representative species of that ecosystem. Researchers must select regionally-representative organisms for testing; that selection is critical to the final validity of the criteria document. There are obvious selections of species for these studies that are not appropriate to climate, ecology or characteristics of these ephemeral and effluent-dependent streams. For example, many toxicological studies involve trout which exhibit extreme sensitivity to many stress factors. Utilizing the criteria developed from such studies makes little sense when applied to the dry, hot areas of the arid west.

Researchers have identified many species of organisms which exist in arid environments along ephemeral streams. However, an inventory of existing scientific literature reveals that little, if any, research has been conducted on the toxicity effects of effluent and stormwater discharges on such organisms.

#### EXAMPLES OF RESEARCH TO BE CONDUCTED

Researchers need to conduct laboratory and field tests on appropriate species to answer specific questions associated with the effects effluent/stormwater may be having on those species. For example:

- Determine the effects of effluent on terrestrial riparian and emergent species of plants.
- Does current effluent quality inhibit or enhance any species of terrestrial, riparian or emergent vegetation?

- What are the physiologically limiting loading rates for common constituents of effluent?
- What is the "mechanism of limitation"? For example, respiration, photosynthesis, water balance, seed germination, seedling growth, inhibition of flowering, etc.
- What are the implications with respect to water quality criteria and water quality standards in arid environments?
- Determine the natural succession of pioneering invertebrate populations.
  - Under what flow and effluent-constituent regimes do aquatic invertebrate populations become established?
  - Do pioneering species give way to populations of other species over time under a variety of flow and constituent regimes? What are the implications for discharge into normally dry river beds?
  - What effluent constituents inhibit or enhance the appearance of aquatic invertebrates?
  - What are the implications with respect to water quality criteria and standards in arid environments?
- Determine wildlife use of effluent-enhanced wetland habitats with emphasis on riparian and wetland-dependent species.
  - What is the extent, if any, of pollutants moving from the aqueous medium into the terrestrial vertebrate inhabitants of riparian areas?
  - What pollutants, if any, are moving through the food chain into local top carnivores (e.g., hawks and owls)?
  - What is the significance of the presence of fat soluble organochlorines in small mammals and birds?

- Determine the effects of filtering treated wastewater through a marsh/cienega habitat.
  - What effluent constituents are reduced?
  - What effluent constituents are not affected?
  - What are the implications for water quality criteria and standards in arid environments?

#### IV. REGIONAL WATER QUALITY RESEARCH PROJECT (WQRP)

##### PIMA COUNTY, ARIZONA AS THE SITE FOR THE WQRP

Pima County, Arizona is conveniently located in the arid west (Figure 1). Pima County and other western governmental authorities have been actively advocating the establishment of a WQRP in Pima County to conduct an integrated program of research on water quality. The research would improve the scientific community's understanding of what needs to be done to protect arid ecosystems which are receiving effluent and stormwater discharges. The technical data resulting from such research could be utilized by the EPA to develop appropriate water quality criteria for arid ecosystems.

Pima County Wastewater Management (PCWWM) has offered land adjacent to one of its wastewater treatment facilities and an analytical laboratory (See Figures 3 & 4), to serve as the site for the WQRP. The Roger Road facility is located on approximately 100 acres of land. It discharges approximately 25 million gallons per day of effluent into the Santa Cruz River, an ephemeral stream adjacent to the wastewater treatment facility. The Santa Cruz River also receives large quantities of stormwater during summer and winter storm periods. Pima County is ideally suited for location of the WQRP:

- The Pima County Board of Supervisors has responsibility for effluent and stormwater discharges into the Santa Cruz River;
- Pima County is located in an area that typifies the arid west. The County is located in the Sonoran Desert and has an average rainfall of less than 12 inches per year;
- PCWWM has a state-of-the art analytical laboratory for wastewater treatment facilities; additional biological laboratory facilities to accommodate specific research needs could be easily constructed at reasonable costs;

**Figure 3: Graphite Furnace Atomic Absorption Spectrophotometer**  
With EPA-approved methodology, this unit analyzes metal concentrations in water and wastewater.

**Figure 4: Inductively Coupled Plasma Mass Spectrometer**  
This unit analyzes a series of metals in water and wastewater.

- PCWWM would make available approximately 50 acres of land adjacent to the Roger Road treatment facility to construct an on-site research facility (Figure 5);
- Pima County has developed significant expertise in bringing together local and out-of-state scientists, water resource agencies, wastewater agencies, and industrial representatives to analyze water quality issues, and develop alternative national and regional policies;
- Pima County is ideally located and accessible to research scientists from throughout the arid west who will want to conduct research at the WQRP;
- Pima County is the home of the University of Arizona; the University is a "Research-1"<sup>2</sup> institution which specializes in water resources, health sciences, arid lands, and public policy;
- Pima County, with the cooperation of the University of Arizona, has participated in the development of human health standards for incidental human contact in effluent-dominated waters<sup>3</sup>;
- PCWWM has extensive experience in establishing programs for alternate uses of effluent. Figure 6 illustrates current and potential uses of effluent in the proposed study area;
- Pima County provides a good climate for researchers to conduct research out-of-doors year round.

---

<sup>2</sup>"Research-1" institutions offer a full range of baccalaureate programs, are committed to graduate education through the doctorate degree, and give high priority to research. They receive annually at least \$33.5 million in federal support and award at least 50 Ph.D. degrees each year. The UofA has exceeded such criteria for several years. In 1992 alone, the UofA received \$191.9 million in external funding and awarded 346 Ph.D.s. Michael Cusonovich, Ph. D., Vice-President for Research, University of Arizona, Profile '92, 1992.

## ORIGINAL CONCEPT FOR THE WQRP

In April of 1992, PCWWM published a concept paper<sup>4</sup> which recommended the construction of a specifically-designed "experimental stream" WQRP in Pima County. The concept called for a joint venture between the federal government and Pima County. The joint venture called for Pima County to provide (i) staff support, (ii) laboratory time/access at one of its wastewater treatment facilities, and (iii) fifty (50) acres of property adjacent to its Roger Road wastewater treatment facility. The concept paper recommended that the federal government be asked to provide up to \$35 million to construct and operate the proposed WQRP over a four-year period.

The Pima County concept paper called for the construction of the "experimental stream" WQRP on the 50-acre site. Multiple channels were to be constructed on the 50 acres; the channels were to be lined and a variety of ephemeral and riparian ecosystems placed in and on the channels to simulate fauna and flora normally found in arid environments. The design was expected to replicate, to the greatest degree possible, naturally occurring conditions in arid ecosystems. The concept called for effluent to be conveyed from the Roger Road wastewater treatment facility, treated to varying levels, through the channels to test the tolerance of the various ecosystems simulated in the channels. The design of the WQRP also allowed for the retention of stormwater on-site and its discharge into the channels to permit its research and analysis.

PCWWM distributed the April 1992 paper to local, state, and federal officials to explain the need and purpose of the WQRP and to gain support for the concept. The County learned a great deal from those discussions and decided to modify its approach accordingly. First, it abandoned its original concept to immediately begin pursuing the construction of the specifically-designed WQRP described in the April 1992 paper. The comments received indicated that while the need for a project was certain, the County should not become enamored with any one specific design from the outset. The County agreed.

Second, a study was performed to review the April 1992 concept paper and to seek independent recommendations on the best way to proceed and to develop a research plan. The results and recommendations of that study<sup>5</sup> have been reviewed and accepted by the County.

---

<sup>4</sup> George A. Brinsko, Director, Pima County Wastewater Management Department; Water Quality Criteria for Ephemeral Streams and Riparian Habitats in Semiarid and Arid Regions: Regional Water Quality Research Project; April 1992.

<sup>5</sup>D.J. Baumgartner, E.L. Smith, et al.; Rationale for a Program of Research to Develop Water Quality Criteria for Effluent-Dependent Ephemeral Streams and Riparian Habitats in the Arid West; University of Arizona; Tucson, Ariz; February 1993.

## REVISED PLANNING, DESIGN AND FUNDING CONCEPTS FOR THE WQRP

The study supports the need to develop a regional WQRP with multi-modal research capacity which could respond to a wide range of research questions. Initial research at the WQRP would focus on water quality issues in the west including water quality criteria for effluent and stormwater; effluent reuse and recharge; and regional water quality/quantity management. The project could also be expanded to permit researchers to gather scientific data to develop sediment and biological integrity standards.

The study recommends, however, that further analysis and planning be conducted to determine the exact design of the proposed facility to be constructed. For example, to what degree should the proposed facility include the capability to conduct laboratory dose-response experiments? What form of model ecosystems would best be constructed (e.g., microcosms and/or mesocosms) to achieve project objectives? Should a large experimental stream ecosystem model (similar to the system constructed at Monticello, Minnesota) be constructed to test "real-world" situations? To what extent should scientists conduct experiments on resident species on-site (in various stream ecosystems which receive effluent or stormwater throughout the arid west)?

PCWWM has accepted the study recommendations and fully supports further analysis and planning before deciding upon final project design. Given the study's recommendations, PCWWM will initially seek \$5 million in federal funding in FY 94 to pay for the cost of planning and design of the WQRP including construction of biological laboratory facilities at the Roger Road wastewater treatment facility. Monies to complete construction of any other facilities needed will be sought thereafter.

Pima County is prepared to contribute up to \$500,000 of matching funding in land, effluent, laboratory testing services and staff support to the project.

## WQRP OPERATIONAL CONTROL

PCWWM believes that development, construction, and operation of the WQRP must have the full support of the EPA. The EPA must have total confidence in the results of the research to be conducted at the facility, in order for it to accept such data as the basis for development of its criteria documents.

With that in mind, PCWWM proposes to organize an advisory council comprised of representatives from EPA, scientists, regulators, and WQRP users to draft and develop an appropriate WQRP mission statement and operational guidelines. The advisory council would also provide peer review, set research objectives, and monitor project progress. PCWWM is prepared to operate the WQRP with the cooperation of the EPA.

## V. CONCLUSION

For some time, state and local governments throughout the western United States have been urging the EPA to develop specific water quality criteria documents for the arid west, just as it has for "wet ecosystems". The creation of such documents will permit states in the arid west to develop reasonable water quality standards for effluent and stormwater discharges to ephemeral streams and riparian habitats throughout the west. Local municipalities should not have to expend tens of millions of dollars to retrofit existing, or construct new, wastewater treatment facilities to treat effluent and stormwater to meet water quality standards that do not result in any net environmental benefit. States should only be required to develop water quality standards designed to protect what is there i.e., the fauna and flora which actually exists in the environment.

There is widespread support from scientists, water and wastewater officials and regulators throughout the west for the need to develop criteria documents for arid ecosystems. This will require basic and applied research on resident species in an arid environment. Pima County proposes to establish a federally-funded WQRP in Arizona to conduct the research. The County would make available land, laboratory facilities, and professional staff support for the project. The County is seeking \$5 million in federal funding to begin planning and design of the WQRP, including construction of a biological facilities laboratory, in 1993; it will pursue funds to complete construction of the other necessary facilities thereafter.

GOVERNMENT OPERATIONS

**Congress of the United States**  
**House of Representatives**

STATEMENT OF THE HONORABLE ILEANA ROS-LEHTINEN  
BEFORE THE  
SUBCOMMITTEE ON WATER RESOURCES  
APRIL 21, 1993

## PLEASE RESPOND TO

- 127 CANNON BUILDING  
WASHINGTON, DC 20515-0918  
(202) 225-3931
- DISTRICT OFFICE  
5757 BLUE LAGOON DRIVE  
(NW 11TH STREET)  
SUITE 240  
MIAMI, FL 33126  
(305) 262-1800

Mr. Chairman, I am pleased to have this opportunity to testify before this committee in support of "Save the Florida Bay Act of 1993" to protect the Florida Bay, a body of water which is of critical importance to the state of Florida.

The Florida Bay is of state-wide importance because it affects the environmental health of the Everglades. The Florida Bay is one of our state's most essential natural resources.

I urge you to support the "Save the Florida Bay Act of 1993" because immediate action is necessary to decrease the rapid deterioration of the bay. As we speak, there is massive seagrass die-off, and the abundant growth of algae threaten the economic character of the commercial and recreational fisheries in the area. Additionally, our country's only living coral reef system, located in the Florida Keys, is threatened by this declining water quality. Lack of fresh water drainage and disturbance of the natural flow of water in the Florida Bay have caused many environmental problems.

I request that this Subcommittee acknowledge the need to save our Florida Bay and consider "Save the Florida Bay Act of 1993" as an essential provision to the Clean Water Act. I look forward to working with my colleagues and the Subcommittee to save this indispensable natural resource. Thank you for considering our request.

Statement of the Hon. E. Clay Shaw, Jr.  
before the  
Subcommittee on Water Resources  
April 21, 1993

Mr. Chairman, I appreciate the opportunity to testify before you on a project that is vitally important to my home state of Florida. I am referring to legislation to save the Florida Bay.

If you have never had the pleasure of visiting this magnificent body of water, Florida Bay is located off the southern tip of Florida, between the Everglades National Park and the Florida Keys. Florida Bay serves as the principal nursery for Florida's largest commercial fishery, and its warm, clear tropical waters attract visitors from all over the world.

Unfortunately, today Florida Bay is a dying body of water. Its clear waters are turning murky, and the sea life which was once abundant is now disappearing at an alarming rate. The coral reefs off the Florida Keys, the only living coral reefs in the United States, are being threatened by the changes occurring in the Bay.

Although Florida Bay is not in my congressional district, I have a critical interest in this dying body of water. With the retirement last year of Congressmen Fascell and Lehman, I have become the senior Member of Congress from the South Florida area. I have long been interested in the environmental health of the Everglades, and my interest in Florida Bay is an extension of the growing concern I have had in restoring the natural flow of waters to the Everglades. Scientists agree that the environmental problems stem from the lack of fresh water drainage.

Poor decisions and poor planning made by the government years ago are the principal reasons for the decline of Florida Bay. Not properly dredging and channeling the water has disturbed the natural flow of the water to the bay. In 1992 alone, 55 square miles of seagrass have mysteriously died off, and the largest algae bloom ever found in Florida Bay was recorded last summer.

Because this is a national concern, especially with the Everglades National Park involved, I have reintroduced the "Save the Florida Bay Act of 1993" with support from the entire Florida delegation, after having first been introduced in the last Congress. Unfortunately, because the bill was introduced late in the Congress, on September 24, 1992, it was not acted on before Congress adjourned in October. On March 31, 1993, my reintroduced bill was referred to the House Merchant Marine and Fisheries, and Natural Resources Committees. Since its introduction, I have also received Florida Governor Chiles' support for the bill, through his letter to me of April 6, 1993. I have attached a copy of the letter for inclusion into the public record.

In summary, the Act would create an interagency committee, including representatives from the Department of Interior, the Environmental Protection Agency, the U.S. Army Corps of Engineers, and the National Marine Fisheries Service. The committee would be given a mandate to develop a program for facilitating the restoration of Florida Bay. The Secretary of the Interior would

also be directed to assist the Superintendent of the Everglades National Park in administering an action plan to research the problems plaguing Florida Bay, including an assessment of the effects of Hurricane Andrew. An authorization of \$3 million would be designated for use by the Secretary of the Interior to aid in implementing the plan. I have attached a copy of the Act, H.R. 1564, for your perusal.

It is important to note that my approach would not detract from existing efforts, but would serve as a starting point for the federal government in addressing the environmental concerns of Florida Bay. I am also open to recommendations from other interested parties should there be some additional ideas that would make the Act more effective.

Senator Mack and Senator Graham are currently preparing the Senate version of my bill, but it is unclear right now what timetable the Senate may operate under with regard to the bill.

The Clean Water Act is an important piece of environmental legislation that deserves priority during the 103rd Congress. Because your subcommittee is presently holding hearings on this significant Act, it is my hope that the subcommittee will recognize the urgent need to save Florida Bay. I am therefore requesting the subcommittee's serious and favorable consideration of the "Save the Florida Bay Act of 1993" as a necessary provision to the Clean Water Act.

The time to act is now. I look forward to working with the subcommittee to save Florida Bay, one of Florida's most vital natural resources. I thank the subcommittee for consideration of my request.

## THE GOVERNOR OF THE STATE OF FLORIDA

LAWTON CHILES

April 6, 1993

Honorable E. Clay Shaw, Jr., M.C.  
 Twenty-Second Florida District  
 2267 Rayburn House Office Building  
 Washington, D.C. 20515

Dear Clay:

I am pleased that you have introduced the "Save Florida Bay Act of 1993." Restoration of the entire Everglades system, including Florida Bay, is a top priority of mine. I recently wrote to Secretary Babbitt concerning restoration of the Everglades system and the critical conditions in Florida Bay. A copy of that letter is enclosed. I strongly support your efforts to focus action on and provide funding for the Bay.

Conditions in Florida Bay have deteriorated over the last several years. Massive seagrass die-off and algal blooms threaten the economic integrity of both the commercial and recreational fisheries of the area. In addition, declining water quality conditions threaten this nation's only living coral reef system in the Florida Keys. Many in the scientific community believe that the problems in the Bay are due, at least in part, to reduced freshwater flow from the Everglades. Others believe the main problem is water quality.

I hope that you and the Florida delegation are successful in gaining full congressional support for this very important environmental objective -- a clean and healthy Florida Bay.

With kind regards, I am

Sincerely,

A handwritten signature in cursive script that reads "Lawton Chiles".

LAWTON CHILES

LC/ddt  
 Enclosure

cc: Florida Congressional Delegation

THE GOVERNOR OF THE STATE OF FLORIDA

March 22, 1993

LAWTON CHILES

The Honorable Bruce Babbitt  
 Secretary  
 Department of the Interior  
 1849 C Street, Northwest  
 Washington, D.C. 20240

Dear Bruce:

Thank you for addressing the Everglades Coalition in Tallahassee and meeting with me to discuss the restoration of the Everglades ecological system. The Everglades is not only important to Florida, but it is also a national treasure. While much has been accomplished since the Save Our Everglades Program began in 1983, a great deal remains in our quest to restore this system which spans from Orlando to Florida Bay.

Your commitment to restoration is most timely. I particularly appreciate your support for a re-evaluation of the entire water management system of South Florida. While the current system has served a beneficial purpose in the growth of South Florida, this system which was actually begun over 100 years ago warrants an evaluation relative to today's and tomorrow's needs.

Conditions in Florida Bay have deteriorated over the last several years. Many in the scientific community believe that the problems in the bay are due, at least in part, to reduced freshwater flows from the Everglades. Massive seagrass die-off and algal blooms threaten the economic integrity of both the commercial and recreational fisheries of the area. In addition, declining water quality conditions threaten this nation's only living coral reef system in the Florida Keys. Returning clean fresh water into the bay and implementation of the plans to improve water quality in the Florida Keys National Marine Sanctuary should help to improve conditions in the bay.

We would likewise appreciate your assistance in obtaining funding for scientific research, acquisition of land and project construction for restoring Northeast Shark River Slough, Taylor Slough and Florida Bay.

The Honorable Bruce Rabbitt  
March 22, 1993  
Page Two

Bruce, your enthusiastic support for our efforts to protect and restore Florida's environment is extremely important. It gives us new enthusiasm in the pursuit of this paramount environmental objective - a clean and healthy Everglades System.

With kind regards, I am

Sincerely,

LAWTON CHILES

LC/ddt

103D CONGRESS  
1ST SESSION

# H. R. 1564

To save Florida Bay.

---

## IN THE HOUSE OF REPRESENTATIVES

MARCH 31, 1993

Mr. SHAW (for himself, Mr. DEUTSCH, Mr. LEWIS of Florida, Ms. ROS-LEHTINEN, Mr. BILIRAKIS, Mr. STEARNS, Mr. MCCOLLUM, Mr. GOSS, Mr. GIBBONS, Mr. BACCHUS of Florida, Mr. JOHNSTON of Florida, Mr. MILLER of Florida, Mr. HASTINGS, Mr. HUTTO, Mr. DIAZ-BALART, Mr. MICA, Mr. PETERSON of Florida, Mrs. THURMAN, Mrs. FOWLER, Ms. BROWN of Florida, Mr. CANADY, Mr. YOUNG of Florida, and Mrs. MEEK of Florida) introduced the following bill; which was referred jointly to the Committees on Merchant Marine and Fisheries and Natural Resources

---

## A BILL

To save Florida Bay.

1 *Be it enacted by the Senate and House of Representa-*  
2 *tives of the United States of America in Congress assembled,*

3 **SECTION 1. SHORT TITLE.**

4 This Act may be cited as the "Save Florida Bay Act  
5 of 1993".

6 **SEC. 2. FINDINGS.**

7 The Congress finds the following:

8 (1) Florida Bay is vitally important to both the  
9 economy and ecology of the State of Florida.

1           (2) Florida Bay's environmental health has  
2       been deteriorating at a rapid rate, which for un-  
3       known reasons is presently accelerating.

4           (3) Florida Bay is the principal nursery for  
5       Florida's largest commercial and sport fishing fish-  
6       eries.

7           (4) 55 square miles of seagrasses in Florida  
8       Bay have died since 1987.

9           (5) The number of pink shrimp caught after  
10      maturing in Florida Bay is near a 30-year low.

11          (6) Mangroves and sponges in Florida Bay are  
12      dying at an alarming rate.

13          (7) Florida Bay is currently abnormally saline  
14      and warm, causing an unhealthy habitat for juvenile  
15      shrimp, lobster, fish, and other creatures.

16          (8) The nearby coral reefs, the only living coral  
17      reefs in the Nation, are endangered by the changes  
18      occurring in Florida Bay.

19          (9) The most massive plankton bloom ever  
20      found in Florida Bay was recorded in the summer  
21      of 1992 and still exists.

22          (10) A dearth of knowledge exists on how Flor-  
23      ida Bay's ecosystem functions.

1 **SEC. 3. ESTABLISHMENT OF COMMITTEE.**

2 Not later than 30 days after the date of the enact-  
3 ment of this Act, the Chairman of the Council on Environ-  
4 mental Quality (in this Act referred to as the "Chair-  
5 man") shall establish and thereafter coordinate an inter-  
6 agency committee, including representatives from the De-  
7 partment of the Interior, the Environmental Protection  
8 Agency, the Corps of Engineers, and the National Marine  
9 Fisheries Service, to develop a program for facilitating the  
10 restoration of Florida Bay and to define the roles and re-  
11 sponsibilities of each of those agencies in facilitating that  
12 restoration.

13 **SEC. 4. SENSE OF CONGRESS REGARDING INCLUSION OF**  
14 **FLORIDA BAY IN COASTAL AMERICA PRO-**  
15 **GRAM.**

16 It is the sense of the Congress that not later than  
17 30 days after the date of the enactment of this Act, the  
18 Chairman should include Florida Bay as part of the  
19 Coastal America program.

20 **SEC. 5. FLORIDA BAY ELIGIBLE FOR PRIORITY CONSIDER-**  
21 **ATION UNDER NATIONAL ESTUARY PRO-**  
22 **GRAM.**

23 Section 320(a)(2)(B) of the Federal Water Pollution  
24 Control Act (33 U.S.C. 1330(a)(2)(B)) is amended by in-  
25 serting "Florida Bay, Florida;" after "Sarasota Bay,  
26 Florida;".

1 **SEC. 6. STUDY.**

2 (a) **STUDY REQUIRED.**—Not later than 30 days after  
3 the date of the enactment of this Act, the Secretary of  
4 the Interior shall direct the superintendent of the Ever-  
5 glades National Park to conduct a study of the problems  
6 plaguing Florida Bay, including an assessment of the im-  
7 pact of Hurricane Andrew. Such study shall be completed  
8 no later than September 30, 1993, and upon completion  
9 the Secretary of the Interior shall submit a report to the  
10 Congress describing the findings, conclusions, and rec-  
11 ommendations of the study.

12 (b) **AUTHORIZATION OF APPROPRIATIONS.**—There is  
13 authorized to be appropriated to the Secretary of the Inte-  
14 rior for the study under subsection (a) \$3,000,000 for fis-  
15 cal year 1994, to remain available until expended.

**Statement of Congressman Peter J. Visclosky (D-IN)**  
**In Support of Establishing a National Clean Water Trust Fund**

**Subcommittee on Water Resources and Environment**  
**Hearing on the Re-authorization of the Clean Water Act**

April 21, 1993

I appreciate the opportunity to be here this morning as the Water Resources and Environment Subcommittee continues its hearings on the re-authorization of the Clean Water Act. I would like to commend you, Mr. Chairman, as well as the other Subcommittee members, for your fine work and commitment to facilitate the re-authorization process.

The congressional district I represent is in Northwest Indiana, located in the Great Lakes "water belt" on the southern tip of Lake Michigan. Northwest Indiana has abundant rivers and wetlands, and it is home to the Indiana Dunes National Lakeshore. As you may know, the Indiana Dunes National Lakeshore is the most visited national park in the Great Lakes region, and it has the greatest diversity of plant life of any national lakeshore or national seashore in the National Park System. These natural treasures co-exist with a major, urban industrial center. Indeed, Indiana's First Congressional District is the largest steel-producing district in the country, making over 20 percent of our nation's steel. I am keenly aware of the importance of balancing our efforts to improve Northwest Indiana's, and the nation's, water quality with economic development concerns.

National Clean Water Trust Fund:

Toward that goal, I would like to focus your attention on legislation I am introducing today to expedite the clean-up of our nation's waters. This bill, the National Clean Water Trust Fund Act of 1993, which is similar to legislation I introduced in the 102nd Congress (H.R. 2724), would create a trust fund established from fines, penalties, and other moneys collected through enforcement of the Clean Water Act to help alleviate the problems for which the enforcement actions were taken.

Currently, there is no guarantee that fines or other moneys that result from violations of the Clean Water Act will be used to correct water quality problems. Instead, some of the money goes into the general fund of the U.S. Treasury without any provision that it be used to improve the quality of our nation's waters.

Purpose:

I am concerned that EPA enforcement activities are extracting large sums of money from industry and others through enforcement of the Clean Water Act, while ignoring the fundamental issue of how to pay for the clean-up of the water pollution problems for which the penalties were levied. If we are really serious about ensuring the successful implementation of the Clean Water Act, we should put these enforcement funds to work and actually clean-up our nation's waters. It does not make sense for scarce resources to go into the bottomless pit of the Treasury's general fund, especially if we fail to solve our serious water quality problems due to lack of funds.

Statement of Rep. Peter J. Visclosky  
Page 2  
April 21, 1993

Specifically, my bill would establish a National Clean Water Trust Fund within the U.S. Treasury for fines, penalties, and other moneys, including consent decrees, obtained through enforcement of the Clean Water Act that would otherwise be placed into Treasury's general fund. Under my proposal, the EPA Administrator would be authorized to prioritize and carry-out projects to restore and recover waters of the United States using the funds collected from violations of the Clean Water Act. However, this legislation would not preempt citizen suits or in any way preclude EPA's authority to undertake and complete supplemental environmental projects (SEPs) as part of settlements related to violations of the Clean Water Act and/or other legislation.

For example, last month, Inland Steel announced a \$54.5 million multi-media consent decree, which includes a \$26 million SEP and a \$3.5 million cash payment to the U.S. Treasury. I strongly support the use of SEPs to facilitate the clean-up of serious environmental problems, which are particularly prevalent in my congressional district. However, my bill would dedicate the cash payment to the Treasury to the Clean Water Trust Fund.

The bill further specifies that remedial projects be within the same EPA Region where enforcement action was taken. Northwest Indiana is in EPA Region 5, and there are ten EPA Regions throughout the United States. Under my proposal, any funds collected from enforcement of the Clean Water Act in Region 5 would go into the National Clean Water Trust Fund and, ideally, be used to clean-up the specific problem for which the fine was levied.

My bill also instructs EPA to coordinate its efforts with the states in prioritizing specific clean-up projects. Finally, to monitor the implementation of the National Clean Water Trust Fund, I have included a reporting requirement in my legislation. One year after enactment, and every two years thereafter, the EPA Administrator would make a report to Congress regarding the establishment of the trust fund.

#### Extent of Clean Water Act Penalties:

To illustrate how a National Clean Water Trust Fund would be effective in cleaning up our nation's waters, I would like to highlight the magnitude of the fines that have been levied through enforcement of the Clean Water Act. Nationwide, in Fiscal Year (FY) 1992, EPA assessed \$61 million in penalties for violations of the Clean Water Act. These penalties represented 43 percent of all penalties assessed by EPA under various environmental statutes.

Statement of Rep. Peter J. Visclosky  
Page 3  
April 21, 1993

In Region 5 alone, in FY 1992, EPA collected \$2,270,500 in civil penalties for violations of the Clean Water Act. These funds were the result of 5 consent decrees and 11 administrative penalty orders. So far this year, EPA Region 5 has collected \$2,357,500 in civil penalties for violations of the Clean Water Act.

Endorsements:

I am pleased to inform you that my legislation has already garnered the endorsement of several environmental organizations in Northwest Indiana, including the Grand Calumet Task Force, the Northwest Indiana Chapter of the Izaak Walton League, and the Save the Dunes Council. Further, I am encouraged by the initial support within the national environmental community and the Northeast-Midwest Congressional Coalition for the concept of a National Clean Water Trust Fund.

I would also like to point out that, in a 1992 report to Congress on Clean Water Act enforcement mechanisms, an Environmental Protection Agency (EPA) workgroup recommended amending the Clean Water Act to establish a National Clean Water Trust Fund. Without objection, I would ask that the hearing record remain open so that additional comment could be received on this proposal.

Other Clean Water Act concerns:

So far this morning, I have focused your attention on what I believe would be part of the solution to improving the Clean Water Act. However, as we know all-too-well, the magnitude of the challenge is staggering. There are tremendous needs in terms of funding -- even with the resources of my proposed National Clean Water Trust Fund.

I would like to emphasize my strong support for improvements in and increased funding for programs to address contaminated sediment remediation, wastewater treatment, control of stormwater discharges, and combined sewer overflow (CSO) policy in the re-authorization of the Clean Water Act. There is no question that all of these issues need to be addressed to improve our nation's water quality. However, it is less clear how states and municipalities are going to be able to comply with more stringent federal mandates without enhanced federal funds.

Statement of Rep. Peter J. Visclosky  
Page 4  
April 21, 1993

I recently surveyed local officials in Northwest Indiana to better understand their various needs, as well as the cost that would be involved. I was informed that the price tag for the necessary projects would be over \$118 million. Mr. Chairman, I would be happy to provide you and the other Subcommittee members, as well as your respective staffs, with a more detailed analysis of these individual projects should there be an opportunity to discuss worthy demonstration projects or other earmarked funding in the Clean Water Act re-authorization.

In re-authorizing the Clean Water Act, we have a unique opportunity to improve the quality of our nation's waters. The establishment of a National Clean Water Trust Fund is an innovative step in that direction. By targeting funds accrued through enforcement of the Clean Water Act -- that would otherwise go into the Treasury Department's general fund -- we can put scarce resources to work and facilitate the clean-up of problem areas throughout the Great Lakes and across this country. I look forward to working closely with you, Mr. Chairman, and the other members of the Water Resources and Environment Subcommittee in the re-authorization process, and I would hope to have your support in establishing a National Clean Water Trust Fund.

Thank you.

ADDITIONS TO THE RECORD

---

## Coalition for Health Concern

Route 0, Box 25  
Benton, Kentucky 42025  
(502) 527-1217

April 12, 1993

The Honorable  
Douglas Applegate  
Committee on Public Works  
and Transportation  
Rayburn Office Building  
U.S. House of Representatives  
Washington D.c. 20515

Dear Congressman Applegate:

Please include our comments as part of the formal hearing record on the Clean Water Act Reauthorization:

1. Our county of Marshall is listed as one of the top TEN counties in the U.S. in the permitted discharge of toxics and cancer causing chemicals into the Tennessee River. The discharges are from the Calvert City chemical complex.
2. We are concerned about the increased numbers of rare types of cancer, leukemia, brain tumors, lupus and children with cancer that we see here.

We make the following recommendations:

- A. EPA recommendations that the "single operational upset" defense and preclusive effect of prior state administrative actions be eliminated.
- B. Mandatory minimum penalties should be imposed for serious and chronic violations. The "Fox guarding the chickens" has not worked with the self reporting by industries. EPA and the states must be authorized to assure compliance.

Page 2

- C. So long as industries profit by violations the Clean Water Act will not be effective. Give the Courts and EPA the rigid authority and mandate to recover the economic benefit due to non-compliance
  - D. Require EPA to make its database on permit compliance available to the public. Increase Citizen Oversight of State-issued permits along with EPA increased oversight.
3. All priority pollutants in the Clean Water Act should be included in the Toxic Release Inventory.
- A. Non-manufacturing facilities that release toxics should be subject to reporting requirement, including federal facilities, publicly-owned treatment works, hazardous waste incinerators, cement kilns that burn toxics and hazardous waste.
  - B. Assure that non-compliance by industries and facilities that pollute is widely publicised. Presently, it is almost impossible to determine what is going on. Public notices in Post Offices and Court Houses should be required.
  - C. The public pays for the Publicly Owned Treatment Works(POTWs) and the public has the right to know about the violations of the standards for pollutants dumped into the sewers by trucking terminals, industries and facilities that handle toxics. Include the information in the bills to customers.
4. POLLUTION PREVENTION LANGUAGE MUST BE ADDED TO THE CLEAN WATER ACT.
- A. Phase out the most hazardous and toxic substances.
  - B. Reduce toxic chemical use in the first place.
  - C. Improve treatment & discharge controls & close the "dilution is the solution to pollution" loophole.
5. The Clean Water Act should require that the EPA shall assess a fee to cover the costs of permit issuance, compliance monitoring by EPA and the states.

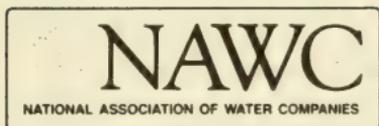

Page 3

- A. Require that all effluent limitations and monitoring requirements be expressed in terms of total mass of each toxic pollutant discharged, in addition to concentration.
- B. AMEND SECTION 301 TO PROHIBIT MIXING ZONES FOR TOXICS, including zones of initial dilution and dilution with stream flow or lake volume and require attainment of chronic criteria at the end of pipe.
- C. Amend Section 303 to require states to revise their water quality standards and regulations to prohibit the use of mixing zones or dilution for all but conventional pollutants.

WE ARE ASHAMED THAT KENTUCKY REMOVED ALL RESTRICTIONS ON THE DISCHARGE OF DIOXINS TO THE WATERS OF THE STATE AT THE BEHEST OF THE PAPER AND HAZARDOUS WASTE INCINERATION INDUSTRIES. WE URGE STRICT REQUIREMENT FOR DEADLY CHEMICALS INCLUDING DIOXIN IN THE REGULATIONS OF THE CLEAN WATER ACT.

Respectfully,

  
Corinne Whitehead  
President

JAMES B. GROFF, EXECUTIVE DIRECTOR

TESTIMONY OF  
THE NATIONAL ASSOCIATION OF WATER COMPANIES  
BEFORE  
THE SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
CONCERNING  
REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT  
PRESENTED BY  
J. JAMES BARR, VICE PRESIDENT AND CHIEF FINANCIAL OFFICER  
AMERICAN WATER WORKS COMPANY

APRIL 21, 1993

Good morning Mr. Chairman. My name is Jim Barr. I am Vice President and Chief Financial Officer of the American Water Works Company. American is the largest investor-owned water utility in the country, serving over 5 million people in 606 communities in 20 states.

I am also Chairman of the Board of the National Association of Water Companies. The National Association of Water Companies (NAWC) is the trade association representing the nation's investor-owned water utilities. Its 360 members in 41 states provide safe, reliable drinking water to over 22 million Americans every day. Our member companies provide service from Pine Bluff, Arkansas to Chattanooga, Tennessee and from San Jose, California to Marion, Ohio. Our members employ a combined work force in excess of 15,000. In 1991, these companies had operating revenues of \$2.3 billion and gross utility plant of \$9 billion. Shares in 18 of our largest member companies are publicly traded. Ten of our companies also provide wastewater service to 350,000 persons nationwide.

Mr. Chairman, I applaud your leadership in holding this series of hearings on the Clean Water Act (CWA). My company and other NAWC members, some of whom own or operate wastewater treatment facilities, are directly affected by the requirements of this Act. The experience of these companies demonstrates that the private sector can play a role in the provision of wastewater services. We believe the private sector can - and should be encouraged to - play a larger role in providing wastewater treatment facilities. Changes to the Clean Water Act to affect this end will be the main focus of my statement today. I will also touch on the need to strengthen section 319, concerning non-point source pollution, to recognize protection of drinking water supplies.

#### Encouragement of Public-Private Partnerships in the Provision of Wastewater Treatment Facilities

The goals of the Clean Water Act are to eliminate the discharge of pollutants into navigable waters and attain waters deemed fishable and swimmable. While these goals have not yet been achieved, 75 percent of assessed waters do comply with standards for conventional pollutants. This success was not cheap. Since 1972, Congress has provided \$57 billion in grants for the construction of treatment works and authorized another \$8.4 billion for the state revolving fund (SRF) program which replaced the grant program in 1987.

But the need for funds remains great. In its 1988 needs survey, the EPA estimated total construction needs at \$83.5 billion through 2008. At current levels, the SRF will meet only 31 percent of States' wastewater treatment needs by 2001. This percentage will actually be reduced through competition for SRF monies from the

National Estuaries Program, non-point source pollution control and other worthy programs.

In addition, these needs come during a time when the demand for scarce federal resources is fierce and growing. This limits the ability of the federal government to provide additional funds for any programs under the Clean Water Act. Making the private sector a partner in the provision of wastewater treatment facilities is one way additional resources can be raised to address these needs. I recommend two changes to the Act that will facilitate the ability of the private sector to invest in wastewater treatment facilities.

First, the Clean Water Act should be modified to encourage the establishment of public-private partnerships to construct and manage treatment works. Under current law (section 601(a)(1)), SRF funds are only available for treatment works which are publicly owned. Modifying this section to permit SRF monies to be used in conjunction with private funds could leverage additional monies which will help close the need gap described above and free-up more funds for other important programs authorized under the Act.

Such a program is not without precedent. The Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA), permits up to 50 percent of the funds for construction of toll roads to come from the highway trust fund. This Committee's report on this provision makes reference to water and sewer infrastructure as follows: "the public-private partnership is important and should be encouraged. From the Federal perspective, one of the ways to approach infrastructure improvement would be to ease unnecessary Federal constraints preventing the mixing of Federal dollars with private funds on projects". The Committee looked to the private sector not only to "bring new sources of capital to infrastructure projects" but also to "expedite the completion of projects with the efficiencies of the private sector".<sup>1</sup>

A fully privatized wastewater treatment plant in Auburn, Alabama, supports the Committee's contention. According to EPA, the plant saved the city \$25 million in costs over the life of the project and enabled the facility to go on line in one-quarter of the time of similar, non-privatized facilities.

As with the ISTEA toll road provision, using SRF funds to finance public-private partnerships would not be a requirement of the Act. Rather it would be an option available to state and local governments as a method to leverage additional funds for treatment plant construction. At Appendix A you will find a paper describing how such a program might be structured.

---

<sup>1</sup> House Committee on Public Works and Transportation; House Report No. 102-171(I); July 26, 1991; pgs. 13-24.

Second, a definition of a "publicly-owned treatment work" should be added to the Clean Water Act. Such a definition should be based on purpose rather than ownership. The Safe Drinking Water Act (SDWA) clearly defines drinking water systems by purpose rather than ownership.<sup>2</sup> This provides for uniform environmental regulation of a drinking water system whether owned by one of our member companies or a municipality.

In contrast, the Clean Water Act does not define a "publicly-owned treatment work" (POTW). It does acknowledge the existence of privately owned treatment works in section 201(h) and EPA regulations have recognized a distinction. Under regulatory treatment, this is a distinction with a difference.

For example, a privately-owned wastewater treatment facility loses the domestic sewage exclusion provided to POTWs under the Resource Conservation and Recovery Act (RCRA). This exclusion exists to avoid duplicative CWA and RCRA permits for the same unit. A private facility is subject to Best Available Technology Economically Available/Best Conventional Pollutant Control Technology requirements, while a public one is subject to secondary treatment requirements. Two very different requirements.

Different requirements based on ownership are required by the Clean Water Act. But they are not necessary to provide clean water. They merely serve as barriers to entry of the private sector and a barrier to the transfer of facilities between private and public ownership. Entirely different requirements would apply to a treatment facility sold by a municipality to a private investor, even though the purpose of the facility and its customer base remain unchanged.

I strongly urge the Committee to amend the Clean Water Act to provide a single and clear definition of a wastewater treatment facility based on purpose rather than ownership. Such a change will provide uniform regulations for all such facilities. This in turn will provide local governments the flexibility to make arrangements for the provision of wastewater services that meet local needs. A single definition of a treatment facility based on purpose allows for a facility that is 100 percent publicly-owned,

---

<sup>2</sup> Section 1401(4) of the Safe Drinking Water Act reads: "The term "public water system" means a system for the provision to the public of piped water for human consumption, if such system has at least fifteen service connections or regularly serves at least twenty-five individuals. Such term includes (A) any collection, treatment, storage, and distribution facilities under control of the operator of such system and used primarily in connection with such system, and (B) any collection or pretreatment storage facilities not under such control which are used primarily in connection with such system."

100 percent privately-owned or any percentage in between.

#### Non-Point Source Pollution

America's drinking water suppliers are the nation's front-line environmentalists. Long before enactment of the Safe Drinking Water Act, water suppliers took steps to ensure the safety and quality of drinking water. Disinfection of drinking water to kill microbial contaminants, hailed as the greatest benefit to public health this century, has been routine for almost 100 years. Our historical commitment to protecting the public health continues to this day with our support of and compliance with the stringent requirements of the Safe Drinking Water Act.

But compliance is not cheap. Over the course of this decade, EPA estimates water suppliers will have to invest \$2.5 billion a year to comply with SDWA requirements. This is in addition to an annual investment of \$10 billion for maintenance, expansion and improvement of drinking water infrastructure. We and our customers are naturally eager to keep these costs as low as practicable. One way this can be done is by enhancing the protection of drinking water supplies.

As stated above, the Clean Water Act has as its goal fishable and swimmable waters. Great steps have been taken towards this end, yet every year billions of tons of pollutants find their way to both surface and groundwater, largely through run-off from non-point pollution sources. The largest source of non-point pollution is pesticide, fertilizer and animal waste run-off from farms.

The federal government regulates "both ends of the pipe"; drinking water quality through the Safe Drinking Water Act, pesticide and fertilizer application through the Federal Insecticide, Fungicide and Rodenticide Act. These acts should be complimentary. In other words, when a drinking water standard is set by the federal government, it should not at the same time bless activities which are likely to lead to violation of those standards. The left and right hands must work in concert.

The Safe Drinking Water Act regulation governing pesticides and nitrates became effective on January 1, 1993. If monitoring reveals pesticides or nitrates at levels exceeding the prescribed MCL, drinking water systems will have to install facilities for their removal.

This is no idle concern. Two years ago, the Missouri River Public Water Supplies Association performed a monitoring study to determine pesticide levels in this mighty river. It found atrazine

at levels above the maximum contaminant level (MCL) established under the SDWA. A subsequent study by the US Geological Survey (USGS) confirmed these findings. Both of these studies may be found at Appendix B.<sup>3</sup>

Should average pesticide levels exceed the MCL, systems will have to install granular activated carbon (GAC) to treat the water and comply with the MCL. A large utility in Missouri serving a million persons has estimated that financing the installation of GAC will require a 70 percent rate increase! Nitrates pose a similar problem; their treatment can cause significant cost increases as well.

These costs should not be borne by our customers when they can be avoided. Section 319 of the Clean Water Act provides for the establishment of state plans to reduce non-point source pollution. But these plans only apply to water quality standards issued under the Clean Water Act. I recommend that section 319 (a) and (b) be modified to recognize the protection of drinking water quality as a goal of state non-point source management programs. You will find proposed bill language at Appendix C.

In Putting People First, President Clinton calls for stronger non-point source standards. He also advocates placing "greater emphasis on preventing and reducing pollution before it happens, so we won't have to spend so much on cleaning it up after the fact". Finally, he states polluters should pay. Our proposed changes to section 319 conform with these policy goals.

#### Conclusion

The changes described above will help produce a more effective and efficient Clean Water Act. This will hasten the achievement of its worthy goals - fishable and swimmable waters. Adoption of our amendments will also make compliance with SDWA requirements easier.

We appreciate this opportunity to provide testimony on the Clean Water Act and look forward to working with you on these issues during reauthorization. Please feel free to contact the NAWC if you require additional information on any of these items.

---

<sup>3</sup> The USGS is also gathering additional water quality data over the remainder of the decade. Its National Water Quality Assessment Program will perform intensive assessment activity in 60 study areas. Twenty four-year studies began in FY91 with an additional twenty to begin each in FY94 and FY97. Upon completion, these studies will provide invaluable data to our member companies concerning pollution levels and sources nationwide.

**A PROPOSAL FOR  
PUBLIC-PRIVATE PARTNERSHIPS  
IN THE  
WASTEWATER TREATMENT INDUSTRY**

**Background**

Increased Federal support, in the form of State Revolving Funds, is critical to spur treatment plant construction projects to increase capacity, address treatment needs and develop new technologies to reduce nitrogen pollution. Federal monies invested in additional wastewater treatment construction will strengthen regional economies, and create critically needed jobs in the construction industry, related businesses, service providers and suppliers.

In its 1988 Needs Survey, the EPA estimated that a total of \$83.5 billion would be required for construction of new wastewater treatment facilities through 2008. At current levels the State Revolving Loan Fund (SRF) will meet only 32 percent of states' wastewater treatment needs by 2001.

These needs come during a particularly critical time when the demand for scarce Federal resources is fierce and growing and when the Federal Government has projected a deficit of \$300 billion next year. This limits the ability of the Federal Government to provide more resources for the Clean Water Act. To meet the growing need for additional wastewater treatment capacity, innovative approaches are required to provide additional financial resources.

It has been argued that government's role is to ensure that essential public services are provided, not necessarily to provide those services. Involving the private sector in this effort through privatization initiatives or a public-private partnership (P-3) is a way for government to provide public services, stretch tight financial resources with private sector investment and generally help save money through more efficient operations.

In this light, it is believed that through public-private partnerships, communities can gain additional resources to meet their ongoing needs for the construction and upgrading of wastewater treatment facilities. Therefore, this proposal recommends that the Clean Water Act (CWA) be modified to encourage the establishment of public-private partnerships to construct and manage sewage treatment plants. Under current law, Section 601(a)(1) of the CWA, State Revolving Funds are only available for treatment works that are publicly owned. Modifying this

section to authorize P-3 initiatives will permit SRF monies to be used in conjunction with private funds which will leverage additional billions *and* help close the need gap described above.

As a means of demonstrating the effectiveness of P-3 initiatives, we recommend that the Clean Water Act be modified to permit SRF fund to be used in conjunction with private funds for the construction, expansion, rehabilitation or modernization of wastewater treatment facilities.

(Note: If the current EPA Pilot Program is cancelled, you may want to consider authorizing the Administrator to designate pilot programs that would increase the level of funding available to the states to match SRF funds. This pilot program approach would recognize that P-3 initiatives are a new way of augmenting the federal granting procedure to states for the privatization of wastewater treatment plants and would allow a period to assess the effectiveness of this new program and solve any issues that may become apparent in privatizing sewage treatment plants.)

#### Public-Private Partnerships

A public-private partnership is a contractual relationship between a public and private partner that commits both to providing an agreed upon service. In terms of the wastewater treatment industry, the private sector can be involved in a variety of ways, ranging from the initial design of a sewage treatment facility, its construction, expansion, rehabilitation, or modernization to its daily operation and maintenance. Private sector participation not only can stretch scarce federal dollars but through contract management can help make the facility's operations more cost-effective, thereby reducing the tax burden on the local community.

To help improve the condition of the nation's major estuaries, this proposal recommends giving state and local governments more freedom to privatize facilities financed totally or partially by the Federal government. Additionally, Federal funds should be permitted to be applied to a broad range of P-3 initiatives at the state and local levels to expedite the construction, expansion, rehabilitation or modernization of sewage treatment plants.

The following is a list of P-3 concepts that could be employed for public-private partnerships and to which Federal funds could be used in conjunction with the private sector:

- o **Contract Services:** The private sector is contracted for a fee to provide a specific service, ranging from the operation of a wastewater treatment plant or a particularly troubled department, to billing services, bill collection, security services, or automated mapping and facilities management. The facility is owned by the public sector.

- o **Turnkey Facility:** The private sector designs, constructs and operates the wastewater treatment facility. The plant is turned over to the public sector, which retains ownership, or its leased back to the private contractor. Federal funding participation is in whole or in part. Depending on the financial and ownership structure, the contractor is paid a fee to operate the plant that is sufficient to cover costs, provide a profit and/or a return on investment.
- o **Developer Financing:** The private sector participates in financing the construction or expansion of a wastewater treatment plant in return for a right of use. The facility is owned by the public sector, but the developer is paid a fee to operate the plant, which is sufficient to cover costs, earn a profit and a return on investment.
- o **Privatization:** Through the build, own and transfer model (BOT), the private sector builds, owns and operates the wastewater treatment plant, partially financing the facility. At the end of a specified period, such as 30 years, the plant may be transferred to the public sector for a nominal fee. Through a special purpose corporation structure, the contractor operates the plant for a fee that is sufficient to cover costs, earn a profit and a return on investment. A public authority levies and collects the fees paid to the contractor.

#### **Federal Participation Defined**

Congress should amend the Clean Water Act during this session to permit the Administrator of the Environmental Protection Agency to authorize Federal funding and participation in partnership with the State and the private sector to spur construction and development of the nation's sewage treatment plants. Under this option, Federal participation would be permitted in whole or in part to encourage private development in the following areas:

- o Construction of new wastewater treatment plants and related facilities;
- o Expanding, modernizing, installing new process technology, and rehabilitating a wastewater treatment plant and its related facilities;
- o Reconstructing or replacing a wastewater treatment plant and its related facilities;
- o Feasibility studies to determine the need for a sewage treatment facility to be built, expanded, modernized, rehabilitated, the effectiveness of a new process technology or to determine if it is cost-effective for the contract management of all or part of a wastewater treatment plant operation;

### Federal Participation Levels

- Under this proposal, SRF funds could be used to fund up to 50 percent of the cost for:
- o The initial construction of a wastewater treatment plant and its related facilities;
  - o expansion, modernization, or installation of new process technology, rehabilitating;
  - o Reconstructing, upgrading or replacing facilities;
  - o Conducting preliminary feasibility studies to determine the need for one of the above actions or to determine if it is cost-effective to use contract management of the sewage treatment plant operations.

### Ownership

Federal participation is currently allowed on publicly owned facilities. To facilitate private ownership, the CWA definition of Publicly Owned Treatment Works should change to recognize the purpose of the facility rather than the ownership. Under current law, a privately-owned POTW is treated differently than a true POTW. For example, a privately-owned POTW loses the domestic sewage exclusion under RCRA and is subject to BAT/BCT requirements rather than secondary treatment requirements.

To facilitate transfer of POTWs to the private sector, all wastewater treatment works should be defined by purpose (Public Purpose Treatment Works) and apply the same regulations regardless of ownership. The Safe Drinking Water Act has always recognized water systems by purpose rather than ownership; regulations are uniform and apply to all drinking water systems.

### Use of Revenues From Facility

Before Federal participation can be authorized by the Administrator, the public authority responsible for the wastewater treatment plant must enter into an agreement with the Administrator which provides: that the revenues received from the operation of the facility will be used first for debt service; for a reasonable return on investment of any private party or entity financing the project; for the costs necessary to operate and maintain the plant whether directly or through contract management.

### Loans

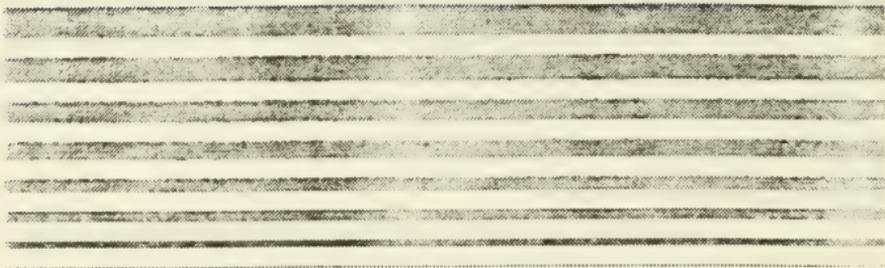

Under this proposal, loan terms would remain the same as required under current SRF programs.

**Authorization for Federal Participation In P-3 Initiatives**

If it becomes apparent that a P-3 program for the wastewater treatment industry cannot be implemented as suggested, then consideration could be given to authorizing the EPA Administrator to initiate pilot demonstration projects in key areas as a way to demonstrate in the short-term the effectiveness of public-private partnerships. If this becomes the case, then the following guidelines are suggested:

- o The Administrator will designate three wastewater treatment plant improvement projects to serve as P-3 pilot programs for the implementation of approved conservation and management plans.
- o For the purpose of selecting P-3 pilot programs, the Administrator will give priority status to those approved conservation and management plans with the greatest funding deficit.
- o In a pilot project, the Administrator would enter into an agreement with a community and the state to explore opportunities for private sector involvement, which would share in funding the P-3 pilot project. The EPA would provide technical guidance and other assistance to the public and private participants and would expedite the granting of permits and waivers as necessary for the transaction to proceed.
- o The Federal government will also specifically guarantee bond issues used exclusively by the private sector to privatize a wastewater treatment plant. This will enable these regulated public entities to ensure the cost-effective delivery of service for the public good.

**Acknowledgements**

The author wishes to acknowledge the various organizations and individuals who assisted in conducting this study.

Assistance from the Missouri River Public Water Supplies Association was invaluable. Members committed many hours of manpower to collect daily river samples and return them promptly to the SLCWC laboratory.

Dave Collins and the American Water Works Service Company Laboratory participated with us in split sample analysis, providing invaluable quality assurance for the data.

Dale McMurtrey and the Kansas City Water and Pollution Control Laboratory provided daily herbicide data to supplement this report, and relieve the sample/analysis burden at a single laboratory.

Jackie Cleveland and Sharon Woods, of St. Louis County Water Company, organized sending, receiving, preparing, and analyzing the hundreds of samples which made up this study.

Paul Keck

## 1991 Missouri River Monitoring Study

### Background

In April of 1990, the Missouri River Public Water Supplies Association announced the authorization of a one-year study to examine the occurrence of pesticides in the Missouri River.

A Contract Laboratory was retained to analyze quarterly samples from four locations on the Missouri, testing for the priority #1 and priority #2 contaminants (102 pesticides). After the first sampling and analysis, atrazine and alachlor were added to the list. Three sample rounds were completed in the study before the contract laboratory underwent a change in organization, which resulted in a loss of ability to continue the project. The 75% complete study showed no significant occurrence of pesticides.

Concurrent with the contract laboratory study, the individual utility laboratories at Kansas City and St. Louis collected and analyzed samples for atrazine and alachlor on a daily or near daily basis during the period of May through July, 1990. The results of the individual utility laboratory studies were dramatic. Unlike the quarterly grab sample contract laboratory project, these studies showed nearly continuous presence of atrazine during a 90-day period and highly variable day-to-day concentrations.

The inability to complete the Contract Laboratory Project, coupled with the striking difference in results obtained through daily sampling, prompted this present study which sought to formalize the approach to daily sampling throughout sub-regions of the basin during the Spring-Summer runoff period in 1991. At its outset, the study was termed "The 100-Day Study" in anticipation of the probable length of the runoff season. The study approach rejected the option of using Contract Laboratories, and instead used individual utility laboratories.

## Introduction

The promulgation of Primary Drinking Water Regulations establishing maximum contaminant levels (MCL's) for the phase II synthetic organic contaminants (SOC's), has caused concern among midwestern water suppliers about their ability to comply with these new limits. Many investigators have reported significant levels of several of these SOC's in studies conducted throughout the Midwest. Most of these studies report values obtained from random sampling and short term events yielding only "snapshots" at various locations over limited periods of time (1,2,3,4). Water suppliers must contend with regulations which suggest regulatory monitoring at times of likely contamination. "States are advised to examine sampling practices of systems to assure that periods of likely contamination are not avoided. This is especially true for surface water systems monitoring for pesticides after rainfall and/or application of pesticides (5)."

Herbicide concentrations have been shown to vary greatly in short periods of time (6). Obtaining an accurate evaluation of the herbicide levels contained in Midwest rivers therefore requires frequent sampling over an extended time period. A true understanding of herbicide migrations is needed to assess the risk of surpassing MCL's and to formulate remedial actions to prevent or reduce the potential of exceeding regulatory limits.

Environmental conditions related to runoff can impact contaminant levels, and should be reported jointly with herbicide levels to gain relevance when comparing various years of data or comparing various regions of data. Weather and hydrological conditions during the sampling period which represent above average, below average, or near average conditions affect whether or not the results are applicable in projecting reasonable future risks. Likewise, current farm practices during the sampling period must be addressed to determine the normalcy of herbicide distribution and usage for the study period. Inability to plant due to unsuitable field conditions would result in lower applications of herbicides and these lower applications would be reflected in the amount of herbicide available to be transported in runoff.

Collecting and reporting herbicide data without also reporting whether or not the samples used were collected under normal conditions does not provide a valid statistical model. Such data would not be applicable to all situations, and could lead to false conclusions. In a 1990 study of daily herbicide levels at St. Louis, it was noted that river flow data appeared to correlate spikes of high herbicide events with runoff events which happened hundreds of miles upstream (6). In order to better understand regional loadings and the migration characteristics of several widely used herbicides as they move downstream, this study was initiated by the Missouri River Public Water Supplies Association (MRPWSA) on behalf of its utility members.

## Study Protocol

### Sample Collection

The three month period of May, June, and July 1991 was selected as the study period in an attempt to encompass the spring/summer herbicide application season and period of highest runoff potential. Sample sites were selected from among the members of MRPWSA using three selection criteria. The first criteria was to choose sample sites so as to bracket the major tributaries feeding the lower Missouri River basin. The major individual tributaries and groups of tributaries selected were the Platte River in Nebraska, the Kansas River in Kansas, the Grand and Chariton Rivers in Missouri and the Osage and Gasconade Rivers in Missouri. This bracketing allowed determination of the tributaries' herbicide levels before and after their convergence with the main stem of the Missouri River.

The second selection criteria was to locate sample sites as far from the convergence of streams as possible to ensure complete mixing of the influent tributaries with the mainstream Missouri River.

Criteria three was to choose sites on the basis of their proximity to a U. S. Army Corps of Engineers flow gaging station. The daily flow data from the gaging stations was combined with the daily herbicide data to calculate the herbicide loads throughout the lower Missouri River basin during the three month study period from May 1 to July 29, 1991. Seven sample sites were estimated to be the maximum number manageable for time and analytical resources available to perform the analyses. Figure 1 on page 6 presents the sample site locations within the Missouri River Basin. An inventory, used in the selection of sample sites, of flow gaging stations, major tributaries, MRPWSA members, and MRPWSA members cities is presented in Table 1 on page 7.

### 1991 Missouri River Daily Sampling Points

<u>Sample Site</u>	<u>Site Code</u>
Sioux City, Iowa	SX
Omaha, Nebraska	OM
St. Joseph, Missouri	SJ
Kansas City, Missouri	KC
Lexington, Missouri	LX
Boonville, Missouri	BN
Chesterfield, Missouri	SL

All samples were grab samples and no attempt was made at acquiring depth or width integrated samples. Samples were picked up daily and refrigerated pending weekly shipment to St. Louis County Water for analysis, except in the case of Kansas City where samples were picked up daily and analyzed in the Kansas City Missouri Water and Pollution Control Laboratory.

#### Analysis

The method used at St. Louis County Water Company was a modification of EPA Method 505 (see page 30). The major modifications were that a Nitrogen/Phosphorus Detector (NPD) was used in lieu of the stated Electron Capture Detector (ECD) and a megabore capillary column was used in place of a true capillary column. The use of the NPD provided greater sensitivity to the widely used nitrogen containing herbicides targeted in this study. The use of the mega bore capillary column halved gas chromatograph (GC) run times, which helped facilitate heavy sample loads, but in turn the use of the mega bore column caused the loss of ability to separate metolachlor and cyanazine. The use of 40 milliliter sample vials made collection, shipping, storage, and sample preparation much more manageable. This small sample size however, did increase the reporting levels as compared to the other laboratories, which used larger sample volumes.

With each sample batch, extracted standards were used to develop calibration curves. Every fifth GC run was an extracted check standard to assure detector stability. Herbicide levels were only reported out within the range of the calibration curve. The reporting level is the lowest standard in the standard curve for that sample batch which maintained response through out the GC sample run.

The herbicides that were targeted through the entire study were simazine, atrazine, and alachlor. The results of analysis represent the dissolved portion of the herbicides in the river samples. Earlier studies by Perieira (4) indicate that only small percentages (<0.5%) of atrazine, cyanazine, and metolachlor loadings are transported on solid surfaces and that these compounds are transported mainly in the dissolved phase. Alachlor soil adsorption and leaching capacity are rated in the same range as atrazine and metolachlor (7).

### Quality Control

The quality control measures used in this study included travel blanks, spikes, and split samples. Travel blanks were shipped out, returned and analyzed weekly with each sample kit for the participating sample sites. The travel blank analyses showed that no positive interference was introduced by sample transport or by the method procedure. One sample from each weekly sample kit was picked up in duplicate and spiked with known levels of targeted study compounds. The summary of the spike results are listed in the following table.

<u>Compound</u>	<u>Spike Level (ug/L)</u>	<u>Average % Recovery</u>	<u>Std. Dev. % Recovery</u>
Simazine	0.78	83%	43%
Atrazine	0.70	96%	38%
Alachlor	1.00	106%	22%

Approximately every other week, split samples were picked up one day during the daily sampling. A 1 liter split sample was picked up and sent directly to the American Water Works Service Company Laboratory (AWWSCL) in Belleville, Illinois. These samples were then analyzed using EPA method 507 and EPA method 508. The results are summarized on page 31. Additional samples from St. Louis were analyzed by the Ciba-Geigy Corporation using a method developed in their laboratory. These results are summarized on page 32. The Kansas City, Missouri Water and Pollution Control Laboratory used a solid phase extraction technique and a GC with a NPD to analyze their samples. Although the Kansas City Lab's method is capable of reporting lower concentration levels than the St. Louis County Lab method, Kansas City results have been truncated to achieve reporting consistency in the combined data set. The atrazine levels reported using the modified EPA 505 method are well corroborated by intra laboratory quality control measures and the inter laboratory studies. Alachlor and Simazine intra laboratory quality control was adequate, however, additional inter laboratory spikes would have been advantageous to compare levels above detection limits.

## Results and Discussion

### **Herbicide Concentrations**

Out of a possible 630 sample results, 589 successful sampling and analyses were conducted. Broken samples caused a 7% loss in the total sample set. Computation of averages uses the actual number of completed samples at each site. Of the 589 samplings, the following herbicides were measured above the reporting level: simazine was reported 2 times; alachlor was reported 104 times; and atrazine was reported 441 times. Herbicide concentrations were plotted for each day of the study period at each of the sample sites. The graphs are included as figures 2 thru 8 beginning on page 14. The fluctuations in concentration resulting from daily sampling is most pronounced for atrazine which occurred above the reporting level in 75% of the samples.

Alachlor occurs less frequently than atrazine, and predominantly during high runoff periods. The highest alachlor level was reported at Kansas City on May 6 at a level of 14.91 micrograms per liter. The next two consecutive days, alachlor at Kansas City was 5.33 and 2.13 micrograms per liter. Samples from downstream sites did not show these levels. Alachlor's half-life in soil is reported as 15 days compared to atrazine's 60 days (7). While these half-lives vary with soil conditions like pH, moisture, and microbial population, it is believed that the mass of alachlor available for transfer in runoff is depleted at a much greater rate than atrazine.

Comparing the graphs of daily atrazine levels from each sample site, from upstream to downstream, shows that the complexity of the downstream occurrence pattern increases with the addition of inflows from tributaries between the sampling sites. The upper river sampling sites, like Sioux City and Omaha, have relatively simple graphs compared to sites like St. Louis. Runoff events in the Nebraska-Iowa region caused high, sharp spikes of atrazine for these upper river sample sites. As these spikes progress downstream approximately 72 miles per day the peaks broaden and are joined by peaks from the intervening tributaries. At the mid river sites these peaks begin to meld together and the herbicide level graphs appear as a broad hump, with the upstream peak events projecting out on top of this broad base. In St. Louis, these protruding peaks become even less pronounced.

Though the highest daily atrazine concentrations were measured in the central region, higher daily averages occurred through out the lower river regions of the study area. The highest maximum daily atrazine levels were 10.65 micrograms per liter at St Joseph on May 18, and 11.10 micrograms per liter at Kansas City on May 28, 1991. The lowest maximum was recorded in St. Louis on June 10 at 6.71 micrograms per liter. Sioux City and Omaha averaged around 0.60 micrograms per liter for the 90-day study period, while the balance of the downstream sites averaged around two micrograms per liter. This data is summarized on page 13.

Boonville, Missouri derived the highest daily average of all the sample sites, over 3 micrograms per liter. The influx of the Lamine River, a small tributary, which flows into the Missouri River 5 miles upstream of the Boonville sample site may have introduced sample bias. Samples from the Lamine on three days in late July showed approximately 2 micrograms per liter of atrazine, while at the same time, the Missouri mainstream measured 0.60 ug/L. This indicated that the elevated levels found at the Boonville site could be due to contributions from this small, nearby, tributary. While this sample may represent the source water available for Boonville, this site was excluded as a representative point to measure mass atrazine levels on the Missouri River.

Atrazine was found above 3.0 ug/L 165 times, or in 28% of the 589 samples, and in 37% of the total atrazine occurrences. At Omaha, atrazine occurred above 3.0 ug/L only six times, or about 16% of the total reported Omaha occurrences. Below Omaha, atrazine occurred above 3.0 ug/L in 154 of 366 occurrences, or about 42% of the time. Alachlor exceeded 2 ug/L six times. Simazine never exceeded 1 ug/L.

#### Summary of Hydrological/Climatological Data

Runoff from rainfall is the major route of transport for herbicides from the fields to rivers and streams. To compare the hydrological conditions of this study period, the river flows recorded by the U. S. Army Corps of Engineers were used for each of the seven sites. The monthly data from 1967-1987 was averaged and used to describe "a historical average month". Flows at Hermann, Missouri were compared to historic averages to describe the total flow from the Missouri River. Tributary flows were derived for comparison to the historical average and contribution to the total at Hermann by subtracting adjacent gaging station flow.

## HERBICIDE CONCENTRATION SUMMARY

Atrazine

Runoff during the three month study can be considered below average when compared to 1967-1987 historical database. Average flows for the Missouri River were 96%, 73%, and 54% of historical monthly averages ('67-'87) for the months of May, June, and July, 1991, respectively.

In May, streamflow conditions in the upper half of the study area were near average; in the lower half, they were above average. Most of Missouri, Iowa, Kansas, and, Nebraska received 150% or greater than average rainfall (see page 33). An area encompassing the Iowa-Nebraska border received 100% of normal. Above Lexington, the Missouri River was flowing at 80% of average, but with substantial runoff in mid state Missouri regions, flows at Hermann were recouped to 96% of average. This recovery was brought about by a 210% above average contribution from the Grand and the Chariton Rivers and a 96% of average contribution from the Osage and the Gasconade Rivers.

In June, rainfall on the lower Missouri River basin was below normal and the upper half was slightly above normal. Large areas of Missouri and Kansas received 50% of normal rainfall (see page 34). Likewise, large areas of Iowa and Nebraska received only 75% of normal precipitation. The exception was an area encompassing the Iowa and Nebraska border which received rainfall 150% of normal. The upper half of the study area had average runoff, while the lower half contributed minimally to the Missouri River flow. Flows of the Missouri above Lexington were 94% of average, but fell to 73% of average at Hermann. Contributions below Lexington were only 44% of average.

In July, conditions were dry throughout the study area of the lower Missouri basin. Total flow of the Missouri River was 54% of average and runoff was marked by two small episodes, one from the Platte River area and one from the Grand and Chariton River region.

The Department of the Interior Geological Survey publishes streamflow and precipitation data in the publication "National Water Conditions" (8,9). The streamflow illustrations for May and June are on page 35. This 1991 monitoring study uses monthly averages to compare flow and flow contributions. The June Missouri River flows at Hermann were described as 73% of average and contributions between Lexington and Hermann were reported as 44% of average in the preceding paragraphs. The National Water Conditions reports and illustrates streamflow in Missouri in June as "normal". Even though streamflow falls below the average of the twenty years of historical data (1967-1987) used in this study, the flow does fall within what the U.S. Geological Survey defines as the "normal" range. "Normal" is defined as any value falling between the twenty fifth percentile and seventy fifth percentile of the historic sample from 1951 to 1980. A description of the flow for the Missouri River at Hermann during May would be "normal" and near average. A description of the flow for the Missouri River at Hermann during June would be "normal", but below average. The report on July was not available for inclusion herein.

### **Herbicide Loading**

To determine the regional loading of atrazine, a program was developed to calculate the pounds of atrazine passing each sampling site daily. U.S. Army Corps of Engineers daily flow data was used with daily herbicide data to calculate the mass of atrazine traversing each sample point.

The reports for May, June, and July are on pages 36-38. The total mass of Atrazine was calculated for each individual monitoring location, and regional contributions were determined by subtracting each total from the previous sample site. The estimated total mass of Atrazine discharged by the Missouri River during the 90-day study period was 106,143 pounds. May contributed 40,262 pounds, June 56,884 pounds, and July 8,997 pounds to account for this total.

In May, the major regional contributor of atrazine with 19,512 lbs. or 48% of the monthly total, appears to have been the region bordered

by Omaha, Nebraska and St. Joseph, Missouri. The Platte River and several medium size streams flow into the Missouri between these two sites. The second largest atrazine contribution in May originated from the region between Lexington, Missouri and St. Louis, Missouri with a 38% contribution, or 15,110 pounds. This region encompasses the Grand and Chariton Rivers in the mid section of Missouri. The upper Missouri study region, from Sioux city to Kansas City, experienced above normal precipitation. The flow was 75% of average and represented 48% of the total flow that month. This upper region contributed 58% of the atrazine load delivered to the mouth of the Missouri River.

In June the total atrazine load at St. Louis was 56,884 pounds. Approximately 91% of the atrazine load observed in St. Louis originated above Kansas City, and the flows at Kansas City reached 91% of the historical average. Again, the Platte and the other tributaries between Omaha and St. Joseph generated the greatest atrazine contribution at 59% (33,370 lbs). The water contribution for this region was 109% of the historical average. As mentioned in the hydrology/climatological section, June was very dry in the state of Missouri region. So even though 90% of the atrazine originated above Kansas City, so did 84% of the water.

July loadings were down dramatically to only 8,997 pounds, and this can be attributed to the extremely dry conditions throughout the lower Missouri basin. The total flow on the Missouri was 54% of average. The major contribution was caused by a runoff episode between Lexington and St. Louis contributing 4,418, or 49% of the July total. A summary of water contributions compared to historical water contributions compared to atrazine loading contributions can be found on page 39. Totals, and contributions for the entire study period and a discussion of the significance of the findings are presented in the Tributary Basin Analysis section.

## Tributary Basin Analysis

### Description of Regions

The objective of this study was to determine pesticide levels at various reaches of the Missouri for comparison to MCL's, and to identify the primary contributing river basins. The sample sites selected divide the Missouri River into the six primary tributary regions depicted in figure 1 on page 6.

- a) The upper Missouri Basin essentially contains the land area above Sioux City, Iowa, and makes up more than half of the entire basin. It includes all or a portion of Montana, Wyoming, North Dakota, South Dakota, Nebraska, Minnesota, and a portion of Canada. The flow contribution of this region to the Missouri is made up primarily of controlled releases from the main stem reservoir system at Gavins Point. A lesser contribution from South Dakota tributaries is included. Due to the volume of storage and control of releases from Gavins Point, the Lower Missouri Basin is virtually immune to rainfall and runoff events that occur above Gavins Point.
- b) The Little Sioux Basin and other tributaries drain a small portion of Western Iowa and Northwestern Missouri. This region is described as Western Iowa in this study. In comparison to other basins, the flow contribution is small.
- c) The Nebraska Platte drains central Nebraska, a portion of Wyoming, and Colorado. Unlike the upper basin, the Nebraska Platte discharge varies directly with rainfall events. In this study, flow from the Nebraska Platte was combined with runoff from Western Iowa between the gaging locations at Omaha and St. Joseph, Missouri.
- d) The Kansas River Basin includes the drainage from southern Nebraska, North Central Kansas, and eastern Colorado. It discharges to the Missouri just downstream of Kansas City. In this study, the impact of the Kansas River Basin is measured as the difference between the results of sampling at Kansas City and Lexington, Missouri.

e) The Grand-Chariton Basin drains north central Missouri and a portion of southern Iowa, discharging to the Missouri River between Lexington and Boonville, Missouri.

f) The Osage-Gasconade Basin drains the Central Missouri Region and a small portion of eastern Kansas. Unlike the broad plains of other tributary basins, the Osage-Gasconade includes a rocky, hilly region of Missouri. The upper Osage River flow is controlled by releases from the Bagnell Dam.

### Regional Contributions

Because of its overwhelming presence, when compared to the other pesticides studied, tributary contribution of atrazine has been analyzed for the entire runoff season encompassed by the 90-day study period.

For the entire study period the total atrazine load was 106,143 pounds at St. Louis, made up as follows:

#### Total Study Period

River Basin	Location	Cumulative Amount (lbs.)	% of Total
Upper Missouri	Sioux City, IA	9,059	8%
Western Iowa	Omaha, NE	15,714	15%
Platte & Western Iowa	St. Joseph, MO	71,613	67%
	Kansas City, MO	76,116	72%
Kansas	Lexington, MO	63,823	60%
Grand-Chariton	Boonville, MO	123,625	-
Osage-Gasconade	St. Louis, MO	106,143	100%

The tolerances of laboratory analysis and flow gaging must be considered when interpreting these data. Large incremental changes, such as the near doubling of atrazine from Lexington to St. Louis are significant. Small incremental differences between sites, such as the 6% difference between St. Joseph and Kansas City, or the 14% difference between Boonville and St. Louis, are within the overall study tolerance. The mass of atrazine at St. Louis is used as the basis for determining regional percent contribution.

Sub-basin contribution of atrazine is most notable from the Nebraska Platte - Western Iowa Basin, which accounted for over half of the total atrazine at St. Louis, and from the Grand-Chariton Basin which accounted for about 40% of the atrazine. Combined, these two regions contributed 90% of the atrazine runoff.

The largest land mass region, the upper Missouri Basin, contributed less than 10% of the total and the Kansas River Basin's contribution was virtually zero. Similarly, no atrazine was contributed by the Osage-Gasconade.

During the study period, the volume of flow from the Missouri River was 5,068 billion gallons, made up as follows:

Volume of Water

Location	Cumulative Amount (billion gallons)	% of total
Sioux City*	1571	31%
Omaha	2078	41%
St. Joseph	2889	57%
Kansas City	3294	65%
Lexington	3396	67%
Boonville	4359	86%
St. Louis	5068	100%

\*Includes 1,428 billion gallons from reservoir release at Gavins Point

The Upper Missouri Basin contributed just under one-third of the flow, and as mentioned above, only 8% of the atrazine. Controlled reservoir releases from Gavins Point contributed 1,428 billion gallons, or 91% of the Upper Missouri Basin volume. The Nebraska Platte and a portion of Western Iowa contributed 26% of the volume of water and 50% of the atrazine. The Grand-Chariton's 18% volume of flow contributed 40% of the atrazine. Ninety percent of the atrazine was contained in less than half of the tributary inflow.

### **Significance of Findings**

Of the flow contributing tributary basins, both the Upper Missouri Basin and the Osage-Gasconade basin show a diluting effect on atrazine levels. With all other conditions unchanged, a restriction of releases from the upper basin and/or a reduction in rainfall and runoff in the Osage-Gasconade would have resulted in increased concentrations of atrazine. The opposite is true for the primary atrazine contributing basins. Had no runoff occurred in the Nebraska Platte, Western Iowa, and/or Grand-Chariton, atrazine levels would have been lower in the Missouri River. Based on the heavy agricultural nature of the Kansas Basin, atrazine levels would likely have been higher, had precipitation and runoff occurred there.

The study shows the fallacy of using a predictive model, since the atrazine concentration is primarily a result of instances when and where rainfall/runoff occurred or failed to occur. Such circumstances allow only for post season analysis and not predictive modeling.

It is noteworthy to consider the calculated concentration of atrazine in the total volume discharged. Had the 106,143 pounds of atrazine been uniformly distributed in the 5,068 billion gallons, the resulting concentration would have been 2.5 ppb.

## Conclusions

1. Peak levels of atrazine exceeded 3.0 ug/L at every sample site on one or more days during the study. Peak levels of alachlor exceeded 2.0 ug/L at three of the seven locations on one or more days of the study. The average of occurrences for both compounds was less than the MCL equivalent for the 90-day period.
2. Atrazine was found prevalent enough to monitor this compound's migration throughout the lower Missouri River basin. Alachlor was detected primarily during peak runoff events. Virtually no significant amounts of simazine were detected.
3. The herbicide levels depended on the location of the sampling site, as compared to the influx of contamination source, roughly following basic river model ideals. The farther downstream from a contamination source, the lower and broader the peak became.
4. Tributary sources close to a sampling site may inadvertently boost herbicide level higher than might be expected in sampling the mainstream of the Missouri.
5. During the 90-day study period in which this data was collected only the month of May exhibited near average runoff. The balance of the study was below average compared to historical flow data. Precipitation data complements the average flow figures in describing flow conditions.
6. In the period of May, June, and July of 1991, approximately 53% of the atrazine, or 55,899 pounds were introduced from the tributaries between Omaha, Nebraska and St. Joseph, Missouri, originating from the Nebraska Platte and a portion of Western Iowa. An additional 40% originated below Boonville, contributed by the Grand-Chariton basin.
7. Herbicide concentrations in a large, complex river basin like the Missouri cannot be predicted. Runoff events are totally dependent on weather patterns which occur in the river's tributary basins.

**Appendix**

**Microextraction for Nitrogen – Phosphorus  
Pesticides and Herbicides**

1. Remove samples from storage and allow them to reach room temperature.
2. Add 35 mL of sample to 40 mL teflon-capped vial containing 6 grams of sodium chloride and shake by hand 20 seconds.
3. Centrifuge at 1600 RPM for 10 minutes if sample is turbid, transfer the 35 mL sample to a clean 40 mL vial.
4. Add 4  $\mu$ L of surrogate (1,3-Dimethyl-2-nitrobenzene, 18 ng/ $\mu$ L) to sample and, using a class A pipette, add 2.0 mL of pesticide grade hexane. Recap vial and shake vigorously by hand for 1 minute. Allow water and hexane phases to separate approximately 10 minutes.
5. Remove cap and carefully transfer 0.5 mL of the hexane layer into an autoinjector vial using a disposable glass pipette. Label vial with sample name, date, and time.
6. If sample will not be analyzed immediately, store at 4 degrees centigrade.

**GC Analysis**

Inject 3  $\mu$ L on .53 mm 1.5  $\mu$ m film DB-5 Column  
Oven Program 150 to 200 degrees C at 4 degrees/minute

## Summary of Flow Data and Atrazine Contributions

## MAY

'67 - '87 Avg. May Flow	120,715 CFS
Average Flow at Hermann	117,032 CFS - 97% of '67 - '87 avg.
Pounds Atrazine Discharged	40,262 lbs

	Percent Contribution Between Adjacent Sample Sites						
	SX	SX-OM	OM-SJ	SJ-KC	KC-LX	LX-BN	BN-SL
May '91 Contribution mpared to '87 - '87 Avg. Contribution	74%	163%	64%	63%	116%	210%	96%
'67 - '87% Contribution to Total '67 - '87 Flow at St. Louis	29%	4%	17%	13%	2%	12%	22%
May % Contribution to Total May Flow at St. Louis	29%		22%			49%	
% Contribution Atrazine to Total at St. Louis	5%		58%			38%	

## JUNE

'67 - '87 Avg. June Flow	123,639 CFS
Average Flow at Hermann	89,947 CFS - 73% of '67 - '87 avg.
Pounds Atrazine Discharged	56,884 lbs

	Percent Contribution Between Adjacent Sample Sites						
	SX	SX-OM	OM-SJ	SJ-KC	KC-LX	LX-BN	BN-SL
June '91 Contribution mpared to '67 - '87 Avg. Contribution	73%	219%	109%	64%	57%	69%	19%
'67 - '87% Contribution to Total '67 - '87 Flow at St. Louis	30%	5%	17%	14%	2%	10%	21%
June % Contribution to Total June Flow at St. Louis	46%		40%			15%	
% Contribution Atrazine to Total at St. Louis	20%		66%			10%	

## JULY

'67 - '87 Avg. July Flow	97,091 CFS
Average Flow at Hermann	52,280 CFS - 54% of '67 - '87 avg.
Pounds Atrazine Discharged	8,997 lbs

	Percent Contribution Between Adjacent Sample Sites						
	SX	SX-OM	OM-SJ	SJ-KC	KC-LX	LX-BN	BN-SL
July '91 Contribution mpared to '87 - '87 Avg. Contribution	68%	111%	50%	17%	28%	78%	27%
'67 - '87% Contribution to Total '67 - '87 Flow at St. Louis	40%	4%	14%	12%	2%	10%	18%
July % Contribution to Total July Flow at St. Louis	59%		18%			23%	
% Contribution Atrazine to Total at St. Louis	8%	18%			25%	50%

## CONVERSION FACTORS AND ABBREVIATED WATER-QUALITY UNITS

<u>Multiply</u>	<u>By</u>	<u>To obtain</u>
cubic foot per second (ft <sup>3</sup> /s)	$2.832 \times 10^{-2}$	cubic meter per second
foot (ft)	$3.048 \times 10^{-1}$	meter
liter (L)	$2.642 \times 10^{-1}$	gallon
microliter ( $\mu$ L)	$2.642 \times 10^{-7}$	gallon
micrometer ( $\mu$ m)	$3.937 \times 10^{-5}$	inch
mile	1.609	kilometer
millimeter (mm)	$3.937 \times 10^{-2}$	inch
pound	$4.536 \times 10^{-1}$	kilogram
square mile (mi <sup>2</sup> )	2.590	square kilometer

To convert degrees Celsius ( $^{\circ}$ C) to Fahrenheit ( $^{\circ}$ F), use the following formula:  
 $^{\circ}$ F =  $9/5(^{\circ}$ C)+32.

Micrograms per liter ( $\mu$ g/L) is a unit expressing the concentration of a chemical constituent in solution as weight (micrograms) of solute per unit volume (liter) of water.

Milligrams per liter (mg/L) is a unit expressing the concentration of a chemical constituent in solution as weight (milligrams) of solute per unit volume (liter) of water; 1 mg/L equals 1,000 micrograms per liter ( $\mu$ g/L).

Use of trade names in this report is for identification purposes only and does not constitute endorsement by the U.S. Geological Survey.

DISTRIBUTION OF SELECTED HERBICIDES AND  
NITRATE IN THE MISSISSIPPI RIVER AND ITS MAJOR  
TRIBUTARIES, APRIL THROUGH JUNE 1991

By D.A. Goolsby, R.C. Coupe, and D.J. Markovchick

ABSTRACT

One or more herbicides were detected in each of 146 water samples collected from 8 sites on the Mississippi River and its major tributaries in April, May, and June 1991. Atrazine was detected in every sample; median concentrations of atrazine ranged from 0.29 micrograms per liter in the Mississippi River at Clinton, Iowa, to 3.2 micrograms per liter in the White River at Hazelton, Ind. Concentrations of herbicides increased in early May in response to rainfall that occurred after herbicide application, and then began to decrease in early- to mid-June. The concentration of atrazine exceeded the maximum contaminant level for drinking water in the Missouri River at Hermann, Mo., throughout the month of June, and at two sites on the Mississippi River during parts of May and June. Alachlor exceeded the maximum contaminant level in a few samples collected from the smaller tributaries. Cyanazine, metolachlor, and simazine were also detected in many samples but concentrations did not exceed maximum contaminant levels or health advisory levels. The largest concentrations of nitrate-nitrogen were measured in the Illinois River and parts of the upper Mississippi River. None of the nitrate-nitrogen concentrations measured exceeded the maximum contaminant level.

Results from this study are consistent with the concept of an annual cycle of herbicide application followed by a series of flushing events during which herbicides are transported to streams by rainfall in late spring and summer. Herbicide concentrations decrease later in the year due to chemical and biological degradation, transport into streams, and other processes. During the flushing events, concentrations of some herbicides may exceed health based limits in streams throughout the upper midwestern United States, regardless of size, including the Mississippi River.

INTRODUCTION

More than 294 million pounds of herbicides are applied annually to cropland and pasture land in the midwestern United States (Gianessi and Puffer, 1990). Most of this amount is used to control weeds in the production of corn, soybeans, and sorghum. Regional-scale studies conducted by the U.S. Geological Survey during 1989 and 1990 (Thurman and others, 1991) indicate that these compounds are transported into streams each year during late spring and early summer, and ultimately discharge to the Ohio, Missouri, and Mississippi Rivers and the Gulf of Mexico. About 18 million people rely on the Ohio, Missouri, Mississippi, and numerous smaller rivers in the central United States for drinking-water supplies. At certain times of the year, herbicides and other agricultural chemicals, such as nitrate-nitrogen derived from fertilizer, may be present in these streams in concentrations that exceed health-based limits for drinking water.

### Pesticide Use

Data reported by Gianessi and Puffer (1990) indicate that more than 294 million pounds of herbicides (active ingredients) were used annually during 1987-89 in agricultural crop production in 12 States that drain to the Mississippi River and its major tributaries (fig. 1, table 1). These States (Arkansas, Illinois, Indiana, Iowa, Kansas, Louisiana, Minnesota, Mississippi, Missouri, Nebraska, Ohio, and Wisconsin) account for most of the herbicide use in the Mississippi River basin. Herbicides used in these States account for about 60 percent of the total herbicide use for agriculture in the United States. Herbicides used in largest quantities are listed in table 2 along with selected physical and chemical properties, maximum contaminant levels (MCL) and health advisory (HA) levels for drinking water, and principal target crops. Herbicides with solubilities larger than about 30 mg/L, organic carbon partition coefficients ( $K_{oc}$ ) smaller than 300-500, and soil half-lives greater than 21 days (table 2) are relatively mobile and persistent in the aquatic environment (Becker and others, 1989). Five herbicides (alachlor, atrazine, metolachlor, EPTC, and cyanazine) account for about 63 percent of the herbicides used in the 12-State area. They are used primarily on corn, soybeans, and sorghum.

### Previous Studies

Studies conducted by the U.S. Geological Survey in 1989 and 1990 indicate that herbicides are flushed from cropland each spring and summer and are transported into streams tributary to the Missouri, Ohio, and Mississippi Rivers (Goolsby and others, 1991; Thurman and others, 1991). During May and June 1989, median concentrations of atrazine, alachlor, cyanazine, and metolachlor ranged from 1 to 3  $\mu\text{g/L}$  in samples from streams draining hundreds to several thousand square miles; maximum concentrations for these four herbicides ranged from more than 10 for alachlor to more than 100  $\mu\text{g/L}$  for atrazine (Thurman and others, 1991). Similar concentrations were measured in samples collected during May and June 1990 (Goolsby and others, 1991; Thurman and others, 1991). These studies also show that concentrations of herbicide that exceed MCLs can persist in streams for several months following application. For example, the concentration of atrazine in the West Fork Big Blue River in Nebraska (fig. 1) remained above the 3  $\mu\text{g/L}$  MCL from early May until the end of August in 1990 (Thurman and others, 1991). A large increase in herbicide concentration in streams following application also has been documented in Iowa (Squillace and Engberg, 1988), Ohio (Baker and Richards, 1989), and Nebraska (Snow and Spalding, 1988).

Major rivers such as the Missouri, Ohio, and Mississippi are affected by the discharge of herbicides from tributary streams. Many water samples have been collected at points along the Mississippi River as part of U.S. Geological Survey research on sediment-related transport of organic substances in the river (Meade, 1989). Pereira and Rostad (1990) reported concentrations of dissolved atrazine and alachlor as large as about 1  $\mu\text{g/L}$  in samples collected between St. Louis, Mo., and New Orleans, La., during May and June 1988. During mid-June 1990, atrazine concentrations in this same reach of the Mississippi River ranged from 3.0 to 4.5  $\mu\text{g/L}$  (U.S. Geological Survey, unpublished data). Very recently, the Missouri River Public Water Supplies Association (Keck, 1991) reported sustained large concentrations of atrazine throughout the lower 500 miles of the Missouri River during May and June 1991. This study showed that at one site near St. Louis, Mo., in the lower reaches of the Missouri River, atrazine concentration exceeded

7/ pH dependent

the MCL of 3  $\mu\text{g/L}$  35 percent of the time between May 1 and July 28, 1991. A few samples had concentrations of alachlor that exceeded the MCL of 2  $\mu\text{g/L}$ , but no samples exceeded the simazine MCL of 1  $\mu\text{g/L}$ .

Results from these studies indicate that measurable quantities of herbicides enter the Ohio, Missouri, and Mississippi Rivers each year. Much of these herbicides ultimately discharge into the Gulf of Mexico. Little is known, however, about the temporal distribution, timing and annual mass transport, and duration of concentrations of herbicides above MCLs in these major rivers, or the predominant source areas for these herbicides.

#### Objectives of This Study

In order to assist Federal and State agencies in determining if agricultural chemicals are present in concentrations that can affect water use in the Mississippi River system, the U.S. Geological Survey is presently (1991) conducting a study. Specific objectives of the study are to:

1. Determine the occurrence, temporal distribution, and annual mass transport of selected major insecticides, herbicides, herbicide metabolites, and inorganic nutrients in discharge from the Ohio, Missouri, and Mississippi Rivers and several smaller tributaries.
2. Determine the predominant source basins for insecticides, herbicides, and inorganic nutrients and estimate the fraction of the major agricultural chemicals applied throughout the Mississippi River basin that discharge to the Gulf of Mexico.
3. Determine the seasonality and timing of the transport of insecticides, herbicides, herbicide metabolites, nitrate, and orthophosphate.
4. Determine the duration of insecticide and herbicide concentrations greater than MCLs and HA levels for drinking water in the lower Ohio and Missouri Rivers and in the Mississippi River from the St. Louis area to New Orleans.
5. Test and implement a solid-phase-extraction gas chromatography/mass spectrometry analytical method that can be used to simultaneously analyze for several classes of pesticides including triazine, carbamate, and organophosphate compounds.

#### Purpose and Scope of this Report

Information obtained during the early phase of the study indicated that concentrations of some herbicides exceeded the drinking water MCLs or HAs in samples collected during May and June 1991. The purpose of this report is to document the methods used to collect and analyze the water samples and to describe the distributions of selected herbicides and nitrate-nitrogen at eight sampling sites on the Mississippi River and its major tributaries (fig. 1). The scope is limited to reporting information on the concentrations of five herbicides (atrazine, alachlor, cyanazine, metolachlor, and simazine) and nitrate-nitrogen in samples collected during April-June 1991.

After completion of the study in April 1992, all data and interpretation resulting from the study will be made available.

## METHODS

### Data Collection

This section provides a description of the sampling sites, the rationale for their selection, the sampling schedule, documentation of sample collection and sample analysis procedures, and a description of quality-assurance procedures for the study.

#### Description of Sampling Sites

The Mississippi River main stem is formed by the inflow from three major tributaries: the Missouri, the upper Mississippi, and the Ohio Rivers (fig. 1). Sampling sites were selected near the outflow of each of the three major rivers and on one or more large streams tributary to each of the three major rivers. The following is a brief description, by river basin, of each of the eight sampling sites. Their locations are shown on figure 1.

#### Upper Mississippi River Basin

1. Mississippi River at Clinton, Iowa (drainage area 85,600 square miles;  $mi^2$ ): This site is the uppermost sampling site on the Mississippi River main stem. Samples from this site provide a measure of the agricultural chemical inputs from the upper basin States of northeastern Iowa, Minnesota and Wisconsin.
2. Illinois River at Valley City, Ill. (drainage area 26,742  $mi^2$ ): Samples from this site provide a measure of the inputs from a major tributary to the upper Mississippi River and an area of intensive row crop agriculture.
3. Mississippi River at Thebes, Ill. (drainage area 713,200  $mi^2$ ): Samples from this site provide a measure of all agricultural chemicals discharged from the upper Mississippi and Missouri River basins and represent essentially all of the Mississippi River discharge above the Ohio River. These samples indirectly (mathematically) provide an estimate of inputs from basins draining eastern Iowa and parts of Illinois below the Clinton sampling site.

#### Missouri River Basin

4. Platte River at Louisville, Nebr. (drainage area 85,800  $mi^2$ ): Samples from this site measure the inputs from a major tributary to the Missouri River. It drains an area of intensely irrigated agriculture in Nebraska.
5. Missouri River at Hermann, Mo. (drainage area 524,000  $mi^2$ ): This site is near the mouth of the Missouri River, and samples from the site provide a measure of agricultural chemical discharge to the Mississippi River from the entire Missouri River basin.

Ohio River Basin

6. White River near Hazleton, Ind. (drainage area 11,305 mi<sup>2</sup>): This small basin drains an area of intensive agriculture in central and western Indiana. The White River discharges to the Wabash River, which in turn discharges to the Ohio River.
7. Ohio River near Grand Chain, Ill. (drainage area 203,100 mi<sup>2</sup>): Samples from this site provide a measure of all inputs from the Ohio River basin to the Mississippi River.

Lower Mississippi River Basin

8. Mississippi River at Baton Rouge, La. (drainage area 1,125,000 mi<sup>2</sup>): Measurements at this site and estimates of the Mississippi River diversions into the Atchafalaya River provide a measure of the total agricultural chemical discharge from the Mississippi River basin to the Gulf of Mexico. Discharge of agricultural chemicals into the Atchafalaya River, about 85 miles upstream from Baton Rouge (fig. 1), are estimated based on measurements of the quantity of water diverted to the Atchafalaya River and the concentrations of agricultural chemicals measured at Baton Rouge.

## Sampling Schedule

Sample collection for this study began in early April 1991 and will continue for one year. Sample collection occurs about once per week, but is more frequent during late spring and summer when the concentrations of agricultural chemicals are expected to be largest and less frequent in the winter when concentrations of these chemicals are expected to be smallest. The sampling schedule is as follows:

April 1991	1 sample per week
May 6-July 15, 1991	2 samples per week (except Ohio River-- 1 sample per week)
July 15-October 30, 1991	1 sample per week
November 1991-February 1992	1 sample every two weeks
March, 1992	1 sample per week

The twice-weekly samples during May, June, and July will provide more intensive information on the concentrations and transport of agricultural chemicals during the "first-flush" events following application. Special efforts are made to distribute these samples over the discharge hydrograph to obtain the best estimates of mass transport.

## Sample Collection and Processing Procedures

Samples are collected by equal-discharge-increment or equal-width-increment procedures (Edwards and Glysson, 1988) at all sites except the Mississippi River at Baton Rouge, La. Samples are collected in glass containers at five or more locations across the river at each sampling site using depth-integrating samplers and are composited in large glass or stainless steel

containers. A Teflon cone splitter is then used to divide the composite sample into subsamples to be analyzed for the concentrations of dissolved herbicides and insecticides, dissolved nitrate, nitrite, and ammonia-nitrogen, dissolved orthophosphate, total organic plus ammonia-nitrogen, total phosphorus, and suspended sediment. This procedure provides a sample that is representative of the entire cross section of the river and makes it possible to compute loads of dissolved and suspended substances.

Previous work has indicated that dissolved solutes in the Mississippi River at Baton Rouge, La., are well mixed vertically and laterally (C.R. Demas, U.S. Geological Survey, Baton Rouge, La., oral commun., 1991). Therefore, to minimize sample-collection costs, samples collected at Baton Rouge are collected from the upper 20 feet of the water column at the end of a dock that extends about 150 feet from shore. As a quality-assurance measure, samples are periodically collected at several points across the river channel to verify that the river is well mixed. Samples for total organic plus ammonia-nitrogen, total phosphorus, and suspended sediment are not collected at this site.

In the present study, samples for herbicide and insecticide analysis are filtered through a 142-millimeter-diameter glass-fiber filter with a nominal pore size of 0.7 micrometer using aluminum or stainless steel-filter holders. Filtration is accomplished using either compressed nitrogen gas or pumps with ceramic and/or Teflon pump mechanisms. The filtrate is collected in pre-cleaned glass bottles.

Samples for nutrients (dissolved nitrogen and phosphorus compounds) are filtered through 0.45 micrometer membrane filters and preserved with mercuric chloride (40 mg/L). All herbicide, insecticide, and nutrient samples are chilled immediately after collection and are shipped to the U.S. Geological Survey's National Water Quality Laboratory (NWQL) in Arvada, Colo., for analysis.

#### On-Site Measurements and Streamflow

On-site measurements for specific conductance and pH are made on the composite mixture for each sample. Stream temperature is measured in situ. Except for the Baton Rouge, La., site, measurements of streamflow are obtained from stage-discharge relations at stations operated by the U.S. Geological Survey. Streamflow data for the Baton Rouge site are provided by the U.S. Army Corps of Engineers, New Orleans District; these data are for Tarberts Landing, about 80 miles upstream from Baton Rouge, but should closely represent the discharge at Baton Rouge. The U.S. Army Corps of Engineers also provides streamflow data for Mississippi River water that is diverted into the Atchafalaya River (fig. 1). The sum of the flow at Baton Rouge and the Atchafalaya diversion closely represents the total discharge from the Mississippi River basin above Baton Rouge.

#### Analytical Procedures

All water samples are analyzed at the NWQL in Arvada, Colo., for herbicides, insecticides, and nitrogen and phosphorus compounds. Analytical procedures used to analyze for herbicides and nitrate are briefly described below. Because results for insecticides and nutrient

compounds other than nitrate are not presented in this report, analytical procedures for these compounds are not described.

### Herbicides

Two analytical procedures are presently in use at the NWQL to analyze for the herbicides of interest in this study. These are a liquid-liquid extraction procedure using methylene chloride, and a solid-phase extraction procedure. The primary procedure used to obtain the data presented in this report is solid-phase extraction. A few samples were split and analyzed by both solid-phase extraction and liquid-liquid extraction.

#### Solid-Phase Extraction

This procedure is used for the isolation and analysis of triazine and other nitrogen-containing compounds. The procedure is described in detail by Sandstrom and others (in press), and is a modification of the procedure previously described by Thurman and others (1990). Approximately 100 milliliters of sample that has been filtered on-site through a 0.7-micrometer glass-fiber filter is pumped through a disposable C-18 solid-phase-extraction cartridge. Prior to extraction, a surrogate standard (terbuthylazine) is added to the sample to aid in determining the extraction efficiency and to aid in interpreting the analytical results. After extraction, the cartridges are dried with nitrogen gas and eluted with 1.8 milliliters of hexane-isopropanol (3:1) to remove the extracted compounds. The eluent is evaporated to about 100 microliters ( $\mu\text{L}$ ) and herbicides are analyzed on a gas chromatograph equipped with a capillary column. Herbicides are identified and quantified with a mass spectrometer detector based on selected ion monitoring of the parent compound and two characteristic ions for each herbicide. Reporting limits for the five herbicides summarized in this report are 0.05  $\mu\text{g/L}$  for alachlor, atrazine, metolachlor, and simazine, and 0.2  $\mu\text{g/L}$  for cyanazine.

#### Liquid-Liquid Extraction

This is a long-established procedure for the analysis of triazine and other nitrogen-containing herbicides (Wershaw and others, 1987). The procedure is based on extraction of a 1-liter sample with methylene chloride. Extracts are analyzed on a gas chromatograph equipped with dual nitrogen-phosphorus detectors. This procedure is slightly less sensitive than the solid-phase extraction procedure, but has a long and well-documented history of use.

### Nitrate-Nitrogen

Nitrate is determined by an automated colorimetric procedure. An aliquot of the sample is passed through a cadmium column on which nitrate is chemically reduced to nitrite (Fishman and Friedman, 1989). The resulting solution, which contains both the nitrite originally present in the sample plus the nitrite produced from the reduction of nitrate, is analyzed colorimetrically. A second part of the sample that does not pass through the cadmium column also is analyzed for nitrite. The concentration of nitrate in the sample is then calculated from the difference between these two determinations.

### Quality-Assurance Procedures

Before collection of each sample, all sampling equipment is washed with a phosphate-free laboratory detergent, rinsed with tap water and distilled or deionized water, rinsed with a small amount of methanol and allowed to air dry. At the sampling site, all equipment (collection container, compositing container, cone splitter, pump mechanism, and filter) is rinsed with water from the stream. Glass-fiber filters and sample containers are baked at about 350 degrees Celsius to remove organic material. A field-equipment blank for pesticides is obtained with about every 10th sample. This sample consists of organic-free water that is processed through all of the sampling and filtration equipment. The sample is analyzed for the herbicides of interest. Sample collection and processing procedures used in the field are periodically reviewed for conformance with protocols established for the project.

Laboratory quality-assurance procedures include the determination of surrogate compound recoveries in each sample, blank, and laboratory reagent-water spikes. Blanks are used to verify that the glassware and reagents used in sample preparation are free of contamination. The surrogate added to each sample is used to monitor the extraction efficiency for each sample. Reagent-water spikes monitor extraction efficiencies for each analyte of interest. Spike data also are used to compile recovery statistics from which control limits can be established. Additional quality-assurance procedures include analysis of blind spike samples submitted from the field and analysis of split samples by both solid-phase extraction and liquid-liquid extraction.

## ANALYTICAL RESULTS

### Herbicides and Nitrate-Nitrogen

Analytical results for five herbicides, obtained by solid-phase extraction, and nitrate-nitrogen in samples collected during April, May, and June 1991 are listed in table 3 along with streamflow data and measurements of physical properties (temperature, pH, and specific conductance). The sampling sites are listed in downstream order in accordance with the streamflow-station numbering system of the U.S. Geological Survey. Results of analyses for herbicides and nitrate-nitrogen are statistically summarized in table 4. These results and their significance are discussed in subsequent sections of this report.

### Quality-Assurance Samples

Results for herbicide recovery on reagent-water spikes are shown in table 5 for the solid-phase extraction and in table 6 for liquid-liquid extraction. Similar recoveries are obtained by both procedures. Atrazine recovery using solid-phase extraction ranged from 48 to 105 percent and averaged 88.5 percent. Similar recoveries were obtained for the other herbicides analyzed using this procedure. During May and June, 13 blind spikes in distilled water with concentrations ranging from 0.5  $\mu\text{g/L}$  to 4.0  $\mu\text{g/L}$  were analyzed using this procedure. Recoveries for the five herbicides of interest were within the range for the reagent-water spikes shown in table 5. For example, atrazine recovery ranged from 56 percent to 95 percent and averaged 82 percent

Table 3.--Streamflow, physical property data, and results of analyses for herbicides and nitrate-nitrogen in samples collected during April, May, and June 1991

Results obtained from the analyses of nine samples that were split and analyzed by both solid-phase extraction and liquid-liquid extraction are shown in table 7. Similar results were obtained for alachlor, metolachlor, and simazine. However, solid-phase extraction gave lower results than did liquid-liquid extraction for atrazine and cyanazine at concentrations greater than about 2 µg/L. These results and the spike recoveries indicate that concentrations obtained for atrazine by solid-phase extraction may be slightly (10-20 percent) lower than concentrations actually present in the samples.

Herbicides were not detected in any of the 17 field-equipment blanks analyzed during April, May, and June. This provides assurance that samples were not contaminated during sample collection and processing.

<sup>1</sup> Sample had low surrogate recovery.

#### DISTRIBUTION OF HERBICIDES

Results obtained from the first 3 months of this study show that herbicides were present in the Mississippi River and several large tributaries (tables 3 and 4). Herbicide concentrations began to increase in early May in response to rainfall that occurred after herbicides were applied

to cropland. The pattern of occurrence was similar to that reported by Thurman and others (1991) for streams throughout 10 midwestern States. They reported that large concentrations of herbicides are transported through the surface-water system in pulses each year during late spring and summer. Results from the present study show that these pulses reach the major rivers of the Midcontinent and can cause herbicide concentrations to exceed drinking-water regulations for periods of several weeks or longer.

#### Areal Distribution

One or more herbicides were detected in every water sample collected during April, May, and June 1991 (table 3). The distribution of alachlor, atrazine, cyanazine, and metolachlor concentrations are shown in boxplots in figures 2 and 3 for each of the 8 sampling sites. Lines extending to the bottom and top of each boxplot show the minimum and maximum concentrations measured at each site. The horizontal line near the middle of each boxplot shows the median concentration and the bottom and top of the rectangular portion of the boxplot represent the 25th and 75th percentiles, respectively. For example, the boxplot of atrazine for the Illinois River (fig. 2) shows that concentrations ranged from 0.18  $\mu\text{g/L}$  to 6.3  $\mu\text{g/L}$  with a median of 2.8  $\mu\text{g/L}$ .

Atrazine was detected in every sample (146 samples) and had the largest concentrations of the herbicides measured (fig. 2, table 4). Median concentrations of atrazine ranged from 0.29  $\mu\text{g/L}$  for the Mississippi River at Clinton to 3.2  $\mu\text{g/L}$  for the White River (fig. 2). Cyanazine and metolachlor were detected in 78 and 98 percent of the samples, respectively. Median concentrations of cyanazine ranged from less than the reporting limit of 0.2  $\mu\text{g/L}$  (fig. 3) in the Mississippi River at Clinton to 1.9  $\mu\text{g/L}$  in the Illinois River. These two sampling sites also had the smallest median (0.20  $\mu\text{g/L}$ ) and largest median (1.5  $\mu\text{g/L}$ ) concentration of metolachlor, respectively. Overall, the concentrations of alachlor were somewhat lower than atrazine, cyanazine, and metolachlor. Median concentrations of alachlor ranged from less than 0.05  $\mu\text{g/L}$  in the Ohio River to 0.73  $\mu\text{g/L}$  in the Illinois River (table 4; fig. 2). Simazine was detected in less than one-half of the samples; its median concentration was less than the reporting limit of 0.05  $\mu\text{g/L}$ . Alachlor, atrazine, cyanazine, and metolachlor are among the most extensively used herbicides in the 12-State area of the Mississippi River basin (table 2).

The largest concentrations of herbicides were measured in samples from the smaller tributaries—the White, Illinois, and Platte Rivers (figs. 2 and 3, table 4), probably because of the greater percentage of drainage area of the smaller basins that is in cropland and the more rapid response of these rivers to rainfall, which transports herbicides to the streams. For example, the concentration of atrazine exceeded 5  $\mu\text{g/L}$  in about 25 percent of the samples collected from these tributaries, and the maximum atrazine concentration ranged from 6.3 to 10  $\mu\text{g/L}$  (fig. 2).

The median concentration of atrazine measured in samples from the Missouri River at Hermann (fig. 2, table 4), 2.9  $\mu\text{g/L}$ , was similar to median concentrations measured in samples from the smaller tributaries; the maximum atrazine concentration was 5.7  $\mu\text{g/L}$  (table 4). A recent study of herbicides in the Missouri River by Keck (1991) indicates that the herbicides are derived largely from tributaries discharging to the Missouri River in Iowa, Kansas, Missouri, and Nebraska.

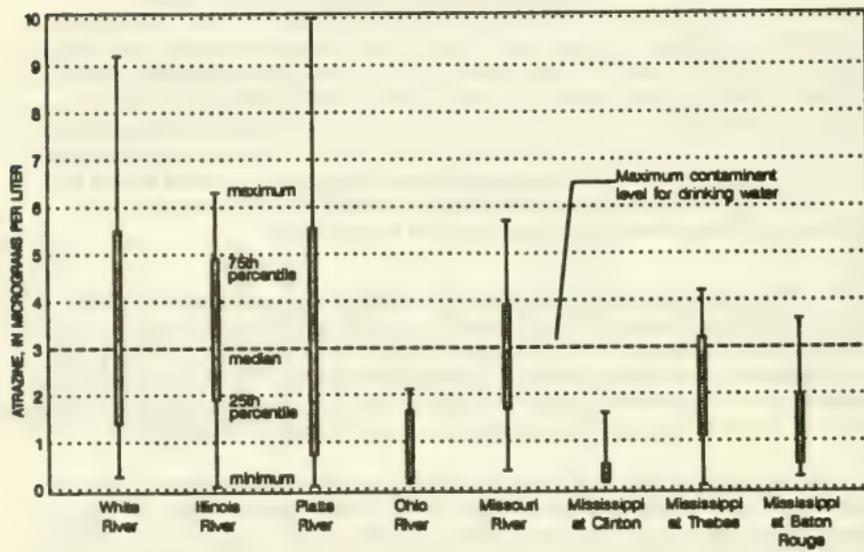

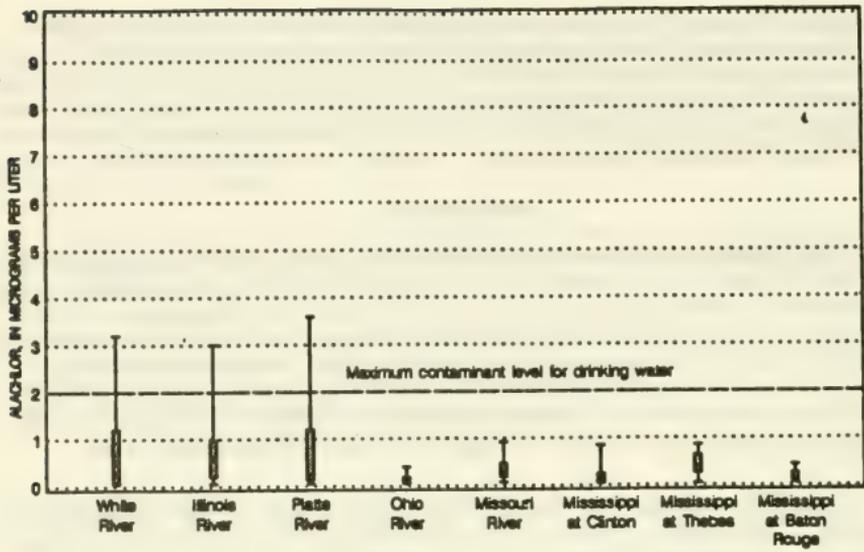

Figure 2.—Boxplots of alachlor and atrazine concentrations arranged by downstream order for samples collected in April, May, and June 1991.

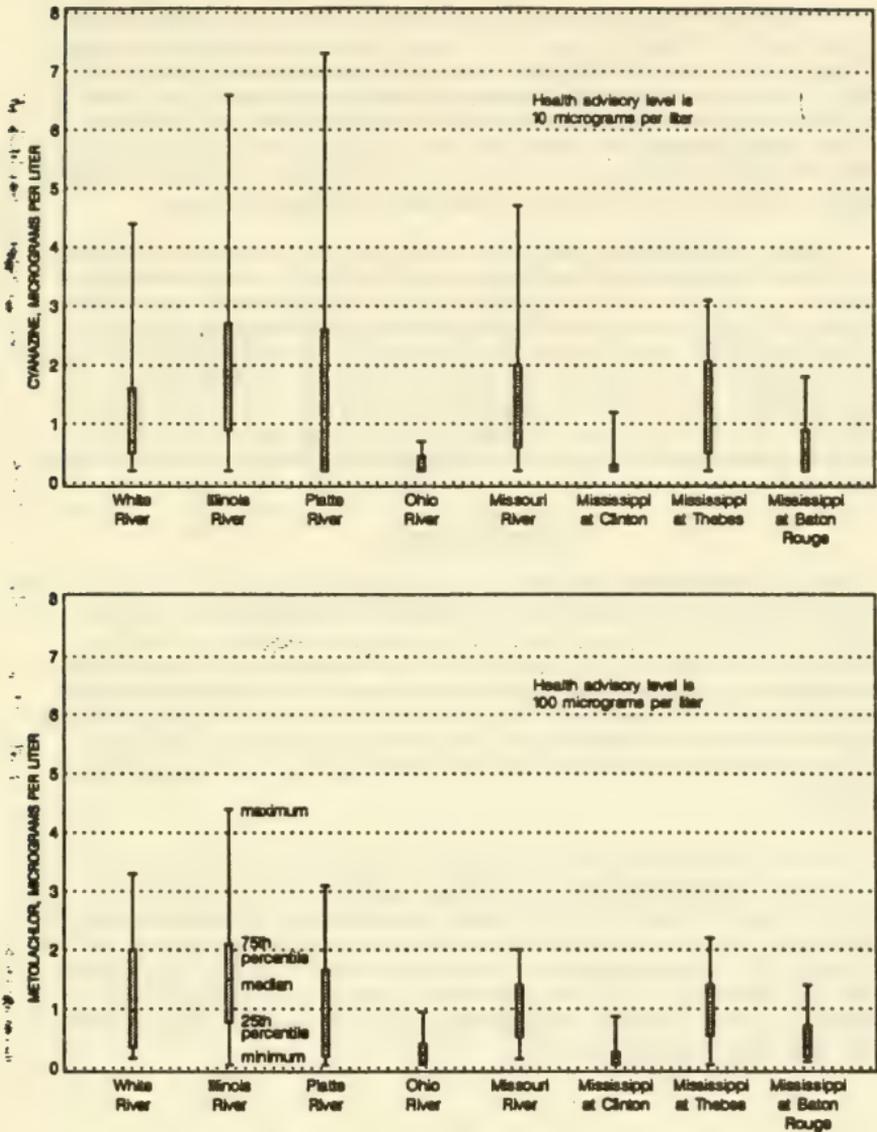

Figure 3.—Boxplots of cyanazine and metolachlor concentrations arranged by downstream order for samples collected in April, May, and June 1991.

Herbicide concentrations larger than 1  $\mu\text{g/L}$  were measured in many samples from the Mississippi River at the Thebes site (fig. 1). For example, the median concentration of atrazine was 2.3  $\mu\text{g/L}$  (table 4), and about 25 percent of the samples had concentrations larger than 3.2  $\mu\text{g/L}$  (fig. 2). Median concentrations of cyanazine and metolachlor exceeded 1  $\mu\text{g/L}$ . These concentrations reflect the inflow from the Missouri River and inflow from the Illinois River and other rivers draining from Iowa and Illinois downstream from the Clinton sampling site. As shown in a later section of this report (Atrazine Loads and Source Areas), the inputs from streams draining from Iowa and Illinois are larger than those from the Missouri River basin.

Herbicide concentrations generally were smallest in the Ohio River and in the Mississippi River at Clinton, Iowa, the most upstream sampling site (figs. 2 and 3). Median concentrations were about 0.5  $\mu\text{g/L}$  or less and the maximum concentration for any herbicide measured at these two sites was 2.1  $\mu\text{g/L}$  for atrazine in the Ohio River. This probably reflects the lower overall intensity of herbicide use in these drainage areas. Herbicides concentrations in excess of 20  $\mu\text{g/L}$  have been documented in drainage to the Ohio River from the States of Indiana and Ohio (Thurman and others, 1991). However, streamflow entering the Ohio River from Kentucky and Tennessee, where herbicide use is much less than in the other States, results in dilution and decreases the overall concentration of herbicides measured in the Ohio River at the Grand Chain, Ill., sampling site.

#### Temporal Distribution

The temporal distribution was similar for all herbicides. When the concentration of atrazine increased or decreased, so did the concentrations of the other herbicides. The rank correlation coefficient between atrazine and alachlor, cyanazine, and metolachlor was highly significant ( $p < 0.001$ ) for each of the eight sites. Thus, the temporal pattern for atrazine shown in figures 4-6 generally is indicative of the patterns (but not absolute concentrations) of the other herbicides measured. The temporal distribution for atrazine in the smaller tributaries--the White, Illinois, and Platte Rivers--is shown in figure 4. The distributions for atrazine in the major tributaries--the Missouri and Ohio Rivers--and in the Mississippi River main stem are shown in figures 5 and 6.

Herbicide concentrations in the smaller tributaries began to increase in early- to mid-May (fig. 4) following herbicide application and subsequent rainfall. Herbicide concentrations generally were largest between early May and early June, and began to decrease in mid-June. A smaller and more gradual increase in herbicide concentrations occurred in the Missouri and Ohio Rivers (fig. 5). The largest concentrations of herbicides in the Missouri River occurred a little later than in the tributaries. The atrazine concentrations measured in the Missouri River at Hermann (fig. 5) were very similar to concentrations reported by Keck (1991, p. 20) for a site at St. Louis, 60 to 70 miles farther downstream.

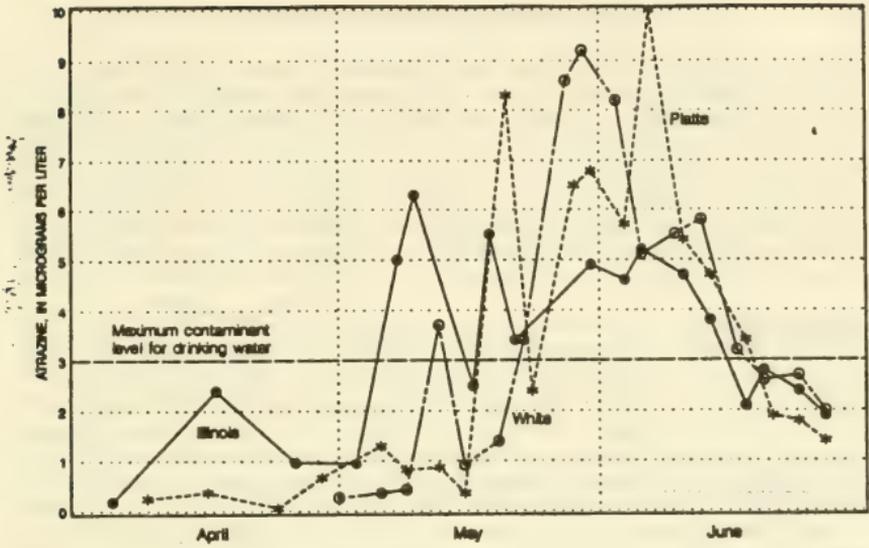

Figure 4.—Time-series plots of atrazine concentrations in the Illinois River at Valley City, Ill., Platte River at Louisville, Nebr., and White River at Hazelton, Ind., April through June 1991.

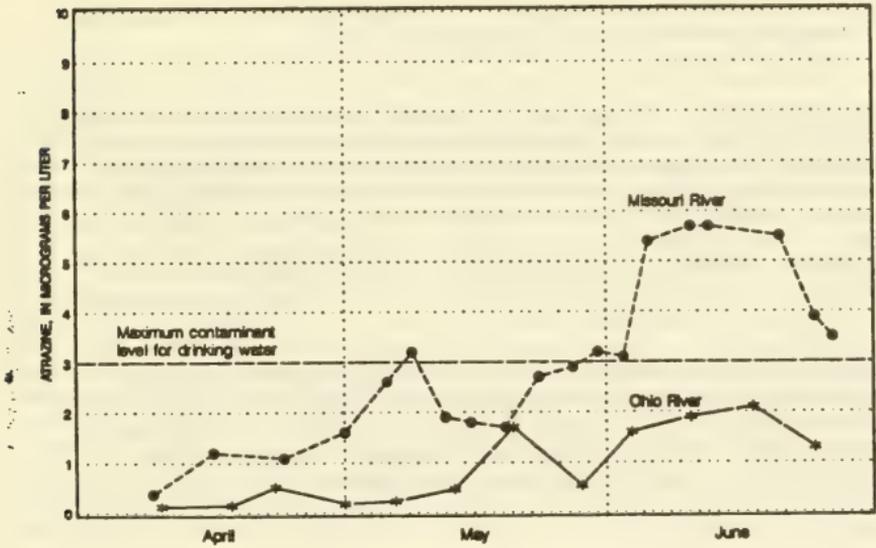

Figure 5.—Time-series plots of atrazine concentrations in the Missouri River at Hermann, Mo., and the Ohio River at Grand Chain, Ill., April through June 1991.

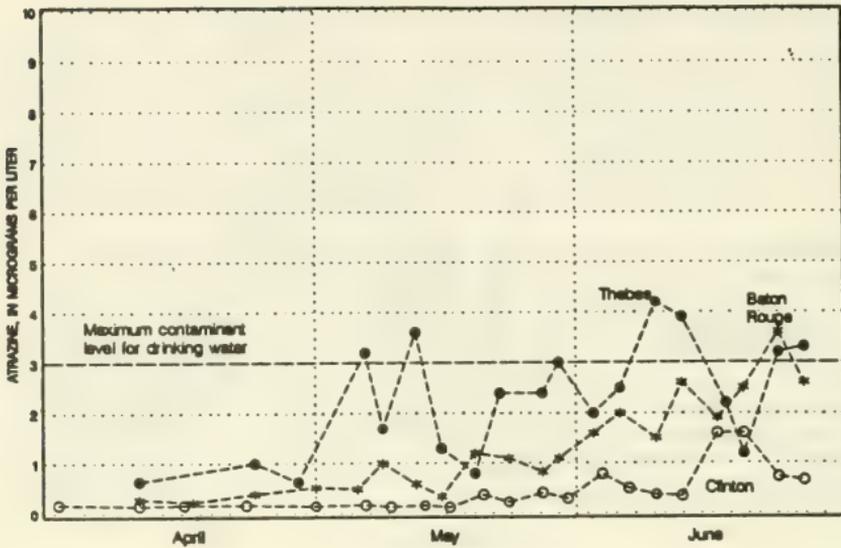

Figure 6.—Time-series plots of atrazine concentrations in the Mississippi River at Clinton, Iowa, Thebes, Ill., and Baton Rouge, La., April through June 1991.

An even smaller and more gradual increase in herbicide concentrations was measured on the Mississippi River main stem at the Thebes and Baton Rouge sites (fig. 6) than was measured on most tributaries. The increase in concentration at the Thebes site results from inflow to the Mississippi River from the Missouri River and streams draining from Iowa and Illinois. The concentrations at Baton Rouge result from inflow from the entire upper Mississippi River basin as measured by the Thebes site, inflow from the Ohio River, and to a small extent inflow from tributaries that enter the Mississippi below the Ohio River. The peak concentrations at Baton Rouge occurred 10 to 14 days later than at Thebes (fig. 6), which is the approximate travel time for this reach of the river (about 760 river miles).

Generally, the concentrations of herbicides began to decrease by mid-June, which is consistent with findings reported by Thurman and others (1991). It is also consistent with the concept of an annual cycle of increasing herbicide concentrations in streams after application and a subsequent decrease in concentrations as a result of chemical and biological degradation, sorption, transport in storm runoff, volatilization, and other processes.

### Relation to Maximum Contaminant Levels

About 18 million people in the Ohio, Missouri, and Mississippi River basin receive drinking water from surface-water sources (U.S. Geological Survey, Water Use Data System). Many of these sources are reservoirs and streams that are tributaries to these three major rivers. In addition, a number of cities withdraw water directly from the Ohio, Missouri, and Mississippi Rivers for public supply. These cities include: Cincinnati, Ohio, Evansville, Ind., and Louisville, Ky., on the Ohio River; Omaha, Nebr., Kansas City, Mo., and St. Louis, Mo., on the Missouri River; and Minneapolis/St. Paul, Minn., Cape Girardeau, Mo., and much of New Orleans, La., on the Mississippi River. The concentrations of herbicides in these rivers are therefore of interest to the suppliers and consumers of surface water throughout the entire Mississippi River basin.

Of the five herbicides studied, only two, atrazine and alachlor, occasionally were present in concentrations that exceeded the MCLs for drinking water established by the U.S. Environmental Protection Agency (1990, 1991a). The results in this report are for untreated river water whereas MCLs apply to water supplied to the user after treatment. However, conventional treatment processes generally do not remove these herbicides. Atrazine exceeded the MCL of 3  $\mu\text{g/L}$  in 27 percent of the samples collected during these 3 months, and alachlor exceeded the MCL of 2  $\mu\text{g/L}$  in 4 percent of the samples. On the basis of the 146 samples analyzed, atrazine exceeded the MCL from about mid-May to mid-June in the smaller tributaries (fig. 4), and for all of June in the Missouri River at Hermann (fig. 5). Atrazine also exceeded the MCL in the Mississippi River at Thebes during parts of May and June, and in one sample collected at Baton Rouge in late June (fig. 6). Alachlor only exceeded the MCL in 6 samples, all of which were collected from the three smaller tributaries (fig. 2) during mid- to late-May (table 3).

### Atrazine Loads and Source Areas

One of the objectives of this study is to determine the mass of each major herbicide transported in 1 year (April 1991-April 1992) into the Mississippi River from each of the principal tributaries, the mass transported to the Gulf of Mexico, and the principal source areas for the herbicides. This objective cannot be achieved with only 3 months of data. However, it is possible to determine the principal source areas, estimate the relative contribution from each, and estimate the loads transported during this 3-month period. This was accomplished for atrazine based on loads estimated by the following approach.

Loads were calculated for each day on which samples were collected using atrazine concentration and streamflow data (table 3). An average daily atrazine load was then estimated for each month by averaging the loads calculated from the samples collected that month. Generally, there were about four samples per month for April and seven or eight samples per month for May and June, except for the Ohio River which only had four samples per month for the entire period. The average daily load (pounds per day) for atrazine was then multiplied by the number of days in the month to obtain an estimate of the total load for each month (pounds). Loads for each month were summed to obtain the total atrazine mass transport for the 3-month period. Mass-transport estimates were made using this method for each site on the main stem of the Mississippi River, and the Missouri and Ohio Rivers. In addition, an estimate was obtained for the atrazine load entering the Mississippi River from Iowa and Illinois between the Clinton,

Iowa, site and the Missouri River (fig. 1). This estimate was obtained by subtracting the atrazine load for the Clinton site and the atrazine load for the Missouri River basin from the load calculated at the Thebes site. The mass transport of atrazine from the Mississippi River basin to the Gulf of Mexico was estimated from measurements of concentration at the Baton Rouge site and the flow at Baton Rouge plus the flow diverted into the Atchafalaya River. The results of these calculations are given in the following table for the period April-June 1991. Because the solid-phase extraction analytical procedure did not give 100 percent recovery of atrazine (see section of this report on quality assurance samples), and because no correction was made to account for incomplete recovery, the actual loads may be 10 to 20 percent larger than reported here.

Source area (see fig. 1)	Drainage area (mi <sup>2</sup> )	Atrazine (pounds)	<sup>1</sup> Atrazine (percent)
Mississippi basin above Clinton	85,600	24,900	4.8
Mississippi basin, Clinton to Missouri River	103,600	189,700	36.7
Missouri River basin	524,000	131,600	25.4
Ohio River basin	203,100	95,500	18.5
Undetermined	208,700	75,300	14.6
<sup>2</sup> Total discharge from Mississippi basin	1,125,000	517,000	100.0

<sup>1</sup> Percent of atrazine contributed to the total atrazine discharge from the Mississippi River basin.

<sup>2</sup> Flow at Baton Rouge plus flow diverted into Atchafalaya River.

Keck (1991) estimated the monthly loads of atrazine discharged from the Missouri River for May, June, and July 1991. The results for May and June are similar to results obtained in this study.

	Atrazine load, in pounds	
	Keck (1991)	This study
May 1991	40,262	44,800
June 1991	56,884	70,700
Total	97,146	115,500

Estimates obtained from this study for April, May, and June indicate that the area between the Clinton sampling site and the Missouri River contributes the largest percentage of atrazine (36.7 percent) to the Mississippi River. This area includes the Illinois River and numerous smaller rivers that discharge into the Mississippi River from Iowa and Illinois. The second largest source area is the Missouri River basin (25.4 percent), followed by the Ohio River basin (18.5 percent). The mass of atrazine discharged from the Mississippi River basin to the Gulf of Mexico during April, May, and June 1991 (517,000 pounds) is within the range reported by Pereira and

Rostad (1990). They reported an annual transport (converted from metric units) of 231,000 pounds in 1988 and 945,000 pounds in 1989. Their calculations were based on fewer samples than are available from the present study but were for the entire year. The atrazine discharge from the basin during April-June 1991 represents about 0.9 percent of the atrazine applied in the 12-State area (tables 1 and 2). The atrazine discharge from the Mississippi River basin for a 1-year period, obviously, will be somewhat larger than values for April-June.

#### DISTRIBUTION OF NITRATE-NITROGEN

The distribution of nitrate-nitrogen concentrations at the eight sampling sites is shown in figure 7. Concentrations were largest in the Illinois River and two Mississippi River main-stem sites—Clinton and Thebes. These results indicate that the major influx of nitrate-nitrogen to the Mississippi River is from Iowa, Illinois, and possibly Minnesota and Wisconsin. The maximum nitrate-nitrogen concentration measured in any sample was 6.4 mg/L in the Illinois River. Unlike the temporal distribution pattern for herbicides, nitrate-nitrogen showed very little response to rainfall, except in the smaller tributaries (table 3). None of the samples had nitrate-nitrogen concentrations in excess of the 10 mg/L MCL.

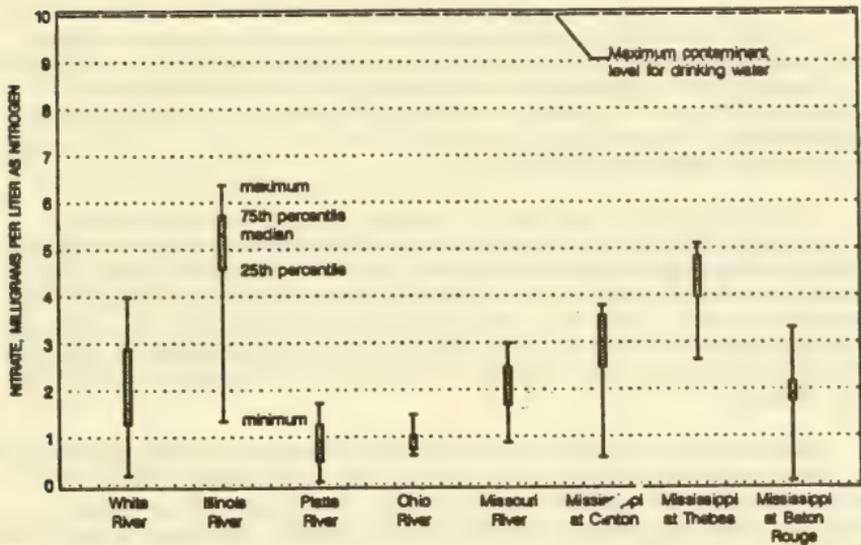

Figure 7.--Boxplots of nitrate-nitrogen concentrations arranged by downstream order for samples collected in April, May, and June 1991.

## SUMMARY

The U.S. Geological Survey is presently (1991) conducting a study to determine the distribution, transport, and persistence of herbicides, insecticides, and inorganic nutrients in the Mississippi River and several major tributaries. The study began in April 1991, and will continue for 1 year. Results obtained for April, May, and June 1991 showed the presence of herbicides in the Mississippi and Missouri Rivers and several smaller tributaries. These early findings prompted the preparation of this report in order to make the sampling methods and results available.

Water samples were collected once or twice a week from three sites on the main stem of the Mississippi River, and from sites on the Ohio River, the Missouri River, and three smaller tributaries. One or more herbicides were detected in every sample (146) collected in April, May, and June. Atrazine was detected most frequently (100 percent of samples), followed by cyanazine, metolachlor, alachlor, and simazine. The median concentration of atrazine ranged from 0.29  $\mu\text{g/L}$  in the Mississippi River at Clinton to 3.2  $\mu\text{g/L}$  in the White River. The range in median concentrations for other herbicides were: cyanazine, <0.2 to 1.9  $\mu\text{g/L}$ ; metolachlor, 0.20 to 1.5  $\mu\text{g/L}$ ; alachlor, <0.05 to 0.73  $\mu\text{g/L}$ ; and simazine, <0.05 to 0.17  $\mu\text{g/L}$ . The largest herbicide concentrations occurred in the smaller tributaries--White River in Indiana, Illinois River, and the Platte River.

Herbicide concentrations began to increase in early- to mid-May in response to rainfall after herbicides were applied to cropland. Maximum concentrations measured for atrazine were 6.3 to 10  $\mu\text{g/L}$  for the smaller tributaries, and 3.7 to 5.7  $\mu\text{g/L}$  in samples from the lower Mississippi and Missouri Rivers. Maximum concentrations measured for cyanazine, metolachlor, and alachlor were 7.3, 4.4, and 3.6  $\mu\text{g/L}$ , respectively. These concentrations persisted for several weeks and began to decrease in early to mid-June.

Two herbicides, atrazine and alachlor, occasionally exceeded maximum contaminant levels for drinking water. Atrazine exceeded the MCL in 27 percent of the samples and alachlor in 4 percent of the samples. Atrazine exceeded the 3  $\mu\text{g/L}$  MCL in samples from the smaller tributaries from mid-May to mid-June, and in samples from the lower Missouri during all of June. Atrazine also exceeded the MCL in samples from the Mississippi River at Thebes, Ill., during part of May and part of June. Atrazine exceeded the MCL in 1 sample collected from the Mississippi River at Baton Rouge, La. Alachlor exceeded the 2  $\mu\text{g/L}$  MCL in a few samples, but only in the smaller tributaries.

Mass-transport calculations were made for atrazine to determine the predominant source area. These calculations indicate that about 37 percent of the atrazine discharged from the Mississippi River into the Gulf of Mexico entered the river from streams draining Iowa and Illinois. The second largest source area was the Missouri River basin, which contributed about 25 percent of the atrazine. The atrazine discharged from the Mississippi River basin during April, May, and June 1991 was estimated to be 517,000 pounds and was equal to about 0.9 percent of the amount applied in 12 major crop-producing States that drain to the Mississippi River.

Nitrate-nitrogen concentrations in the smaller tributaries increased slightly in response to rainfall, but did not have the same response that was observed for herbicides. The maximum concentration measured in any sample was 6.4 mg/L in a sample from the Illinois River. The maximum concentrations measured on the Mississippi River main stem were 3.8 mg/L at Clinton, Iowa, and 5.1 mg/L at Thebes, Ill. Nitrate concentration did not exceed the MCL in any sample. A major source for nitrate-nitrogen in the upper Mississippi appears to be discharge from streams in Iowa and Illinois.

Draft Amendments to the Clean Water Act

This legislation would amend §319 of the Clean Water Act, 33 U.S.C. §1329, to require states, in developing non-point source management programs, to take into consideration non-point source pollution which contributes to downstream exceedances of Maximum Contaminant Levels (MCLs) established under the Safe Drinking Water Act.

Section 319(a)(1) is amended to read as follows:

The Governor of each State shall, after notice and opportunity for public comment, prepare and submit to the Administrator for approval, a report which -

(A) identifies those navigable waters within the State which, without additional action to control non-point sources of pollution, cannot reasonably be expected to attain or maintain applicable water quality standards or the goals and requirements of this Act;

(B) identifies those navigable waters which serve as source waters for drinking water and which, without additional action to control non-point source pollution, will result in downstream public water systems being unable to meet Maximum Contaminant Levels established under the Safe Drinking Water Act. 42 U.S.C. -----

(C) identify those categories and subcategories of non-point sources or, where appropriate, particular non-point sources which add significant pollution to each portion of the navigable waters identified under subparagraph (A) above, in amounts which contribute to such point not meeting applicable water quality standards or such goals and requirement;

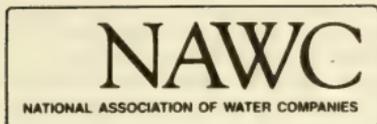

(D) for each portion of the navigable waters identified under subparagraph (B) above, identify those categories and subcategories of non-point sources or where appropriate particular non-point sources

which cause or contribute to downstream public water systems being unable to meet maximum contaminant levels established under the Safe Drinking Water Act, 42 U.S.C. 300f et. seq.

Section 319(b) (2) (A) is amended to read as follows:

(2) Each management program proposed for implementation under this subsection shall include each of the following:

(A) An identification of the best management practices and measures which will be undertaken to reduce pollutant loadings resulting from each category, subcategory, or particular non-point source designated under paragraph (1)(C) and (D) above taking into account the impact of the practice on ground water quality and drinking water quality. Such practices and measures shall specifically address reduction of pollutants which contribute to downstream public water systems being unable to meet maximum contaminant levels established under the Safe Drinking Water Act, 42 U.S.C. 300f et. seq.

JAMES B. GROFF, EXECUTIVE DIRECTOR

TESTIMONY OF  
THE NATIONAL ASSOCIATION OF WATER COMPANIES  
BEFORE  
THE SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
CONCERNING  
REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT  
PRESENTED BY  
J. JAMES BARR, VICE PRESIDENT AND CHIEF FINANCIAL OFFICER  
AMERICAN WATER WORKS COMPANY

APRIL 21, 1993

Good morning Mr. Chairman. My name is Jim Barr. I am Vice President and Chief Financial Officer of the American Water Works Company. American is the largest investor-owned water utility in the country, serving over 5 million people in 606 communities in 20 states.

I am also Chairman of the Board of the National Association of Water Companies. The National Association of Water Companies (NAWC) is the trade association representing the nation's investor-owned water utilities. Its 360 members in 41 states provide safe, reliable drinking water to over 22 million Americans every day. Our member companies provide service from Pine Bluff, Arkansas to Chattanooga, Tennessee and from San Jose, California to Marion, Ohio. Our members employ a combined work force in excess of 15,000. In 1991, these companies had operating revenues of \$2.3 billion and gross utility plant of \$9 billion. Shares in 18 of our largest member companies are publicly traded. Ten of our companies also provide wastewater service to 350,000 persons nationwide.

Mr. Chairman, I applaud your leadership in holding this series of hearings on the Clean Water Act (CWA). My company and other NAWC members, some of whom own or operate wastewater treatment facilities, are directly affected by the requirements of this Act. The experience of these companies demonstrates that the private sector can play a role in the provision of wastewater services. We believe the private sector can - and should be encouraged to - play a larger role in providing wastewater treatment facilities. Changes to the Clean Water Act to affect this end will be the main focus of my statement today. I will also touch on the need to strengthen section 319, concerning non-point source pollution, to recognize protection of drinking water supplies.

#### Encouragement of Public-Private Partnerships in the Provision of Wastewater Treatment Facilities

The goals of the Clean Water Act are to eliminate the discharge of pollutants into navigable waters and attain waters deemed fishable and swimmable. While these goals have not yet been achieved, 75 percent of assessed waters do comply with standards for conventional pollutants. This success was not cheap. Since 1972, Congress has provided \$57 billion in grants for the construction of treatment works and authorized another \$8.4 billion for the state revolving fund (SRF) program which replaced the grant program in 1987.

But the need for funds remains great. In its 1988 needs survey, the EPA estimated total construction needs at \$83.5 billion through 2008. At current levels, the SRF will meet only 31 percent of States' wastewater treatment needs by 2001. This percentage will actually be reduced through competition for SRF monies from the

National Estuaries Program, non-point source pollution control and other worthy programs.

In addition, these needs come during a time when the demand for scarce federal resources is fierce and growing. This limits the ability of the federal government to provide additional funds for any programs under the Clean Water Act. Making the private sector a partner in the provision of wastewater treatment facilities is one way additional resources can be raised to address these needs. I recommend two changes to the Act that will facilitate the ability of the private sector to invest in wastewater treatment facilities.

First, the Clean Water Act should be modified to encourage the establishment of public-private partnerships to construct and manage treatment works. Under current law (section 601(a)(1)), SRF funds are only available for treatment works which are publicly owned. Modifying this section to permit SRF monies to be used in conjunction with private funds could leverage additional monies which will help close the need gap described above and free-up more funds for other important programs authorized under the Act.

Such a program is not without precedent. The Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA), permits up to 50 percent of the funds for construction of toll roads to come from the highway trust fund. This Committee's report on this provision makes reference to water and sewer infrastructure as follows: "the public-private partnership is important and should be encouraged. From the Federal perspective, one of the ways to approach infrastructure improvement would be to ease unnecessary Federal constraints preventing the mixing of Federal dollars with private funds on projects". The Committee looked to the private sector not only to "bring new sources of capital to infrastructure projects" but also to "expedite the completion of projects with the efficiencies of the private sector".<sup>1</sup>

A fully privatized wastewater treatment plant in Auburn, Alabama, supports the Committee's contention. According to EPA, the plant saved the city \$25 million in costs over the life of the project and enabled the facility to go on line in one-quarter of the time of similar, non-privatized facilities.

As with the ISTEA toll road provision, using SRF funds to finance public-private partnerships would not be a requirement of the Act. Rather it would be an option available to state and local governments as a method to leverage additional funds for treatment plant construction. At Appendix A you will find a paper describing how such a program might be structured.

---

<sup>1</sup> House Committee on Public Works and Transportation; House Report No. 102-171(I); July 26, 1991; pgs. 13-24.

Second, a definition of a "publicly-owned treatment work" should be added to the Clean Water Act. Such a definition should be based on purpose rather than ownership. The Safe Drinking Water Act (SDWA) clearly defines drinking water systems by purpose rather than ownership.<sup>2</sup> This provides for uniform environmental regulation of a drinking water system whether owned by one of our member companies or a municipality.

In contrast, the Clean Water Act does not define a "publicly-owned treatment work" (POTW). It does acknowledge the existence of privately owned treatment works in section 201(h) and EPA regulations have recognized a distinction. Under regulatory treatment, this is a distinction with a difference.

For example, a privately-owned wastewater treatment facility loses the domestic sewage exclusion provided to POTWs under the Resource Conservation and Recovery Act (RCRA). This exclusion exists to avoid duplicative CWA and RCRA permits for the same unit. A private facility is subject to Best Available Technology Economically Available/Best Conventional Pollutant Control Technology requirements, while a public one is subject to secondary treatment requirements. Two very different requirements.

Different requirements based on ownership are required by the Clean Water Act. But they are not necessary to provide clean water. They merely serve as barriers to entry of the private sector and a barrier to the transfer of facilities between private and public ownership. Entirely different requirements would apply to a treatment facility sold by a municipality to a private investor, even though the purpose of the facility and its customer base remain unchanged.

I strongly urge the Committee to amend the Clean Water Act to provide a single and clear definition of a wastewater treatment facility based on purpose rather than ownership. Such a change will provide uniform regulations for all such facilities. This in turn will provide local governments the flexibility to make arrangements for the provision of wastewater services that meet local needs. A single definition of a treatment facility based on purpose allows for a facility that is 100 percent publicly-owned,

---

<sup>2</sup> Section 1401(4) of the Safe Drinking Water Act reads: "The term "public water system" means a system for the provision to the public of piped water for human consumption, if such system has at least fifteen service connections or regularly serves at least twenty-five individuals. Such term includes (A) any collection, treatment, storage, and distribution facilities under control of the operator of such system and used primarily in connection with such system, and (B) any collection or pretreatment storage facilities not under such control which are used primarily in connection with such system."

100 percent privately-owned or any percentage in between.

### Non-Point Source Pollution

America's drinking water suppliers are the nation's front-line environmentalists. Long before enactment of the Safe Drinking Water Act, water suppliers took steps to ensure the safety and quality of drinking water. Disinfection of drinking water to kill microbial contaminants, hailed as the greatest benefit to public health this century, has been routine for almost 100 years. Our historical commitment to protecting the public health continues to this day with our support of and compliance with the stringent requirements of the Safe Drinking Water Act.

But compliance is not cheap. Over the course of this decade, EPA estimates water suppliers will have to invest \$2.5 billion a year to comply with SDWA requirements. This is in addition to an annual investment of \$10 billion for maintenance, expansion and improvement of drinking water infrastructure. We and our customers are naturally eager to keep these costs as low as practicable. One way this can be done is by enhancing the protection of drinking water supplies.

As stated above, the Clean Water Act has as its goal fishable and swimmable waters. Great steps have been taken towards this end, yet every year billions of tons of pollutants find their way to both surface and groundwater, largely through run-off from non-point pollution sources. The largest source of non-point pollution is pesticide, fertilizer and animal waste run-off from farms.

The federal government regulates "both ends of the pipe"; drinking water quality through the Safe Drinking Water Act, pesticide and fertilizer application through the Federal Insecticide, Fungicide and Rodenticide Act. These acts should be complimentary. In other words, when a drinking water standard is set by the federal government, it should not at the same time bless activities which are likely to lead to violation of those standards. The left and right hands must work in concert.

The Safe Drinking Water Act regulation governing pesticides and nitrates became effective on January 1, 1993. If monitoring reveals pesticides or nitrates at levels exceeding the prescribed MCL, drinking water systems will have to install facilities for their removal.

This is no idle concern. Two years ago, the Missouri River Public Water Supplies Association performed a monitoring study to determine pesticide levels in this mighty river. It found atrazine

at levels above the maximum contaminant level (MCL) established under the SDWA. A subsequent study by the US Geological Survey (USGS) confirmed these findings. Both of these studies may be found at Appendix B.<sup>3</sup>

Should average pesticide levels exceed the MCL, systems will have to install granular activated carbon (GAC) to treat the water and comply with the MCL. A large utility in Missouri serving a million persons has estimated that financing the installation of GAC will require a 70 percent rate increase! Nitrates pose a similar problem; their treatment can cause significant cost increases as well.

These costs should not be borne by our customers when they can be avoided. Section 319 of the Clean Water Act provides for the establishment of state plans to reduce non-point source pollution. But these plans only apply to water quality standards issued under the Clean Water Act. I recommend that section 319 (a) and (b) be modified to recognize the protection of drinking water quality as a goal of state non-point source management programs. You will find proposed bill language at Appendix C.

In Putting People First, President Clinton calls for stronger non-point source standards. He also advocates placing "greater emphasis on preventing and reducing pollution before it happens, so we won't have to spend so much on cleaning it up after the fact". Finally, he states polluters should pay. Our proposed changes to section 319 conform with these policy goals.

### Conclusion

The changes described above will help produce a more effective and efficient Clean Water Act. This will hasten the achievement of its worthy goals - fishable and swimmable waters. Adoption of our amendments will also make compliance with SDWA requirements easier.

We appreciate this opportunity to provide testimony on the Clean Water Act and look forward to working with you on these issues during reauthorization. Please feel free to contact the NAWC if you require additional information on any of these items.

---

<sup>3</sup> The USGS is also gathering additional water quality data over the remainder of the decade. Its National Water Quality Assessment Program will perform intensive assessment activity in 60 study areas. Twenty four-year studies began in FY91 with an additional twenty to begin each in FY94 and FY97. Upon completion, these studies will provide invaluable data to our member companies concerning pollution levels and sources nationwide.

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

THURSDAY, APRIL 22, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER  
RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC  
WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to recess, at 9:51 a.m. in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLEGATE. Good morning.

This morning, we will continue our hearings on the issues concerning the reauthorization of the Clean Water Act. At yesterday's hearing, we received a great deal of good testimony from Members of Congress. Today, we are going to hear from representatives of environmental and agricultural organizations on the issues of concern to each of these groups.

Following today's hearing, the subcommittee will meet again on Wednesday, May 5th, to receive testimony from Carol Browner, who is administrator of the Environmental Protection Agency, as well as representatives from the U.S. Army and the Tennessee Valley Authority.

Before we begin with our first panel, I would like to yield to our substitute for Mr. Boehlert, the ranking minority member of the Subcommittee, Susan Molinari.

Ms. MOLINARI. Thank you very much, Mr. Chairman. I join you in welcoming our guests to this hearing today. Congressman Boehlert will be along shortly.

It is appropriate that we discuss the Clean Water Act on Earth Day. The Clean Water Act has been a success story since it was enacted in 1972 and will likely be the most important piece of environmental legislation enacted this Congress. The act is an example of responsible environmental policy, policy that balances the needs of the environment and industry in an effort to make the earth a better, safer place for all of us.

In 1993 the rivers are no longer catching fire. Here in Washington, the Potomac is once again a center for recreation. People are boating and fishing on it instead of trying to walk across it. We have made significant improvements, yet the Clean Water Act's goal of fishable and swimmable waters is not there. When you come from a district such as mine in Staten Island, New York, we became a national landmark several years ago when the outfall of combined sewers washed up on our beaches on a daily basis. Clean water takes on an even deeper meaning.

I am delighted to be with you today to continue to work on the Clean Water Act. The witnesses before us today come from the agricultural community and the environmental community and will be instrumental in the amendment process. I want to assure our witnesses that we will listen to your testimony and seek your advice as the issues are hashed out.

Mr. Chairman, Earth Day must be more than just a free concert and trite phrases. To be successful, Earth Day must be a day when we carefully reflect on our Nation's environmental policies, a day when we examine what we can realistically expect to accomplish in the next five years, a day to ask ourselves what the next step should be.

I thank the witnesses for joining us today so we can make this Earth Day hopefully a memorable one. I also ask at this point in time that I be allowed to submit a statement from the ranking member of the full committee, Congressman Shuster.

Mr. APPLEGATE. Without objection, Congressman Shuster's statement will be included in the record.

[Mr. Shuster's prepared statement follows:]

HONORABLE BUD SHUSTER  
CLEAN WATER ACT REAUTHORIZATION  
SUBCOMMITTEE ON WATER RESOURCES  
AND ENVIRONMENT  
APRIL 22, 1993

Today we continue the Subcommittee's series of hearings on reauthorization of the Clean Water Act.

Since the enactment in 1972 of the Federal Water Pollution Control Act (today known as the Clean Water Act), this country has made significant progress in protecting and improving the quality of our waters.

We have made tremendous strides in addressing point source pollution from municipal wastewater treatment facilities and industrial plants. Based on waters assessed, states report that 70 percent of our rivers, 60 percent of our lakes, and 64 percent of our estuaries are currently supporting designated uses. Some of these waters remain threatened by pollution, however, and other waters are impaired or are not fully meeting designated uses. Accordingly, we as a nation have a great deal more work to do in protecting our precious water resources.

Our hearings are intended to give the Subcommittee a sense of how well the Act is working and what changes may be needed. Thus far we have focused on the needs of state and local governments, and particularly the needs of small and rural communities.

Yesterday, we also heard from a number of House Members who testified on important national, regional and local issues for consideration by the Committee. Later this spring we will also hear from the Administration, industry, the development community, and other affected interest groups.

-2-

Today, we will hear from representatives of the environmental and agricultural community. As a consequence, we will touch upon virtually all of the major issues that must be considered by the Committee.

I want to thank all of the witnesses for their testimony but in particular, Keith Eckel from the Pennsylvania Farm Bureau Federation for his valued testimony on behalf of the American Farm Bureau. Keith will touch upon two issues which are vitally important to me -- reform of the current morass of wetlands laws and regulations and improved but sensible measures to control non-point source pollution.

I am sure the Members of the Subcommittee will benefit as I will from Mr. Eckel's insights into these and other issues before the Committee.

Mr. APPLEGATE. Okay. First of all, we are going to have two panels. The first panel will be comprised of the environmental witnesses. We have Robert Adler with the Natural Resources Defense Council, Brett Hulseley from the Sierra Club, Doug Inkley from the National Wildlife Federation, Dawn Martin from the American Oceans Campaign, Carolyn Hartmann with U.S. Public Interest Research Group, and Diane Cameron from the Natural Resources Defense Council.

Let me just say before we get started because this could get into a very long day, all statements will be made a part of the record. We would ask that perhaps you summarize as best you can because we will have your full statements and they will all be considered in our work as we move forward. I would like to have the members know that we would like to stick to the five minute rule. I think in this way we will be able to expedite time and get the information that we need.

Mr. Adler?

**TESTIMONY OF ROBERT W. ADLER, SENIOR ATTORNEY, NATURAL RESOURCES DEFENSE COUNCIL, INC.; BRETT HULSEY, GREAT LAKES PROGRAM DIRECTOR, SIERRA CLUB; DOUG INKLEY, LEGISLATIVE REPRESENTATIVE, NATIONAL WILDLIFE FEDERATION, ACCOMPANIED BY STEPHANIE GROGAN AND TERRY SCHLEY; DAWN MARTIN, ISSUES DIRECTOR, AMERICAN OCEANS CAMPAIGN; CAROLYN HARTMANN, STAFF ATTORNEY, U.S. PUBLIC INTEREST RESEARCH GROUP; AND DIANE CAMERON, SENIOR RESEARCH ASSOCIATE, NATURAL RESOURCES DEFENSE COUNCIL**

Mr. ADLER. Thank you very much, Mr. Chairman and members of the subcommittee. It is a pleasure to be here today.

We have put together a panel of witnesses who will address the full range of Clean Water Act issues that the subcommittee will be facing this year. The panel was put together by the Clean Water Network, which is a coalition of more than 400 organizations all around the country who are working together to work on Clean Water Act reauthorization and to ask this subcommittee to strengthen the law. These groups have all endorsed a document called "A National Agenda for Clean Water" and I ask that, in addition to my full testimony, a copy of the agenda, a list of the endorsing groups, and a briefing book on reauthorization that we've provided to members of the committee be put into the record as well.

Mr. APPLEGATE. Without objection, so ordered.

Mr. ADLER. Thank you.

Earlier this month the subcommittee heard from panels of witnesses who focused on the economic price of water pollution control. But little was said about the serious human health, environmental harm, and harm to our economy that is caused by continuing water pollution. So while I will defer to my colleagues to talk about specific programs and specific solutions, I would like to begin by assessing the state of our aquatic resources two decades after the Clean Water Act was passed in 1972. What the public wants to know is not how many permits have been written, but basic questions like Ms. Molinari asked: How safe are our beaches for

swimming? How safe is our drinking water? How are our populations of aquatic organisms faring and are they safe to eat?

Let me begin first by looking at the traditional measures of water pollution looked at by EPA and the States. According to EPA's most recent national inventory, at least one-third of our assessed rivers, half of our assessed estuaries, and more than half of our assessed lakes are not meeting designated uses, are not meeting the water quality standards that we sought to achieve by 1983. Even these reports are incomplete because only a fraction of our waters are actually tested for water pollution, so we don't really know the full scope of the problem.

Now I do not mean to suggest that the Clean Water Act has not worked. We have made tremendous progress; we simply have a longer way to go. The percent of the U.S. population served by secondary treatment or better has more than doubled in 20 years. Industrial pollution controls have reduced the discharge of toxic pollution by a billion pounds a year, according to EPA estimates. But when you look at the numbers, industrial sources continue to release hundreds of millions of pounds of toxic pollutants a year into our surface waters and the discharge of raw or partially treated sewage continues unabated in many waters around the country.

Again, I want to focus on real world measures of progress and the health and environmental threats faced by the American public. Many waters remain unsafe for swimming, not just in New York and Staten Island but around the country. In 1991, there were more than 2,000 beach closures or advisories around the country, and, again, that is based on only partial monitoring. Many beach waters simply aren't tested for pollution. State water quality reports confirm that a quarter of our rivers and estuaries, one-fifth of our lakes, and at least 10 percent of our coastal beaches are unsafe for swimming.

Many drinking water supplies remain contaminated. The events of Milwaukee a few weeks ago underscore the problem, but let me underscore that this is not an isolated problem. According to the Centers for Disease Control, there were more than 525 outbreaks of disease caused by drinking water supplies since the Clean Water Act was passed, affecting more than 130,000 people. Again, this is only the tip of the iceberg. EPA experts believe that 25 times as many drinking water-related outbreaks are caused than are actually reported.

Many sources of fish and shellfish remain contaminated. Forty-five States recorded almost a thousand fishing advisories and bans in the two-year period of 1988-89. But if you look at EPA's database, there are actually about 3,000 fishing bans and advisories in place today around the country, and, again, only a fraction of our waters are actually tested for toxic pollutants.

The second fundamental measure is the health of our aquatic ecosystems. Again we find serious trouble, as our aquatic species are in serious jeopardy. We have heard a lot about spotted owls and red squirrels and other land-based animals, and without intending to minimize the threats to those species, our aquatic species are faring far worse. According to the Nature Conservancy, while about 10 to 15 percent of land-based species are threatened or endangered or otherwise in peril, those figures are a third of our

fish species to 73 percent of our fresh water mussels; a third to three-quarters of aquatic species are in trouble.

Even species that are not directly threatened or endangered are plummeting, especially when you look at important commercial species. From 1970 to 1989, spiny lobster harvest dropped by 34 percent, commercial landings of striped bass declined continuously since 1973, with a total fall of 92 percent since 1982. From 1983 to 1989, bay scallop landings fell by 88 percent. Duck breeding populations have dropped continually from 1955 to 1985. The list goes on and on.

We thought that serious fish kills were a thing of the past with the passage of the 1972 Clean Water Act. And while EPA data show that the severity of each incident is going down, for which we can take credit, the number of pollution caused fish kills per year has not gone down. Even pollution that doesn't actually kill fish is causing severe impacts on the reproductive systems of our aquatic organisms, birth defects, behavioral changes, and increased susceptibility to disease, impacts that we face as well when we eat those fish and wildlife.

The cause of these serious declines in aquatic species is predominantly habitat loss and pollution. We have lost more than half of our wetlands, we've lost more than half of our riparian habitat, our streamside habitat. According to the 1984 Fisheries survey, 81 percent of our instream habitat is degraded and less than 4 percent of our waters are completely healthy.

To close, I want to emphasize that these are not just health and environmental impacts, they are serious economic impacts to the U.S. economy as well. Let's look at the value of water resources to our economy. In 1990, commercial fisheries contributed \$16.5 billion to the U.S. economy. In 1988, there were more than 360,000 people employed by our commercial fishing industry. Protecting clean water is critical to protecting those jobs. Recreational fishers spent more than \$28 billion in 1985 on their sport, shell fishers, another \$2.5 billion; water fowl hunters, almost another \$1 billion. The boating industry contributes about \$20 billion a year to our economy, an economy depending on clean water, and employs about 600,000 people. Florida beach-goers alone contributed \$2.5 billion to the Florida economy in 1984. Those economies and those jobs are jeopardized if we don't protect our water resources. I am not meaning to suggest that we can completely capture the economic value of water resources in dollars. Resources for the Future economists tried to do so and estimated the value of the national swimmable goal alone at \$30 to \$47 billion a year.

The point, Mr. Chairman and members of the subcommittee, is that we can't just look at the cost of cleaning up our waters. We have to look at the value of those waters to the human environment, our health and our economy. In his book "Earth in the Balance", Vice President Gore quoted Oscar Wilde as saying "A cynic is one who knows the cost of everything and the value of nothing." It is easy to dwell on the cost of water pollution control and the cost of cleaning up those waters while forgetting the tremendous value of those resources not just to our environment and our health, but to our economy as well.

We look forward to working with the subcommittee in the next few months to try to solve these many problems. Thank you.

Mr. APPLGATE. Thank you, Mr. Adler.

What we are going to do is run right through the panel first and then we will get down to asking some questions.

Mr. Hulsey.

Mr. HULSEY. Thank you, Mr. Chairman.

My name is Brett Hulsey and I am the Sierra Club's Great Lakes Program Director. I am testifying today on behalf of the Sierra Club and a whole host of Great Lakes and national groups to urge a comprehensive program to clean up contaminated sediments that line our harbors and stop additional toxic pollution from sullyng our waters.

For those of us who live in Wisconsin and who have witnessed the tragedy in Milwaukee, the need for clean water is clear. In the past few weeks, we have seen thousands of people sick and missing work and 800,000 people who were not to safely drink their water. We have seen several elderly people and people with AIDS die or are critically ill from the contaminated water. Schools and businesses were forced to close. The public in Wisconsin and throughout much of the country has lost their faith in clean water.

While this problem may have stemmed from nonpoint pollution, we feel it is a growing concern for everyone who depends on the Great Lakes for their water. We urge you to address nonpoint pollution, and I think someone else is going to talk about that.

I will use the Great Lakes as an example because 25 million Americans drink from the Great Lakes everyday and their faith in their daily water supply is important.

The Great Lakes is a hub for much of the industry of the United States. Yet this economy that circulates around the Great Lakes is threatened. Currently, PCB levels in Great Lakes coho salmon exceeds 70 times the EPA's 1/100,000 cancer risk level. The Great Lakes are not safe. About two-thirds of the Great Lakes are not safe for fishing and swimming according to EPA's water quality advisory. This is largely because current water, air, and waste laws allow polluters to continue to dilute toxins and emit them in large quantities.

In 1990, according to the U.S. General Accounting Office, Great Lakes polluters were legally allowed to dump over 7 million gallons of oil, 89,000 pounds of lead, almost a ton of PCBs, and almost a thousand pounds of mercury into the Lakes. To put this into perspective, the Exxon Valdez illegally dumped 11 million gallons of oil into Alaska waters and was fined almost \$1 billion. Each year, U.S. industries are allowed to dump two-thirds of that amount into the water supply of 25 million Americans.

Scientific evidence shows that this is of major concern. EPA risk assessment shows that over 38,000 people may die from cancer from eating Great Lakes fish. A study out yesterday indicating the link between DDT and breast cancer, it is important to note that in the Great Lakes DDT is found in many of these fish and continues to be cycled through the sediments that line our harbors. There are numerous other health effects associated with pollution in the Great Lakes including unborn children being threatened with premature birth, low birth weights, and impaired learning loss.

Currently the Great Lakes States employ a hodgepodge of environmental regulations to try to stop this pollution. For instance, according to one study, a plant that could emit 4 pounds of mercury in Wisconsin would be allowed to emit 55 pounds of mercury in Ohio, 99 pounds in Illinois, and 323 pounds in New York. This also puts industries at a disadvantage, especially in Wisconsin, Minnesota, and Michigan that tend to have tougher regulations, because States tend to compete for jobs by lowering their water pollution standards rather than trying to provide a healthy education to workers.

So what must we do to deal with this problem? We urge the phase-out of persistent toxins like mercury and PCBs to make our water safe. To do this, we need to give the EPA Administrator authority to phase out these under the MPDES program. We need to make pollution prevention a major part of the Clean Water Act because, as we have seen in many cases, a few thousand or hundred thousand dollars worth of prevention can save millions of dollars in clean up cost. We need to use the best available technology and give the EPA Administrator the right to set fees and consistent water quality standards that protect the public. We must go beyond protecting the average person, we must protect people who rely on water for their livelihood, like Native American urban fishers, as well as wildlife, like bald eagles and mink. Bald eagles currently are experiencing reproductive failure along the Great Lakes for consuming Great Lakes fish, similar problems that we have seen exhibited in people.

We would like to see Lake Superior designated an outstanding natural resource water to show that we can achieve zero discharge someplace in the United States. Lake Superior is our best place to do that. Also, we would urge you to take a look at the EPA's recently released Great Lakes Water Quality Guidance as a model for how to achieve this in a large-scale area.

In addition to cleaning up point sources though, we have a huge problem with existing toxic pollutants in the Great Lakes and the Nation's waters. This chart is a result of NOAA and EPA data that show that every major water body in the U.S. likely has moderate to severe contaminated sediments lying at the bottom of it. You can see that while this doesn't include inland waterways, there are also significant sediment problems along the Ohio and Mississippi River as well. We have seen this exhibited particularly in areas like New York/New Jersey harbor that is currently trying to work out a negotiation on how to deal with their sediments. According to the EPA Water Quality Advisory, Ohio leads the Nation with 193 sites clogged with contaminants like arsenic, cadmium, and lead. In Lake Michigan, about 75 percent of the PCBs that pollute our fish come from contaminated sediments. And according to the EPA, landfills and contaminated sediments are the leading sources impairing our Great Lakes.

This is a huge problem that we began to address in the 1987 amendments with the ARCS program, the Assessment and Remediation of Contaminated Sediments. Under this program, we have tested about ten technologies and assessed five sites throughout the Great Lakes and have some very promising information on how to clean up these sediments in a cost-effective manner. We urge

you to look at this approach as a model to be applied to salt water coasts and other parts of the Nation.

The National Contaminated Sediments Working Group has been working with the EPA, the ports, and the Corps of Engineers to come up with a national comprehensive plan to deal with these sediments. We urge you to develop a national program with deadlines and funding to clean up contaminated sediments and that has sediment quality criteria to ensure they are cleaned up, use technologies developed by EPA's ARCS program and expand those technologies to other areas including salt water sites; we clearly need some marine demonstration sites, perhaps New York/New Jersey harbor would be an excellent place to start; make pollution prevention part of each sediment disposal permit to ensure that the amount of new pollutants going into the area is minimized; and also to strengthen and enact the Metzenbaum Great Lakes Sediment Control Act to set up a structure to reduce new sediments coming into the areas and reduce dredging costs.

In conclusion, this year's Clean Water Act gives us an opportunity to stop the additional persistent pollutants that are poisoning our fish, our water, and our wildlife and to clean up existing sorts. We urge these principles to guide your Clean Water Act reauthorization and restore our faith in America's waters.

Thank you.

Mr. APPLGATE. Thank you very much, Mr. Hulseley.

Mr. Inkley.

Mr. INKLEY. Thank you, Mr. Chairman, members of the subcommittee. I have the somewhat daunting task today of presenting to you the National Wildlife Federation's legislative recommendations to correct the problems with the Clean Water Act, and also, as chairman of the Wetlands Working Group for the Clean Water Network, to present to you our concerns about the inadequacies of the section 404 program for wetlands protection. Before commencing, I would like to first mention that accompanying me today are two NWF staff and Clean Water Act experts who would also be happy to field questions during the question and answer period. They are Ms. Stephanie Grogan and Ms. Terry Schley.

Very briefly this morning what I would like to do is address four issues.

Issue one, prevention of food chain contamination. Toxic chemical contamination of the Nation's waters remains a very serious threat to the health of people and wildlife. For example, EPA data indicate that health advisories, warnings, or bans on eating fish are in place in over 4,000 bodies of water in 46 of the 50 States. Tragically, children born to women who ate moderate to high amounts of PCB contaminated Lake Michigan fish have now performed significantly worse on tests of their visual and verbal memory skills.

To address these problems of toxic chemical contamination Congress should amend the Clean Water Act to immediately implement the sunseting of the most dangerous chemicals, with priority given to those chemical that bio-accumulate.

Issue two, keeping clean waters clean. Conservation of clean waters have been relatively neglected while much attention has been focused on cleaning up of polluted waters. The Clean Water Act should be amended to protect from degradation existing water

quality by preventing new or increased sources of pollution. The designation of outstanding national resource waters should be implemented with absolute protection from new or increased pollution.

Issue number three is water conservation. Amendments to the Clean Water Act which require and encourage water conservation can significantly reduce the cost of wastewater treatment while effectively helping to protect our Nation's water resources and aquatic resources. We urge Congress to enact minimum water conservation standards for new or expanded water and wastewater systems.

Issue four is wetlands conservation. Wetlands conservation is very important to the National Wildlife Federation and also to member organizations of the Clean Water Network. The genesis of our concern is the enormous loss of the Nation's wetlands, some 100 million acres of wetlands to date or more than half that once existed in the 48 States. The loss continues today at unacceptable rates. I refer the subcommittee to Table I at the back of my testimony wherein the percent loss of wetlands for each of your States is given.

Mr. Chairman, you personally have the opportunity as chairman of this subcommittee to help mold the future of wetlands protection for Ohio and the rest of the Nation. I am one of those "home folks" that you referred to in your opening remarks as I am also from the State of Ohio. Unfortunately, our home State has suffered a 90 percent loss of wetlands, second only to California in the Nation.

Concurrent with the loss of wetlands is the loss of the enumerable benefits that they provide. One of the most important wetland benefits is jobs. For example, in Louisiana over 30,000 jobs are linked to the commercial and sport fishing industry which is closely linked to wetlands. Loss of wetlands ultimately means billions of dollars in higher taxes as well, higher taxes to pay for water treatment facilities, higher taxes to pay for flood control. For example, the Boston Globe reported that elimination of protection from just the drier end wetlands alone would force communities—in other words, taxpayers—to spend up to \$75 billion new dollars for water treatment facilities. In another example, a Corps study has revealed that losses of all wetlands associated with the Charles River near Boston could result in \$17 million in annual flood damage downstream.

Wetlands also provide critical fish and wildlife habitat, especially for waterfowl and also for 43 percent of this Nation's threatened and endangered species.

In conclusion, to address the continued loss of wetlands, we urge that Congress amend section 404 of the Clean Water Act with strengthening amendments. Specifically, we urge you to close the regulatory loopholes so that all causes of wetlands destruction will finally be regulated. We also urge you to make the permitting process more efficient by adopting a fast-tracking permit process for small scale permits. These concepts, and others as well, are all embodied in H.R. 350, the Wetlands Reform Act, introduced by Congressman Don Edwards of California. We strongly endorse this bill. We see it as a balanced solution to the section 404 wetlands regulatory program debate.

This completes my remarks, Mr. Chairman. I look forward to your questions. Thank you very much for the opportunity to testify.

Mr. APPLGATE. Thank you very much, Mr. Inkley.

Ms. Martin.

Ms. MARTIN. Good morning. Thank you to Chairman Applegate and the other members of the committee for inviting us here today. My name is Dawn Martin and I am the Issues Director for American Oceans Campaign and the coordinator of the National Coastal Caucus. My comments are on their behalf and that of the American Planning Association and Coast Alliance.

Since the original Clean Water Act was signed into law, Congress has consistently strengthened protections for our coasts. But with this reauthorization, we believe the critical state of our Nation's aquatic ecosystems demand even stricter protections be imposed.

A recent poll found that 80 percent of the U.S. public think protecting the environment is so important that requirements and standards cannot be too high and continuing environmental improvements must be made regardless of the cost. Therefore, we encourage you to reauthorize the Clean Water Act with confidence that the public solidly supports strong and enforceable legislation.

Aquatic ecosystems worldwide are being severely altered or destroyed at a rate greater than at any other time in human history. This is likely due to the fact that historically resource protection was constrained by artificial boundaries such as local or State borders. Today we have clear hydrological and ecological evidence linking successful watershed restoration with broader aquatic ecosystem management strategies.

Another problem is that despite the goal of the Clean Water Act to maintain and restore the physical, chemical, and biological integrity of the Nation's waters, EPA has primarily focused on developing chemically-based water quality criteria without addressing the physical and biological impairments of these waters. It is time for the Clean Water Act to focus on the biological integrity of our Nation's aquatic ecosystems.

According to EPA's most recent national water quality inventory, at least one third of our rivers, half of our estuaries, and more than half of our lakes are not safe for swimming, fishing, and other uses. Research also indicates that aquatic species are threatened and endangered much more so than their terrestrial cousins. Likewise, nearly one third of the native North American fresh water fish species is at risk.

My remarks today will deal with specifically two bills that affect aquatic ecosystems, and those bills we would like to see incorporated into the broader reauthorization of the Clean Water Act. Those bills are H.R. 31, the B.E.A.C.H. bill, and H.R. 1720, the DeLauro-Lowey estuary bill, which I will address respectively.

In 1988 coastal pollution was brought to national attention when medical waste washed up on our shores and sewage spills and polluted runoff posed such health threats as hepatitis and gastroenteritis. Since coastal tourism, recreational activities, and the fishing industry generate billions of dollars annually, it is logical for States to provide consistent health protections for these interests. However, few States conduct water quality testing of their beaches and those that do use different standards that would deem

water safe on one side of the border and unsafe on the other. H.R. 31, sponsored by Representative Hughes, essentially deals with these problems in three important ways.

First, it requires EPA to develop minimum water quality standards for testing coastal recreational waters. Public health will not be protected until there is consistency regarding the threshold beyond which exposure to bacteria is unacceptable.

Secondly, the bill sets minimum monitoring practices to guide States in testing beach waters to ensure that they are safe for swimming. These protocols should be adequate enough to detect even periodic violations of the standards.

And finally, H.R. 31 establishes mandatory public notification procedures when pollution levels are exceeded. The public has a right to know about the safety of their beaches. Closure notices should be posted at all access points and advisories should explain the type of pollution and its known or suspected source.

The second bill is the DeLauro-Lowey Water Pollution Control and Estuary Restoration Financing Act. Estuaries form transition zones between fresh water and marine ecosystems, making them one of the most productive natural systems. However, they are also among the most densely populated areas and, therefore one of the Nation's most highly stressed natural systems.

Recognizing this, Congress authorized the National Estuary Program in 1987. Modeled after the Chesapeake Bay and the Great Lakes Programs, the NEP process includes all relevant international, Federal, State, and local Government agencies, affected industries, educational institutions, and citizens. The purpose of the program is to develop comprehensive conservation and management plans to restore and maintain the chemical, physical, and biological integrity of each estuary. To date, actual implementation of these plans has been stymied by inadequate Federal financial commitment to the program.

Working with citizens groups for the past several years, AOC has gathered comments on the estuary program that were essentially incorporated into the NEP reforms of H.R. 1720. Because of these reforms and its ability to create clean water jobs, the bill has secured the support of several broad based coalitions, including labor unions, professional associations, businesses, construction trade councils, and environmentalists. In addition, the bill strengthens other clean water issues. It increases Federal aid to States for upgrading sewage treatment plants, controlling polluted runoff, and fixing combined sewer overflows. It also ensures full coordination of efforts taken to carry out other requirements of the Clean Water Act and the Coastal Zone Management Act.

But many States and municipalities possess neither the infrastructure nor the financial resources to protect these valuable estuaries. This bill recognizes that investing in healthy estuaries is tantamount to investing in jobs and a healthy economy. It is expected to create up to 1.4 million new jobs.

H.R. 1720 addresses the major weaknesses in the current estuary program in four significant ways. First, section 320 of the Clean Water Act is amended to ensure implementation of management plans. Efficient use of the resources expended in developing the plans necessitates Federal support for implementing them once

they are completed. Deadlines are tightened to ensure that individual participants can't stall the entire process. Secondly, it requires EPA to take on a more aggressive leadership role in assisting the program fulfill its goals. Third, the bill increases citizens input in the development of the plans and requires environmental organizations to participate in the management conference. And finally, it provides funding to ensure that States are given Federal assistance for implementation, enforcement, and monitoring of their plans. Current appropriation levels are severely inadequate to meet growing demands. The bill amends Title VI of the Clean Water Act to increase funding for SRFs to \$4 and then up to \$5 billion per year with a specific set aside for implementation of management plans. Section 320 is also amended to provide grants for innovative projects and interim actions not ordinarily funded through the SRFs.

In summary, the National Estuary Program has done an excellent job in identifying waters of national significance and documenting their problems. However, the program must be strengthened. Proper implementation of the NEP would help address a full range of other coastal pollution issues that impact the economic and environmental health of our communities.

This concludes our testimony. Thank you for soliciting our views, and we appreciate the committee's attention to estuary and aquatic ecosystem protection.

Mr. APPLGATE. Thank you, Ms. Martin.

Ms. Hartmann.

Ms. HARTMANN. Thank you, Mr. Chairman. My name is Carolyn Hartmann. I am a staff attorney with the U.S. Public Interest Research Group, U.S.PIRG. U.S.PIRG is the national lobbying office for State PIRGs with over 1 million members in 30 States.

For over two decades, the PIRGs have fought to clean our waterways. PIRGs have played a key role in helping to pass pollution prevention and toxics use reduction laws, we have filed over 60 Clean Water citizen suits, and helped to pass the New Jersey Clean Water Enforcement Act, the strongest of its kind in the country. We urge Congress to bring the lessons learned at the State level up to the national level.

"Weak and sporadic," this is how a top GAO official described the Clean Water's enforcement program. He went on to say that "despite serious and longstanding violations, most enforcement actions are informal slaps on the wrist." Strong enforcement of the Clean Water Act is fundamental to the success of the program. Unfortunately, studies conducted by the GAO, the EPA's Inspector General's office, environmental groups, and the States show that discharge violations are routinely ignored even for serious and chronic violations.

In addition, economic benefits are often not taken into consideration when penalties for violations are determined. John Martin, EPA Inspector General, testified last Congress that when penalties are reduced to below what it would cost to comply with environmental laws they encourage, rather than deter, noncompliance. Small fines and lengthy time limits to achieve compliance promote a "pay-to-pollute" mentality. The Clean Water enforcement program should be strengthened to create greater incentives to comply

with the law by setting mandatory minimum penalties for serious and chronic violators, prohibiting profits from polluting, and strengthening the reporting and inspection requirements.

The New Jersey Clean Water Enforcement Act contains such provisions. New Jersey has found that under its tougher enforcement program more facilities are attaining compliance. In addition, the average penalty assessed in each formal enforcement action has actually decreased. Because the Act requires the New Jersey Department of Environmental Protection and Energy to conduct more frequent inspections of facilities operated by significant noncompliers, the agency finds violations more quickly and takes timely action. This results in reduced average penalties.

Noncompliance at any given facility must be addressed quickly rather than waiting for patterns of chronic violations to develop. Uniform minimum responses to violations will decrease average penalties assessed and bring violators into compliance more rapidly.

We recommend that State programs be required to establish mandatory minimum penalties for serious violations of and significance noncompliance with the act based on the definitions currently used by the EPA and New Jersey.

The existing Clean Water Act allows economic benefits to be taken into consideration in assessing penalties. Unfortunately, this authority is greatly under utilized. GAO has found that in nearly two out of three penalty cases in EPA programs, there was no evidence that economic benefits had been calculated or assessed. We believe that the penalty should not be less than the economic gain realized by the polluter; otherwise, it pays to pollute.

Access to accurate and consistent reporting is fundamental to the success of the Clean Water Act. To improve access to discharge reporting, Congress should amend the Clean Water Act to require all facilities discharging to ground water, surface waters, or treatment works facilities to submit discharge monitoring reports on a monthly basis.

In addition, Congress should amend the act to require that permitted facilities be inspected once a year and that the inspection should, at a minimum, include a review of housekeeping measures, sampling techniques, maintenance records, and independent sampling of the permittee's effluent. New Jersey has implemented this improved inspection program and has credited it with bringing compliance up and average penalties down.

We also recommend that Congress remove current obstacles to citizen suits. Citizen suits are a tried and true method of bringing polluters into compliance with the act. Unfortunately, a 1987 Supreme Court case, *Gwaltney*, seriously weakened the deterrent effect of citizen suits. The result of *Gwaltney* is that companies have an incentive to delay compliance until citizens submit their 60 day Notice of Intent to sue. The company then has 60 days to get itself into compliance and avoid all penalties and keep any economic benefit from the violation. Some States that PIRGs are currently filing citizen suits in report that up to 60 to 80 percent of their cases are affected by the *Gwaltney* decision. This greatly undermines the deterrent effect of citizens suits. Congress amended the Clean Air Act

in 1990 to remedy the *Gwaltney* problem. We urge Congress to make a similar amendment to the Clean Water Act.

Other recent court decisions have over broadly interpreted the ability of State actions to preclude citizen suits under the Clean Water Act. These decisions severely undermine both Federal and citizen enforcement and encourage violators to negotiate private sweetheart deals with State Governments that may impose inadequate penalties. EPA has recommended that the Clean Water Act be amended to clarify or delete these provisions. We agree.

Finally, citizens have a right to know when significant threats to their health or the environment are present in their communities. The public should have access to information regarding the discharge of toxins and other pollutants into the waterways in which they swim and fish. Congress should amend the Clean Water Act to require public posting at waterways that do not meet applicable water quality standards or are subject to a fishing or shellfish ban or advisory or consumption restriction.

In addition, Congress should expand existing toxic release inventory reporting to cover additional chemicals, facilities, and data necessary to track and encourage pollution prevention. We are working with Congressman Pallone and Senator Lautenberg to introduce legislation which will strengthen enforcement of the Clean Water Act. We thank Congressman Pallone and Senator Lautenberg for their leadership and urge you all to join them by supporting this legislation.

Thank you.

Mr. APPLGATE. Thank you, Ms. Hartmann.

Ms. Cameron.

Ms. CAMERON. Mr. Chairman and members of the committee, I am going to talk briefly about polluted runoff problems and solutions.

Polluted runoff is our Nation's biggest water quality problem. To give a few examples. Agriculture is widely recognized as the biggest source of water quality impairment in the United States. In EPA's latest compilation of State data, about 100,000 river and stream miles nationwide had agriculture runoff contributing to their impairment. Agriculture was a contributing source in over 60 percent of impaired stream and river miles. The next largest known source of impairment was municipal sewage treatment plants, a contributing source on only 16 percent of impaired river and stream miles. So agriculture does stand out as a major source of water body impairment.

Some specific examples are soil erosion, sediments pollution, fish kills from pesticides and low dissolved oxygen, herbicides detected by the United States Geological Survey throughout surface waters in the Mississippi River system, and nitrates in ground water. All of these are systemic, widespread water quality problems of agriculture. They are not the fault particularly of a few bad actors, although bad actors are there and we must address that problem as well.

In the West, grazing and over-grazing is a major problem. State-wide surveys by the Bureau of Land Management in Colorado, Idaho, Nevada, and Utah show that over 80 percent of assessed streams or riparian zones were in poor or only fair condition.

As you can see from the diagram we have here entitled "Watershed Pollution Sources", on the far left we have a tractor that symbolizes agricultural water quality problems, pesticides and manure spreading. Earlier Brett Hulseley talked about the problem in Milwaukee that may very well have been related to a manure type of pollution. On the right of the diagram you see the homes in blue. Those symbolize suburban development causing polluted runoff and prohibiting or preventing groundwater recharge. When we pave the land, unless we do it very carefully, we ruin water quality. So urban runoff is another major source of water quality.

Right now, we do not have good national statistics from any Federal agency on the full extent of the urban runoff problem. However, the Natural Resources Defense Council has done coarse estimates of runoff loadings in seven major urban areas, including District of Columbia, Los Angeles, and Cleveland. In these urban areas, we found that urban runoff discharges of suspended sediment, organic matter that robs oxygen, and heavy metals often rivaled or exceeded the loadings from factories and sewage plants in the area. So urban runoff is very significant.

Logging is another major water quality impairment. We have new evidence from the Northwest showing that it is not enough to simply protect the river mainstems of the Columbia River and other types of rivers, we must have water quality standards and logging runoff controls that require the protection of vulnerable small streams, tributaries, that are the nursery grounds to rear the small coho salmon and other critical fish for the Northwest.

So leading into solutions. We have technical solutions. We have the know-how to solve all of these water quality problems caused by land-based sources. The problem right now is we lack vision, structure, and enforceable requirements in most States. Existing programs are there in the Farm Bill under the Water Quality Incentives Program but it is a voluntary, underfunded, scatter-shot program. Under the 319, which is the relevant section of the Clean Water Act, we have a program but, again, it is mostly voluntary, scatter-shot, and underfunded.

We also have a new program that shows a lot of promise, the Coastal Zone Nonpoint Source Pollution Control Program. Coastal States right now must implement enforceable runoff controls under this new program. The Coastal program gives us a model for the rest of the country. EPA published a book that is very thick that is full of management measures and these measures are amenable to creative tailoring on each site. We do not wish to dictate practices to landowners but only to ensure that all landowners work together. As you can see in the diagram, we have many different land uses that together impair our watersheds. So together they must work for solutions.

We are working with Congressman Oberstar of Minnesota, who was the framer of the 1987 319 program, to revise that program to give us the vision, the structure, and the enforceable requirements that we need. There are three essential elements that we are looking for. First of all, we want to put all watersheds that are now listed as sick, damaged, degraded, or threatened on a schedule for restoration. I would like to point out that we have a very wide consensus provided to us by Water Quality 2000 for these require-

ments. To quote from Water Quality 2000, "Farm level resource management plans should be mandatory for all farms in watersheds where surface water bodies or ground water systems are impaired or where there is a probability for impairment." So we have a very broad consensus emerging throughout the country that we have to have a watershed-based program and that all land users in these watersheds need to work together under a mandatory requirement that they undertake site level planning, although we want flexible planning and we want the ability for every farmer or logger or developer to tailor it to their individual needs in combination with the needs of the watershed.

We have one more major initiative that I want to highlight, and that is urban watersheds. Urban watersheds are among the most neglected in the country. I mentioned earlier the scourge of urban runoff, which is what we call poison runoff. We also have other widespread damages going on in the Anacostia River, the Cuyahoga River in Cleveland, the Los Angeles River. There are grassroots groups that are working to revive these rivers but they need help.

We are working with Congresswoman Eleanor Holmes-Norton to craft legislation to amend the Clean Water Act and we are looking here again for three major elements in this legislation that we're working on with Ms. Norton. First of all, we want local leadership emphasized. We want to have local citizen groups and grassroots groups working with local government to lead these programs. Secondly, we want green jobs. We want to hire inner-city youth and skilled and semi-skilled workers. Thirdly, we want to hire these workers to do biological restoration, work like creating new wetlands that will act as the kidneys to filter out the poisons from the runoff.

I wanted to mention just one final element that is in the draft Oberstar bill that will also help us to fill the monitoring gaps. We want to require that every State devote a target level of \$100,000 a year out of its 319 budget to volunteer citizen monitoring programs. These programs will be essential in putting our volunteer resources to work around the country to help us find out exactly where are damages going on and how we can fix them.

Thank you.

Mr. APPLGATE. Thank you very much, Ms. Cameron. And thank you all for some very thought provoking testimony. You have certainly represented your positions exceedingly well.

Mr. Adler had mentioned somewhere in his testimony that most people cannot drink from their taps, eat the catch from their fishing pole, or swim with full assurance that they will not become ill or face long-term chronic health problems. Unfortunately, there is no full assurance of protection of anything in life. That doesn't mean that we shouldn't at least set it as a goal to try to achieve that. It would be nice to think we would reach the Garden of Eden, but I am not sure that is within our undertaking.

I just wanted to ask you one thing, just sort of in reference to the Exxon oil spill of some 11-12 million—who said that?

Mr. HULSEY. I said that.

Mr. APPLGATE. That was you, okay. There is two-thirds of that amount is legally allowed to be dumped into the Great Lakes.

What manner is that? Are they permitted to do that? Do they get a special permit or—

Mr. HULSEY. No, these are through standard NPDES permits. For instance, there is a oil refinery on Lake Superior, Murphy Oil, that now dumps about 30,000 pounds of oil and grease into a tributary that runs into Lake Superior. They are now applying for a permit to dump 300,000 pounds of oil and grease directly into the Lake using the Lake as a larger mixing zone. So that is 1 of over 1,000 emitters of oil and grease into the Great Lakes.

Mr. APPELEGATE. How is that permitted?

Mr. HULSEY. Just through the standard State Water Quality—

Mr. APPELEGATE. I don't mean paperwork, I mean why or how? Does it have some benefit other than to the oil company?

Mr. HULSEY. No.

Mr. APPELEGATE. Why would they be allowed to dump that much into any one of the tributaries or into the lakes?

Mr. HULSEY. By using mixing zones, they dilute this oil to such a low concentration that, they claim, it causes no biological effect. And oil does break down; it is not a persistent toxic. But it can be acutely toxic at the point—in fact, in some harbors it lines the bottom and creates sort of a gooey muck that we're probably going to have to go in and clean up.

Mr. APPELEGATE. Yes. Okay.

Mr. Inkley, I think you were talking about the loss of wetlands and you had a chart back there.

Mr. INKLEY. Yes.

Mr. APPELEGATE. I was interested in that and, of course, the reference to Ohio that they have lost 90 percent of their wetlands. I am curious to know over what time period did most of that occur and how did it occur and why did it occur.

Mr. INKLEY. The loss of wetlands in Ohio, the 90 percent loss, goes back over a 200 year time period. The most rapid period of loss of wetlands throughout the country and in Ohio as well was during the 1900s. So it is more recent rather than a more historic loss. A lot of those losses are attributed to agriculture, a lot of those losses are attributed to development in Ohio as well.

Mr. APPELEGATE. Prior to the turn of the century, you say?

Mr. INKLEY. No. I am saying that part of—

Mr. APPELEGATE. You said the 19th century?

Mr. INKLEY. No, in the 1900s.

Mr. APPELEGATE. Oh, 1900s.

Mr. INKLEY. Most of it has been in this century. There has been greatly accelerated loss of wetlands in this century. Unfortunately, the loss of wetlands continues on a nationwide basis at approximately 290,000 acres per year.

Mr. APPELEGATE. Okay. They are interesting figures.

Mr. Adler, you mentioned that by 1985 some 74 percent of the population was served by wastewater treatment plants. Is that the latest figures that you have or do you have others? And let me ask, do you know what percentage of the population which is required to have wastewater treatment facilities is represented by that number?

Mr. ADLER. I believe, Mr. Chairman, that the current figures are roughly 85 percent of the U.S. population is served by secondary

treatment or better. I can check that figure and get an accurate figure to the committee.

As to the percent of population required to have secondary treatment, any city with a surface water discharge sewage treatment plant, except for those limited number of cities with a 301(h) waiver, are required to have secondary treatment. I would point out that there are sewage discharges into our waters every time it rains that receive less than primary treatment through combined sewer overflows. In addition, we have many essentially leaky sewer pipes around the country where we have raw sewer overflows from the pipes themselves. So looking at the percent population served by a secondary treatment plant does not mean that those percentages of our actual sewage is treated to the secondary level, which causes some of the problems that Congresswoman Molinari was referring to in her statement.

Mr. APPLEGATE. And you cite the lack of information to judge progress in overall water quality. But I am sure you are familiar with the work being performed by the Intergovernmental Task Force in monitoring water quality, which is chaired by the EPA with the U.S. Geological Survey, and its efforts to evaluate existing technology to interpret and assess water quality data to recommend better ways to access such technology and to recommend ways to provide technical assistance. How would you rate the concept and the work performed up to this point? And do you have suggestions that you would like to make to them?

Mr. ADLER. I have read the Intergovernmental Task Force report. I think it is excellent work that is being done, not just by EPA but by USGS and other Federal agencies. Experts agree that we have a lot of data but very little information. One USGS commentator referred to our water resources data as data rich but information poor. The information is often inconsistent, taken by different States using different methods that have changed over time at different locations, making it virtually impossible on a national scale to determine long-term water quality trends. That is just looking at chemical data.

As some of my colleagues mentioned, we are doing even less in terms of finding biological impairment. How is the ecosystem faring? A number of States, including Ohio, are leaders in that area, North Carolina, Maine, others who are looking at biological impairment. I believe that the work of the Intergovernmental Task Force will move us forward in looking at the health of the entire ecosystem, and we would encourage amendments that would require EPA and the States to set biologically-based water quality standards as a supplement to chemical-specific standards.

Mr. APPLEGATE. Okay.

Mr. ADLER. Did that answer your question?

Mr. APPLEGATE. Yes, I think so.

Mr. Inkley, your organization has advocated that the Clean Water Act be amended to specifically ban certain chemicals. Do you think it would be more appropriate to do that through law or through the rulemaking process or some other process which would allow for full public participation?

Mr. INKLEY. I would like to ask Stephanie Grogan, our staff expert on that, to address that, if that would be okay with you. I introduced her at the outset of my testimony.

Mr. APPLGATE. Certainly.

Ms. GROGAN. Thank you. I think that there is some maneuvering room within the existing statute under section 307 for EPA to undertake prohibitions of discharges of chemicals. Unfortunately, since the time that was put into the law it has never been effectively used. So while there is potential for that, I think that maybe the law needs to be kind of recharged with further explicit direction on how to do that. We certainly would advocate the laudability of having a public process, mainly because there are a lot of details that need to be accumulated from industry. What are the alternative safe substitutes that could be used in place of banned chemicals? What are alternative processes that manufacturers can use? We really feel that industry should be brought to the table on this to be able to come forth with their information and make it a public process.

Mr. APPLGATE. Okay. That helps to answer my question. That's fine. Thank you. I appreciate that.

We have been looking at President Clinton's idea of establishing a revolving fund for municipal and industrial water supply, drinking water. What do you think of that idea? Would you best answer that, Mr. Adler?

Mr. ADLER. If no one else jumps in, I will try to answer. NRDC, and I believe other organizations, supports the creation of a State revolving fund for drinking water systems around the country. Recognizing that particularly in small communities around the country that do not have the economies of scale and perhaps the access to the bond markets that larger cities have and don't have regional treatment systems, we ought to help with the financing of those safe drinking water supplies for all Americans. We also want to encourage regionalization of drinking water systems so that we can attain those necessary economies of scale.

Mr. APPLGATE. What kind of cost would we be talking about? I know that you said you were quoting Oscar Wilde a while ago and that's fine, it is one thing to know the cost, another the value. We understand that but we also have to deal with reality and we have to know about amounts of money and where we're going to get it.

Mr. ADLER. The environmental community's recommendations on the President's infrastructure plan back in December asked for drinking water financing at the rate of about \$2 billion a year and that included funding for SRF and money through the Farmers Home programs. I believe that the President's program is about a \$1 billion a year SRF proposal, and we certainly think that is a start in the right direction to financing these systems.

Mr. APPLGATE. Yes. Some of his ideas haven't been able to fly so far, so I am not sure how—but I don't think there is any question that it does have value. It is something we certainly are going to want to be taking a look at.

Let me just mention to all of you that we will be submitting questions if we don't have time to ask them all today and we would appreciate your response ASAP. We appreciate your input.

Ms. MOLINARI.

Ms. MOLINARI. Thank you, Mr. Chairman.

Mr. Adler, in your testimony you stated that pollution caused by raw or partially treated sewage seems to be getting worse in some areas. Yet, it has been my understanding that a lot of the urban areas have been upgrading their combined sewer overflows or their package sewage treatment plants. Why is it that in some areas the situation is getting worse?

Mr. ADLER. I believe that the part of my testimony to which you refer talks about shellfish bed closures around the country which is monitored by NOAA, the National Shellfish Register, which is showing that in the past several years the percent of shellfish beds that are closed or restricted has increased by 6 percent. That means either that the pollution is getting worse or our monitoring is getting better; it is difficult to distinguish between the two. But less than two-thirds of our shellfish beds, particularly in the Northeast, Southeast, and some Gulf Coast areas, are fully unrestricted to shell fishing, showing that we have a serious problem both from sewage pollution and from polluted runoff.

Ms. MOLINARI. Mr. Hulse, you mention an issue that is extremely sensitive to part of the area I represent relative to sediments contaminated with dioxin. It is a discussion that continues to go on in the New York/New Jersey area with the fishermen versus the Port Authority, I think that is just about how it boils down. What can we do? We have commissioned a study with the assistance of I think just about every group represented here to go back in and do a dredge material demonstration project. That's not going to help us right now as we attempt to resolve this problem. What should we be doing to prevent this problem. What are your recommendations as to what we should be doing with the contaminated sediment?

Mr. HULSEY. What we found in the Great Lakes is that by identifying very precisely the high contaminant material—in one harbor we had 500,000 per million PCBs which is similar to dioxin in the way it behaves in the environment—and then by surgically going in and removing this material and decontaminating it, as opposed to trying to decontaminate a whole large blob of material, we were able to do it in this one example for about \$17 million at a Superfund site in Waukegan Harbor. This has been our best example. If you have very precise assessment information, sort of a 3-D computer model of where the stuff is, you can go ahead and remove that. Perhaps that material might be stored. I know NRDC and EDF have been working on this with the Port of New York/New Jersey as well as the Contaminated Sediments Working Group, and they are working toward some solution. But by identifying the high contaminated material, you are usually able then to deal with the less contaminated or uncontaminated material in a conventional fashion.

One problem right now is we do not have national sediment criteria to tell us what is contaminated and what is not contaminated. So there is a very low level of trust between the environmental and fishing community and the ports. The ports say it is clean, we say it is dirty. That's why we need to move forward with this EPA process for contaminated sediments standards.

Ms. MOLINARI. Would anybody else at the table like to comment on that? I don't know if you personally have been involved in that issue.

Mr. HULSEY. We can get you some more information on that.

Ms. MOLINARI. I appreciate that. Obviously, it is an issue that needs to be resolved as quickly as possible. Thank you.

Ms. Hartmann, I know that you have met with my staff regarding the enforcement issues concerning our area. What are the objections that we're starting to hear from the New Jersey businesses relative to the new enforcement programs that have developed? If you could just give us a little update on that.

Ms. HARTMANN. All right. As far as I understand, I spoke to some people at the New Jersey DEPE yesterday to find out from the horse's mouth, as it were, how the program is working. Probably the two areas that are causing greatest concern for the industry are the inspection process and the permitting fee system that is involved in the program. The representative from the agency credited the inspection process with being sort of the backbone of the program. By increasing inspections and increasing the value of the inspections, they are finding that they can get the worst violators into compliance more quickly, thereby reducing average penalties. So they see that as being a critical component of the program.

With regard to permitting fees, the State is currently in the process of reviewing the fee system. That is something that we are not recommending be changed. In the Pallone and Lautenberg bills, that is something that we're not touching.

Ms. MOLINARI. Thank you.

Just one last question. Mr. Adler, you indicated that there has been a significant decline in the aquatic habitat, citing a variety of commercial and sport fisheries and shellfish. Can you estimate how much of the decline is due to the physical alteration such as dredging or development versus pollution or over harvesting?

Mr. ADLER. No, I can't and I don't think anyone can assign specific percentages of fisheries decline caused by habitat loss or pollution or by over-fishing. But I can quote to you from the best experts I know of, which are a panel of experts from the American Fisheries Society, who wrote in 1989 that "habitats continue to be degraded through human activities associated with agriculture, mining, industry, and urban development. While harmful exotic species, non-native species, continue to be introduced and native fishes are transplanted beyond their natural ranges, overuse was a relatively minor factor and only for a few species." So over-fishing turns out not to be the big part of the problem. Alteration of habitat, physical and chemical and biological habitat decline is the larger part of the problem.

Ms. MOLINARI. Thank you. Thank you, Mr. Chairman.

Mr. APPELGATE. Thank you, Susan.

Mr. HAYES.

Mr. HAYES. It is interesting in listening to the panel, as almost always the case with any group of environmental panels, I find myself that I agree implicitly with some of the things that are said and that I disagree with some others that are said all in the same morning at the same time. As I was sitting here I was thinking,

in light of some of your comments, how to add some kind of structure into that chaos so that we can both prioritize our concerns and reduce them through the use of criteria that everybody can understand and implement.

Let me give you an example and I'll show you why the difficult process. I think the worst example that I know of a permit granted by a State agency to do environmental harm is only about 30 miles from what I think is the worst example from the failure to grant a 404 permit to do some tremendous good. In the first case, the Department of Environmental Quality in the State of Louisiana is granting a permit for discharge of waste materials through injection that I am convinced is going to harm the Chico aquifer. I think that is outrageous. In the other, we have what is an illustration of a clash not between development or farm community and environmental issues, but a clash within itself.

This is leading to some of the difficulties I have with the position taken with the Wildlife Federation where the agencies themselves through different missions have clashed. In other words, marine fisheries is interested in fish and so is U.S. Fish and Wildlife. On the other hand, you will have some efforts by the Corps and you will have some efforts by environmental organizations on duck habitat on fresh water and, on occasion, agriculture interests moving in on fresh water. Those two collide. In looking at your brochure, which I think is excellent, when you talk about "we" have got to save fishing interests that are commercial, "we" have got to translate that to environmental benefit and jobs, "we" have got to save a declining duck population, guess what? You can't always be on the same side as if they never, ever come into conflict. And when they do we need a rational basis of determination because the one made 20 miles from the site I think is insane and ends up having erosion and salt water intrusion and the loss of wetlands.

My question is, and I am really going to Doug only because you have covered the areas I am most interested in. The truth is I would like to talk to all of you on a different occasion and maybe with a different kind of forum where there was an opportunity for interchange within the groups here. But almost everything in your organization's brochure that I agree with points to the need for more localized control, not more central control from Washington. In other words, I don't know how many people in this audience with what environmental credentials would actually believe that I am sitting here looking at a fight with the Catholic Church trying to do a marsh management plan where those who are in favor of it say it will increase duck population, it is good marsh management with approvals from the Corps, and those who criticize it at EPA saying that actually erosion has declined, it is not bad as it could be, and it will harm commercial fishing if you go forward with more freshwater.

How do you resolve that from Washington? Can't you resolve that better with a coastal management plan for Louisiana where those interests are closer and more visible and can be seen better? You will never satisfy both sides. In other words, you can't legislate the answer to that question; you will always have those clashes. I would be most interested in your response on localization.

Mr. INKLEY. Thank you, Congressman Hayes. I am not sure I got all of that. Perhaps you could repeat the question for me? [Laughter.]

Mr. HAYES. I'll be glad to. [Laughter.]

Mr. INKLEY. I was kidding. I would like to go ahead and address your question directly. We do believe that the Army Corps of Engineers should be responsible for continuing a program as they have managed it. That is a national program. Also involved should be the Environmental Protection Agency as the oversight agency. We stand by both of those agencies being involved. It is important to have the Environmental Protection Agency as an oversight organization. After all, they are the Environmental Protection Agency. It is a national program which, by and large, has worked very well. Certainly, there have been some problems but we believe that it does need to continue as a national program.

Mr. HAYES. But looking at your recommendation on page 40 of your information, you are recommending amending section 404 to require the permitting agency to accept the recommendations of Fish and Wildlife Service or National Marine Fisheries Service unless—and then you say (1) is inconsistent with legal requirements, and (2) alternatives to Fish and Wildlife Service recommendation to provide equal protection for aquatic functions. What I am saying is you just made them all fish and in so doing removed the balance in order to have a conflicting view on trying to do some kind of duck population preservation, which gets back to your \$1 billion a year that sportsmen spend doing that, and once again pushes the two against each other with now the resolution made by Fish and Wildlife. I assure you they are going to resolve each and every instance in one manner. That is not balance and that is not going to preserve wetlands. That is going to erode and cause salt water intrusion which is killing wetlands.

The 46 percent loss you are referring to in my State of Louisiana—and by the way, I notice you are using the Fish and Wildlife Service definition and not that of the manual. Congratulations. You probably couldn't understand the manual and neither can anybody else. But even in using the limited definition of Fish and Wildlife, you are concluding those coastal wetlands are being lost, and you are right. They are being lost mainly not by construction, not by the building of roads, bridges, tunnels, sewers, they are being lost by salt water intrusion. Salt water intrusion is precisely what is often promoted on plans to enhance movement and estuary systems for more fish. That is not wrong but what I am trying to point out to you is it is not so simple to simply say you have an environmental concern and an industrial concern. That is just not true. I think that has got to be brought to local levels for decisionmaking.

Why would you automatically assume, for example, with no—look, this agency has a mission. I don't want anything I am saying to be critical of Fish and Wildlife. Their mission is to do what they are doing. But why would you make it defer to them automatically and remove from that any kind of balance or decision that EPA, for example, would make in your illustration of looking at the balance of both competing interests?

Mr. INKLEY. I think the answer to your question, Mr. Hayes, is that what we really need to do is try to conserve the wetlands as

they exist today. The problem that you are referring to of different agencies having different objectives is that we're talking about manipulation of wetlands from their original condition to some other type of condition. Wetlands type conversion is very difficult to do, very expensive to do. I think that we need to look towards conserving and preserving wetlands in their original condition where they exist today rather than trying to make massive type conversions to other types of benefits that supposedly the wetland would provide.

Mr. HAYES. Okay. But let me give you perspective of two different States and two different parts of the world. Mrs. DuPuis came up here last week, she was among the many Americans who received environmental awards. Some of you may even have been among those who nominated her. She was the Louisiana winner and there was a very nice dinner where I believe Jay Hare[ph] spoke as a matter of fact and where the awards were given. She sat in my office and she said the most difficult thing for her to explain to the people she had met up here when they would talk about what are you doing in Louisiana is that doing nothing murders our State, whereas doing nothing on beautiful sand beaches in parts of California or Florida may well be a lofty goal, but that we are losing these great numbers because of salt water intrusion and erosion added to by natural forces of hurricanes on occasions. If we do nothing, we are going to lose tremendous additional numbers of those acres.

That difference in perspective is probably where most of our disagreement comes from. If you look at the geography, you can look much more at what I am and why I have arrived at confrontations with environmental groups. Doing nothing down there murders the State. That's why I go so much for localized treatment and continue to talk about not balance in the traditional terms of 20 years ago, about jobs versus pristine forest lands, but a balance of understanding that if we don't build structures, if we don't dredge and fill, then we are going to continue not conversion, but watching it convert through our inaction to nothing but a salt water basin and move salt water in the Gulf of Mexico up Interstate 10, which would be the last barrier. Those are real concerns and why I keep pressing all of you in the environmental community to show you my perspective. Because if you don't localize those areas, if you don't allow them a marsh management system and a system of coastal control and management, then you are not going to have environmental good, you are going to have dramatic environmental harm.

And, yes, the young lady who points out there are some State permits that are disastrous is absolutely right. But science can play a different role there because the role science can play there is to look at water quality, to look at both water and air emissions under Clean Air, and play a more objective role. To do a manual that defines what a wetland is may be an interesting scientific exercise but it is meaningless to our problem in Louisiana because it doesn't matter what you call it or don't call it. If we can't have some kind of more localized control, then we are going to watch it disappear under anyone's definition.

Mr. INKLEY. The Army Corps of Engineers, as you know, is responsible for running the permitting program. In 1991, over 80,000

actions took place in wetlands under the individual and general permit program. By and large, most of the applications that are applied for are granted and the project goes ahead, the project proceeds. I believe this particular project that you are referring to is the Point DeFeur project?

Mr. HAYES. Yes.

Mr. INKLEY. I understand that permit application has been withdrawn at this time.

Mr. HAYES. Right. Which is a good example of why you can't use the overrides of the vetoes. All of those statistics are meaningless; they are numbers that don't matter. And why? When you talk about instances, it is under general permits. Yet, under the Edwards bill, we do away with general permits. The Edwards bill does not have general permits done under it. It has requests for specific permits. Why would that be good?

Mr. INKLEY. The fact of the matter is that still there continue to be these 80,000 actions that occur in wetlands per year. That was a statistic from 1991. This is under the Clean Water Act as it is run now. By and large, the Army Corps of Engineers is a permit-granting agency. Less than 4 percent of the permits are denied on an annual basis. The projects do, by and large, proceed.

Mr. HAYES. It is not important enough to get into the semantics of that. I don't agree with that but it is not important enough to waste the time on. It is a matter of definition of how you call "proceed" and what enters and exits the system.

Leaving that aside, let's take the Corps then as an agency, let's take EPA with its function. What I am getting at is this, why would you not trust the EPA to do its job, leave the Corps as permitting, allow the EPA's role? Why do we have to keep expanding into more and more agencies? Why do we keep having to add to the amount of paperwork flow there and back? Why not give EPA the resources and Corps, which has the resources and a presence in virtually everywhere, the authority to go on as a permitting agency with the oversight through EPA, instead of needing five other agencies to give their input, including, under Don Edward's bill, the addition of the Department of Commerce?

Mr. INKLEY. It is very important for the agencies, the Army Corps of Engineers and the EPA, to have—

Mr. HAYES. No. That's those two. Why do we need additional agencies? Why can't we streamline it where we're now dealing with two agencies?

Mr. INKLEY. The U.S. Fish and Wildlife Service and the National Marine Fisheries Service both have trained biologists that are specifically trained to do those duties as to assess the environmental impacts with respect to marine fisheries and with respect to fish and wildlife impacts. It is their responsibility to make advisements to the EPA and to the Army Corps of Engineers. They should have that responsibility. The Army Corps of Engineers and the EPA should be seeking out the best authorities possible. That's why we want to include the National Marine Fisheries Service and the U.S. Fish and Wildlife Service in that process. Let's get the best information available.

Mr. HAYES. But with an automatic assumption that their recommendations are followed. That's not including them in the process, that is elevating them.

Mr. INKLEY. It is not an automatic assumption that their recommendations follow. It is stated that they must reply specifically in writing as to why the recommendations are not being followed.

Mr. HAYES. Actually, it says to follow them. It says, "Therefore, we recommend amending 404 to require the permitting agency to accept the recommendations." To require to accept is not to take a look at it and ask them what their comments were and respond to them. What I am saying is I have nothing against Fish and Wildlife except you are elevating it, and then where is EPA's role? What happens when EPA doesn't veto and says "By the way, we disagree." Are we going to elevate these to Washington? Are we going to have 80,000 elevations to Washington? Obviously, you would overwhelm EPA there.

The problem with all this is in Washington people are looking at papers. Where these sites are, we have too few resources. What we ought to be doing is using resources at the site level to make better judgments than can be made at a higher level. You are talking about science and doing research. Where are you going to do the research? How about the site? How about the place where it is happening?

Mr. ADLER. If I may interject for a moment. The Edwards bill, as I understand it, says that the recommendations of the resource agencies, Fish and Wildlife and National Marine Fisheries Service, are required to be followed unless the Corps of Engineers has good reasons in writing for ignoring them. So it essentially says listen to the expert biologists unless you have good reasons not to do so which you can articulate in writing. I guess I don't think that's a particularly unreasonable process.

I was shaking my head earlier about the general permits. The Edwards bill does not eliminate general permits, it simply requires the Corps of Engineers to evaluate the impacts of those permits so that the cumulative impacts of activities under general permits are not environmentally degrading. Recent studies by the Fish and Wildlife Service have shown that is occurring.

Mr. HAYES. It says evaluate them in each individual case. In which case, you may as well not have a general permit. If you are evaluating it in each individual case as the permit applies to that case, then it doesn't matter that you don't have a general permit, you are evaluating each case over again and not putting it under the general permit.

Mr. ADLER. I think that's an interpretive—

Mr. HAYES. I'm not sure that is entirely wrong. The point is the resources to do that are nonexistent.

Because of the time constraints, and actually I have probably imposed upon the Chairman's patience more than I would have, but let me ask you to accept this responsibility. As spokesmen for the environmental community, you have at stake what Barney Frank correctly called yesterday "the ability to retain confidence of the public", without which you are going to fail. My concern is that if we don't structure correctly the interplay of individual property owners and add sanity back to a system that can be seen where

the system is being enforced—and most of what I am talking about now is in the wetland area, in the contaminants into major water streams where people at home can see an impact of removing chemical waste, et cetera—but if sanity is not put in those programs where people at home can see it, then you are not just going to lose their vocal support, you are going to lose the entire means by which environmental quality is sustained.

If you bust the funding source, then we're not going to have environmental quality that we can be very proud of. And an insane system will be the genesis of a public reaction to it, a rejection of it because it is not working at home. We are doing crazy things to local people and I don't mean we can excuse it on their ignorance of environmental standards, it is the other way around. They can't excuse us up here in this city on our ignorance of what is really happening in the sites in which they live.

This can be done. You can preserve every environmental goal that you have without the need of an imposition of an absolutely insane system with a dozen comments from God knows how many Federal agencies and bring it to an entire grinding halt just through red tape and regulation alone. The goal in many cases, as I say, is not to shut everything down; in some, it had better be that progress is made through activity instead of throttling it. Because I promise you, if you fly over south Louisiana and look at dead patches of individual mitigation, it is nothing more than testimony to a 404 permit system that makes no sense, and compare that to Secretary Browner's ideas of large mitigation banking, then you will see failure versus the potential for great success. Those are the kind of places where we can meet and where I totally agree with you. I think that the confidence you build at home in using sane systems will reflect very well on future environmental activities, the absence of which is going to lead to an economic destruction and an environmental destruction.

Mr. INKLEY. As a private landowner and also as an owner of wetlands, I would like to respond to your comments. I would say that there is very strong public support for the wetlands agenda that the National Wildlife Federation has outlined. There is no question that there have been editorials written in newspapers all the way across the country supporting wetlands protection. In fact, our own Louisiana Wildlife Federation is a very strong advocate of wetlands protection, including the agenda that we have outlined in the book that you have there. So there is strong support for wetlands protection.

Mr. APLEGATE. The gentleman from Arkansas, Mr. Hutchinson.

Mr. HUTCHINSON. Thank you, Mr. Chairman. Let me commend my colleague from Louisiana for his comments and his line of questioning.

Mr. Adler, in your written testimony you indicate some support for new methods to put a price on environmental protection benefits using what you call the "contingent valuation survey method". If I understand what you are saying in your written testimony, that is a process based on asking citizens what they would be willing to spend for such protection. Is that what is meant by that "contingent valuation survey method"? What is that?

Mr. ADLER. Contingent valuation is a relatively new economic method of assessing the economic value of intangible environmental resources, the value of sitting on a beach and knowing the water is clean, the value of knowing that your kids can swim in their waters safely, that they can go to their favorite fishing hole and be reasonably certain that the fish they eat are safe to eat. It is something which we can't easily put an economic value on.

I believe that there are cases where use of contingent valuation is appropriate. An example was in assessing the damage caused by the Exxon Valdez oil spill. I do believe that it is a new methodology. We can't use it to say this is the total benefit of a resource which is shared by all Americans and future generations, but I think it has some limited value.

Mr. HUTCHINSON. Couldn't the survey easily be manipulated by either emphasizing the costs of pollution to society or, alternately, to emphasizing what society already spends on pollution control?

Mr. ADLER. It could be manipulated in many ways. Criticisms of contingent valuation methodology on both sides argue that it is critical that the people being surveyed are properly informed. So, for example, if the public doesn't know, as Mr. Inkley noted, that wetlands protect 43 percent of threatened and endangered species, if I got that figure correct, then they will give a different answer than if they do know that statistic. So I do agree with you that this is not a perfect methodology and I certainly do not mean to imply that we should use that to come up with a fixed valuation on aquatic resources. I used it more to say that the hard numbers that I presented, the value of commercial fisheries, dollars spent on water-based recreation, do not fully measure the value of our water resources. There are intangible values that we can't possibly put in economic terms and this just gives a sense of the value of those resources.

Mr. HUTCHINSON. I think my concern would be that through surveys like this and through economic methods like this that you end up imposing something from on top. We underestimate I think what people can demonstrate of their concern about environment and the cost to society of pollution through a voluntary method and through a market system.

Ms. CAMERON, in your testimony you referred to farm level resource management plans. Can you help me understand what you mean by that?

Ms. CAMERON. Yes. There are at least two proposals circulating now, maybe even three. First of all, we have the Oberstar draft bill, which I mentioned earlier, that refers to site level or farm level water quality plans. There is also a proposal from Representative Glenn English to have whole farm or total resource management plans for farms. And thirdly, there is a proposal circulating from the Association of Metropolitan Sewerage Agencies that also talks about minimum standards of operation for all land uses that degrade water quality. Those could be thought of also as site level plans potentially.

So regardless of what the individual proposal calls it, we're looking for site level flexible plans that are developed by the land-owners and operators, with the help of and technical assistance of experts like people in the Soil Conservation Service and other ex-

perts, to craft their own approach to water quality on the farm, on the logging site, on the construction site so that the watershed goals are met.

Mr. HUTCHINSON. Would the site level plan or the farm level management plan which would be individually developed be voluntary? Would there be voluntary compliance or would it be mandated?

Ms. CAMERON. We're looking for—and, again, these are in the target watersheds. What we mean by “target watersheds” are that we want all of the watersheds, the drainage areas of the impaired waters known to the States to be impaired or threatened now to be on a schedule for restoration. So when we take all of those waters that are in need of restoration, what we recommend is that the States require the landowners and operators to undertake site level planning. So in that sense, it is not purely voluntary. We want the States to require—well, we want Congress to direct the States to require that those plans be developed and implemented. Right now, as you know, we have a voluntary system and it has not worked.

Mr. HULSEY. Congressman Hutchinson, could I add a quick comment to that?

Mr. HUTCHINSON. Yes.

Mr. HULSEY. In Wisconsin, we have one of the best nonpoint water pollution programs in the country. In this budget, the State of Wisconsin has about \$35 million of its own money relegated to nonpoint pollution control. In our targeted watersheds, we have 30 to 40 percent enrollment in the 319 program yet we are not seeing significant improvements—despite the resources, despite all the time we've spent, despite our State program—in improving nonpoint pollution. What we have seen in Milwaukee is an example of that. So we firmly believe that all farmers need to be involved in this program and all individuals in the watershed cities included.

Mr. HUTCHINSON. I wouldn't contest that a bit but I would contest the statement that it is not working or that voluntary compliance cannot be successful. I think that we're seeing a much, much higher percentage of participation and compliance on a voluntary basis in Arkansas than what you are indicating in your testimony.

Ms. CAMERON. If I could add two more points to respond. First of all, where we are seeing a lot of gains, for example, in keeping soil on the farm it is largely the result of a required program. For those who receive commodities—

Mr. HUTCHINSON. When you say “required”, are you referring to a requirement that a plan be initiated and that they implement the plan?

Ms. CAMERON. That is correct. Under conservation compliance under the Farm Bill, those who receive commodities benefits and have highly erodible land under farming, they are required to undertake soil conservation plans and to implement. So that is an example of a farm level plan related to water quality that is already in place that is required.

Secondly, I will give you an example of a well-known watershed case study in Ohio, the Big Darby Creek watershed. It is a tremendous example of what farmers and environmentalists and State people can do when they work together. This is a watershed with

many endangered species of aquatic life. Even there right now there is only about 15 percent of the farmers that have undertaken the kind of water quality measures that they need to undertake, and that is a voluntary program and only 15 percent is no where near the target goals for that very important watershed where roughly 75 percent or 85 percent of the farmers are needed to join that program in order to make it work.

Mr. HUTCHINSON. We won't debate that. As a group, let me just ask the whole panel a question. As a group, you have outlined a very, very ambitious agenda for clean water reauthorization. Would anyone or has anyone on the panel estimated the total cost to industry, to municipalities, to society as whole if your proposals were fully implemented?

Mr. HULSEY. No, in a word. But I think that for each of the proposals that we have talked about we have considered the cost and considered cost-effective ways of achieving the results. Let me give you at least one example of combined sewer overflows which we've talked about here today. Recently there was a negotiated quasi rulemaking situation in which the Association of Metropolitan Sewerage Agencies and my organization, NRDC; the Environmental Defense Fund, and the State water pollution control agencies got together, recognized that combined sewer overflows are a critical water quality problem, especially in our larger older cities and along our coastlines, but realized that traditional secondary treatment controls might be prohibitively expensive in some areas and we figured out solutions that were cost-effective and we will be recommending to this committee and the committee in the Senate that they adopt those as part of the bill.

So, no, I can't give you a total cost but I can give you assurances that we are interested in the most effective, efficient way of solving these very serious problems. The data in our testimony shows that industry is currently spending \$6-\$8 billion a year on industrial pollution controls. The EPA needs surveys for sewerage are about \$110 billion over the next 20 years for the sewage treatment systems that we need. An additional \$60 or \$70 billion for CSO controls. It will cost a lot of money to fix these problems. But as I outlined earlier, if we don't do so, we jeopardize literally hundreds of thousands of jobs in industries that depend on clean water and that also add billions of dollars to the U.S. economy. So you have to consider both sides of the equation.

Mr. HUTCHINSON. Indeed, you do. I certainly appreciate the need for environmental impact statements. But I think sometimes when we issue these environmental mandates that maybe we need an economic impact statement as to how it is going to impact the community, the school district, the job situations. There is a balance to be maintained and there is an impact on both sides.

Thank you, Mr. Chairman.

Mr. HULSEY. Mr. Hutchinson, in the Great Lakes we have estimated that it will cost about \$540 million to clean up 27 contaminated sites. That is applying our current experience with cleaning up the worst site and multiplying simply by the 27 other contaminated sites you saw.

Mr. HUTCHINSON. What I would suggest though is that does not tell the whole story on what the economic impact will be.

Mr. HULSEY. Right. And right now, if we do not dredge some of those sites—for instance, in Indiana Harbor ships cannot come in full of ore, they have to light load ore. So it is costing the steel industry in the country millions of dollars right now because they can't deal with the problem.

Mr. APPLEGATE. Mr. Parker.

Mr. PARKER. Thank you, Mr. Chairman.

Our technology is getting more and more advanced and sophisticated every year. In some of the testimony, reference has been made to restoring the zero discharge philosophy. Well, zero is changing. It is getting less and less. We can find more and more minute particles, different types of unbelievably small amounts of chemicals and elements in water. Do any of you feel there is a problem with us chasing zero? When does this thing stop?

Mr. HULSEY. Zero discharge is called for by the Great Lakes Water Quality Agreement that we have with Canada, or actually it is the virtual elimination of persistent toxins. That 2,000 pounds of PCB figure that I quoted that companies legally emit into the Great Lakes every year, many of the times the companies have permits that are at the level of detection or below or slightly above. So they are emitting those in very small quantities, parts per billion, parts per trillion. But because they are emitting such huge quantities of water, we have to consider the total maximum daily load from those companies; in other words, have them add up the amount. For instance for PCBs, that is coming out of about 75 pipes at a very small quantity. Many of those are paper mills. So we have to try to measure the total maximum amount of PCBs that are coming out of those paper mills, not just the concentration, even though it is close to the level of detection.

Mr. PARKER. But do you see a problem with us chasing zero whether it is air quality or water quality?

Mr. HULSEY. We believe that progress should be made toward zero discharge of the most egregious persistent chemicals. Those can be identified by their cumulative nature or persistence nature. But as a level of detection, lower than that will automatically start to phase out these chemicals. Right now, we are about 70 times the level of PCBs in fish in the Great Lakes than the EPA says is healthy. So, clearly, we aren't making progress toward zero discharge. And those numbers are actually increasing in some lakes.

Mr. PARKER. From an overall view, do you think that we should move toward a procedure where we would have, for lack of a better term, peer review where we would establish a standardized system where everybody would know what to expect—and I know technology is going to continue to move forward—where everyone both on the Federal and State level would know what we would be looking for, what they would be responsible for? Am I making sense in trying to ask this question?

Mr. INKLEY. I would like to address that with respect to wetlands. We do, indeed, believe that a peer review process is appropriate. That is now underway. The Congress has charged the National Academy of Sciences with developing recommendations, looking at the scientific merits for delineating wetlands. Through that peer review process we should then be able to move on and base our wetlands determinations, base our wetlands policies on science.

Mr. PARKER. Let's talk about water quality. Do you feel that same mechanism would work as far as water quality?

Mr. HULSEY. Congressman, I think that we do have peer review mechanisms in place for such things as development of water quality standards which have specific EPA protocols for the number of studies that must be done and they must be peer reviewed studies to develop a standard. And of course we have got Notice and Comment under the Administrative Procedure Act for every regulation that EPA and the States under State analogues have to promulgate.

Mr. PARKER. Answer this question for me. Why do I have my city officials back home who are trying to meet all the Federal regulations for water quality coming to me saying "They said we had to put in this system so we raised taxes and we put in this system. We don't have it paid for and now they are coming saying things have changed and now you have got to change your system". Why is that? Are my officials back home confused or am I confused not knowing how to explain?

Mr. ADLER. Mr. Menendez actually asked a similar question several weeks ago. And I will give two answers. One is that no one ever agrees entirely on science. You can have 10 scientists disagreeing on the same point just as you can have 10 lawyers disagreeing on the same point. At some point, we need to give a presumption of correctness to our public officials if they followed good process and have reasonable science. Otherwise, we would never do anything. If you wait for perfect science, then those who are harmed are the public who end up with no standards until there is an elusive goal of scientific perfection.

Second, science moves. We continue to learn more and more. And so when we learn that a chemical is more or potentially less harmful than we knew before, then we need to adjust our sights appropriately or else the public and the environment is at risk.

Mr. PARKER. Don't you think there should be some type of standardization so everybody would kind of know where you're going and sometimes spending needless hundreds of thousands of dollars?

Mr. ADLER. I think I agree entirely, and let me give you one example. Right now, EPA writes water quality criteria under section 304(a) which are guidance to the States. The 50 different States then take those criteria and develop different water quality standards for each State based on those criteria. Each of them have to go through an independent process, each have to defend their criteria in different State courts, resulting in tremendous inconsistency. An example is dioxin, where the public in Maryland has a standard which is 100 times weaker to protect public health than across the border in Pennsylvania; and in Virginia, the standard is 100 times weaker than across the border in North Carolina.

We're not talking about the difference between protecting bass in Alabama and trout in Maine; we are talking about people whose susceptibility to cancer and reproductive illnesses and other effects from these chemicals does not vary. You are correct, we ought to have standardization of the degree to which public health and the environment are protected across the country.

Mr. PARKER. One final question. When you are dealing with agriculture and nonpoint source pollution, agriculture pollution, from

reading your testimony, I get the impression that you want everything mandatory down the line. Am I right about that?

Ms. CAMERON. Well, we don't want everything mandatory in the sense that we want to have farmers as well as all other landowners and operators in the target watersheds undertaking water sensitive practices but we do not want to dictate what those practices should be, except for the provision that those practices obviously will need to be in conformance with the needs of the watershed. For example, atrazine levels in the Ohio River or in other rivers that service drinking water supplies, where atrazine levels are detected by the U.S. Geological Survey to be exceeding the drinking water standard for human health, what we want to have is the farmers who are using that herbicide on their corn and other crops in that watershed undertaking practices that they will design, that they will choose of how they want to reduce the atrazine that comes off their lands. But, yes, we definitely need flexibility but the duty should remain and should be established that all the landowners that contribute to this common water quality problem need to contribute to its solution.

Mr. PARKER. Let me ask you this now. Let's say you go out to west Texas and you are irrigating because you have to because it doesn't rain enough. Then you have got a place like Mississippi where it rains so much our children mildew. [Laughter.]

There has got to be some flexibility there. For instance, a city down there can't build a system that will handle the water that comes down, let's say, like some of our hundred year floods. You can't do it. It seems to me there has got to be some flexibility on this thing so it will work.

Ms. CAMERON. We agree that we definitely have to have flexibility in what exactly happens on each site and that those decisions need to be left up to the site owners and operators. But, on the other hand, because we have already invested so many billions of dollars in pollution clean-up for factories and sewage plants, we want to make sure that those investments for the whole watershed yield results. In order to have those investments yield results, we need to bring in the other additional sources of those same pollutants. For example, if sewage plants don't work properly, they could result in pathogen contamination in the same way that feedlots, dairy operations, and other kinds of animal operations also tend to have a lot of runoff with possible pathogen problems if they aren't brought into a whole watershed program.

Mr. PARKER. Thank you. Thank you, Mr. Chairman.

Mr. APPELEGATE. Thank you, Mr. Parker.

Mr. Quinn.

Mr. QUINN. Thank you, Mr. Chairman. Just briefly some general questions. I know we're coming to the end here.

Thank you for your testimony. Before I came up here to the Congress, I was a local town supervisor in western New York and, in that capacity, was on the receiving end of Clean Water Act programs. My predecessor here, Henry Nowak, a member of the committee and Chairman of this subcommittee, was a great help to us back in western New York. But in my capacity as a local town supervisor, I know the fear that local officials have when dealing with

the bureaucracy and government red tape here in Washington, D.C.

A general question for you, Mr. Adler, if you want to be the spokesman for the group. We are going to be dealing with financial reality here in Washington, D.C. very, very soon. One of the advantages we have with the Clean Water Act reauthorization is that over the years Congress has done a lot of hard work. As you all said previously, we have had two decades to review this legislation. I think this statute has been working, but needs more work. Is it a question of just more money, will more Federal money make this a more effective program?

There needs to be a streamline to the legislation, to give the localities greater flexibility and easier administration. We heard yesterday from municipalities, towns, cities, and villages from around the country who have made suggestions on simply how to refinance some of these projects. Have you, or will you, as a group from an environmental point of view make some suggestions that don't just throw money at the problem? Are you prepared to comment on that?

Mr. ADLER. Yes, and I appreciate the comment. Just as a preliminary, we do support increased Federal funding for the State Revolving Fund program, a matter that was addressed a couple of weeks ago. We will put ourselves in the \$5 billion and up club in terms of how large we believe the SRF ought to be to responsibly meet the needs of local communities around the country. But we do not think that just throwing more money at the problem is the only solution.

We need to spend that money more wisely. I will give you two examples in the sewage treatment arena. One is the water conservation proposal that Mr. Inkley outlined. Just as least cost energy planning is not only protecting the environment, but saving electric utilities around the country money by ensuring that if it is wiser and cheaper to invest in efficiency than to build a new power plant, it is the better environmental as well as economic decision. The same is true for water. We ought to be doing least cost water planning so that if it is cheaper to invest in water efficiency than to build both a new water treatment supply system and a larger sewage treatment plant to handle the increased flows, we ought to be doing that. We ought to be having communities do least cost planning to spend our Federal dollars more wisely.

A second example raised by Congressman Hamburg a couple of weeks ago is the use of alternative treatment technologies for sewage in small communities where we don't necessarily have to build the same type of gold-plated secondary treatment plants that we might in a large city. It might be both more environmentally sound and more cost effective to use marsh pond treatments or spray irrigation systems that are less capital intensive and, probably more important, less expensive to operate. So we need a combination of increased funding and wiser use of the funds.

Mr. QUINN. Thank you. And I think that flexibility and the regional approach which my colleague, Mr. Hayes talked about this morning is something that I am going to be looking at in these next few months and through the rest of the year so that we can build in that flexibility we talked about earlier today. I think it is key.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Quinn.

I am sure you will be relieved to know that is it. But I would want to just mention that the ranking minority member Mr. Boehlert regrets that he cannot be here. However, he is working on a very important issue and that is base closings, of which he has one, and so he must be there. But he said that at some time in the future that he would hope to have an opportunity to sit down and talk with each of you.

So thank you very much for appearing before the committee this morning.

Our next panel is titled "Agriculture Panel". We have today Bennett Raley, the National Water Resources Association; Keith Eckel, the American Farm Bureau; Paul Genho, the National Cattlemen's Association; Danita Rodibaugh, National Pork Producers Council; Pete Wenstrand, the National Corn Growers Association; and John Lewis, the Agricultural Retailers Association. I would add that Mr. Lewis is from Belmont, Ohio, in Belmont County which is down in my neck of the woods. It is good to have him here.

As I mentioned with the preceding panel, all of your full statements will be part of the record and the Chair would appreciate if you would summarize your positions. We will attempt to have some questions that we will want to ask and, in the event that we don't get all of the questions from all of the Members, then we would submit questions to you and hope that you would submit answers back to us.

Mr. Raley.

**TESTIMONY OF BENNETT RALEY, NATIONAL WATER RESOURCES ASSOCIATION; KEITH ECKEL, AMERICAN FARM BUREAU; PAUL GENHO, NATIONAL CATTLEMEN'S ASSOCIATION; DANITA RODIBAUGH, NATIONAL PORK PRODUCERS COUNCIL; PETE WENSTRAND, NATIONAL CORN GROWERS ASSOCIATION; AND JOHN (J.I.) LEWIS, AGRICULTURAL RETAILERS ASSOCIATION, ACCOMPANIED BY CHRIS MYRICK, DIRECTOR OF GOVERNMENT AND ENVIRONMENTAL AFFAIRS, ARA**

Mr. RALEY. Thank you, Mr. Chairman and members of the committee.

The agricultural community well understands the importance of the Clean Water Act and of its role and responsibility as a part of our society to address the issues associated with it. The agricultural community has been very focused on the issue, particularly since section 319 in the 1987 amendments. This focus continued when approximately two years the agricultural community joined together 20 groups and developed something, which is attached to my testimony, called "The Principles Statement of the Clean Water Act Working Group". This was a two year effort to identify successes in section 319 that could be built on and areas where there is a need for improvement. I think that the agricultural community has worked very hard to look at the Clean Water Act in a very proactive and realistic manner and that these principles are a good work product resulting from it.

What I would like to do is focus on two parts primarily of my written testimony. The first one is a broad issue that is very, very important to agriculture, but important to point source dischargers as well. The second issue that I will get into is what I will refer to as a regional issue, it is a water allocation issue that is primarily important to the arid States of the west.

Let me go back to the broad issue. In 1972 Congress stated a very laudable goal. It said let's protect, preserve, and enhance the physical, biological, and chemical integrity of the Nation's waters. That is a laudable goal. But let me explain what has happened since then. Some well-intentioned person said, well, Congress meant what it said and so let's develop biological criteria, let's start transforming that goal into a regulatory requirement. And EPA has done just that. In its 1990 Biological Criteria Guidance which EPA asserts States must adopt within this coming triennium and implement in the following triennium, your goal of protection of the biological integrity of the Nation's waters is put into a regulatory scheme because it is folded into criteria that States have to consider when they adopt standards.

Let me tell you what that goal is. That goal is—the narrative standard quotes an example—the status of the stream shall be as it naturally occurs. Again, that is a great thought, but that is absolutely impossible to achieve and still have the society that we know today. It is impossible. I will prove to you that it is impossible to achieve that because one cannot have a natural or pristine stream and withdraw water for use, as we must do in the west to survive. The stream is no longer in its natural state; we have something different. It is a human induced change to that environment.

It is critical for Congress to decide whether or not these theoretical goals of preservation of biological, physical, and chemical integrity are to be continued to be imposed in a very realistic sense on folks that are subject to the Clean Water Act. The answer? The answer is to leave that decision to the States. The "flexibility", as referred to by Mr. Hayes and others, in terms of balancing the competing goals of society, that flexibility we believe can best be achieved at the State level. And it requires that Congress and EPA not render States only an enforcement mechanism, but truly give them the flexibility to make some of these balancing tests that are inherent in a political environment.

The second thing that I want to address, because it is critically important to the west, is that the Clean Water Act cannot be viewed separate and apart from the 125 year history of Congress deferring to the States to decide how to allocate and administer water rights. It is the same water. We are at both ends of the pipe; we need clean water for our uses and we discharge water. The relationship between the two is established by my prior reference to physical integrity. Our fears are that the Clean Water Act will be used to try to reallocate water that has been previously allocated under State systems. In most States, those are property rights and there is very serious concern about an overlying regulatory effect on these property rights.

But the concern is not just property rights. These are allocation systems that, if you strip away the politics, strip away the emotion, and strip away the history, are simply a mechanism to allocate a

resource when there is not enough to go around. And if Congress wants to replace State water allocation systems with a Clean Water Act water quality-driven allocation system, they should do so explicitly and it should explain to the States how it is going to replace it, how these decisions are going to be made in the future.

This is not just a theoretical problem. Look at the California Bay-Delta where sediment standards are being used as a surrogate to get at and limit the diversion and withdrawal of water. And I will give you a second example from Colorado. I was on the State's Nonpoint Source Task Force. In particular, I was on the subcommittee that dealt with hydrologic modifications, which are the dams and diversions that divert the water so we can use it. In those negotiations the environmental community made it very clear that they wanted the Clean Water Act to be applied so as to force prior water rights to give up water that they are entitled to. That was honestly and candidly stated.

It is that concern that I would like to raise with this committee today. It is a very difficult issue to craft a substitute system if you want to throw out what the States have done in their individual systems over all these years. I think that you need to be aware that this general rhetoric about environmental, ecological, biological, physical integrity has potentially direct implications for these water quantity systems.

Thank you.

Mr. APPELATE. Thank you very much, Mr. Raley.

At this moment, I would like to recognize the gentleman from Pennsylvania, Mr. Clinger.

Mr. CLINGER. Thank you very much, Mr. Chairman. I just wanted to take an opportunity to welcome the panel, but particularly to welcome my friend Keith Eckel, who is the president of the Pennsylvania Farmers Association and has been an outstanding leader in agricultural issues for many, many years and one of the more thoughtful and constructive participants in the ongoing debate on the issues affecting the agriculture community. I look forward to his contribution to these hearings today. Welcome Keith.

Mr. ECKEL. Thank you, Congressman. I appreciate that.

Mr. Chairman, members of the committee, I appreciate this opportunity to testify before you this afternoon. My name is Keith Eckel. I am president of the Pennsylvania Farmers Association, the Farm Bureau in Pennsylvania, and serve on the board and the executive committee of the American Farm Bureau Federation. We represent over four million families across this Nation who have joined the Farm Bureau. I also am a farmer and proud of that fact.

I was interested in the previous testimony that there was an indication of concern for contingent valuation methodology. Until that point in the hearing, I was concerned about a farmer's place in this hearing this morning. But I think we might stack up quite well on contingent valuation. I know the committee will be studying all of the testimony that we're submitting today, but there are a couple of points that I want to emphasize.

One of those points is the success of agriculture in feeding this Nation and also maintaining environmental quality. You will find in that testimony a statement that we are working with the same land base as we did in 1900; we are farming 340 million acres of

land. We're feeding 179 million more people just in this country. If you look a little bit further, you will find that we have 35 million acres in conservation reserve where any type of erosion has been eliminated by 90 percent. We have done that while meeting that challenge, and, yes, we have done it while we have reduced the amount of disposable income to 11 percent expended by the food consuming public for food in this country. I think that those are contingent valuations that under any methodology are very important.

I come to you this afternoon to assure you that farmers and farm families are extremely concerned about water quality for our families, for our neighbors, for our livestock, and for our crops. It has been our intent to work in a manner to preserve that land. I personally believe that working together, agriculturalists and environmentalists, we can achieve our goals, and that is of a better land tomorrow.

I live on a farm that we have farmed for four generations. Our intent has not necessarily been to make only a profit today and forget about tomorrow because there was the next generation that was going to take care of that land and make a living from it. I am one of those who believes that private property rights are not an antithesis to environmental quality but a strong contributing factor. One of the strong concerns that I have, especially listening to the testimony this morning, is that we believe that we can centrally mandate improved water quality. We only need to look to the Soviet Union and Eastern Europe to recognize almost immediately that central control doesn't mean that we improve the quality of our land or our water resource base.

There are three broad perspectives and aspects to the Clean Water Act that we believe you need to give strong attention to and all have equal importance.

First is the need for a nonpoint source program that retains the basic tenets of the current 319 program. Specifically, preserving the right of the States as the unit of government responsible for water quality standards, emphasis on locally designed solutions, and emphasis on voluntary programs. There was a lot of concern expressed this morning about voluntary programs. But I would remind you that since 1982 we have cut pesticide use by 20 percent in this country while increasing our food production, not because it was mandated but because it was good business and financially sound to do it. We did it voluntarily, not being mandated to do such. Nitrogen efficiency in corn production has increased 14 percent since 1980.

But let me bring it more importantly home to the farmer, I'm one of those, involved in tomato production. In the last 10 years, working with Penn State University, we have moved toward banding of fertilizers rather than broadcasting of fertilizer. That doesn't sound very dramatic, but, ladies and gentlemen, what it has done has enabled us to cut our chemical fertilizer application in half and yet increase our productivity per acre. A win-win for efficiency, competitiveness, and the environment. It can be done when working together. I think that is the point I want to continue to hammer at today. It has to be a cooperative effort rather than an antagonistic effort.

I heard suggestions this morning that the right of private action would be important for compliance with a new act. Ladies and gentlemen, that is not for the protection of neighbors; neighbors already have the right to sue. That is an invitation for litigation, costly on both sides, to achieve goals that we commonly have; not for the neighbor, but for an outside source to become involved in litigation. I think we know what litigation has done to our insurance industry and our health industry. We cannot afford that in the agriculture industry as a solution to our problems.

I think secondly, we need to have a clear, comprehensive wetlands law passed from the standpoint both of equity of the landowners and also from the standpoint of good conservation. We need to finally define what a wetland is, classify it according to its importance, identify it for the benefit of all landowners and the general public surrounding it, and then study the question of compensation. If, in fact, it is in the public interest to preserve, it needs to be at the public cost.

I was very encouraged by questions from the committee this morning, especially as they centered around the recognition of the need for measured progress and the need also to invest our resources to their utmost good. That brings me to our third point, a commitment of financial resources and time to achieve our goal.

By everyone's testimony here today, we have learned that point source pollution has seen tremendous progress made over the last 20 years because of 2 things—taking time to analyze the solutions, and because, yes, in some case, public investment. It is impossible to judge changes in agricultural practices in one year in one watershed. That takes time. I am confident that we are making that progress. The new reauthorization needs to take that into consideration also. It is not something that happens overnight just because we say it is going to be.

Secondly, in the case of investment, as this committee and former congresses have acted to provide for control of point source pollution, funding was also provided because it was recognized that there was significant cost. Funding will have to be provided in these cases to assist agriculture in order to comply with the regulations over time. We do not encourage increased taxes, per se, or increased levels of spending, but perhaps the time has come as we reauthorize the Clean Water Act to determine whether some of the funds now invested in the point source pollution situation should be shifted to nonpoint source pollution.

I am always an optimist. To be a farmer you have to be. You have to be confident that when you sow the seed you are going to reap a harvest. I believe that if we give sufficient study and analysis to the problems I have discussed this morning we can confidently sow a seed for a better tomorrow, but a seed planted with optimism and cooperation, without finger pointing and finding a need not for achieving compliance but violation. We need to work together, gentlemen, to achieve our common goals.

Thank you.

Mr. PARKER [assuming the chair]. Mr. Paul Genho, National Cattlemen's Association.

Mr. GENHO. Thank you very much. My name is Paul Genho. I am chairman of the National Cattlemen's Association's Private

Land and Environmental Management Committee. I am a cattle rancher and citrus grower from the State of Florida. Today I am here to represent the policy of NCA's 230,000 affiliated cattlemen which represent 46 State associations.

At the beginning, I would like to express our support for the testimony that will be given by the National Corn Growers and also given by the National Water Resource Association. NCA also joins with the 20 other national agricultural organizations in support of a statement of principle for reauthorization of the Clean Water Act. We have appended this statement of principle to NCA's written testimony which we would like to submit for the record.

Cattlemen across the country are vitally interested in the reauthorization of the Clean Water Act. No other issue could have such a potential impact on our business. I would like to, if I may, briefly address six areas that we think are of concern.

First, NCA's policy is that the Clean Water Act should continue to focus on the control of discharge of pollutants in the waters of the United States in order to protect State classified use of a particular water body. This goal should not be changed directly or indirectly to create a federally-driven program for restoration of aquatic habitat as measured by pristine standards for biological integrity.

The second point is States should clearly retain primary authority on water allocation and land use. The Clean Water Act should not be used as a vehicle for imposing EPA-driven land use planning.

The third point that I would like to make refers to cattle feeding operations. Concentrated animal feeding operations, CAFOs, for beef cattle have been regulated by the Clean Water Act for over 20 years. Current regulations require NPDES permits for all feeding operations with more than 1,000 head of cattle. Also, the current laws confers authority for permitting feeding operations of any size if they are determined to be a significant contributor of pollution to waters of the U.S.

According to the U.S. Department of Agriculture, in 1990 85 percent of the fed cattle marketed were finished in feed lots of 1,000 head capacity or more. This is the highest percentage of any animal species regulated by the NPDES program. The National Cattlemen's Association supports the current NPDES provisions of the Clean Water Act with several recommendations for clarifying amendments, which are explained in our written testimony.

The fourth point I would like to address today is the nonpoint source provision. NCA generally supports the current nonpoint source provisions in section 319 of the Clean Water Act. NCA believes these provisions should be given additional time and adequate funding with better targeting to impaired areas before their effectiveness is judged. NCA's written testimony and others testifying today document that many USDA programs and State nonpoint source programs are currently working to reduce agricultural runoff. It is our impression that substantial progress has already been made. As explained in the statement of principle, NCA believes the central focus of nonpoint source management programs authorized by the Clean Water Act should be a voluntary approach based on incentives, education, and technical assistance.

This Clean Water Act reauthorization consideration of nonpoint source pollution is being driven by EPA's recent National Water Quality Inventories which claim agriculture is the cause of over half of the nonpoint source pollution. NCA strongly urges this committee to carefully scrutinize the actual magnitude of agriculture's role and a careful analytical review of the data upon which EPA issued this national summary. For lack of time, I will not comment further on that but that is a very important point.

NCA would like to know where and what the problems are. Where there are genuine problems related to livestock production, cattlemen intend to do something about it. To this end, NCA has begun a water quality information project to review the States' 305(b) reports. Our purpose is to determine exactly where there are NPS problems associated with beef cattle, the magnitude of the problem, cause and means of remediation. The first year of this project will concentrate on 15 key States.

Our questioning of the magnitude of agriculture's contribution to nonpoint source pollution is not meant to deny that there is significant nonpoint source problems caused by agriculture. However, on the basis of current data, it appears that these genuinely severe problems are limited to certain areas. We urge Congress to provide meaningful targeting of provisions to remediate any such real problems rather than a shotgun approach to NPS.

Although coastal areas are waters for which there is more meaningful data, reported problems, and thus worthy of targeted programs, NCA opposed the approach taken in the recent amendments to the Coastal Zone Management Act. These amendments have created a federally-driven land use control program with minimum management standards. These standards would be enforceable for all land users in coastal areas whether or not a particular property owner is a cause of a problem. In other words, he would be obligated to comply whether he was contributing to the problems or not. EPA's estimated initial cost to the private sector for initially getting in compliance is \$500 million. We should recall that this is for a small part of the Nation. What will be the cost if this approach is included in the Clean Water Act?

This kind of land use control is a serious infringement of property rights. It is also a questionable assumption of State constitutional rights to control land use.

The fifth point that I will briefly mention is wetlands. NCA supports the need for comprehensive legislation to define wetlands. As such, we support H.R. 1330 authored by Mr. Hayes. It is worth noting that the normal farming and ranching exemption in section 404(f) of the Clean Water Act is not being adequately implemented for ranchers. Cattlemen have been required to obtain or have been denied 404 permits for normal ongoing practices as basic as haying, grazing, maintenance of ditches, stock ponds, and removal of shrubs and brush.

The final point which I would mention is that NCA urges this committee to keep in mind private property rights protected by the Fifth Amendment in your deliberation of wetlands and nonpoint source issues. NCA joins with the growing number of landowners seeking legislative guarantee for financial compensation from regulatory takings of property and land use. In recent years, the Su-

preme Court and the U.S. Claims Courts have continually upheld the compensation requirements of the Fifth Amendment in what is now a series of cases. The cost of this kind of litigation though is prohibitive, especially for the small farmer. Legislative relief should precede judicial relief.

Cattlemen are willing to address genuine environmental problems and seek practical, viable solutions. Cattlemen all over the country are currently engaged in private and cooperative management projects to reduce and prevent water quality problems. With targeting sufficient funds for nonpoint source programs, realistic time frames, and site-specific management voluntary programs will succeed.

Thank you very much.

Mr. PARKER. Thank you, Mr. Genho.

Ms. Danita Rodibaugh with the National Pork Producers Council.

Ms. RODIBAUGH. Mr. Chairman and members of the committee, my name is Danita Rodibaugh and I am a pork producer from Rensselaer, Indiana. I live on a 1,600 acre farm which consists of 900 acres of corn and 500 acres of soybeans. In addition to my involvement in the family farm, I serve on the executive committee and the environment committee of the National Pork Producers Council.

Today I am speaking on behalf of the National Pork Producers Council, the National Turkey Federation, the National Broiler Council, the National Milk Producers Federation, and the United Egg Producers. We appreciate this opportunity to testify on the reauthorization of the Federal Water Pollution Control Act. We look forward to working with the committee as new legislation is developed. The Clean Water Act plays a key role in our future.

The 1985 Farm Bill and the 1990 Farm Bill included provisions to help agriculture producers in addressing nonpoint source pollution concerns. The programs implemented under the 1985 Farm Bill are beginning to show dividends in protecting water quality. These efforts and the new programs included in the 1990 Farm Bill need to be given a chance to work if we are going to make substantial gains in water quality.

The Agricultural Water Quality Protection Program is a potentially significant and far-reaching program for improving water quality. This program was designed to provide producers with the financial and technical resources necessary to develop and implement comprehensive water quality protection programs. It requires an investment of time and money by the producer that, through incentives, makes the adoption of these practices economically feasible. If proven successful, this approach could serve as a model for future water quality programs.

Congress began to take a comprehensive approach to the problem of pollution from all nonpoint sources in 1987 when it last amended the Clean Water Act. Some of you on this committee provided the leadership in adding section 319 to the act authorizing State-Federal programs aimed at controlling the diverse sources of pollution. The livestock and poultry producers represented here today disagree with the criticism directed at section 319 and urge Congress to retain and enhance this watershed approach. Section 319 has

not suffered because of structural flaws in its program, it has suffered because Congress has failed to provide adequate funding.

Our most fundamental goal is to develop and implement a coordinated program to help livestock and poultry producers be better stewards of our natural resource. We believe that problem identification, environmental research, producer education, and technical and financial assistance are essential building blocks for ensuring that livestock and poultry systems are effective in addressing environmental concerns. We strongly believe that an incentive-based approach that includes cost-share assistance, no interest or low interest environmental loans, and environmental tax credits would help provide agriculture producers with the financial tools to effectively deal with nonpoint source concerns.

In addressing water pollution problems, we must remember that our primary focus is to improve the overall quality of water in threatened watersheds. The use-based standard currently employed in the Clean Water Act has served our community and our country well. It is unlikely that the scientific community or the general public would support a move to extreme standards such as bio-diversity. We believe it would be a mistake for Congress to further encourage citizen law suits in the reauthorization of the Clean Water Act. Farmers already spend an extraordinary amount of time and incur significant expense complying with regulations promulgated by Government agencies. Our producers do not need the additional burden or expense that comes from defending ourselves against third party law suits that may, or may not, be related to environmental quality.

Those of us in agriculture want the Federal Government to speak with one voice when making wetland determinations on farm land. A large share of the producer problems with wetland cases in rural areas are the result of contradictory advice given by various Federal agencies that have a legislative interest in the issue. It is imperative that the Clean Water Act contain new wetland language that provides fair and reasonable regulation. Congress should provide necessary protections to true wetlands while respecting individual property rights and providing for a minimum of restriction on available agricultural lands. Significant progress toward water quality is being made through programs currently administered by USDA. We hope these programs will be allowed to work before additional regulatory requirements are placed on the agriculture community.

The livestock and poultry sectors that we, as members of the nonpoint source community, must play a key role in protecting our environment. Our organizations are willing to work with this committee to find creative solutions that protect our Nation's waters while maintaining the financial viability of our members.

Thank you.

Mr. PARKER. Thank you, Ms. Rodibaugh.

Mr. Pete Wenstrand, vice president of the National Corn Growers Association.

Mr. WENSTRAND. Thank you, Mr. Parker, for the opportunity to address the subcommittee today. I am testifying on behalf of the National Corn Growers Association, of which I am vice president, and also on behalf of the American Soybean Association, the Na-

tional Barley Growers Association, the National Cotton Council of America, the National Association of Wheat Growers, and the U.S. Rice Producers Group. Our organizations do work closely together on environmental issues and are especially interested in the reauthorization of the Clean Water Act.

At the outset, I do want to stress that we enthusiastically support the positions on legislation addressing nonpoint source pollution that were developed last year by a broad based coalition of agriculture industry groups. Cattlemen's Association this morning already referred to that document and, again, it is attached to their presentation.

I would like to take a few minutes to outline some points of particular interest to crop farmers whose operations stand to be significantly affected by some of the proposals that have been put forth so far in the debate over the Clean Water Act rewrite. In short, we favor adequate protection for our Nation's water resources while ensuring that agriculture is provided an opportunity to contribute to water quality enhancement by means that are technically and economically viable. We feel the current authority in section 319 of the act provides a valuable framework for managing nonpoint source pollution and should not be cast aside in favor of a new mandatory regulatory approach.

First among our core principles is that the Federal Government should allocate additional resources to States to assist them in better identifying water quality problems and activating effective management strategies to address the problems. Second, greater financial commitment should also be directed to research, monitoring, and assessment programs to enable effective and cost-efficient responses to water quality problems. Finally, where problems are identified, landowners should be encouraged to adopt voluntary, site-specific water quality best management practices through cooperative programs which provide education, technical assistance, and incentives to accelerate those best management practices.

We also recognize that in some cases the Environmental Protection Agency may need to give additional direction to State agencies as they develop plans to achieve water quality goals. Any such new oversight activity should, however, preserve the flexibility of State and local authorities to tailor programs to fit their local situations.

As for our interest in continuing a voluntary approach to protecting water resources, there are several Federal programs with the potential for improving water quality which have been warmly received by farmers. Perhaps best known is the Conservation Reserve Program. This program is reducing erosion and runoff on more than 36 million acres nationwide. The Rural Clean Water Program run between 1980 and 1990 established several pilot projects for testing the effectiveness of management practices for managing nonpoint source pollution. Ongoing efforts include the Great Plains Conservation program, the Agriculture Conservation Program, and the Water Quality Incentives Program which encourages producers to enter into three to five year agreements to put in place resource conservation practices. It should also be recognized that the conservation compliance requirements for highly erodible land established in the 1985 Farm Act have contributed significantly to water quality improvement.

While I realize this subcommittee does not hold the purse strings for water quality programs, permit me to address the issue of funding for just a moment. Appropriations for section 319 programs, first approved in fiscal year 1990, have averaged \$47.8 million per year. It should come as little surprise that some States have been less than enthusiastic about enacting vigorous nonpoint source programs when, on average, they can expect to receive less than \$1 million per year to carry them out.

There are some encouraging signs, however. In fiscal year 1994, the Clinton Administration has proposed increasing 319 funding to \$80 million. We also applaud the administration for proposing an additional \$47 million in section 319 projects for fiscal year 1993 atop the \$50 million already appropriated. Our organizations feel these developments are a strong signal of support from the administration for nonpoint source pollution management approaches envisioned by section 319. Accordingly, we encourage this subcommittee to authorize significant resources to ensure that quality nonpoint source programs can be put into effect.

At the same time, we were disappointed to note that no funds were specified for the Water Quality Incentives Program as part of the fiscal year 1994 budget for the U.S. Department of Agriculture. We hope that the Appropriations Committee will see fit to at least continue this year's funding level of \$15 million.

But getting back to our preference for voluntary programs, there is ample evidence that when farmers are provided with information on management practices which minimize erosion and runoff and enhance their economic viability, they are quick to adapt. I think back to my own situation. I farm about 1500 acres of corn, soybeans, and wheat and am currently using a no-till system. I realize that no-till farming is maybe not applicable in every area, but I do want to point out that the information on a different tillage system, on reduced tillage system was available to me. I evaluated it from an economic standpoint, I evaluated it from an environmental standpoint and decided to do it and do it without facing any Government mandate.

In a study recently released in my home State of Iowa, researchers found that a policy similar to that which our groups support, based on increased research and education efforts would result in significant improvements of water quality while maintaining the profitability of agriculture production. One of the researchers, Michael Duffy of Iowa State University, said that a State investment of \$1.5 to \$2 million would help farmers reduce nonpoint source pollution. That is only slightly more than the \$1.4 million in section 319 funds which Iowa received. Obviously, the figures will vary from State to State.

But our message today is that we can improve water quality without burdensome regulation or taxation of inputs through reasonably funded programs that encourage farmers to carry on a legacy of stewardship while maintaining their economic ability to produce food and fiber for a world market.

Thank you again for the opportunity to testify today. Our Nation's farmers look forward to working with you in the future.

Mr. PARKER. Thank you, Mr. Wenstrand.

Mr. John Lewis, president of Belmont Mills.

Mr. LEWIS. Mr. Chairman and members of the subcommittee, my name is J.I. Lewis and I am president of Belmont Mills, a retail fertilizer, pesticide, and seed outlet in the 18th Congressional District of Ohio. I am here today representing the Agricultural Retailers Association, ARA.

ARA was formed just last year to address the unique interests of small agricultural businesses across the United States. Today, ARA represents over 5,000 retail dealers who market well over 80 percent of the pesticides and fertilizers sold in this country. I am accompanied today by Mr. Chris Myrick, director of Government and Environmental Affairs for ARA.

The issues that I have come here to testify on are nonpoint source pollution that may emanate from agriculture production operations and the ever-increasing regulatory burdens that are impacting small businesses such as mine.

Agriculture, especially over the last decade, has come under increasing scrutiny as a result of claims that we are a main contributor to the degradation of our lakes, streams, and groundwater. I am here today to say that my business and agriculture industry have taken aggressive steps to address this issue. However, I believe that over-regulation is becoming such a serious issue that my business and businesses of my customers located in Ohio are being threatened.

The retail segment of the agriculture industry is under tremendous regulatory pressure by Federal, State, and local Governments at the present time. Belmont Mills has been a family owned business since 1900. At no other time have we seen so many costly and burdensome regulation changing than over the last few years.

In 1979, we shipped approximately 400 cars of feed, grain, and fertilizer into our mill at Belmont by rail car. By 1980, one year, we had lost our rail service in the name of Federal regulation. We have experienced two grain embargoes, various acreage reduction programs, and two milk buy-outs which left us six employees and \$1 million less in business. We are heavily involved in strip mine reclamation but, through the Clean Air regulations, our mines are all but gone.

Due to this kind of pressure, ARA expects to lose over 30 percent of our Nation's retail businesses by 1997. Surveys have shown that regulatory compliance costs for the average retail dealership will skyrocket by over 200 percent annually by 1997. Since many of these regulations are aimed at water pollution and environmental training for those who apply pesticides and fertilizers, Congress must consider the economic impact that increased regulations will have on small businesses in rural communities such as Belmont where retail dealers are, in many cases, the largest employer.

I am proud to say that Belmont Mills and agribusinesses across the country are doing a good job of addressing environmental issues such as nonpoint source pollution. Over the last decade, agriculture has voluntarily adopted numerous measures that have resulted in the reduction of possible sources of pollution from our Nation's farms. For an example, I custom apply pesticides and fertilizers for many of my farm customers in Ohio. Custom application benefits the environment because my trained and licensed applicators have a tremendous amount of experience in applying input in

a manner which will reduce the chances of nonpoint source runoff. In addition, I work closely with my farm customers to ensure that only the proper amounts of inputs are applied to their fields. Not only is my business using these types of environmental stewardship practices, many dealers and commercial operators across the country now custom apply for their farm customers.

The agriculture industry has made tremendous strides in adopting new technology and management practices that reduce chances for nonpoint source pollution. Because of time constraints, I cannot go into depth on each of these new areas but I hope you will review my written statement which does go into more detail.

Besides voluntary steps being taken by retail agriculture suppliers to reduce nonpoint source pollution, I will spend a few minutes talking about the tremendous increase in the use of soil conservation and residue management practices. Belmont Mills, for example, has practiced no-till for 20 years and now approximately 65 percent of the businesses we serve use no-till production practices. Because there is a significant correlation between reduced pesticide and fertilizer runoff and no-till, steps to reduce erosion through no-till greatly reduce the potential for fertilizer and pesticides being found in our water systems.

Now I would like to talk specifically about what I think Congress should do to reauthorize the Clean Water Act. First, I ask don't pull the rug out from under my business by passing legislation that imposes overly burdensome requirements and reduces what profit there is left in agriculture. After looking over some of the proposed legislation reauthorizing the Clean Water Act, I see a potential for more economic problems if mandated nonpoint source programs are instituted.

As a taxpayer and small businessman, I cannot sit here today and tell you that I would support the adoption of new nonpoint source legislation that will eventually cost taxpayers millions, if not billions, to duplicate existing programs. Congress has already given States the authority to regulate nonpoint source pollution through the Clean Water Act. This leads me to my second suggestion. Congress should fully fund existing programs and give them time to work before establishing new programs.

Since I am running out of time, let me conclude by stating that any new legislation should keep programs voluntary and flexible to ensure the maximum participation and reduction of economic burdens. Agriculture and nonpoint source pollution are site-specific issues that must be addressed on a site-by-site, farm-by-farm basis. Be sensitive to the needs of farmers in rural communities.

I would like to thank the committee for having me here today to testify, and request that my written statement be submitted for the record. Mr. Myrick and I will be happy to answer any questions that you might have.

Mr. APPLGATE [resuming the chair]. Thank you very much, Mr. Lewis, and to the panel for your expertise. It is extremely helpful to this committee. We have a long journey to make before we are going to be able to put all of this together into some kind of legislative form and then try to get it passed through the Congress.

Just generally, in order to put this whole thing together there seems to be this relationship we have between the Clean Water Act

and what we are trying to do, on the one end, and the wetlands issues. And there comes a question of whether or not they should be put together at all. The Senate seems to be looking at the possibility of trying to divide this into two issues and maybe trying to pass one. That would probably be a difficult task because I am sure there would be people who would feel that was germane, which probably would be by the parliamentarian, and try to develop it through amendments.

On the other hand, the National Academy of Science is now attempting to try to put together just exactly what wetlands are and try to define it. Do you have any thoughts on that? Do you think we should wait for the National Academy of Sciences to come through with their work? Should we move ahead and try to do what we can do now, immediately, with a bill? Should we try to move a bill that would deal with wastewater treatment, point source, nonpoint source? Do you have any ideas at all on that?

Mr. ECKEL. Yes, Mr. Chairman. I would indicate that we are always concerned with scientific fact and basis and analysis. I think that is key to any program. Having said that, I think if we wait until every scientific issue is decided on the wetlands issue, we will delay the badly needed day that we need for the Congress finally to legislatively define what a wetland is. I would encourage you, the committee, and Congress to take a very hard look at that. We personally support the concepts of Congressman Hayes' bill, H.R. 1330. But there is no question that there needs to be a definition, identification, and classification of those wetlands so that we can proceed about the work. I don't know if waiting a year and a half is in the interest of any of the groups involved.

Mr. APPELATE. Mr. Raley?

Mr. RALEY. Mr. Chairman, the National Water Resource Association would be opposed to separating them on a number of grounds, but I think one of the more important is it is too late to separate them. In Colorado, in the last several weeks, we have been meeting extensively within the State because Colorado has been told by EPA that it has to adopt water quality standards that are applicable to wetlands. So the State is in the unfortunate position of having to adopt water quality standards for something that nobody can identify. Congress needs to solve that problem because it is a practical problem that will be shared by the other States as well. If they are not doing it right now, they will be doing it very soon.

Mr. APPELATE. Okay. I bring that up because Senator Baucus seems to be committed to divide the two issues. I was interested in hearing what you had to say about that.

You have heard from the environmental panel that progress that has been made, if you wish to call it that, especially in the agriculture nonpoint area, has been very poor at best. Your statements point to a completely different result thus far. Do you think we can all agree that much more must be done? The real question I guess is what is the best way to get there? I think that you urge voluntary approaches and the environmental panel urged an enforceable program. Will a voluntary program be adequate?

Mr. ECKEL. From the Farm Bureau standpoint, Mr. Chairman, we believe that the voluntary program is absolutely the route to take if we anticipate success. Mandated regulation, at best, can

only hope to eliminate operations that I don't think are in the interests of Americans in general, or agriculture in particular.

One area I didn't touch on in the testimony but one of your committee members did highlight is the immense progress that technology continues to make. I continue to believe in that process. We have a research project currently going on at the University of Pennsylvania School of Veterinary Medicine working with changing the diet of dairy cattle, of varying the sources of protein and the amounts of protein, as well as maintaining or enhancing production levels, and decreasing the protein content of animal waste significantly. And when I talk about significantly, I am talking in excess of 20 or 25 percent. Those types of practical research projects need to be funded and pursued.

Secondly, the point I would make as far as the analysis of the progress that we have made is it has taken us 20 years in the point source issue and we need to give time to see the fruition of the labors that we have seen in the conservation programs that have been talked about this morning. Secondly, the basis of analysis needs to be looked at. We have one study that I will provide to the committee where there was an analysis that there was a serious agricultural pollution problem I believe it was in the Iowa River. When the facts were reviewed it was found that the level was no higher than it was 50 years ago, prior to the use of nitrogen fertilizer.

So I would suggest that we need to be certain of our facts before we make the judgment that we aren't making progress. I believe farmers make progress every day. There was a comment made that there is an incentive not to be environmentally sound. When it comes to agriculture, there is an economic incentive to be totally sound. It does not serve our interests to use excessive pesticides or excessive chemical fertilizers because that costs us more money in our operation; it does not add to our profitability. That is why you have seen the wiser, better reduced use of those technologies over the last 10 to 12 years.

Mr. APPLGATE. Okay. I thank you. That's very interesting.

Some, and I say some of you, have been very critical of the 404 dredge and fill program. But getting back to the wetlands, what do you think Congress can do to afford the protection to the wetlands? That seems to be a very key question and a very sensitive one.

Mr. ECKEL. I don't mean to preempt my fellow panel members, and I apologize for that, but I think there are some areas that need to have a great deal of work done. We talked about the 404 permit, we talked about the general permit, and there was testimony before on that. I have four case studies here that I am going to leave with the committee.

One of those case studies involves a Pennsylvania farmer who wanted to create a farm pond of 2.5 acres for additional water supply for his cattle. He has dealt with five different agencies at this point in time, has been into the project two and a half years, has finally drilled a well for a supplemental water supply, and is no closer to resolving the problem than he was two and a half years ago.

We have a second situation——

Mr. APPLGATE. What was the problem with that one?

Mr. ECKEL. The problem with that one was that the various agencies couldn't even agree whether or not they had jurisdiction as far as issuing a permit. This gentleman wanted to meet the law so he went to the Soil Conservation Service and asked them for their assistance. They went to U.S. Fish and Wildlife. U.S. Fish and Wildlife raised some concerns and transmitted those to the Army Corps of Engineers. The Army Corps of Engineers indicated that they did not have jurisdiction over this because they did not consider it a significant wetland. Our own Department of Environmental Resources indicated that they did and that it needed a joint permit between Army Corps and DER. And that is where the man is now with those two agencies still arguing where there is jurisdiction.

Mr. APPLEGATE. So there is no problem with the physical plan itself, it is just in the procedural work?

Mr. ECKEL. That is our understanding to this point. In fact, to my knowledge they have not gotten to the point that they have analyzed his plan. All of the time has been spent in paperwork.

That is the one other issue that I want to raise to this committee. Our farmers do not have the financial resources nor the time to spend two and a half years solving a problem that should have been taken care of in six months. If you have a project with large dollars involved for development or whatever, you can afford to go through that type of process and perhaps convert a very important wetland to another use. In agriculture, what happens is the farmer, after a long period of time, says I either can't afford it or I can't spend the time at it, and nothing is done. That is not in the interest of the agricultural community or the consuming community of this country. That is what we are trying to highlight.

We do have to bring these different entities together with a set of guidelines so that everybody knows where they are.

Mr. APPLEGATE. I have other questions but I am going to look to some of the other members of the panel to ask some questions.

Mr. Hutchinson.

Mr. HUTCHINSON. Thank you, Mr. Chairman. I would ask unanimous consent that a statement from Congressman Emerson, who regrettably is unable to be here, be entered into the record.

Mr. APPLEGATE. Without objection, the statement will be made a part of the record.

[Mr. Emerson's prepared statement follows:]

STATEMENT OF CONGRESSMAN BILL EMERSON  
BEFORE THE SUBCOMMITTEE ON  
WATER RESOURCES AND ENVIRONMENT  
REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT  
APRIL 22, 1993

MR. CHAIRMAN, I WOULD LIKE TO THANK YOU AND OUR RANKING MEMBER, MR. BOEHLERT, FOR HOLDING THIS IMPORTANT FORUM ON AN ISSUE CAUSING GREAT CONCERN IN MANY RURAL TOWNS AND COMMUNITIES -- PARTICULARLY IN SOUTHERN MISSOURI. INDEED, THE REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL OR CLEAN WATER ACT HAS TREMENDOUS IMPLICATIONS FOR BOTH RURAL AMERICA AND THE CRITICAL AGRICULTURAL ECONOMY THAT SUSTAINS THESE SAME RURAL TOWNS AND COMMUNITIES. I WELCOME THIS OPPORTUNITY TO ADDRESS BOTH NEEDS AND SOLUTIONS TO PROBLEMS FACING THE FAMILIES OF TODAY'S FARMING COMMUNITIES.

WITHOUT A DOUBT, AMERICAN FARMERS AND RANCHERS ARE THE ORIGINAL STEWARDS OF THE LAND. NO ONE HAS A GREATER INTEREST IN MAINTAINING AND IMPROVING THE QUALITY OF THEIR WATER AND SOIL THAN THE DOMESTIC FARM PRODUCER. CERTAINLY, THE HARD-WORKING MEN AND WOMEN OF TODAY'S FARMING AND RANCHING COMMUNITIES ARE WILLING TO FURTHER COMMIT THEMSELVES TO CONTINUED RESPONSIBLE SOIL AND WATER CONSERVATION PRACTICES WHICH WILL ALLOW THEM TO PASS ON THEIR PRODUCTIVE LAND, CROPS, AND LIVESTOCK TO FUTURE FARMING GENERATIONS.

AS WE SET ABOUT TO REAUTHORIZE OF THE FEDERAL WATER POLLUTION CONTROL ACT, WE MUST ACKNOWLEDGE THE TWENTY YEAR COMMITMENT OUR NATION HAS PUT FORWARD TO ADDRESS THE CHALLENGES OF POINT AND NON-POINT SOURCE POLLUTION. I BELIEVE THAT OUR SUCCESS IN FURTHER REDUCING WATER POLLUTION, PARTICULARLY NON-POINT SOURCE EFFORTS, WILL REQUIRE SIMILAR TIME AND RESOURCE COMMITMENTS.

NON-POINT SOURCE POLLUTION IS LARGELY A WEATHER-RELATED OCCURRENCE THAT CAN BE MANAGED, BUT NOT ECONOMICALLY ELIMINATED ENTIRELY. RATHER, WE MUST BEAR IN MIND THAT NON-POINT SOURCE POLLUTION IS CAUSED BY THE INADVERTENT DISCHARGE OF POLLUTANTS FROM A WIDE RANGE OF SOCIETY'S MOST ESSENTIAL ACTIVITIES.

AS WE SEEK SOLUTIONS TO THESE NON-POINT ISSUES, A SOUND AND REASONABLE APPROACH MUST BE OUR GUIDE. FEDERAL AND STATE INCENTIVES, EDUCATION, AND TECHNICAL ASSISTANCE ARE JUST A FEW OF THE MEANS WE MUST MAKE AVAILABLE TO THE FARM AND RANCH PRODUCTION COMMUNITY IN MANAGING NON-POINT SOURCE POLLUTION.

IT IS VERY IMPORTANT THAT WE COORDINATE THE EXTENSIVE WATER QUALITY PROGRAMS THAT ARE ALREADY IN PLACE AT THE U.S. DEPARTMENT OF AGRICULTURE, THE ENVIRONMENTAL PROTECTION AGENCY, AND EQUALLY IMPORTANT U.S. GEOLOGICAL SURVEY. WE COULD MAKE TREMENDOUS PROGRESS WITH VERY MINIMAL ADDITIONAL FUNDING IF WE COULD START TO GET THESE AGENCIES TO NOT ONLY SHARE DATA, BUT TO USE THE SAME DATA IN MAKING WATER QUALITY DETERMINATIONS.

THE CLEAN WATER ACT HAS BEEN TREMENDOUSLY SUCCESSFUL -- IN FACT PERHAPS IT COULD BE CALLED THE MOST SUCCESSFUL ENVIRONMENTAL LAW SO FAR -- BUT WE NEED TO REALIZE THAT THERE ARE OTHER PROGRAMS OUT THERE AFFECTING AND SHAPING WATER QUALITY AND IF WE CAN COORDINATE THESE PROGRAMS, WE WILL MAKE SUBSTANTIAL PROGRESS TOWARD THAT GOAL. MANY PROGRAMS ARE ALREADY IN PLACE AND THE FARMING COMMUNITY IS WILLING TO PARTICIPATE -- BUT THE LACK OF AVAILABLE FUNDS REMAINS A LARGE OBSTACLE IN APPROPRIATELY RESPONDING TO THESE RURAL NEEDS.

MOREOVER, WE DO NEED TO GIVE AN EYE TOWARDS FULLY FUNDING THE 319 PROGRAM. WHILE WE HAVE LARGELY FOCUSED ON POINT SOURCE POLLUTION IN THE PAST 20 YEARS AND HAVE SUCCEEDED IN SIGNIFICANTLY REDUCING POINT SOURCE PROBLEMS, WE MUST KEEP IN MIND THAT WE HAVE SPENT NEARLY 60 BILLION DOLLARS IN FEDERAL FUNDS OVER 20 YEARS, AND ALMOST 90 BILLION IN STATE, LOCAL, AND PRIVATE MONIES OVER THIS SAME PERIOD TO ACHIEVE THAT GOAL. IF WE WISH TO NOW TURN OUR FOCUS TO NON-POINT SOURCE POLLUTION, A SIMILAR DOLLAR COMMITMENT NEEDS TO BE FORTHCOMING.

MR. CHAIRMAN, I LOOK FORWARD TO WORKING WITH YOU AND THE MEMBERS OF THIS COMMITTEE TO DEVELOP AND ADDRESS THE PROBLEMS FACING THE MEN AND WOMEN OF AMERICAN AGRICULTURE AND THE PROUD COMMUNITIES IN WHICH THEY LIVE. INDEED, ONLY IF OUR NATION'S AGRICULTURAL PRODUCERS CONSERVE THEIR SOIL AND WATER RESOURCES WILL THEY CONTINUE TO MAKE A LIVING ON THE LAND AND SUSTAIN OUR RURAL CULTURE. IT IS MY HOPE THAT WE CAN SHED MORE LIGHT ON NEEDED SOLUTIONS TO THIS MATTER THAT OUR NATION'S BACKBONE, RURAL AMERICA, SO RIGHTFULLY DESERVES.

Mr. HUTCHINSON. I thank the panel for your very good presentations.

Mr. Eckel, you support continued voluntary approaches at controlling nonpoint source pollution. That seems to me to be a big debate on the evidence as to whether the voluntary approach has been successful or whether it has not. You have cited some indications that it is effective. I think the environmental panel disputed that, disputed my contention that it was working quite a bit.

If you could suggest any other evidence that it is successful or—I think I gathered from what you said that we need more time to evaluate that, that it takes some time to know how successful that has been. Could you comment on that?

Mr. ECKEL. Number one, the Farm Bureau will be pleased to provide to the committee instances and facts reflecting that, in fact, progress has been made. Secondly, yes, we do believe that it takes time to analyze the benefits of these changes. For instance, in my testimony I indicated that we had a 20 percent reduction in pesticide use since 1982. If those levels aren't indicating to be lesser than they were eight or ten years ago, I would suggest there is some type of problem with the analysis that is being done because we know that there is that much less product being used.

I also gave testimony that as far as nitrogen is concerned, we have seen a 14 percent increase in nitrogen efficiency since 1980. If we haven't at least seen that much improvement, then it would appear that the base line or the analysis is flawed and that, too, needs to be studied.

Mr. HUTCHINSON. Thank you for that. It seemed a moment ago that you acknowledged that there is financial benefits for the farmer in instituting best management practices and the reduction of the use of pesticides and so forth. With that acknowledgement, I think that the environmentalists would argue—and I suppose we all are environmentalists, so I don't want to put that as a "they"—but that if best management practices in agriculture result in significant savings to the farmer through reduction of the use of fertilizers and pesticides, why not mandate it and therefore mandate the savings for the farmer?

Mr. ECKEL. I think in mandating, what we also lack is an understanding of the education process that has to take place. Mandating doesn't mean compliance, it just means that we have a law now in place that says that it has to be done. What we really need is a strong educational and continued research effort to help our farmers develop and see the wisdom of using that technology.

Now I don't want to mislead the committee into thinking that all practices are not expensive. I will take you back unfortunately to Pennsylvania again where I am more comfortable with knowing precisely what we wrestle with. In our farming operation, we farm 1400 acres of land on 54 different farms; 44 of them are owned by other landowners, many of them absentees. A number of the practices that we're talking about are expensive land construction practices, such as the institution of diversion ditches and so forth. In those cases, that calls for long-term investment and that is not as easily achieved as some of the other instances that I was using.

Mr. HUTCHINSON. So there are two edges to this thing. There are some savings, there is also some long-term cost involved.

Mr. ECKEL. Yes, sir.

Mr. HUTCHINSON. If more stringent regulatory mandates are imposed on the agricultural community through the reauthorization of the Clean Water Act, what do you think—or anybody on the panel—will be the long-term impact on the American economy?

Mr. ECKEL. The problem we have is that additional cost is going to be swallowed by that farmer. There is a hidden cost that I would be remiss if I didn't bring to the committee this afternoon. I am 46, my brother is 55. About eight years ago we were recognized as Pennsylvania's Master Farmers. I happen to have a good friend that had that same honor bestowed on them about six years ago, the same age. The huge myriad of regulations that we are piling upon our individual farmers are coming to the point of raising the question, should we continue? At my age and, theoretically, in a successful farming operation, that should be the last question that I should be asking.

We have to find a method to streamline these regulations. In preparing this testimony, staff indicated to me eight different laws and regulations that we had to comply with in just this area. About six weeks ago I presented testimony to a different committee on labor regulations. There were 16. Gentlemen, we can't even maintain the number of regulations in our mind and all their names let alone the specific technical compliance regulations for one of them. That added cost is going to cripple our industry over time and our attitude.

Mr. HUTCHINSON. Okay. That is what I am getting at. When we talk about the impact of over-regulation, is it the cost or is it the headache and the attitude that is going to drive people out of agriculture?

Mr. ECKEL. I think it is both. Unfortunately, the second is worse than the first. We have had a lot of rain in Pennsylvania. We haven't been able to plant anything yet or work our land. Two days ago we got an opportunity to plant 13 acres of sweet corn, just for an illustration. We went to work about 10:00 in the morning when we discovered this plot of land was fit to work. We finished that night at midnight. I got up and watched the news the next morning before I went out at about 6:15 and the local news had a helicopter picture of our farm being farmed and the indication that what we may need is buffer zones with agriculture there.

I thought we had done something good for ourselves and for the consumers that day by getting 13 acres of corn planted and working until midnight that night. But there was a concern raised about what we did. No one asked why was the ground surrounding that area that was plowed was so green. The answer to that was that we have been planting living mulches on that farm for the last five years, the full five years that I have been growing on that land that protected that land from two inundations that we had in the last month from that river flooding. That whole land was covered with rye grass and is for nine months out of the year. It is one of our normal practices; not mandated but one we believe in. That really impacts how we think about this.

Mr. HUTCHINSON. I have one more question, and this may have been my misunderstanding when the Chairman questioned you, Mr. Eckel, concerning wetlands and whether we should wait. If I

understood you correctly, you said that we can't afford to wait. My question is, how in the world can you legislate, how in the world can you define—which you had spoken of earlier—and classify if we don't have a good definition yet? And if that is still in the process of being studied, how can we act intelligently and legislate responsibly without that information?

Mr. ECKEL. My belief is that there is sufficient evidence for you to make a good decision on what a wetland is. I honestly don't think that you need to wait the additional year for that information. I think that the Congress has been wrestling a long time with that definition. I think it is fairly clear in most of our minds what our important wetlands are. We don't have a problem with that; in fact, we embrace protecting the important wetlands in this country. Our future is dependent upon a good environment and how well our farmland is maintained.

Mr. HUTCHINSON. Thank you.

Mr. GENHO. May I comment briefly on that, on the wetlands?

Mr. HUTCHINSON. Sure.

Mr. GENHO. Agriculture has a great respect for science. Most of us have training in science, we look to science for answers. And we applaud the fact that there is going to be a scientific review of wetlands. The real question there though is perhaps what level of Federal jurisdiction there is over 100 million acres. And while the scientific community might shed some light on proper management of wetlands, the real question of the level of Federal jurisdiction is a political question and not a scientific question. And we think that is the question that probably needs immediate attention from Congress.

Mr. HUTCHINSON. Okay. Thank you very much. Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Hutchinson.

Mr. Parker.

Mr. PARKER. Thank you, Mr. Chairman.

Will Rogers never met a person he didn't like. I'm a little different; I've never met a person who wasn't an environmentalist. If you take what has been said this morning, just on the face of it the only real difference between you, the business community, versus the proactive environmentalists on the previous panel is mandatory versus voluntary. But there is more to it than just that. There is a lot more to it than just that.

Everybody has got their own agenda. Laws are not made for the good; never have been. They are made for the irresponsible, both on the proactive environmental side and also on the business side. The majority of the people in your industry are good but some of them are not responsible. Those are the ones that we have to deal with. And that's a sad commentary but that is human nature.

I have got a basic question. Did any of your organizations support the Clean Water bill that was enacted back in 1987, the one that we are reauthorizing now? Did any of you support it then or did you oppose it then?

Mr. ECKEL. After consultation with staff, it was the indication to me that we did support the Clean Water Act when it was originally enacted.

Mr. PARKER. Okay. Is that true for everybody?

Mr. RALEY. It is for the 1987 Amendments, the National Water Resources Association supported those as well.

Mr. LEWIS. The Agricultural Retailers Association was just formed last year, so we weren't involved in that.

Mr. PARKER. Okay.

Mr. WENSTRAND. Likewise, we don't have enough history in the room, sir, to answer your question.

Mr. GENHO. The National Cattlemen's Association staff informs me that we did support it. We participated in the process and supported the final bill.

Mr. PARKER. All right. Does everybody agree that we need something and not just the status quo? Do you agree that something needs to be done, whatever that is and we'll talk about that. Does everybody agree that something needs to be done on the pollution side?

Mr. ECKEL. We definitely believe that in all areas of the CWA that there are areas for improvement.

Mr. PARKER. Okay. So the question comes down to exactly what we do. Everybody on the panel, except for J.I., deals with production. J.I., your industry provides the pesticides, you provide the fertilizer going out. What type of liability do you hold right now as far as your business? In your testimony, you talked about losing 20 percent of the retailers out there over the next few years if they come with a bunch of harsh mandatory requirements. What type of liability do you hold financially in your business?

Mr. LEWIS. You are referring to the possibility of us being held liable for our pollution?

Mr. PARKER. Right.

Mr. LEWIS. We, as a agriculture retailer, are licensed through a State board and through this license are regulated to the point that if we go out here and apply pesticides to a farm and it ends up in a stream or we misapply it and kill the wrong crop or anyway that we would be help responsible for what we do, we are not only liable for the damages but the reputation of our business is damaged to the point that next year they look for someone else to do that. I would say that puts you at 100 percent risk in everything you do. In order to be competitive in this market and be an environmental advocate for what you are doing, you have to do it right and you have to do it right the first time.

We use computer technology to apply chemicals. We go to training. From the time we stop in the fall until we start in the spring, our members are in training sessions. This is all to avoid the liability that you are talking about. If we don't do what we're supposed to do right, next year we won't be doing that business, someone else will, someone that is doing it right and someone that is doing it more cost-effectively.

Mr. PARKER. One of the things that bothers me is that I sit here and have watched what was accepted practice, what was deemed safe by the scientific community, by the Government, both Federal and State, we keep coming up with different products and all of a sudden then say, oh, by the way, this is no longer safe, we have found out more information about this. It is really a quagmire that we find ourselves in. And the people that live on the farm are the ones that are most adversely affected. You take somebody in west

Texas who has to drill wells, there is not a lot of water out there to begin with, and then because they put a check valve on their irrigation system—that's what they were told to do, told that was all that needed to be done—and it failed or the electricity went off and the valve didn't work and they didn't have a backup valve, which nobody told them they needed to do, and all of a sudden the pesticide is going aquifer, they are destroying their water, the water that they utilize. They are destroying their way of life, not just their economy, it is their standard of living.

We just keep moving forward so quickly, I don't know for sure that just voluntary—because the American public wants clean water—I don't know if just voluntary methods are going to do the trick. I think there has got to be something mandatory, or do you disagree with that?

Mr. ECKEL. Congressman Parker, I would disagree with that. The Chairman, in some of his remarks after the first panel, made the comment that, as I understood it, it wasn't realistic to anticipate zero risk. President Roosevelt said "We have nothing to fear but fear itself". We need to be sure that the fears that we're raising are justifiable.

The American Farm Bureau is concerned about its farmer members and its farm families. We have had a very large and widespread well testing program conducted by the county Farm Bureaus across this country, and that is part of our testimony indicating the level of water quality there. But I would urge each of you to recognize that there will always be risk to some degree. The question is to determine what is that risk and balance that against what is the benefit.

Sitting in this committee room this morning I can't help but notice all of the pictures that are related to this committee's work. All of them I would suggest, at least by the appearances of the water in them, had some impact on our water quality and the environment. But I would suggest that the balance in most of those cases was in the favor of the common good. And that is the challenge of the committee and the challenge of the Congress in the reauthorization of this Clean Water Act.

Mr. PARKER. Thank you all for coming to testify. One other statement. Ms. Rodibaugh, you represent the American Turkey Association?

Ms. RODIBAUGH. That is one of the groups that I, as a member of the National Pork Producers Council, work with in trying to protect the water quality.

Mr. PARKER. When you get ready to elect your next president, I have got several people on the Hill I'd like to nominate for president of that. [Laughter.]

Mr. APPELEGATE. Sometimes those projects are turkeys and sometimes they are pork. [Laughter.]

Mr. Ewing.

Mr. EWING. Well, she surely has some great clients. [Laughter.] They are certainly important in my State of Illinois, both turkeys and pork. So I welcome you here today.

Mr. Wenstrand, you indicate that you are an operating farmer among other things. I was interested in your testimony and in the comments that you made about voluntary programs which might

be reasonably funded by the Federal Government which might help us achieve some of our goals. I think that is, at least for my part, something that interests me. I like the carrot approach more than the stick, more than the mandatory regulations. Could you expand on that and give us a few examples of how you think that could work to enhance our efforts?

Mr. WENSTRAND. I'd be glad to and to introduce that response in reference to Mr. Parker's question on voluntary incentive efforts versus regulation. I will refer back to the study that was just released this last month in Iowa which was conducted by Iowa State and the University of Iowa and they compared those approaches. Yes, you can do it by mandatory regulatory control, there is no doubt, but the regulatory financial burden imposed upon agriculture with that approach was tremendous. I would be glad to forward that study to the committee if you would so like because it really did try and balance the regulatory versus the incentive.

But to your question. There is a revolution going on at least in the upper Midwest in tillage systems. Whether that be the result of any conservation compliance, that is debatable. The rate of change that I see that operators are undergoing is revolutionary, it is historic, and people are I think trying to do it systematically. In a no-till system, certainly the primary benefit is reduced soil erosion, decreasing the sediment problem. But you really have to take a systems approach as far as pesticide application, as far as really targeting your fertilizer use. Actually, I think some of us were considered kind of weirdos in the last few years talking about trying to increase the aerobic activity, the biological activity in our soils. So it is a systems approach.

Again, the measures, it can be with tillage enhancements, incentives to change tillage systems. It can be identifying those site-specific, as several people have mentioned, cases. And I think everybody has to understand there is a great deal of variance not only between farms and areas but also even within—even on my farm I have some flat black land but I also have a considerable amount of highly erodible hilly land. Those different situations take different managements. So my situation is different in southwest Iowa than it would be in other parts of the country.

So there just needs to be a lot of flexibility. Again, the incentive programs can be primarily aimed at best management practices which focus on tillage, pesticide, and fertilizer application techniques.

Mr. EWING. Do you think that we could do a lot better job at initiating incentive programs than we have done?

Mr. WENSTRAND. Certainly there has been indications that incentive programs have been warmly received by producers. I guess the primary example which comes to mind is the Wetland Reserve Program. When they had their initial application period they were overwhelmed with applications, not only the number but the acres as well. So I think there is indication that incentive programs work.

As far as the education, I've said to other groups that I think the discussion over the environment in the course of the last several years has raised the conscientiousness, has raised the environment up the scale for all agriculture producers. The agriculture produc-

ers out there today are increasingly involved in business planning, long-range planning, and I think when you have that situation it is easier to address environmental situations on your farm in a long-term, systematic process.

So, the incentive programs certainly work. The education and research programs, again, I think there are indications from numerous sources that those programs can be effective. The question again, will all producers do that? Increasingly so. The number of people that are interested in pursuing those efforts is increasing everyday.

Mr. EWING. Thank you.

I just would make a comment, Mr. Chairman. Coming from a farm background and being involved in farming, the comments that they make about what the farmers try to do out there, the producers, is true because I have lived it. We really see a change in attitudes.

A question to all of the panel. With your familiarity with soil and water conservation, is there enough money to do the projects we need to do in your individual counties? Do any of you know if the money runs out before the projects that are applied for?

Mr. LEWIS. I can speak to that somewhat. In our county, the primary county that I serve is Belmont County, and they usually start out by having sign ups as early as fall for next spring practices. The reason they do that is because the money is gone within just a few days of when they have the practices sign up. Within a short period of time after that, there may be some people that find that they can't comply or for one reason or another aren't going to be able to take advantage of these programs. When the small amount of money then that does come back is more than used up immediately.

I had a meeting with the people day before yesterday just before I came over here and we were talking about trying to consolidate the different departments of Soil and Water Conservation and ASC and our Extension Service and things like this. The people themselves are up in the air as to where they are going and what cost-saving measures they can take to keep their programs viable. We definitely need those programs on a county-to-county basis. We can't afford to give them up to larger consolidated geographic areas because it is just not as good for someone to come from a long way off to tell you what to do as it is for someone who is there and studies the thing day in, day out.

Mr. EWING. Would anybody else, just yes or no, there is enough money or there isn't. Anyone else have a comment?

Mr. ECKEL. We have additional needs.

Mr. EWING. One final question I wanted to ask this panel of experts in the agricultural area. From my own personal observation, a great deal of land that was designated as wetlands was incorrectly designated. It almost went straight up in the air. A drop of water wouldn't sit on it, let alone be a wetlands by anyone's definition. So when we look at changing the definition, it appears that we are losing millions of acres from what was originally very sloppily designated as wetlands, not properly designated. That's my observation. Would anyone disagree or do you agree that it was poorly designated?

Mr. GENHO. The definitions that you referred to would make everything south of Jacksonville, Florida, my home State, a wetland virtually. Clearly, those definitions were way too expansive in defining what was a wetland and were impossible for agriculture to operate with. So more realistic definitions are certainly needed as well as what is the Federal Government's regulatory authority in regulating those wetlands.

Mr. ECKEL. We would totally agree, Mr. Ewing, with your observation that the definition was applied so expansively. It encompasses land that I don't think anyone conceived to be wetlands, to the point that we had one State official, rather than Federal official, who, looking at the guidelines, indicated that a wet spot at the end of a drainage spout on a home was a wetland. I don't think that is what anyone had the intent of.

Ms. RODIBAUGH. I was just going to share I attended a wetlands tour with my Congressman a year ago. Those wetlands that we visited, on the first part of the agenda it was very obvious they were wetlands and the agricultural people along on that tour wholeheartedly agreed that there needs to be some preservation of those wetlands. Those on the afternoon session included places that had been farmed for years and, even at the time we were standing there after a big rain, showed no surface water at all or even moisture. Those are the types of things that we question and we would like the delineation to be better.

Mr. ECKEL. Thank you. Thank you, Mr. Chairman.

Mr. RALEY. If I could, Mr. Ewing.

Mr. ECKEL. Sure.

Mr. RALEY. The definition in Colorado and other places in the west has resulted in the classification as jurisdictional wetlands of lands that 99 of 100 people and many scientists would characterize as desert. And it has been extended further in several cases in Nevada to apply to activities on lands that aren't even wetlands but drain into or affect wetlands. So the definition in many respects has no practical reality to anything that has any water on it at all.

Mr. APPLGATE. Thank you, Mr. Ewing.

I would only say that Mr. Genho I think said that we need to have wetlands more finely defined; yet, as I understand from your answers before, you are not willing to want to wait for the National Academy of Sciences to do that. Mr. Hutchinson had brought up the point of how can you know what you are dealing with if you don't know what you are dealing with. What do you do? Should we wait until we get a definition or should we try to move forward, or do you think that Congress should then establish by definition what a wetland is? I don't know that we're capable of doing it.

Mr. GENHO. I'm shooting from the hip on this answer and haven't thought through this question, but the problem is that while we are waiting regulatory agencies are proceeding. So, in fact, we are not waiting. Action has gone on, a few people have been put in jails, fines are being imposed, regulations are being put in place. So the ball is rolling. I guess the concern of the agricultural community is that something definitive must happen to restrict those actions or to give agriculture a clear understanding of where they are at. And I guess we have reservations to waiting for a year and a half for our scientific review, although I think every-

one on this panel would applaud a scientific review, while the ball is still rolling. I would hope that Congress would take some action that would help define what the Federal Government's role is and give some direction to agriculture that would help us in understanding where we're going.

Mr. APPLGATE. Okay. Well I guess I could agree with that too. I think we definitely have to know what it means, what it is. We seem to be sort of floundering around with different definitions. But I think we have to have a very finely defined definition of what it is and we also have to inject some common sense into it.

Thank you very, very much for your testimony before the committee. It certainly will be extremely important to us in our work that needs to be done to try to put together legislation, and by the Grace of God we will be able to do it, and also about 218 votes.

Thank you very much.

Mr. APPLGATE. The committee stands in recess until 9:30 a.m. on May the 5th, at which time we will receive testimony from the Administrator of the EPA Carol Browner as well as the Tennessee Valley Authority and the Army Corps of Engineers.

[Whereupon, at 1:27 p.m., the subcommittee adjourned, to reconvene at 9:30 a.m. on Wednesday, May 5, 1993.]

## INTRODUCTION

Mr. Chairman and members of the Subcommittee:

I am Bob Adler, a Senior Attorney and Director of the Clean Water Project of the Natural Resources Defense Council (NRDC).<sup>1</sup> Over the past 16 years I have worked on clean water issues, in various professional capacities, for EPA, the Commonwealth of Pennsylvania, the Municipality of Anchorage, and for environmental groups at the state and national levels.

It is a pleasure to be here to participate in hearings to address reauthorization of the Clean Water Act. You will hear this morning from a panel of witnesses who will address the full range of issues facing this Subcommittee as it crafts a clean water bill -- wetlands, polluted runoff, toxics, aquatic ecosystem protection and enforcement.

These witnesses are all affiliated with the Clean Water Network, a coalition of over 400 organizations all over the country who are working together to strengthen the Clean Water Act. These groups have endorsed a National Agenda for Clean Water, which I ask to be placed in the record along with the list of endorsing groups, Briefing Papers on Reauthorization prepared by Network groups, and the full version of this statement.

Earlier this month the Subcommittee heard from witnesses who focused on the economic price of water pollution control. Little was said about the severe harm to human health, the environment

---

<sup>1</sup> NRDC is a nonprofit environmental organization representing approximately 170,000 members and supporters nationwide. NRDC has been involved in all major Clean Water Act reauthorizations, and in implementation of the law over the past 20 years.

and our economy caused by continuing water pollution. To begin, therefore, it is useful to assess the state of our aquatic resources twenty years after the Clean Water Act was passed in 1972, and to weigh the value of those resources.

NRDC searched for a comprehensive analysis of how well our aquatic ecosystems have fared since the Clean Water Act was passed. To our surprise, little work had been done on this subject. No comprehensive source was available to answer basic questions, like: How much cleaner are our rivers than they were two decades ago? Are our coastal beaches safer for swimming? Do our lakes support more fish, and are they safer to eat? What is happening to populations of fish, waterfowl and other animals that rely on aquatic habitat?

NRDC set out to fill this gap. Rather than relying only on traditional federal and state Clean Water Act program documents, however, which experts agree are of limited value in responding to our basic questions, we searched for "real-world" information on the safety of our waters for swimming, fishing and drinking; on the health of our aquatic ecosystems and the availability of important aquatic habitat; and on the status of species that rely on our rivers, lakes, wetlands and coastlines. The following is a summary of our work, which will be released in full in a book published by Island Press this summer.

SUMMARY1. Traditional Measures of Progress are Incomplete and Inadequate, but Show Substantial Ongoing Impairment of Surface Waters

According to EPA's most recent (1990) National Water Quality Inventory, we have a long way to go in meeting the goals of the Clean Water Act:

At least a third of our rivers, half of our estuaries and more than half of our lakes are not meeting designated uses, that is, are not safe for swimming, fishing and other uses. Considerably fewer waters are reported as meeting these uses in 1988-89 than in 1980-81. (In part, this may reflect better monitoring and reporting.)

But these reports are incomplete. Only 53% of river miles, 69% of lake acres, and 75% of estuarine area were "assessed" for the report. And even these claims are misleading, since "assessed" does not mean "monitored" for toxic and other pollutants. The 1990 Report was based on actual chemical measurements for less than a fifth of our rivers, streams, and lakes, and about a quarter of our estuaries.

2. New Controls have Reduced Discharges of Pollution, but We Still have a Long Way to Go

The percent of the U.S. population served by wastewater treatment plants jumped from 42% in 1970 to 67% in 1975, 70% by 1980, and 74% by 1985. EPA estimates that annual release of organic wastes have been reduced by about 46% as a result of this improved treatment, despite a large increase in the amount of wastes treated.

Industrial pollution controls have eliminated the release of almost a billion pounds of toxic pollutants each year into the Nation's rivers, lakes and coastal waters. Even higher amounts of conventional pollutants, like organic wastes and solids, have been controlled.

Still, we continue to release hundreds of millions of pounds of toxics into our surface waters each year from unregulated or poorly regulated industries, and discharges of raw or partially treated sewage continue unabated in many areas.

3. Long-term Water Quality Trends Show Inconclusive Results

Despite the existence of thousands of water quality monitoring stations around the country, very little information collected at these sites is suitable to tell us how much progress has been made in overall water quality.

The little information available to judge long-term progress shows no significant trends in overall water quality. Where improvements are evident, they are in pollutants such as phosphorus, reflecting investments in sewage treatment plants. Where deterioration is shown, it is from nitrogen, sediment, and other pollutants characteristic of polluted runoff from farms and other lands.

4. "Real-World" Measures Show Some Progress but Serious Problems Remain

a. Many Waters Remain Unsafe for Swimming

In 1991, U.S. ocean and bay beaches were closed or advisories issued against swimming on more than 2000 occasions in coastal states that monitor beach water quality. High bacteria levels were responsible for the overwhelming majority of closures. Over 5000 closures or advisories have occurred since 1988.

State water quality reports confirm that a quarter of our rivers and estuaries, a fifth of our lakes and ten percent of coastal waters remain unsafe for swimming.

b. Many Drinking Water Supplies Remain Jeopardized

The recent illnesses caused by Milwaukee's drinking water are not isolated. Reports from the Centers for Disease Control identify 525 disease outbreaks related to public water supplies from 1972-1988, affecting over 131,000 people. These numbers are conservative; some researchers believe that 25 times as many drinking water-related illnesses occur than are reported.

Between 27% and 30% of community drinking water systems reported violations of health-based standards from 1986-91.

c. Many Sources of Fish and Shellfish Remain Contaminated

In 1990, 31 states reported toxic contaminants in fish at levels exceeding action levels set by the Food and Drug Administration. Forty five states reported almost 1,000 fishing advisories in 1988-89, and another 50 complete fishing bans, due to pollutants such as PCBs, pesticides, dioxin, mercury, other metals, and other organic chemicals. These warnings affected over 7,000 river miles, almost 2.5 million lake acres, over 800 square miles of estuaries, and almost 5,000 miles of shoreline in the Great Lakes. EPA acknowledges that these reports are incomplete, and that state criteria for issuing advisories vary widely.

National data bases show some declines in chemical contamination of seafood, but increases and serious remaining problems for some chemicals, particularly in urban waters and other heavily-polluted areas. In a report released by EPA last year, almost half of the chemical forms of dioxins and furans, and a third of the other chemicals measured, were found at over half of the sampling locations. PCBs, biphenyl, mercury and DDE were found at more than 90% of the test sites. And every pollutant in the study was found in at least one location. EPA calculated that the levels of pollutants measured in fish around the country posed significant risks of cancer and other health effects for average fish consumers, and even higher risks to subsistence and recreational anglers who consume more fish from contaminated waters. Information is available, however, for only a handful of chemicals.

Sewage contamination of shellfish, however, is getting worse. The National Shellfish Register shows a 6% increase in estuarine waters closed to shellfish harvest from 1985 to 1990. By 1990, less than two thirds of our shellfish waters were unconditionally approved for shellfish harvest.

d. Aquatic Species are in Serious Jeopardy

Many more aquatic species are threatened and endangered than their terrestrial cousins: 73% of mussels, 65% of crayfishes, 34% of fishes, and 28% of amphibians are jeopardized compared to 13% of mammals, 11% of birds, and 14% of reptiles.

Between 1979 and 1989 the American Fisheries Society added 139 and removed 26 categories of fish from their list of threatened and endangered species, producing a total of 364 fishes that warrant protection due to rarity. Not a single species was removed from the list due to successful recovery efforts, while 10 were dropped because they became extinct.

e. Many aquatic and water-dependent populations are plummeting

Between 1970 and 1989, harvest of oysters dropped by 44% and landings of spiny lobster declined by 34%.

Commercial landings of striped bass have declined continuously since 1973, with a fall of 92% since 1982.

Between 1983-89 landings of bay scallops fell by 88%. Scallop landings also dropped by 50% from 1975-85, with catch per unit effort in 1985 reaching historic lows.

Duck breeding populations in North America dropped continually from 1955-1985. More recent data suggest that this trend has not been reversed. The ten species with over 97% of North America's breeding populations showed declines of 34% from 1970 to 1989.

According to data from the FWS Breeding Bird Survey, which has recorded flight records since 1966, a significant number of water-dependent species have declining population trends.

f. Pollution Continues to Cause Massive Fish Kills and Other Adverse Effects to Fish and Wildlife

From 1972-1989, EPA estimates that at least 429 million fish were killed in almost 10,000 incidents. (These data under-represent number of fish kills for several reasons.) The numbers of fish kills each year do not appear to be declining significantly.

From 1980 to 1989, NOAA reports over 3,650 fish-kill events in 533 coastal and near coastal counties in 22 states. These events involved over 407 million fish killed. In general, the total number of reported fish kills increased during the 1980s, but the average numbers of total fish killed per year declined.

Taken together, NRDC estimates that at least 1.35 billion fish have been killed in inland and coastal waters combined since the Clean Water Act was passed.

Pollutants continue to be released into our aquatic environments at levels that are toxic to aquatic species and to birds, mammals and other predators that consume contaminated fish. Studies in the Great Lakes indicate that toxic pollutants cause population declines and reproductive problems, birth defects, behavioral changes, sexual changes, and increased susceptibility to disease.

g. Aquatic Habitats are being Destroyed and Degraded at an Alarming Rate

Wetlands - At the time of European colonization the coterminous United States had an estimated 221 million acres of wetlands. More than half of this acreage has been lost through draining, dredging, filling, levies and flooding. Twenty two states have lost 50% or more of their original wetlands acreage; and ten have lost over 70%. We continue to lose an average of 260,000 acres of wetlands a year.

Fisheries - According to the 1984 National Fisheries Survey, 81% of the Nation's waters had fish communities adversely affected by a variety of factors, including 53.3% of all

perennial waters. More than one out of four provided only "minimal" support or less for healthy fish populations, and less than 4% of waters were rated as completely healthy.

Floodplains and riparian habitat - By the end of the 1970s, at least half of America's original riparian habitat had been destroyed. According to one 1979 estimate, only 23 million out of 67 million acres of the four predominant riparian vegetation types remained in the United States, a loss of 66 percent. In 1981, FWS calculated that only 26 million out of almost 56 million acres of riparian ecosystems remained in the contiguous states and Hawaii. A detailed 1992 assessment of floodplain management found that out of 75-100 million acres of indigenous, woody riparian habitat in the United States, less than half (about 35 million acres) remain in nearly natural condition. The rest have been inundated, channelized, dammed, riprapped, farmed, overgrazed, or altered by other land uses.

5. Evidence Shows that Healthy Aquatic Resources Have Tremendous Economic as well as Environmental Value

a. Commercial Fishing.

The dockside value of U.S. commercial fish landings in 1990 was \$3.6 billion, and more economic value is generated through processing and wholesaling. In 1990 the industry's total contribution to the U.S. GNP exceeded \$16.5 billion. In 1988 alone, 363,703 people were employed through commercial fisheries -- a major increase from 230,387 jobs in these industries in 1972. Protecting clean water is essential to protecting these jobs.

b. Recreational Fishing and Hunting.

In 1985, almost 60 million Americans fished for pleasure. Total expenditures for recreational fishing in 1985 exceeded \$28 billion dollars.

In 1985, an estimated four million people (two percent of the U.S. population) aged 16 or older participated in recreational shellfishing. Shellfishers estimated that they spent \$2.3 billion to participate in the sport.

According to the National Survey of Fishing, Hunting, and Wildlife Associated Recreation conducted by the Department of Interior, in 1985 3.2 million hunters spent 25.9 million days hunting waterfowl. Expenditures for waterfowl hunting totaled over \$783 million.

All forms of water-based hunting and fishing in the United States are on the rise. Comparing similar national surveys

from 1955-1985, the total number of fishers and waterfowl hunters increased dramatically over the thirty year period, resulting in a major rise in expenditures made to participate in these sports.

c. Other Water-Based Recreation.

Measured by the number of trips away from home, our most popular outdoor activities in 1987 included swimming outdoors (461 million trips per year), warm water fishing (239 million trips per year), and motor boating (220 million trips per year). In 1985, 14.8 million people visited lakes or streams, 8.4 million people went to marshes or wetlands, and 5.7 million went to the ocean. (The Interior Department reported an even higher number of outdoor (non-pool) swimmers in 1982.)

As with recreational hunting and fishing, other forms of water-based recreation are on the rise as well:

- \* Visitors to National Seashores and Lakeshores jumped from 18 million in 1981 to over 23 million in 1988.
- \* The number and value of recreational boats in the U.S. almost doubled from 1970 to 1989, with expenditures on recreational boating quadrupling.

Direct and indirect expenditures on boating (boats, motors, equipment, fuel, insurance, etc.) doubled from \$11 billion in 1970 (1990 dollars) to almost \$20 billion in 1988. This activity supports over 6,200 manufacturers of boats, trailers, motors and accessories, as well as over 8,300 marinas, boatyards and yacht clubs. The recreational marine industry provides jobs for about 600,000 people.

A case study in Florida highlights the tremendous importance of swimming-related tourism. Florida beach users generated a total of \$2.3 billion in economic benefits in 1984. This included direct expenditures of \$1.8 billion (almost 1.5 percent of total gross sales in the State), over \$400 million in payroll for about 84,000 jobs, and tax revenues of almost \$95 million.

d. Intangible Values

Some economists are beginning to assess economic values to intangible environmental benefits through techniques such as contingent valuation surveys. In a 1991 study conducted by Resources For the Future, the economic benefit of achieving the national swimmable water quality goal was estimated at \$29.2 to 46.6 billion per year in 1990. Clearly, the public

places a large economic "value" on even the intangible benefits of our aquatic resources.

Public willingness to pay for the intangible values of water resources is confirmed by of waterside property values:

- A 1983 study estimated that properties on polluted St. Alban's Bay on Lake Champlain, Vermont were selling for \$4,500 less than similar properties elsewhere on the Lake, with a total property value loss of \$2 million.
  - Water quality improvements in the Lower Willamette River near Portland, Oregon led to residential property increases of 16 to 25 percent.
  - Reduction of water pollution in San Diego Bay in the 1960's resulted in an approximately 8 percent rise in residential property values.
- e. Wetlands.

An estimated 50 million people spend nearly \$10 billion annually to observe and photograph wetland-dependent birds.

Wetlands sustain much of the country's seafood. In the Southeast, 96 percent of the commercial catch and over 50 percent of the recreational catch is dependent on estuarine and other coastal wetlands. Estimates of the value of coastal wetlands to commercial and recreational fisheries range from about \$2200/acre on the Pacific coast to almost \$10,000/acre along parts of the Florida coastline.

A 1981 case study at Tufts University evaluated 8535 acres of wetlands in the Charles River Basin, Massachusetts. The following is a break-down of the conservative estimated economic benefits of one acre of Charles River Basin wetland in 1978 dollars: flood prevention (\$33,370), local amenity (\$150 - \$480), nutrient reduction (\$16,960), water supply (\$100,730), recreation (\$2,145 - \$38,469). The total long-term worth of just one acre was estimated to lie between at \$153,000 - \$190,009. Not bad for "just a swamp."

ARE OUR WATERS BETTER OFF THAN THEY WERE 20 YEARS AGO? HAS THE CLEAN WATER ACT PROTECTED PEOPLE AND AQUATIC ECOSYSTEMS?

The Clean Water Act is implemented by EPA, 50 states (plus a number of territories and interstate agencies), and thousands of localities. Its goal is to restore and maintain 3 million miles

of rivers, almost 27 million acres of lakes, and over 35,000 square miles of estuaries.<sup>1</sup> Some of these waters are monitored frequently, others less often, and many not at all. To fill these gaps in knowledge, NRDC looked at three measures:

1. The traditional state reporting system under section 305(b) of the Act, under which states identify waters that meet designated uses. These measures are of only limited value in measuring progress in meeting the goals of the Act.
2. Direct measures, such as pounds of pollutants removed and long-term, national trends in water quality. These measures show progress in protecting waters from chemical insults, but that we have a long way to go in eliminating toxic chemical pollution.
3. Real-world measures such as the presence of pollutants in drinking water or in fish and shellfish; numbers of beaches and shellfish beds that remain closed due to pollution; or the health of aquatic species and aquatic ecosystems. These real-world measures present a far more complete and balanced picture of how well the Clean Water Act has protected human health and aquatic ecosystems, and show that much more work remains than is apparent by looking at chemical data alone.

#### I. Attainment of "Designated Uses"

The Clean Water Act requires states to submit an analysis of water quality to EPA every two years, including an assessment of which waters meet water quality standards. EPA analyzes these reports and submits a comprehensive analysis to Congress every two years.<sup>2</sup> These reports are known as the "National Water Quality Inventory." The first inventory was released in 1974; the most recent was issued in 1992.

Using these tools, it would seem relatively simple to evaluate how well the Act has worked, by comparing the

information in each of EPA's National Water Quality Inventories to determine how many waters have improved or degraded. In fact, this analysis is complicated by a host of problems, including significant changes in the data available over the years, and in procedures used for analyzing and presenting the information.

Early 305(b) reports were extremely cursory, and based on a very small percentage of waters. The 1974 report attempted to characterize water quality in just 22 major waterways.<sup>3</sup> In general, little monitoring data were available for these waters, and water quality criteria existed for only a few pollutants.<sup>4</sup>

The 1990 National Water Quality Inventory, by contrast, is based on information from 51 states and territories and thousands of monitoring stations around the country. The Report includes summaries of compliance with water quality standards in each state, broken down by type of water and reasons for impairment. Clearly, one cannot simply compare the 1974 Report with the 1990 Inventory and draw conclusions about progress.

Even the 1990 Report, however, is hardly comprehensive. Only 53% of river miles, 69% of lake acres, and 75% of estuarine area were "assessed" for the report.<sup>5</sup> And even these claims are misleading, since "assessed" does not mean "monitored" for toxic and other pollutants. The 1990 Report was based on actual chemical measurements for less than a fifth of our rivers, streams, and lakes, and about a quarter of our estuaries.<sup>6</sup>

EPA acknowledges serious problems with the 305(b) system, and severe inconsistencies in state reporting:

Unfortunately, the current value of the 305(b) reports as a source of environmental indicator data is severely limited. There are very large inconsistencies among States in how water quality data are generated, analyzed and reported. States assess different subsets of their waters from one year to the next. In some instances, States even change their accounting of total waters from one year to the next. One problem in using this information for national reporting purposes stems from the considerable discretion that States have under the law in developing their own water quality standards. ... As a result ... making comparisons between States or trying to assess national status and trends is essentially impossible. And the inconsistencies in sampling design from year to year make it difficult to assess trends even within individual States.<sup>7</sup>

Despite these problems, it is possible to compare the last several Water Quality Inventories, which are now issued in a relatively standard format, using relatively consistent terminology. This analysis produces surprising results. Considerably fewer waters are reported as meeting designated uses in 1988-89 than in 1980-81, for all three types of waters. At least a third of our rivers, half of our estuaries and more than half of our lakes are not meeting designated uses. (For a number of reasons it is likely that use impairment is under-reported.)

There are several possible explanations for this trend. First, the total percent of waters assessed and the number of states reporting increased steadily over the past decade. Second, it is possible that the standards by which we measure use attainment are improving, or getting stricter. EPA is making some progress in expanding the criteria by which use impairment is judged, leading some states to report higher levels of impairment than in previous years. Finally, it is possible that the traditional measures of pollution reduction and water quality

used to define success are masked by other types of effects on aquatic ecosystems, such as degradation or elimination of aquatic habitat, or concentration of pollutants over time even where current releases have been reduced.

The most recent National Water Quality Inventory demonstrates that while progress has been made, even the interim goals of the Clean Water Act have not been met. Clearly we have not yet met the interim "fishable and swimmable" goal of the law, which was supposed to be met by 1983, much less the long-term goal of restoring the integrity of the Nation's waters.

## II. Direct Measures of Pollution and Water Quality

### A. Pollutant Reductions

The federal government has invested \$56 billion in municipal sewage treatment since 1972,<sup>8</sup> with total federal, state and local expenditures of over \$128 billion. The percent of the U.S. population served by wastewater treatment plants jumped from 42% in 1970 to 67% in 1975, 70% by 1980, and 74% by 1985.<sup>9</sup> EPA estimates that annual release of organic wastes have been reduced by about 46% as a result of this improved treatment, despite a large increase in the amount of wastes treated.

The same measure viewed from the opposite direction, however, shows a glass only half full. In 1990 EPA estimated that additional municipal wastewater treatment needs through the year 2010 would exceed \$110 billion (in 1990 dollars).<sup>10</sup> Judged by these investment needs, our municipal pollution control

efforts have taken a giant step since 1972, but we are still only half way to our destination. Some of these needs are for advanced treatment systems to reduce nutrients; but others are still to tackle ongoing releases of raw sewage into the Nation's waters. It is estimated that combined sewer overflows alone discharge between 3 and 11 billion pounds of solids, and from 1 and 3 billion pounds of organic matter each year.<sup>11</sup>

Similar gains are evident in the industrial sector. In 1973, industry spent about \$1.8 billion on water pollution controls (including both capital and operating expenses). By 1986 this had jumped to almost \$6 billion.<sup>12</sup> Total industrial pollution control expenditures over this period exceed \$55 billion. But new water pollution equipment expenditures seem to have peaked in the late 1970s, reflecting a substantial curb in EPA's issuance of new industrial water pollution controls.

Again, these investments have reaped dividends in pollution reductions. According to EPA estimates, industrial pollution controls implemented in 22 industries since 1972 -- under a Consent Decree between EPA and NRDC -- have reduced releases of selected "priority"<sup>13</sup> toxic organic pollutants by 99% for these industries, or by almost 660,000 pounds per day. Reductions in toxic metals are estimated at almost 98%, or over 1.6 million pounds per day.<sup>14</sup> All told, assuming EPA's estimates are correct, these controls have eliminated the release of almost a billion pounds of toxic pollutants each year into the Nation's

rivers, lakes and coastal waters. Higher amounts of conventional pollutants (organic wastes and solids) have been controlled.<sup>15</sup>

As with sewage plants, however, the picture looks different from the angle of how much pollution continues to be released by industries. According to EPA's most recent "Toxic Release Inventory" (TRI), in 1990 U.S. industries released almost 200 million pounds of toxics into surface waters, over 2.5 million pounds of which may cause cancer. Almost another 450 million pounds a year are released into public sewers. These numbers are far from complete.<sup>16</sup> EPA estimates that a large percentage of those required to report under TRI fail to do so. And a large number of toxic chemicals and facilities that generate toxics are not even covered by the system.<sup>17</sup> Hazardous waste treaters alone, for example, are not covered by TRI but release over 300 million pounds of toxics into waters and sewers each year. These wastes included over 200 toxic pollutants, at least 60 of which may cause cancer, and at least 23 of which may cause birth or genetic defects.<sup>18</sup> And EPA acknowledges that the availability and quality of data is limited, especially for toxics.<sup>19</sup>

#### B. Long-Term Water Quality Trends

Despite tens of thousands of water quality monitoring stations around the country, relatively little information is useful for long-term trend analysis. There is significant variation in monitoring and analytical methods, water quality parameters measured, and consistency of data. Some stations have

been in place for long periods of time, others for only short durations. As explained by experts at USGS:

Despite expenditure of hundreds of millions of dollars annually on water quality data collection, there is a paucity of data ... that are suitable for a scientifically defensible national water quality trends assessment... Long-term data collection programs have been conducted by many state agencies; however, most of these data are derived from grab samples, which may not be representative of the cross-sectional character of stream quality. In addition, discharge records are not available for many of the state stations, and changes in laboratory procedures used throughout the period of data collection are often not well documented. ... From the standpoint of longterm trend analysis, the shortcomings of state water quality data are widespread enough to preclude their inclusion in a national data base, which must have reasonably uniform geographic coverage.<sup>20</sup>

EPA agrees that while a large amount of water quality information is gathered, most is not collected or stored in a way that allows one to identify trends.<sup>21</sup> One commenter referred to our water quality knowledge as "data-rich but information-poor."<sup>22</sup>

One exception is the USGS National Stream Quality Accounting Network (NASQAN), with 403 stations nationwide located at USGS stream gauging stations.<sup>23</sup> Because this program is run by a single federal agency, it can assess national trends without the problem of variations among state programs. However, the number and location of total monitoring stations and the scope of pollutants measured is quite limited.

In an evaluation of data from 1978 to 1987, the majority of NASQAN stations showed no significant trends. This probably reflects the fact that most of the stations are relatively removed from major point sources. Thus, the data are most likely to reflect water quality effects from land use and atmospheric

deposition than from discrete sources, and not likely to reflect the reductions in pollutant loads discussed above. This does not mean that the point source reductions we have achieved are insignificant; it means that the impacts of this pollution, and its reduction, are more localized than can be measured by 400 stations distributed across the country, which are not located to detect the impacts of point source pollution reductions.

Definite trends were detected, however, in concentrations of some pollutants. For total nitrogen, about 77% of streams that showed significant trends were degraded, as were over 80% of the trends for dissolved solids. These trends are consistent with increased runoff from agricultural sources. For phosphorus about 85% of streams that showed trends were downward, which may reflect reductions from some point sources<sup>24</sup> (sewage treatment plants). For other pollutants, such as oxygen deficit, bacteria, and metals, most stations reflected no trend; but where trends did occur, they reflected improvements that would be expected due to point source controls. Even here, some stations reflected water quality degradation for many pollutants. Thus, across-the-board improvements in water quality are not shown for many pollutants. Notable exceptions were lead, zinc, chromium, silver and arsenic, where only a handful of stations showed upward trends. In the case of lead, these reductions can be explained by the elimination of a major pollution source -- lead in gasoline which formerly reached waterways through runoff.<sup>25</sup>

### III. Real-World Measures of Progress

#### A. Human Health Continues to be Threatened

The Clean Water Act was enacted in part to address concerns about public health -- polluted drinking water, contaminated fish and shellfish, and swimming beaches laden with bacteria. Conditions have improved somewhat in all three areas. Fish no longer is laced with the extreme concentrations of mercury and DDT found in the 1960s. Most public drinking water supplies are tested and treated at least for bacterial contaminants, and some for toxics. And bacteria levels have declined in many of the Nation's most polluted waters.

But most people still cannot drink from their taps, eat the catch from their favorite fishing hole, or take their family to the local beach or lake with full assurance that they will not become ill or face long-term, chronic health threats.

##### 1. Swimming and Beach Closures

EPA's National Assessments report how many waters the states believe are "swimmable". According to the 1990 report, the Clean Water Act's swimmable goal is met in about three quarters of our rivers and estuaries, over 82% of our lakes and almost 90% of our ocean waters. Even these numbers lead us to conclude that, almost a decade after the 1983 goal for swimmable waters, a large number of water bodies are not safe for swimming.

A more telling assessment of beach closures from 1989-91 is available in NRDC's Testing the Waters: A National Perspective on Beach Closings, issued in July, 1992. The major findings of

this report indicate that we are indeed a long way from achieving the swimmable waters goals of the Act, or even from getting an accurate handle on the full scope of the problem:

- \* In 1991, U.S. ocean and bay beaches were closed or advisories were issued against swimming on more than 2000 occasions in coastal states that monitor beach water quality. High bacteria levels were responsible for the overwhelming majority of cases. Over 5000 closures or advisories occurred since 1988.
- \* Most of the closures and advisories were in densely populated coastlines of New York, New Jersey, Connecticut; 588 others were in southern California from San Diego to Los Angeles.
- \* Ten states monitor their beach waters infrequently if ever (AL, GA, LA, MS, NH, NC, OR, SC, TX, WA); 8 others monitor portions of their coasts (CA, DE, FL, ME, MD, MA, RI, VA); only 4 monitor the whole coast (CT, NJ, NY, DE).
- \* States have highly inconsistent water quality standards for sewage contamination, and inadequate (and largely nonmandatory) beach closing standards and criteria.
- \* Lack of federal leadership has resulted in the complete absence of monitoring in some states, and substantial variations in methods and closure standards. Only 7 of 22 coastal states use EPA's recommended indicator and only 4 states use EPA's recommended testing method.
- \* Levels of protection vary -- among 22 states surveyed, there were 11 different bacteria standards for swimming; in 7 states standards vary within the state.
- \* Only Connecticut, New Jersey and Delaware consistently close beaches every time bacteria water quality standards are violated.
- \* Some states issue prompt warnings, while others wait weeks or even months to publicize unsafe conditions.

## 2. Pollution of drinking water

The only reliable, comprehensive information on trends in drinking water quality is available from the Centers for Disease Control, which track water-borne disease outbreaks.<sup>26</sup> These

reports identify 525 disease outbreaks related to public water supplies from 1972-1988, affecting over 131,000 people.

Outbreaks reported between 1971 and 1985 represent more outbreaks of disease than in any previous 15-year period since 1920.<sup>27</sup>

These numbers are conservative, since CDC acknowledges that the number of reported waterborne disease outbreaks represents a fraction of the total number that occur. EPA reports that some researchers believe that there are 25 times more actual illnesses from contaminated drinking water than are reported. 52 Fed. Reg. 42181, 183 (1987). If correct, from 1972 to 1988 this would translate to illnesses affecting over 3.2 million people!

In terms of trends, the number of outbreaks per year generally increased between the early 1970s and the early 1980s, and then dropped down again between 1984 and 1988. Total illnesses vary quite widely from year to year, reflecting high variations in the numbers of people affected per outbreak. This involves not just the severity of the incident but the size of population served by the system. Notably, the highest number of total illnesses in a single year was in 1987, indicating that serious problems remain with the quality of our drinking water. And the recent disease outbreak in Milwaukee underscores that the nation's raw drinking water supply continues to be threatened.

A second nationwide perspective comes from an analysis of drinking water standards violations around the country.<sup>28</sup> The maximum contaminant level (MCL) compliance rate for community water systems (CWS) remained between 70% and 73% from 1986 to

1991. This figure represents the number of MCL violations reported to EPA. In other words, between 27% and 30% of community drinking water systems reported violations of health-based standards during these years.

### 3. Fish and shellfish contamination

Americans are eating fish in record amounts. Average annual consumption jumped from about 12.5 pounds per person in 1972 to 15.5 pounds in 1990, and is expected to increase more in the future. And of course, there is a long and rich history of enjoyment of seafood in America for cultural and aesthetic reasons, especially in coastal areas.

Evidence indicates that levels of some contaminants are declining in parallel with reduced releases of toxic chemicals, but some remain above levels at which serious health effects can occur. In some areas, especially for pollution caused by raw or partially treated sewage, the situation appears to be getting worse. And unfortunately for both the public and the seafood industry, an increasing number of waters are being closed to commercial and recreational fishing.

In the 1990 National Water Quality Inventory, 31 states reported toxic contaminants in fish at levels exceeding action levels set by the Food and Drug Administration.<sup>29</sup> Forty five states reported almost 1,000 fishing advisories in 1988-89, and another 50 complete fishing bans in 1988-89, due to pollutants such as PCBs, pesticides, dioxin, mercury and other metals, and other organic chemicals. These warnings affected over 7,000

river miles, almost 2.5 million lake acres, over 800 square miles of estuaries, and almost 5,000 miles of shoreline in the Great Lakes.<sup>30</sup> EPA acknowledges that these reports are incomplete, and that state criteria for issuing advisories vary widely.<sup>31</sup>

A number of national data bases are available to evaluate general trends in seafood contamination. These include the Fish and Wildlife Service's National Contaminant Biomonitoring Program (NCBP) for inland waters, NOAA's National Status and Trends and Mussel Watch Programs for coastal waters, and the National Shellfish Register for shellfish beds.

#### The National Study of Chemical Residues in Fish

Last year EPA released the results of a five-year effort to evaluate toxic chemicals that may be bioaccumulating in fish.<sup>32</sup> This effort, originally called the National Bioaccumulation Study, tested for the presence of 60 pollutants in 119 species of fish collected from 314 water bodies. Test sites were chosen based on predicted impacts from point sources or polluted runoff, but others were selected to reflect background conditions.

The results of the EPA study are sobering. Almost half of the chemical forms of dioxins and furans, and a third of the other chemicals measured, were found at over half of the sampling locations. PCBs, biphenyl, mercury and DDE were found at more than 90% of the test sites. And every pollutant in the study was found in at least one location.

There was wide variation in the amounts of pollutants in samples. Nevertheless, EPA calculated that the levels of

pollutants measured in fish around the country posed significant risks of cancer and other health effects for average fish consumers, and even higher risks to subsistence and recreational anglers who consume more fish from contaminated waters.

The National Study of Chemical Residues in Fish has obvious limitations in terms of establishing national trends. Only a limited number of pollutants were tested at a limited number of sites. Moreover, the study was not designed to establish trends. Nevertheless, the EPA report presents the most current and most comprehensive evidence that freshwater fish around the country are contaminated by a wide range of toxic chemicals at levels that pose severe human health threats.

The National Contaminant Biomonitoring Program (NCBP)

The results of EPA's study are largely consistent with the Fish and Wildlife Service's National Contaminant Biomonitoring Program. NCBP findings are summarized in two recent reports tracing contaminant levels in inland waters from 1976-1984, for toxic metals and organic chemical pollutants respectively.<sup>33</sup> The data show many victories, but significant remaining battles. Levels of toxic metals in fish tissue declined for some metals (arsenic, cadmium, copper, zinc and selenium) from the mid-1970s to the early-1980s, and then leveled off. Mercury levels had already declined by more than 25% between the late 1960s and 1974, but showed no appreciable change thereafter. The pollutant that showed the most consistent decline was lead, in conjunction with the phase-out of lead as a gasoline additive.

Despite this general decline, however, detectable levels of toxic metals remain in most fish sampled, often at levels of health concern. While there is considerable difference of opinion about "safe" levels of toxic pollutants in fish, a range of criteria used by various countries is presented in an EPA Guidance Manual.<sup>34</sup> Average measured concentrations exceed at least the low-end of this range for all of the tested metals except copper, lead and zinc; and the maximum detected levels were well into this range for all of the metals. For all pollutants except cadmium and copper, contaminant levels were increasing in one or more monitoring station, and in a third of all stations for zinc.

Similar trends are apparent for pesticides and other chlorinated organic chemicals, such as PCBs. Concentrations of some pollutants appear to be declining, while others remained constant or declined initially and then leveled off. While these data show some improvement, substances such as PCBs, DDT and other pesticides continue to be found in fish long after the use of these chemicals was banned. Average levels of contamination remain at levels of concern for the pesticides endrin, chlordane and toxaphene (again measured against the low end of EPA's reported range of criteria used by various countries).

#### The National Status and Trends and Mussel Watch Programs

NOAA maintains a monitoring network to measure sediment and fish and shellfish contamination in estuaries and coastal waters. The program is limited to a small number of pollutants, and does

not include most industrial or agricultural chemicals currently in use. Moreover, because it is designed primarily to address ambient conditions in isolated locations,<sup>35</sup> the monitoring locations were not selected to "find" contaminated areas.

On a national scale, this program shows that contaminant levels are decreasing for most of the pollutants measured. Levels of most toxic metals were either relatively level or decreasing. However, the only pollutant for which all sites showed decreasing levels was PCBs (which are no longer in use), while all other pollutants showed some sites improving and some degrading. In the case of lead, mercury and selenium, more sites deteriorated than improved, and overall showed a worsening trend in copper. Notably, copper is the only of the metals tested for which overall national use has increased during the period of this program. Society's use of a chemical clearly is linked directly to its eventual presence in the environment.

While the monitoring locations were not selected to detect toxic "hotspots," the most polluted areas predictably were in heavily-populated urban areas. These include sites near Boston, New York, San Diego, Los Angeles and Seattle. Water bodies with particularly high levels of contamination include Long Island Sound, the Hudson/Raritan Bay Estuary, portions of the Chesapeake Bay, and Puget Sound.

#### The National Shellfish Register

Unlike chemical contaminants, overall contamination of coastal waters by sewage and other sources of pathogens appears

to be getting worse. The National Shellfish Register<sup>36</sup> shows that estuarine waters in which shellfishing was banned increased by 6% from 1985 to 1990. By 1990, less than two thirds of our shellfish waters were unconditionally approved for shellfish harvest. (While shellfish waters were degrading on the East and Gulf coasts, however, they appear to be improving in the West.)

This high level of contamination of coastal waters by sewage and other sources of bacteria and other biological contaminants is consistent with high reported levels of seafood-associated disease outbreaks, although "... it is likely that only a small fraction of seafood-associated disease is reported and that the two available data bases therefore reflect only a small fraction of the actual number of seafood-associated illnesses that occur."<sup>37</sup> An FDA data base includes 5,342 cases of seafood-borne illness from 1987-1987; while CDC reported 3,271 shellfish-related cases and 203 cases other during same period.<sup>38</sup>

B. Aquatic species and ecosystems are in jeopardy

The second dominant motivation for the Clean Water Act was the awareness that aquatic ecosystems were in serious jeopardy. The most direct indication of biological integrity is the health of the species that inhabit an ecosystem. Unfortunately, judged by the health of both aquatic and aquatic-dependent species, and of the habitats needed to support them, we are failing to meet this most fundamental goal of the Clean Water Act.

1. We are losing aquatic and water-dependent species

Spotted Owls and Red Squirrels have captured headlines in the struggle to preserve habitat for endangered species. Without minimizing the serious threats faced by terrestrial species, evidence shows, at least in North America, that fish and other species that inhabit or rely heavily on our aquatic ecosystems are actually faring much worse than their land-dwelling cousins.

The Nature Conservancy evaluated the status of selected animal groups in North America, and found that aquatic species dominated the list of animals that are rare or threatened. While 13% of mammals, 11% of birds, and 14% of reptiles are threatened, much larger proportions of aquatic species are in jeopardy:

Amphibians	-	28%
Fishes	-	34%
Crayfishes	-	65%
Mussels	-	73%. <sup>39</sup>

Trends in aquatic biodiversity

In 1964, Dr. Robert Rush Miller of the University of Michigan published the first list of endangered fishes. He characterized 38 species as endangered, and 21 as "urgently threatened."<sup>40</sup> By 1979, the American Fisheries Society (AFS) compiled a more comprehensive list of 251 North American fishes designated as endangered, threatened, or of special concern.<sup>41</sup>

The Clean Water Act has done little to reverse this trend. When AFS revisited its catalog of threatened and endangered fishes a decade later, in 1989, the situation had deteriorated severely. The 1989 list added 139 new taxa and removed 26, producing a total of 364 fishes that warrant protection due to

rarity. These include 147 characterized as of special concern, 114 as threatened and 103 as endangered. Most of the species (254 out of 364) are in the United States.<sup>42</sup> Not a single species was removed from list due to successful recovery efforts, while 10 were dropped because they had become extinct. Of the species that changed categories, 7 improved, 24 declined, and 18 were reclassified for other reasons.

AFS experts concluded that the factors that threaten most fishes changed little since the 1979 classification: "Habitats continue to be degraded through human activities associated with agriculture, mining, industry and urban development, while harmful exotic species continue to be introduced and native fishes are transplanted beyond their natural ranges."<sup>43</sup> Overuse was a relatively minor factor and for only a few species. AFS predicted an increased rate of extinction if trends continue.

But fishes are not the only category of aquatic and aquatic-dependant species in jeopardy. In addition to 90 fishes, the current FWS list of threatened and endangered species includes 13 snails, 42 clams and mussels, and 10 aquatic crustaceans.<sup>44</sup> Even among the threatened and endangered species not strictly considered aquatic, many species on the list rely heavily on aquatic ecosystems. The mammals include marine mammals such as the Florida manatee, stellar sea lion, and southern sea otter; wetlands or beach-dwelling species such as beach mice, voles and shrews; and better known cases such as the Florida panther, whose habitat in the Everglades is facing increasing pressure

from development. Currently-listed bird species include waterfowl and other species that use wetlands and other waters for food, nesting, staging, and other critical habitats. These include the Whooping crane, Mississippi sandhill crane, several species of ducks and geese, Everglades snail kite, Brown pelican, Piping plover, wood stork, and others.

Trends in aquatic and other water-dependent populations

Population levels are declining in many aquatic species and other species that depend on aquatic ecosystems. Many seafood populations are on the rise, such as American lobster, landings of which have risen by more than half over the past twenty years.<sup>45</sup> But other indicators are more ominous:

- \* Between 1970 and 1989, harvest of oysters dropped by 44% and landings of spiny lobster declined by 34%.
- \* Commercial landings of striped bass have declined continuously since 1973, with a fall of 92% since 1982.
- \* Between 1983-89 bay scallop landings fell by 88%. Landings also dropped by 50% from 1975-85, with catch per unit effort in 1985 reaching historic lows.<sup>46</sup>

On a regional basis, losses can be devastating:

- \* Between the mid-1960's and mid-1980's, Chesapeake Bay landings declined dramatically: hickory shad down 96%, alewife and blueback herring down 92%,<sup>47</sup> striped bass down 70%, and American shad down 66%.
- \* Columbia River basin salmon and steelhead (2.5 million fish) have declined an estimated 75-84% from estimated historic levels of 10-16 million fish. Approximately 70% of those that remain are produced in hatcheries as mitigation for dam effects, as more than 55% of the Columbia River basin has been blocked by dams.<sup>48</sup>
- \* Sacramento River winter run Chinook salmon have declined 99% in the past 20 years, and they are now listed as "threatened" species.

- \* English sole landings from Puget Sound have declined in recent years from a high of 2.4 million pounds to a low in 1987 of 0.7 million pounds.
- \* The commercial carp fishery in the Illinois River has virtually disappeared, dropping from over 15 million pounds in 1908 to 4 million pounds in 1950 and 213 thousand pounds in 1973.<sup>49</sup>

Again, these trends are not limited to species that spend all of their time in the water. Waterfowl populations in general have plummeted over the past quarter century. According to CEQ's 1989 national assessment of environmental trends, Duck breeding populations in North America dropped continually from 1955-1985. More recent data suggest that this trend has not been reversed. The ten species with over 97% of North America's breeding populations showed declines of 34% from 1970 to 1989.<sup>50</sup> And waterfowl are not the only water-dependent birds showing serious declines. According to the FWS Breeding Bird Survey, which has recorded flight records since 1966, a significant number of water-dependent species have declining population trends.

#### Fish kills

The U.S. Public Health Service began reporting pollution-caused fish kills in 1960. On passage of the Clean Water Act in 1972, this function was transferred to EPA. Summary reports were prepared by EPA for 1961-1975 and 1977-87;<sup>51</sup> and data for 1988-89 are available in the 1990 National Water Quality Inventory.

Unfortunately, these data show little if any progress in stopping fish kills caused by pollution. From 1972-1989, EPA estimates that at least 429 million fish were killed in almost 10,000 incidents. These data under-represent the number of fish

kills for several reasons: (1) reporting is voluntary and some states do not participate; (2) some fish kills go unnoticed; others are not included in reports because causes are not known; (3) data are lost where investigation is delayed, because fish are washed away and pollution is diluted; and (4) the number of fish estimated to be killed often is conservative; in some cases, as much as 80% of the dead fish cannot be counted because of turbid water or settling to the bottom.<sup>52</sup>

The numbers of fish killed each year have fluctuated widely because total kills in a given year may be skewed by catastrophic single events. For example, about 17 million fish were killed in 1972. This number jumped to almost 39 million in 1973 and skyrocketed to over 119 million in 1974, but then dropped back to just over 16 million in 1975. At first blush, it appears that these levels have dropped in recent years. States reported 200 million fish killed from 1977-85, an average of 22 million per year over those nine years. Reported fish kills then dropped to six million a year in 1986-87, and increased again to 13 million a year in 1988-89. But these numbers are skewed by extreme variations in the numbers of states reporting fish kills during certain periods. Reporting dropped from all states in the early 1970s to an average of 36 states from 1977-85, a low of 24-26 in 1986-87 and 42 in 1988-89. When reported fish killed are normalized to reflect these differences, a different picture emerges, showing little if any actual reductions.

Trends in numbers of fish kill incidents show less variability from year to year, and hence are somewhat better indicators of overall progress. Here, a comparison actually suggests an increase in the average number of fish kills each year. Not adjusting to reflect differences in numbers of state reports, there were generally 750 incidents per year from 1972-75, about 625 per year from 1977-85, less than 500 per year from 1986-87, and about 680 per year in 1988-89. But adjusted to reflect variations in the number of states reporting, the trends suggest an increase from roughly 750 incidents per year in the early 1970s to between 800-1000 incidents per year in the late-1970s-1980s. While this increase may reflect better detection and reporting by those states that reported in the later years, the data reflect that large numbers of fish kills continue two decades after the Clean Water Act was passed.

A second source of data indicating trends in fish kills is available from NOAA, which tracks fish kills in coastal waters. From 1980 to 1989, over 3,650 fish-kills were reported in 533 coastal and near coastal counties in 22 states. These events involved over 407 million fish killed. The number of events reported was highest in 1986 (519) and the greatest number of fish killed was in 1980 (138 million).

Taken together, NRDC estimates that at least 1.35 billion fish have been killed in inland and coastal waters combined since the Clean Water Act was passed.<sup>53</sup> These trends show that much

more progress is needed to eliminate sources of pollution that generate major fish kills.

#### Aquatic Toxicity

There is increasing evidence that even extremely low levels of toxic pollutants can cause a wide range of health effects to fish and wildlife. Particularly for pollutants that are persistent and bioaccumulative, this information shows that pollutants continue to be released into our aquatic environments at levels that are toxic to aquatic species and to birds, mammals and other predators that consume contaminated fish. A 1991 report by the National Wildlife Federation and the Canadian Institute for Environmental Law and Policy summarized the effects of toxic contaminants in the Great Lakes area:<sup>54</sup>

**Population Declines and Reproductive Problems** - Bald eagles in the Great Lakes have lower reproductive rates than eagles living inland. There are no longer any minks within a five mile radius of Lake Ontario. Fifteen kinds of birds, animals, and fish in the Great Lakes have had reproductive problems and/or population declines since the 1950s.

**Birth Defects** - Twisted beaks and deformed eyes cause many fish-eating cormorants and terns from Green Bay and Saginaw to die from starvation. Double crested cormorants in four island colonies of Green Bay were born with bill defects 42 times more than in colonies outside the Great Lakes region. Missing brains, missing eyes, internal organs located outside the body, and deformed feet and wings are other abnormalities found in Great Lakes wildlife. Birth defects occurred in almost 50 percent of the species studied.

**Behavioral Changes** - There is increasing evidence that behavioral changes risk the survival of Great Lakes species -- gulls ignore their eggs; terns leave their eggs at night, leaving them vulnerable; young lake trout swim upside down. Six species of wildlife show serious behavioral changes.

**Sexual Changes** - Male herring gulls from Lake Ontario were found with female organs. Similar abnormalities were found in minks and lab animals. It is thought to be caused by the

similarity in structure of PCBs, DDE, and other pesticides to female hormones.

**Increased Susceptibility to Disease** - Beluga whales, terns, and herring gulls have suffered a suppression of their immune systems.

Information from other regions suggests that the Great Lakes findings are not isolated. For example:

- \* Exposure of adult English sole to contaminants (1) causes failure of egg development in some of the fish; (2) of those which do produce eggs, it interferes with the timing of their spawning; and (3) of those which do spawn on time, it results in deformed young. Almost 40% of the female English sole NMFS tested from Eagle Harbor and Duwamish Waterway failed to mature sexually. Sediments in both areas have high levels of aromatic hydrocarbons, which can result in disease and induce a variety of lesions leading eventually to development of cancerous tumors.
- \* Liver cancer (the most extreme lesion) has been found in 20% of English sole collected from two of the most contaminated areas of Puget Sound, and in 15% of winter flounder samples from similarly affected areas of Boston Harbor.
- \* Liver cancer and pre-cancerous liver lesions have been found in 33% and 93%, respectively, of the killifish collected from a contaminated site in the Elizabeth River, Virginia. Virtually all adult grey trout (which feed by sight) collected from heavily polluted areas of that river have contaminant-induced eye cataracts.<sup>55</sup>

More broadly, the Smithsonian Institution's Registry of Tumors has documented that fish with serious contaminant-related abnormalities are generally found in those areas of the U.S. affected most by coastal pollution from about 1,900 major industrial and municipal dischargers.<sup>56</sup>

## 2. We are losing or damaging our aquatic habitats

A combination of factors, including chemical pollution, loss of important physical habitat, and overharvesting, are to blame

for the declines in most species. There is no single source of data on loss or degradation of aquatic habitats since 1972. However, a significant amount of objective information exists on particular types of aquatic habitat. This information confirms the sad reality that while some chemical pollutant loads may be declining, the overall integrity of our aquatic ecosystems is declining dramatically.

#### Instream Fisheries Habitat

Over ten years ago, FWS and EPA conducted the National Fisheries Survey, billed as the first statistically designed survey of the status of the Nation's waters and fish communities. The survey requested detailed information on habitat conditions from professional aquatic biologists around the country, based on a large statistical cross-section of waters. Unfortunately, despite its conclusion that much follow-up work was warranted, the Survey was both the first and the last effort of its kind.

The conclusions of the Survey were striking: 81% of the Nation's waters had fish communities adversely affected by a variety of factors, including 53.3% of all perennial waters.<sup>57</sup> Most telling were the survey's rankings of waters according to the following categories:

- 0 - no ability to support any fish population
- 1 - support nonsport fish only
- 2 - minimally able to support sport fish or species of special concern
- 3-4 - intermediate ability to support sport fish
- 5 - able to support sport fish, species of special concern or both at maximum level

For all streams and perennial streams, rankings were as follows:

<u>Rank</u>	<u>All streams</u>	<u>Perennial Streams</u>
0 (no support)	23.1%	3.1%
1 (nonsport only)	10.0%	5.2%
2 (minimal support)	21.0%	17.2%
3-4 (intermediate)	42.1%	40.1%
5 (maximum support)	3.9%	3.9%

All told, even for perennial streams, more than one out of four provided only "minimal" support or less for healthy fish populations. Less than 4% of waters were rated as completely healthy. Moreover, relative to 5 years earlier the survey found the following trends: 91% kept the same rank, 4% improved, and 5% degraded; and respondents believed conditions would deteriorate severely over the next five years.<sup>58</sup>

#### Wetlands

Wetlands trends were summarized in a 1991 Report to Congress by the Fish and Wildlife Service on "Wetlands Status and Trends" from the mid-1970s to mid-1980s.<sup>59</sup> The results of this analysis are shocking in terms of overall wetlands losses throughout the Nation's history. At the time of European colonization the coterminous United States had an estimated 221 million acres of wetlands. More than half of this acreage has been lost through draining, dredging, filling, levies and flooding. Twenty two states have lost 50% or more of their original wetlands acreage; and ten have lost over 70%.<sup>60</sup>

When the Clean Water Act began to regulate wetlands in the mid-1970s, an estimated 105.9 million acres of wetlands remained. By the mid-1980s, this had dropped to 103.3 million acres, a

total loss of 2.6 million acres, or an average of 260,000 acres/year.<sup>61</sup> Given historical losses, a loss of over a quarter of a million acres a year remains completely unacceptable, and is fundamentally inconsistent with the objective of restoring and maintaining the integrity of the Nation's waters. Unlike many forms of pollution and other partial habitat changes, dredging and filling of wetlands results in complete or virtually complete loss of aquatic habitat and other wetlands functions. And in most cases, these losses are permanent.

At the same time, the study is at least promising from the perspective of recent trends. The rate of wetlands loss has slowed (by about half) since the wetlands protection provisions of the Act have been in place. If this trend continues, and wetlands protection efforts are expanded and strengthened, perhaps we can reverse the tide and begin to restore rather than degrade the Nation's wetlands resources.

However, these figures apply only to the complete loss of wetlands acreage. It does not address pollution or more subtle forms of damage to wetlands which can result in the significant loss of natural and other values. Few states have standards to address wetlands uses or criteria to determine whether those uses are protected. In the 1990 National Water Quality Inventory, only five states (California, Hawaii, Iowa, Kansas and Nevada) reported on use impairment for wetlands. The information in these reports, however, is disturbing. The 5 states combined estimated that only half of their wetlands fully supported

designated uses, with 6% threatened, 26% "partially" supporting, and over 17% not supporting wetlands uses.<sup>62</sup> While the paucity of data makes extrapolations to other states difficult, this information suggests strongly that we have lost far more than half of the Nation's wetlands in terms of the functions they perform, as opposed to raw reductions in acreage.

#### Floodplains and Riparian Habitat

Floodplains (which in many cases overlap with wetlands)<sup>63</sup> and riparian habitat provide essential hydrological and ecological support functions for the adjacent rivers and streams (or in the case of lakeside habitat -- lakes). Floodplains have very high biological productivity due to exchanges of water and materials between river and floodplain, with a highly diverse biota adapted to floodplain habitat and resources.<sup>64</sup>

Estimates of loss of floodplain and riparian habitat vary. But while the estimates differ in the details, they all lead to the conclusion that a large percentage of the original riparian habitat in the United States has been lost, and continues to be lost. A detailed 1992 assessment of floodplain management in the United States found that out of 75-100 million acres of indigenous, woody riparian habitat in the United States, less than half (about 35 million acres) remain in nearly natural condition. The rest have been inundated, channelized, dammed, riprapped, farmed, overgrazed, or altered by other land uses.<sup>65</sup> The Corps of Engineers estimates that there are 574,500 miles of

stream bank with erosion problems in the United States, 142,100 of which are characterized as "serious".<sup>66</sup>

Much of the damage was already done by the time the Act was passed. By 1973 the channels of at least 200,000 miles of waterways in the United States (approximately one out of five stream miles) had been modified.<sup>67</sup> This would equal over half of the total length of large warm water streams where channel alterations are most prevalent. Evidence shows, however, that these trends have continued since the Clean Water Act was passed. For example, the amount of SCS channel work constructed or under contract totaled nearly 11,000 miles by 1980, translating to an average loss of approximately 300 miles of natural stream habitat per year since 1972 from this source alone. By the end of the 1970s, multiple sources confirmed that at least half of America's original riparian habitat had been destroyed.<sup>68</sup> According to one 1979 estimate, only 23 million out of 67 million acres of the four predominant riparian vegetation types remained in the United States, a loss of 66 percent.<sup>69</sup> In 1981, FWS calculated that only 26 million out of almost 56 million acres of riparian ecosystems remained in the contiguous states and Hawaii.<sup>70</sup>

#### Coastal Habitat

While aquatic habitats are suffering throughout the country, the cumulative impacts of upstream degradation converge on coastal ecosystems, and combine with ever-increasing pressures for economic and population growth in coastal regions.

Addressing the 57th North American Wildlife and Natural Resources Conference in 1991, a chief NOAA scientist said:

The evidence of the decline in the environmental quality of our estuaries and coastal waters is accumulating steadily. The toll of nearly four centuries of human activity becomes more and more clear as our coastal productivity declines, as habitats disappear, and as our monitoring systems reveal other problems.... The continuing damage to coastal resources from pollution, development, and natural forces raises serious doubts about the ability of our estuaries, bays, and near coastal waters to survive these stresses. If we fail to act and if current trends continue unabated, what is now a serious, widespread collection of problems may coalesce into a national crisis by early in the next century.<sup>71</sup>

In addition to toxic chemicals and nutrients, NOAA cited habitat degradation as the principle cause of this decline. Sources of coastal habitat degradation include freshwater flow alteration and diversion, wetland conversion, erosion and habitat loss from land development, dam construction, navigation channel construction, port development, energy production, logging, agriculture, and other resource consumptive uses.

#### IV. THE ECONOMICS OF CLEAN WATER

It is impossible to capture in economic terms the full value of clean water and healthy aquatic ecosystems. Still, debates over the Clean Water Act continue to raise the issues of cost versus economic benefits, and need versus budgetary reality. It is essential, therefore, to address the economics of clean water as completely as possible given the limitations of economic valuation. From one angle, we can try to identify the economic value of our existing aquatic resources. From the other side, we

can try to get a sense of how much our economy has suffered from past destruction of these resources. Either way, past investments in clean water programs have reaped considerable benefits, and future investments are more than justified on economic as well as other grounds.

#### Commercial Fisheries

From 1972 to 1990, annual U.S. seafood consumption jumped from 12.5 to 15.5 pounds of fish per person.<sup>72</sup> The U.S. Department of Agriculture indicated that by the turn of the century, this consumption rate could increase to as much as 17.2 pounds per person. If this forecast is correct, supplies of edible seafood products will need to increase by 18 to 31 percent by the year 2000 to meet the demand.<sup>73</sup>

A major and growing U.S. industry supports this demand. In recent years the United States has ranked about 6th among major fishing nations, behind the [former] USSR, China, Japan, Peru, and Chile.<sup>74</sup> U.S. commercial fish harvest increased each year between 1976 and 1990, as did the economic value of each year's catch. Moreover, while the dockside value of U.S. landings in 1990 was \$3.6 billion, more economic value is generated through processing and wholesaling. That year the industry's total contribution to the U.S. GNP exceeded \$16.5 billion.<sup>75</sup>

Besides providing food, commercial fisheries also provide employment for hundreds of thousands of people per year. In 1988 alone, 363,703 people were employed through commercial fisheries (fishing, processing, wholesaling) -- a major increase from

230,387 jobs in these industries in 1972. As fish consumption rises, so will the employment rate. Protecting clean water is essential to protecting these jobs.<sup>76</sup>

#### Recreational Fishing and Hunting

Recreational fishing is the premier outdoor recreational activity in the United States. Over the past thirty years, the number of participants in fishing activities increased steadily. In 1985, one in four Americans 16 years and older (46.4 million total) fished for pleasure. They took over 870 million fishing trips and spent a total of 977 million days on the water.<sup>77</sup> According to EPA, another 12 million younger Americans (under 16) fished for pleasure in 1985 as well.<sup>78</sup> Recreational fishing supports a major U.S. industry. Total expenditures for recreational fishing in 1985 exceeded \$28 billion dollars.<sup>79</sup>

Shellfishing is also a popular sport. In 1985, an estimated four million people (two percent of the U.S. population) aged 16 or older participated in recreational shellfishing. The number of days spent shellfishing was 28 million. Fifty percent of shellfishers lived in the South and accounted for 59 percent of all shellfishing days. Shellfishers estimated that they spent \$2.3 billion to participate in the sport: \$1.1 billion on trip-related expenses such as food, lodging, and transportation; \$1.2 billion on equipment; and \$63 million on other expenses.<sup>80</sup>

Another common water-based sport is waterfowl hunting. According to the National Survey of Fishing, Hunting, and Wildlife Associated Recreation conducted by the Department of

Interior, in 1985 3.2 million hunters spent 25.9 million days hunting waterfowl. Expenditures for waterfowl hunting totaled over \$783 million.<sup>81</sup>

All forms of water-based hunting and fishing in the United States are on the rise. Comparing similar national surveys from 1955-1985, the total number of fishers and waterfowl hunters increased dramatically over the thirty year period, resulting in a major rise in expenditures made to participate in these sports. The following table illustrates this increase by comparing data from 1970 and 1985.

COMPARISON OF MAJOR FINDINGS - 1970 and 1985<sup>82</sup>  
(Fishing and Waterfowl Hunting)

	<u>1970</u>	<u>1985</u>
Total Fishers	33.2 million	45.3 million
Freshwater	29.4 million	39.1 million
Saltwater	9.5 million	12.9 million
Waterfowl Hunters	2.9 million	3.2 million
Fishing expenditures	\$5.0 billion	\$28.6 billion
Hunting expenditures	\$244.5 million	\$783.3 million
Days spent fishing	706.2 million	1.1 billion
Days spent hunting	25.1 million	25.9 million

Other evidence confirms these trends, indicating that the economic value of clean water is on the rise:<sup>83</sup>

- \* Fishing and boating on federal lands rose dramatically from 1982 to 1989.
- \* Total annual fishing licenses increased from 31 to almost 37 million from 1970 to 1988, as did the cost of those licenses.
- \* Sales of fishing tackle rose from \$540 million in 1980 to almost \$740 million in 1989.

These trends are expected to continue. By the turn of the century about 84 million Americans are expected to participate in recreational fishing. And according to some estimates, the available living aquatic resources in the United States are limited and not expected to satisfy demands for quality recreational fishing by the year 2000.<sup>84</sup>

#### Other Water-Based Recreation

Measured by the number of trips away from home, our most popular outdoor activities in 1987 included swimming outdoors (461 million trips per year), warm water fishing (239 million trips per year), and motor boating (220 million trips per year).<sup>85</sup> A broad array of activities are enjoyed near the waterfront. In 1985, 14.8 million people visited lakes or streams, 8.4 million people went to marshes or wetlands, and 5.7 million went to the ocean.<sup>86</sup> (According to EPA, the Interior Department reported an even higher number of outdoor (non-pool) swimmers in 1982.)<sup>87</sup> While at these sites, the majority of people enjoyed feeding, photographing, and observing birds and mammals. Others enjoyed observing and feeding fish, amphibians and reptiles, shellfish and marine mammals. Other recreational activities included water-skiing, walking along the shore, kayaking, canoeing, rafting, surfing, sunbathing, and picnicking.

Moreover, as with recreational hunting and fishing, other forms of water-based recreation are on the rise as well:

- \* Visitors to National Seashores and Lakeshores jumped from 18 million in 1981 to over 23 million in 1988.

- \* The number and value of recreational boats in the United States almost doubled from 1970 to 1989, with total expenditures on recreational boating quadrupling.<sup>88</sup>

Also like recreational hunting and fishing, other water-based recreation generates substantial and increasing economic benefits. Direct and indirect expenditures on boating (boats, motors, equipment, fuel, insurance, etc.) doubled from \$11 billion in 1970 (1990 dollars) to almost \$20 billion in 1988 (although expenditures dropped to just under \$14 billion -- still a 25% increase over 1970 -- in recessionary 1989-90). This activity supports over 6,200 manufacturers of boats, trailers, motors and accessories, as well as over 8,300 marinas, boatyards and yacht clubs. The recreational marine industry as a whole provides jobs for about 600,000 people.<sup>89</sup>

While similar nationwide economic data are not available for swimming expenditures, a case study in Florida highlights the tremendous importance of swimming-related tourism. According to this study, Florida beach users generated a total of \$2.3 billion in economic benefits in 1984. This included direct expenditures of \$1.8 billion (almost 1.5 percent of total gross sales in the State), over \$400 million in payroll for about 84,000 jobs, and tax revenues of almost \$95 million.<sup>90</sup>

#### Intangible Values

Measuring actual expenditures is only one way to establish the value of clean water to people. Aesthetics, nature and the

opportunity to view wildlife are other ways to value the importance of keeping our waters pristine. From swimming to boating to sunbathing, spending time in or near the water is a favorite way for people to spend leisure time.

Many of these activities, of course, contribute to the economy directly through equipment purchase, travel expenditures, and activity fees. However, it is difficult to place a value on the pleasure of spending a sweltering summer day in or near a cool, clean body of water, or on the satisfaction of seeing wildlife in their natural habitat. It is even harder to place a price tag on the assurance that these resources will be left for our children as well.

Some economists, however, are beginning to assess economic values to intangible environmental benefits through techniques such as contingent valuation surveys. These surveys generally describe a hypothetical market in which a public good may be purchased and ask participants how much they would be willing to pay for an increase in the level of this public good.

Care must be taken interpreting contingent valuation studies. Uncertainties about this method lead to questions about how complete or accurate such valuation can be. For example, if survey respondents say they would pay less for ecological or aesthetic resources during a recession than during a period of economic growth, does this mean the resource is really worth less? Moreover, a respondent's willingness to pay for a resource is likely colored by his or her knowledge and understanding about

the benefits provided by that resource. A respondent who did not know that wetlands support many endangered species, for example, probably would be willing to pay less to protect an acre of wetland. Economists continue to debate whether the answers of survey respondents should be based on their current knowledge or whether they should be given more information, and on other aspects of contingent valuation methodology.<sup>91</sup>

Despite these limitations, contingent valuation studies at least can fill in some of the gaps left by traditional economic methods in valuing our water resources. A 1991 contingent valuation study conducted by Resources For the Future asked a national sample of Americans to value a set of water quality improvements. In this study, respondents were asked to give a monetary value to minimum levels of boatable, fishable, and swimmable water. Those who gave useable answers were willing to pay an average of \$106 per year for boatable water quality, plus \$80 for fishable minimum water quality, and an additional \$89 more to reach a national minimum of swimmable water quality. Altogether, people, on the average were willing to pay \$275 per year to ensure clean water.<sup>92</sup> Based on these answers, the economic benefit of achieving the national swimmable water quality goal was estimated at \$29.2 billion per year in 1990. However, a range of \$24 to \$43 billion dollars per year was considered reasonable. When the results of this study were aggregated with other similar surveys and adjusted to correct for the number of current households and the consumer price index,

the estimated value of clean water became \$46.7 billion.<sup>93</sup> Clearly, the public places a large economic "value" on even the intangible benefits of our aquatic resources.

To some extent, public willingness to pay for the intangible values of water resources is confirmed by the increased values of waterside property. EPA cites the following examples:

- A 1983 study estimated that properties on polluted St. Alban's Bay on Lake Champlain, Vermont were selling for \$4,500 less than similar properties elsewhere on the Lake, with a total property value loss of \$2 million.
- Water quality improvements in the Lower Willamette River near Portland, Oregon led to residential property increases of 16 to 25 percent.
- Reduction of water pollution in San Diego Bay in the 1960's resulted in an approximately 8 percent rise in residential property values.<sup>94</sup>

#### Wetlands

Because their importance has been hotly debated in recent years, it is particularly important to underscore the economic, as well as environmental, values of wetlands. While some may view wetlands as just swamps or even eyesores, they are actually rich areas that support an abundance of wildlife and provide services that may be worth billions of dollars in economic benefits. For example, an estimated 50 million people spend nearly \$10 billion annually to observe and photograph wetland-dependent birds.

Wetlands also sustain much of the country's seafood. In the Southeast, 96 percent of the commercial catch and over 50 percent of the recreational catch is dependent on estuarine and other coastal wetlands. Estimates of the value of coastal wetlands to commercial and recreational fisheries range from about \$2200/acre on the Pacific coast to almost \$10,000/acre along parts of the Florida coastline.<sup>95</sup> Wetlands also provide habitats for valued mammals such as muskrats, beavers, and minks. Muskrat pelts alone are worth over \$70 million annually.<sup>96</sup>

A 1981 case study by researchers at Tufts University illustrates the economic importance of wetlands.<sup>97</sup> The researchers evaluated 8535 acres of wetlands in the Charles River Basin, Suffolk, Norfolk, and Middlesex Counties, Massachusetts. The economic benefits measured were flood control, increases in land value, pollution reduction, water supply, and recreation and aesthetics. Other values, including preservation and research, vicarious consumption and option demand, and undiscovered benefits, were "described, not monetarized."

Although the study produced conservative estimates of the monetary value of wetlands, its findings are quite revealing. The following is a break-down of the estimated economic benefits of one acre of Charles River Basin wetland in 1978 dollars: flood prevention (\$33,370), local amenity (\$150 - \$480), nutrient reduction (\$16,960), water supply (\$100,730), recreation (\$2,145 - \$38,469). Therefore, the total long-term worth of just one

acre was estimated to lie between at \$153,000 - \$190,009. Not bad for "just a swamp."

#### CONCLUSION

In Earth in the Balance, then-Senator Al Gore quoted Oscar Wilde: "A cynic is one who knows the cost of everything and the value of nothing." It is easy to dwell on the costs of clean water, while forgetting the tremendous value of aquatic resources to our lives and our economy. We share a large stake in the protection of our rivers, lakes and coastal waters, but we have not done an adequate job of preserving them. These failures bring tremendous economic as well as environmental harm. So whether we view our Clean Water Act record as ecologists or as economists, we must conclude that we have not succeeded in the mission we embarked on twenty years ago.

NRDC looks forward to working with the Committee over the several months to address these serious problems.

53. This estimates reflects adjusted numbers of fish killed as reported to EPA, normalized to reflect states that did not report; and a doubling of the fish killed as reported to NOAA, to reflect that fact that only data from the 1980s are available. The estimates are likely to be highly conservative because EPA assumes that many fish kills go unreported and counts are conservative for kills that are reported; and because the NOAA data show a decrease over time in the number of fish killed, meaning that more fish were likely to have been killed in the 1970s than in the 1980s.

## I. Summary

Poison runoff impairs more waterbodies, surface and ground, urban and rural, than any other pollution source in the country. Poison runoff is the contaminated stormwater and snowmelt that runs off of, or leaches through, land used and abused for human purposes without regard to ecological needs. Although the dominance of poison runoff ("nonpoint source water pollution") as a water quality problem is widely acknowledged, (and was known even before 1972), in general we have failed to create and implement effective programs that protect and restore our nation's waters that are subject to this threat.

The framers of the 1972 Clean Water Act explicitly recognized the need for State water quality programs to address land-based sources of water pollution in their water quality assessments and in their watershed management plans developed under section 208 of the Act ("208 Plans"). The dominance of the "point source challenge," however, eclipsed public awareness of, and government attention to, more diffuse pollution sources.

By the mid 1980s, impatient with the lack of EPA and State progress in controlling poison runoff, Congress created the "State Nonpoint Source Management Program" (§ 319). Unfortunately, the State 319 programs have been plagued by slow and inadequate funding, lack of adequate implementing mechanisms, and insufficient direction and oversight from EPA. The 1987 CWA Amendments also included requirements for the municipal and industrial stormwater permits; these permitting programs are now helping to revive public interest in restoring

blighted urban watersheds into oases of life. In 1990, Congress passed a new program, aimed at reducing poison runoff in coastal watersheds, with a more ambitious pollution reduction mandate and more regulatory clout than the 319 program. The "Coastal Zone Nonpoint Source Pollution Control Program" may be a model for revisions to State runoff and watershed management programs that will help to reduce and prevent poison runoff.

To underscore the severity of the poison runoff problem, and to explain it to the uninitiated, we begin this section with a poison runoff primer. Next, we evaluate the implementation and efficacy of Clean Water Act poison runoff programs that existed before 1987, as well as the two major initiatives passed in 1987 (§ 319) and in 1990 (the Coastal Zone Management Act). Finally, we discuss ways to address urban water quality problems. These include the need for urban stormwater controls in national minimum stormwater permit programs. We also describe the challenges that face urban leaders seeking to restore inner city waters to places of recreation and refreshment, and to provide meaningful jobs in the process of healing urban waters.

## II. Introduction to the Problem of Polluted Runoff and Watershed Restoration

### A. A Primer on Poison Runoff

#### Poison Runoff Problems Were Brought Here by the Pilgrims

Poison runoff is not a new phenomenon; in fact, it has been with us since the first settlers clear-cut the New England forests, and since the first farmers began plowing the fertile lands of the Eastern Coastal Plain. Reflecting a lack of

understanding of history, the official rhetoric has often apologized for the severe lack of money, staff resources, and regulatory clout devoted to poison runoff reduction by claiming that this is a new or obscure pollution source. For example, EPA's Final Report to Congress on Section 319 of the Clean Water Act states,

"Nonpoint source impacts have not been fully assessed. The Nation has focused largely on impacts caused by traditional point sources (POTWs and industrial dischargers) in the past because point source discharges were causing major, visible problems in our surface waters. Thus, very little attention has been given to assessing the impacts of NPSS. Since water quality impacts still exist in many areas, it is now very clear that NPSS have had and continue to have widespread impacts upon surface waters."<sup>1</sup>

Contrary to this assertion, land-based, diffuse pollution sources and the severity of damage they caused were well-known to the framers of the original Clean Water Act. The 1972 Senate Report said:

"One of the most significant aspects of this year's hearings on the pending legislation was the information presented on the degree to which nonpoint sources contribute to water pollution. Agricultural runoff, animal wastes, soil erosion, fertilizers, pesticides and other farm chemicals that are a part of runoff, construction runoff and siltation from mines and acid mine drainage are major contributors to the Nation's water pollution problem. Little has been done to control this major source of pollution....It has become clearly established that the waters of the Nation cannot be restored and their quality maintained unless the very complex and difficult problem of nonpoint sources is addressed....The Committee recognizes, at the outset, that many nonpoint sources of pollution are beyond present technology of control. However, there are many programs that can be applied to each of the categories of nonpoint sources and the Committee expects that these controls will be applied as soon as possible."<sup>2</sup>

Unfortunately, it would be over two decades before any land use category-specific water quality controls were required as

part of a federal program -- the Coastal Zone Nonpoint Source Pollution Control Program -- which we will discuss below. In the intervening years, poison runoff continued unabated.

National Statistics Show That Poison Runoff Damages Are Widespread

Two water quality assessment programs required by the CWA include poison runoff: the biennial 305(b) reports, and the one-time 319(a) reports. The 305(b) reports are supposed to cover all waterbodies and all relevant pollution sources in each State; the 319(a) reports are supposed to be Statewide assessments of runoff problems, conducted wherever possible on a watershed-by-watershed basis. There is some overlap between these two reports.

As we discussed earlier, the 305(b) water quality assessments are difficult to compile for a time-series analysis of trends, since the scope and methodologies for reporting have changed so frequently. And these reports likely underestimate the magnitude of the poison runoff problem even more than for other sources of pollution because, as discussed below, poison runoff is even more dominated by physical and biological (as opposed to chemical) impairment. The most complete, and thus the most revealing, 305(b) reports on runoff problems were from the most recent (1988-1989) reporting cycle compiled by EPA.

EPA in 1991 published a compendium of the States' 319(a) assessments, entitled Managing Nonpoint Source Pollution, as required by § 319(m). This report also contains a comprehensive set of statistics on the role of land-based sources in damaging

aquatic resources nationwide. Below we summarize the damage assessment from this report as well as from the 1988-1989 305(b) compilation (The National Water Quality Inventory).

Rivers: Over 100,000 assessed river miles are impaired or threatened by agricultural runoff nationwide. Over 15,000 more assessed river miles are impaired by logging; and almost 10,000 assessed river miles are impaired by construction runoff. About 40,000 river miles were listed in the 319(a) reports as threatened by runoff pollution sources.

Lakes: Almost 2 million acres of U.S. lakes are impaired by agricultural runoff sources. Storm sewers impair almost another million acres.

Great Lakes: All affected Great Lakes areas of Indiana (Lake Michigan) and New York (Lakes Erie and Ontario) do not support designated uses (wildlife-Indiana), (fisheries-New York), attributed in large part to poison runoff sources. (No other Great Lake State provided quantitative assessments of runoff impacts to the Great Lakes.)

Wetlands: About 52,000 acres of wetlands in California, Iowa, and Delaware are not supporting one or more designated uses, or are threatened due to poison runoff sources. (No other States gave quantitative information on wetlands damage from runoff sources.)

Coastal Waters: 1.2 million acres of coastal waters are not fully supporting one or more designated uses due to poison runoff.

Estuaries: About 5,000 square miles of estuarine waters are impaired or threatened by runoff sources.

Groundwater: Public drinking water supplies are threatened by runoff sources in the four States that specified impacts to designated uses.<sup>3</sup> Nitrates in groundwater exceed current health standards in virtually all States and occur in 5 to 20 percent of sampled wells in the Western Corn Belt and Mid-Atlantic States, largely due to fertilizer applications on farms.<sup>4</sup>

The runoff management and waterbody assessment programs are not the only source of national statistics on runoff damage. In June, 1989, under § 304(1) discussed above, EPA released a list

of over 17,000 "toxic hotspots" -- seriously degraded waterbodies. Only 602, or less than 4 percent, were impaired "wholly or substantially" by factories or sewage treatment plants. The rest were polluted, wholly or substantially, by poison runoff from farms and other sources.<sup>5</sup>

B. The Nature of Poison Runoff Varies by Land Use Category, But Water Quality Damage Tends to Be Systemic, Part of "Business As Usual"

Virtually every human activity on the land has the potential to impair water quality and aquatic habitat. It is beyond the scope of this report to describe every land use category in detail; we will, however, highlight the most significant categories that do the most damage nationwide: Agriculture (including cropping, confined animal operations and grazing); mining; urban development and logging.

Agriculture Dominates as the Number One Source of Aquatic Impairment, But Farming Practices that Save Money, Protect Water Quality Are Available

Agriculture is the leading source of water pollution in the United States, according to EPA.<sup>6</sup> Agriculture was cited by EPA as the leading source of pollutants causing or contributing to "toxic hotspots" in its June 1989 release of the list of 17,000 hotspots nationwide.<sup>7</sup> The latest National Water Quality Inventory (1988-1989) reported that agriculture was far-and-away the largest source of river impairment, serving as a contributing source in over 60% of impaired river miles. For perspective, the next biggest reported source -- municipal sewage plant discharges -- contributed to 16.4% of impaired river miles.)<sup>8</sup>

Agriculture is also a leading cause of species endangerment and extinction. About 37% of the 436 species listed in the Endangered Species Information System data base are imperiled at least in part by irrigation and the use of pesticides. An unpublished EPA staff report from November 1989, based on data from the Department of the Interior, identified 125 endangered or threatened species that are aquatic or water-dependent and are impacted by agricultural practices such as pesticide usage.<sup>9</sup>

Agricultural activities were also fingered as a major cause of fish kills. Three out of the top six pollutant categories cited as causing fish kills, low dissolved oxygen, pesticides, and fertilizers, are wholly or substantially from agricultural uses (the other three are petroleum, pH/acidity and organic chemicals). However, agriculture accounted for only 5% of the total number of fish killed from 1977 and 1985, because the size of each fish kill was relatively small. In EPA's 1986-87 summary of State reports on fish kills, animal feedlot/waste operations were blamed for over 1 million fish killed (most likely due to oxygen starvation from manure pollution).<sup>10</sup> In a separate 1984 survey of fish kill data, pesticides were cited as the leading documented cause of fish kills in the U.S. over the previous two decades.<sup>11</sup>

Because agriculture is by far the biggest source of waterbody impairment nationwide, and because it is such a diverse industry, it is necessary to sub-categorize the industry in order

to explain regional differences in the types of impairments observed.

#### Croplands

Soil erosion, pesticide pollution, nitrates leaching into groundwater, nitrogen and phosphorus runoff into estuaries, wetlands conversion, streambank wastage, and manure runoff are all major problems associated with crop production. Irrigated crop production can be associated with all of these water quality problems, plus the discharge of toxic mineral salts into estuaries and marshlands. Below we give some national and regional data on water pollution from crop production.

Soil erosion data has only been collected on the national level since 1977. The National Resources Inventory, taken roughly every five years by the Soil Conservation Service, includes reports for 1977, 1982, and 1987.

The 1982 and 1987 reports are more reliable than the 1977 reports. Total U.S. soil erosion estimates from sheet and rill (water-borne) erosion from cropland show a decline from roughly 1.8 billion tons of sheet and rill erosion in 1982 to about 1.6 billion tons eroded in 1987 -- a decline of about 11 percent.

Among the trends in crop production accounting for the decline are the onset of the 1985 Farm Bill conservation program, including the conservation reserve and conservation compliance programs. While a direct connection between soil erosion and water quality cannot be made, in general, the more soil is conserved, the more our waters are protected from sediment

pollution. The job of keeping soil on the land is far from over, however. Despite this apparent reduction in erosion losses, sediment and siltation from agriculture and other land uses remains the top water pollution problem in the country.

Pesticides pollute both surface and groundwater. Fish kills from pesticides were discussed above. Overall pesticide use statistics are startling, and give an indication of the magnitude of the potential pesticide problem for water quality. EPA has estimated that approximately 600 active ingredients are marketed in 45,000 to 50,000 formulations. About 430 million pounds of pesticides were applied agriculturally in 1987, with a market value of about \$4.0 billion.<sup>12</sup> According to EPA's compilation of the States' 1988/89 305(b) reports, pesticides impaired 11.2% of all assessed river miles and 14.5% of Great Lake shore miles. (Pesticide impairment of lakes was not assessed, or not reported in this compilation.)<sup>13</sup>

A recent USGS study of ten current-use herbicides in surface waters of the Midwest found that high concentrations of herbicides were flushed from cropland and were transported through surface waters as pulses in response to late spring and early summer rainstorms.<sup>14</sup> Several of the herbicides exceeded the EPA water quality criterion for drinking water-human health protection in a significant percentage of the samples. For example, 52% of the sites exceeded the primary drinking water standard for atrazine (3 ug/L); 32% exceeded the WQC for alachlor (2 ug/L); and seven percent for simazine (1 ug/L). The median

concentrations of the four major herbicides, atrazine, alachlor, cyanazine, and metolachlor, jumped by a factor of ten in the late spring-early summer samples, and then dropped back to near-replanting levels by harvest time. The study sampled 149 sites in 122 river basins of Ohio, Indiana, Illinois, Wisconsin, Minnesota, Iowa, Kentucky, South Dakota, Kansas, Nebraska and Missouri.<sup>15</sup> The fact that over half of these midwestern surface water sites exceeded the atrazine drinking water standard, and a third exceeded the alachlor drinking water standard, is a concern for all communities that rely upon these waters as drinking water supplies, and particularly for those small rural towns that do not use advanced drinking water treatment such as carbon filtration.

The nutrients phosphorus and nitrogen are important water pollutants from agricultural operations including manure spreading and artificial fertilizer applications. Phosphorus in high levels is acutely toxic to fish; in much lower levels it overenriches waterbodies, causing them to fill up with algae ("eutrophication"). Nitrogen, especially in the form of nitrate, is a human health and livestock health concern (EPA's drinking water standard for nitrate is 10 mg/L) because it causes "blue baby syndrome" (methemoglobinemia). Like phosphorus, nitrogen also contributes to eutrophication of lakes and estuaries in much smaller concentrations than those of human health concern. In the form of ammonia, nitrogen is also acutely toxic to fish.

The use of nitrogen fertilizers in the U.S. increased by more than a factor of four in the two decades between 1960 and 1981, to a 1981 total of 11.9 million tons per year. Per-acre use of fertilizers doubled between 1964 and 1984. However, the skyrocketing increase in the use of nitrogenous fertilizers may have reached its apex in the 1980s, and has apparently begun to decline slightly; the total tons of n-fertilizer used declined 12 percent, to 10.5 million tons of annual application, between 1981 and 1988.<sup>16</sup>

Long-term trend data for nitrate pollution is scarce. One ten-year study in Nebraska from the early 1960s to the early 1970s, showed a 25% increase, on a statewide average, of groundwater nitrate-nitrogen concentrations. During that same time frame, nitrogen fertilizer use in Nebraska increased by a factor of four. A longer time-series study on nitrogen pollution from almost 4600 samples from wells all over Iowa showed that nitrate levels in groundwater from shallow wells less than 100 feet deep increased slowly but steadily from 1952 to 1979, where total fertilizer use and per-acre applications were increasing rapidly.<sup>17</sup>

Waters in karst (limestone-solution feature) topographies are especially vulnerable to nitrate contamination. In Iowa's Big Springs Basin, part of the Karst region that straddles portions of Iowa, Wisconsin, and Kansas, groundwater nitrate concentrations tripled (from five mg/L to 15 mg/L) from 1958 to 1982. These data suggest a yearly rate of increase of 0.4 mg/L

of the average nitrate-nitrogen concentration. A farm survey in the basin in the mid-1980s showed that area farmers were not preparing nitrogen budgets to determine appropriate fertilizer application rates. Where such budgets were prepared, they were incomplete. Alfalfa and manure contributions to soil-nitrogen were being neglected, and thus in 1984 artificial fertilizers were being applied in excess of need at a rate of about 90 kilograms per hectare.<sup>18</sup>

Of course, the foregoing examples of nitrate contamination trend data are perhaps from regions with more vulnerable climate and geology, and the problems of nitrate contamination inevitably vary in severity from region to region. Nonetheless, "snapshot" statistics from single-year national studies show us that nitrate contamination of groundwater is indeed a problem that is national in scope. A 1986 USGS sampling of 316 principal aquifers in 46 States turned up 288 (91%) with median nitrate-n levels below three mg/L; 27 aquifers (8.5%) with median nitrate-n levels between 3 and 10 mg/L; and 1 (0.5%) aquifer with median nitrate-n levels above 10 mg/L. The same USGS study found that 41 (13% of the aquifers) in twenty states had nitrate "hotspots" where greater than ten percent of the samples exceeded the EPA-human health 10 mg/L standard.<sup>19</sup>

Conservation practices on the farm, designed to protect soil and water quality, are often easier on the bank book as well. Thus, conservation tillage practices, which are critical to reducing damaging soil loadings into rivers and lakes, also can

save farmers both work time, and fuel costs.<sup>20</sup> Soil nutrient testing can cut farmers' fertilizer costs significantly.<sup>21</sup> And a recent study by a group at the University of Iowa found that agriculture and water quality goals may actually be far more compatible than many now perceive. The Iowa researchers found that, for several policy options for reducing agriculture's impact on water quality including regulation and research and education,

"... the effects on water quality and profitability suggest that water quality can be significantly improved without losses to farm profitability...there is not necessarily a direct tradeoff between water quality and profitability. Improvements to both can be achieved simultaneously and, in some cases, without high implementation costs borne by taxpayers or farmers."<sup>22</sup>

Manure management stands out as perhaps the most costly water-quality practice for most agricultural regions, and more work needs to be done to research cost-effective manure management techniques. As one farm researcher has observed, our agronomic universities need to

"stop funding research in animal-based agriculture production and marketing unless manures are an integral part of the research question. The corollary is to fund more research that both considers manure as an integral part of the production system and innovative ways of better managing this manure."<sup>23</sup>

Thus, integrating manure as a resource into whole-farm management plans will enable us to find cost-effective means of protecting waters from manure pollution.

#### Irrigation Pollution

Irrigation agriculture, which accounts for 90% of the water consumed in the West, results in poisoned return flows which

cause serious damage to waters and wetlands, endangering aquatic wildlife with toxics including selenium, boron, molybdenum, and chromium. Selenium has been identified as the cause of an observed high (64%) rate of deformed and dead bird embryos at Kesterson National Wildlife Refuge in California.

Although they begin with the diffuse flow of irrigation water off of farm fields, irrigation flows end as point source discharges, conveyed through pipes or ditches. Irrigation return flows have been given an express exemption from NPDES permitting in the Clean Water Act, without any database showing that the flows are benign. In fact, the U.S. Fish and Wildlife Service's preliminary data indicate that almost half (48%) of the Service's refuges that have toxic contaminant problems receive agricultural drainage.<sup>24</sup>

#### Grazing

Accurate national statistics on the total water quality damage wrought by grazing on both public and private rangelands are not currently available. However, the surveys that have been conducted on public rangelands do show massive damage to riparian areas from overgrazing. Statewide surveys by the Bureau of Land Management (BLM) in Colorado and Idaho, and more limited BLM surveys in Nevada and Utah, showed that over 80 percent of assessed streams or riparian areas were in poor or fair condition. Surveys by the U.S. Forest Service produced similarly troublesome results; in Arizona, 80 to 90 percent of the stream

riparian areas in the Tonto National Forest were in unsatisfactory condition.<sup>25</sup>

Rangeland expert Lynn Jacobs gives additional data on grazing damages to streams in the West, citing wildlife ecologist Charles Kay: "A recent study in Wyoming found that of 262 miles of streams, only 2% function now as they did in 1850. Eighty-three percent of the streams were lost or destroyed by overgrazing and accelerated erosion. The remaining 15% were in fair to good condition."<sup>26</sup> According to another range technician, riparian damage from cattle is so widespread in the West that most people, including most range managers, have never seen a healthy stream channel.<sup>27</sup>

And this riparian damage is done to vast areas of the West, for the sake of a tiny proportion of the nation's livestock: Although 90% of our western BLM lands are used for ranching, they produce only about 1.1% of U.S. cattle and sheep.<sup>28</sup> A GAO report on the health of riparian areas on U.S. public rangelands points out that the preferred management practice, cattle exclusion from streamside zones combined with revegetation, can reduce many of these impacts. Unfortunately, this practice is not required in many areas, and BLM staff are thwarted by their own top management in carrying out riparian restoration projects.<sup>29</sup>

#### Livestock Confinement (Feedlots)

EPA's Office of Policy, Planning and Evaluation estimates that, based on the U.S. Census of Agriculture, at least 1.1

million farmers have livestock. Of those, only 5,000 to 10,000 operations nationwide may be above the current 1000-unit cutoff for NPDES permit issuance.<sup>30</sup> For the rest, no particular federal manure management requirements apply under the Clean Water Act. For an example of the severity of the manure pollution problem, a Chesapeake Executive Council (the governing body for the Chesapeake Bay cleanup) report that found that "Control of 85 percent of Pennsylvania's animal waste alone would accomplish a 40 percent nutrient reduction for the state."<sup>31</sup> The Chesapeake Bay Foundation concluded that Pennsylvania should toughen its manure management program, including the "targeting of enforcement efforts at those operations responsible for disproportionately high nutrient loads as well as committing more resources to the program in general."<sup>32</sup>

#### Mining/Resource Extraction

Of the 171,008 impaired river miles assessed by the States for the 1988-1990 305(b) reports, 14 percent, or almost 25,000 miles were polluted by mining runoff (designated "Resource Extraction" by EPA.)<sup>33</sup> As reported by GAO, a 1976 study by an EPA contractor found that "80 percent of the nonpoint source pollution from inactive and abandoned ore and mineral mining areas was occurring in five states -- California, Colorado, Idaho, Missouri, and Montana.... The principal pollutants from these mines and mine waste piles were acid mine drainage, heavy metals, and sedimentation." As with all poison runoff sources, assessed sites are only a small portion of the total; in

Colorado, for example, the state had studied the environmental impact from only about one-sixth (8,000 out of an estimated 50,000) of the State's noncoal abandoned or inactive mines.<sup>34</sup>

#### Urban Development

Over 9800 impaired river miles, or 5.7% of total impaired miles, were polluted by construction runoff in the 1988-90 reporting cycle, and over 18,000 impaired river miles, or 10.6% of total impaired miles, were polluted by storm sewers from urban sites in the same cycle. (Urban watershed degradation and restoration are discussed at length below.)<sup>35</sup>

#### Logging

A total of 9% of impaired river miles, or 15,459 miles, were reported by the States as polluted by silvicultural activities in the 1988-1990 reporting cycle. These figures are probably gross underestimates, however, since some key logging States such as Maine do not monitor for logging-related parameters such as siltation levels.<sup>36</sup> As EPA points out in its final 319 report, "The absence of information from 12 states significantly distorts the figures; Alaska and Oregon, in particular, have considerable forestry activity and their inclusion would have affected the total."<sup>37</sup>

Fisheries biologists in the Northwest have discovered that logging tends to destroy fish habitat more profoundly than previously believed. Siltation from logging operations has long been known to clog the gravel beds that are the spawning grounds for threatened salmon species. Only since the early 1980s,

however, have biologists discovered that salmon survival requires more than silt-free gravel beds for spawning. It also requires extensive drainageway protection, since the young-of-the-year are reared in the tiny, capillary-level first-order tributaries, abandoned meander ponds and seep-fed creeks. According to naturalist Robert Steelquist:

"There they grow rapidly on aquatic insects and other organisms. This burst of growth gives these cohos a distinct advantage for survival at sea when they eventually leave the freshwater system.... These pond and tributary habitats, however, had never been recognized for their contribution to coho productivity. Though measures were in place to protect main-stem habitats from destruction, the beaver ponds and small channels were particularly vulnerable to logging, road building, and culverts, often filling with slash and debris."<sup>38</sup>

The road cuts, skid trails, and clear cuts that timber companies bring to forest lands do extensive damage to streams, rivers, and lakes around the country. In Maine, for example, a study done in the late 1970s by the Maine Forest Service found the following: 52% of harvesting sites had erosion or sedimentation problems; a substantial number of sites near State-designated protection zones violated logging road runoff and stream crossing requirements; and siltation in waterbodies from logging operations located from 75 to 250 feet from the waterbody. (Despite this evidence of widespread harm to water quality, water-sensitive practices for logging sites are still voluntary for the vast majority of the Maine Woods.)

III. What does the CWA say about these problems, and how good a job have EPA/States done in carrying out the will of Congress?

A. Runoff Mandates Dating Back to 1972 Were Abandoned or Implemented Poorly.

The Clean Water Act has addressed runoff pollution explicitly since the Act's inception in 1972. As NRDC points out in the book Poison Runoff, runoff control mandates in the pre-1987 Act could have been used more effectively. In fact, since 1972 the CWA has required that EPA and the states devise comprehensive programs to control water pollution from both point and nonpoint sources. At least five pre-1987 sections of the Act -- 102(a); 201(c); 208; 303; and 305(b) relate to, or explicitly describe, poison runoff assessment, control and reduction.<sup>39</sup> Below we describe briefly these requirements of the original Clean Water Act, and the degree to which they were implemented around the country.

Sections 102(a), 201 and 208 provided broad authority to EPA to set up holistic pollution prevention programs to protect water quality (long before "pollution prevention" became a popular term). Section 201(c), addressing areawide waste treatment management, was designed to ensure that State and local managers of the construction grants program would not have "point source tunnel vision." Congress wanted comprehensive water pollution benefits, through the control or treatment of all pollution sources, not just point sources of raw sewage and industrial waste.

Section 208 can be seen as further explication of the "comprehensive program goal" set forth in section 201. Section 208 is perhaps the best-known of the pre-1987 poison runoff requirements of the Act, partly because so many citizens participated in the creation of 208 plans. Section 208(b)(2)(F) requires areawide waste treatment management plans to include:

"a process to (i) identify, if appropriate, agriculturally and silviculturally related nonpoint sources of pollution, including return flows from irrigated agriculture, and their cumulative effects, runoff from manure disposal areas, and from land used for livestock and crop production, and (ii) set forth procedures and methods (including land use requirements) to control to the extent feasible such sources."

A series of Congressional hearings in 1979 highlighted the following problems as having hindered the success of the 208 program:

- \* too little time in which to create the plans;
- \* discontinuity and lack of federal funding;
- \* inadequate water quality data; and
- \* poor management by EPA.<sup>40</sup>

These same hearings emphasized several obstacles preventing managers from implementing practices to stem the flow of runoff:

- \* inadequate data on the effectiveness of control measures;
- \* institutional conflicts;
- \* need for public education on the benefits of nonpoint source control;
- \* [inadequate] funding, and
- \* debates over regulatory versus voluntary approaches to induce cooperation.<sup>41</sup>

A total of 176 Section 208 plans were created, plus another 49 State-level areawide plans. These 225 comprehensive water quality plans represented a definite step forward in the national knowledge base on diffuse, land-based pollution sources, and on watershed management in general. Another strength of the 208 process was that it had very high levels of public participation, particularly from citizen leaders from the League of Women Voters, and from local Resource Conservation Districts.<sup>42</sup>

Sadly, during the 1980s, most 208 plans were shelved, and their excellent concepts have fallen by the wayside. Reasons for the failure of the 208 process, in addition to the overall lack of implementation mandates and other administrative problems listed above, include lack of funding; EPA timidity in issuing stringent guidelines, and in linking 208 implementation with mandates to achieve water quality standards;<sup>43</sup> and the turf battles that flare up when watershed boundaries cut across political boundaries.

Earlier, we described sluggish progress in employing a number of other tools, basic to the CWA, that have potential power to stem the flow of runoff. These include water quality standards, the 303(d) TMDL (Total Maximum Daily Loads and Wasteload Allocation) approach, 305(b) assessments, and other basic CWA tools. Water quality standards and their implementing mechanisms, including effective state antidegradation programs, are especially important to the success

of runoff reduction programs, and are crucial to runoff programs for two basic reasons:

- \* All programs to control poison runoff must be designed to achieve compliance with water quality standards;<sup>44</sup>
- \* At least before 1987, water quality standards formed the principal legal authority for controlling pollution generated by various land use activities.

Volunteers Needed to Help States Fill the Runoff Monitoring Gaps

Water quality standards must work hand-in-hand with well-targeted monitoring and assessment programs in order to be effective for any pollution control program, including runoff control. Section 305(b)(1)(E) of Clean Water Act requires that the biennial state water quality assessments include:

... a description of the nature and extent of nonpoint sources of pollutants, and recommendations as to the programs which must be undertaken to control each category of such sources, including an estimate of the costs of implementing such programs.

Nonetheless, an EPA report on the main elements of State water pollution source monitoring programs suggests that, at least as of 1987, they were characterized by point-source "tunnel vision:"

- 1) self-monitoring of effluent by industrial and municipal dischargers; 2) compliance sampling inspections to cross-check discharger self-monitoring; and 3) effluent characterization studies for industrial dischargers. One of the five major "challenges" set forth for EPA in this study is to "Identify and Characterize Toxic, Conventional, and Anthropogenic Pollutants from Nonpoint Sources" (emphasis added). This report also recommended an in-depth study of the feasibility of initiating a "Citizen's Watch Program."

Both of these recommendations, if they were to be followed by EPA, would have major benefits for the ability of the States to characterize the threats and impairments due to land-based sources of pollution.<sup>45</sup> The good news is that apparently many States are now beginning to shift their monitoring efforts into land-based sources of water pollution, at least according to one 1992 report described in the next section.

The early 1980s represented perhaps one of the lowest periods in the history of poison runoff policy. Funding for the 208 program was gutted in 1981.<sup>46</sup> Then, in 1983, EPA contended that the Agency had no direct role in controlling poison runoff. In addition, the Reagan Administration actively opposed the establishment of a new, comprehensive runoff control policy.<sup>47</sup> Obviously dissatisfied with the lack of progress made by states in stemming the flow of runoff, Congress created new requirements in the 1987 Clean Water Act. For the first time, poison runoff was addressed head-on in a new section of the Act.

**Section 319: Congress Put Increased Emphasis on Runoff Programs in 1987**

In 1987, Congress created Section 319 of the Clean Water Act, designed to get States to identify waters damaged or threatened by runoff sources, and to develop comprehensive programs to heal those waters by reducing and eliminating pollution from those land-based sources. This program was not completely new; rather, it gathered up provisions for runoff controls dispersed throughout the Act and EPA guidance, and corralled them into one program.

This section of the Act strengthened the substantive standard for runoff control program effectiveness by requiring, in 319(a)(1)(C), nonpoint source reduction, "to the maximum extent practicable." By contrast, the earlier 208 programs were held to a much weaker standard of runoff reduction "to the extent feasible." As NRDC observed in Poison Runoff, the new standard of "maximum extent practicable" "will demand a higher level of control and a more stringent standard of proof before degradation or downgrading can be permitted."<sup>48</sup> Unfortunately, the promise of section 319 has not been fulfilled. True, there have been some notable success stories, described below. On a national basis, however, significant progress has not been shown under the new program.

#### B. Watershed Restoration Success Stories

Although Congress intended for the states to structure their poison runoff control programs as much as possible on a watershed basis (319(b)(4)), many states did not do so, choosing instead to write management plans based upon generic management practices intended to apply to all lands within each major land use category in the State. Some states, like Wisconsin, are exceptional in that runoff control is part of a comprehensive, watershed-based restoration and protection program that targets specific watersheds throughout the State. Other States are notable for individual watershed programs that stand as shining examples for others to follow. Three such programs are described briefly below.

Owl Run watershed, in Fauquier County, Virginia, has a major nutrient and animal waste problem that contributes to dissolved oxygen and other water quality problems in the Chesapeake Bay. In response, the Virginia Division of Soil and Water Conservation, in cooperation with conservationists at the John Marshall Soil and Water Conservation District, are helping farmers to reduce manure pollution through a variety of techniques. Management practices in the 2800-acre watershed include soil testing and the creation of nutrient budgets, no-till cropping and filter strips, and the construction of manure storage tanks. Cost-sharing can cover up to 100 percent of the farmer's installation costs. The purpose of the project is to show that these kinds of practices are effective on a whole-watershed basis in reducing pollution. The water quality goals around which the project is designed include both in-stream, and downstream (Chesapeake Bay) restoration.<sup>49</sup>

Big Darby Creek Watershed, Ohio. This multi-party project in central Ohio, coordinated by the Nature Conservancy, proves that farmers and environmentalists can be friends. A major goal of the project is to enroll 75% to 100% of the watershed's farmers in a conservation tillage program; roughly 15% of the watershed's farmers now use conservation tillage. Cooperation and rapport have been enhanced by the knowledge that Big Darby is a unique ecosystem with many endangered or threatened species of mussels and fish, and by the now-famous canoe trips in which each canoe holds a farmer and an environmentalist, who survey the riparian zones together as they glide down the river. Many farmers in the 370,000 acre watershed are also installing forested buffer strips with the help of state foresters. The project's 1992 budget totalled more than \$750,000, with monies obtained from the Soil Conservation Service, TNC, Environmental Protection Agency, and other agencies and groups. Big Darby is not a purely agricultural watershed. A remaining "wild card" for the fate of the headwaters is whether suburban developers, seeking to supply wealthy residents of Columbus with low-density "country" housing, will be convinced to adopt water-sensitive practices of their own.<sup>50</sup>

Big Spring Basin, Iowa. The Iowa Department of Natural Resources, Geological Survey Bureau, has helped to make the Big Spring Basin famous for nitrogen input reductions that have saved farmers money while they reduce water pollution. Through a state cost-sharing program and extensive technical outreach to the roughly 200 Basin farmers, a reduction of over 1.2 million pounds of applied nitrogen was achieved between 1981 and 1989. This input reduction achieved a savings of about \$200,000 per year, or an average of \$1,000 per year per farm. With crop rotations that have farmers

planting corn following alfalfa, maximum yields are often obtained with no addition of nitrogen to the soil.<sup>51</sup>

These "watershed success stories" are cause for hope that whole-watershed restoration works, that cooperation between different stakeholders can be gained, and that farmers are willing to adopt water-sensitive practices once they are convinced of three things: 1) that such changes are needed by an ailing or vulnerable ecosystem; 2) that such changes will not bankrupt their farm (and may even save them money); and 3) that the risk and burden of adopting new practices is shared equally among all other farmers and landowners in the watershed.

The three examples given -- Owl Run, Darby Creek and Big Springs Basin -- are voluntary programs. Their premise is that, given ample time, money, and technical outreach, all farmers will "volunteer" to "do the right thing." Unfortunately, these programs may not be support in all impaired or threatened watersheds in each state, since ample grant monies to replicate their very favorable cost-share ratios statewide simply do not exist. The need for urgent action in the case of impaired watersheds, and the need for accountability, demand more than voluntary programs.

C. Recent Federal Oversight Shows EPA's Implementation of the 319 Program has Lacked Vision and Leadership

The EPA's Office of Policy, Planning and Evaluation (OPPE) reviewed the 319 program in the summer of 1992 at the request of the Office of Water. The study looked at 10 sample state programs, as well as the management policies at the EPA

headquarters and regions. The report reached 12 findings about what's right -- and what's wrong -- with the 319 program:

- 1) Because of the diverse nature of NPS [nonpoint source] pollution, there is no single definition of a NPS program.
- 2) Authority for Implementing State Management Programs is generally decentralized.
- 3) The extent to which States are institutionalizing their NPS programs varies widely.
- 4) The majority of the ten States do not have NPS programs oriented toward improving water quality on a watershed-specific basis. (Emphasis added.)
- 5) State Management Programs generally cannot be used to gauge the States' progress in implementing NPS controls.
- 6) Flexible guidance has enabled States to use 319 resources to address numerous NPS priorities.
- 7) States concentrate their use of 319 resources to focus on different priority activities.
- 8) The majority of States are making some effort to monitor the effectiveness of BMP implementation, though water quality impacts due to implementation of 319 are as yet unknown.
- 9) Section 319 has facilitated increased communication and coordination among agencies and organizations to develop and implement the State Management Programs.
- 10) Although most EPA Regional EPA Offices use several staff to address NPS pollution, few staff are dedicated specifically to assisting States to implement management programs or 319 grants.
- 11) EPA Regional office implementation of the 319 grant program varies considerably across EPA regions.
- 12) EPA provided States the opportunity to develop diverse NPS programs, but has not yet defined a vision or role for a national NPS program.<sup>52</sup> (Emphasis added.)

OPPE then made the following two recommendations: a) the Office of Water should emphasize more clearly that a watershed

protection approach should be the basis of State NPS programs; and b) Office of Water and Regional Offices should clearly define EPA's goals, strategy and role for the national NPS program.<sup>53</sup>

One of OPPE's most important findings was that "The majority of the ten States do not have NPS programs oriented toward improving water quality on a watershed-specific basis." Furthermore, "the majority of [State Management Programs] do not identify strategic plans or milestones for achieving water quality goals for specific waters identified in their Assessment Reports."<sup>54</sup> Thus, the requirement of section 319(b)(4), that States shall, to the maximum extent practicable, develop and implement management programs on a watershed-by-watershed basis simply has not been enforced by EPA. Although of course some state-to-state variation is expected and even desirable in the 319 programs, the report clearly suggests the need for more program focus at both the federal and the State levels.

#### Lack of Adequate Funding

The General Accounting Office (GAO) also reviewed section 319 program implementation in 1990. GAO found that:

"officials in five of the states we visited identified the lack of resources as a key barrier to controlling nonpoint source pollution. Although some states have or will allocate million of dollars to deal with the problem, they maintain that it would require billions to correct."<sup>55</sup>

The total 319 appropriation for the past four fiscal years -- roughly \$200 million -- represents a drop in the bucket, compared both to present program needs, and to the total \$50 billion investment the nation made in sewage treatment, (significant

given that poison runoff pollution dwarfs the sewage treatment challenge of the early 1970s).

D. Summary of Findings on Existing Runoff Control Programs, and Prescriptions for Changes Needed

As is true for many outstanding water quality problems, there are major gaps in the development and use of the Clean Water Act's basic tools for reducing poison runoff. Their absence is perhaps most acute within the context of fledgling state poison runoff control programs, partly because the tool of NPDES discharge permits is usually not available to give these programs the "backbone and bite" of an automatic enforceable mechanism. Thus, the relative weakness and underdevelopment of the tools that are available to runoff managers -- water quality standards, water quality assessments targeted to land-based sources, TMDLs, and whole-watershed plans -- has hindered progress in stemming the flow of poison runoff.

E. On the Need for New Water Quality Criteria Relevant to Runoff Impacts

Although EPA took a quantum leap forward with the publication of its document "Biological Criteria: National Program Guidance for Surface Waters" (April 1990), few states have acted to use biocriteria in important ways in assessment and/or permitting. No water quality standards at the State or federal level have been established to protect physical or hydrological features of aquatic habitat, such as the destruction of first-order streams noted above in the logging discussion. To protect whole aquatic ecosystems from the abuses of shopping mall

and subdivision development, logging, mining, and other land operations, EPA needs to publish, and the States need to implement, water quality criteria for the following factors:<sup>56</sup>

- \* biocriteria, such as EPA's recommended use of the Index of Biotic Integrity, first developed by Dr. James Karr and colleagues;
- \* habitat protection criteria for example, for pool-and-riffle complexes;
- \* drainage density metrics including minimal preservation and restoration of first-order streams;
- \* complete hydrologic specifications including year-round flow minima and minimum streamflow percentages of groundwater;
- \* seasonal and annual sediment loadings;
- \* nutrients (for eutrophication, not acute toxicity); and
- \* current-use pesticides.

In its review of EPA's management of the overall poison runoff program, the GAO listed the lack of appropriate standards as a key barrier to progress:

'Criteria documents' and other technical information are not available to states to enable them to set water quality standards for nonpoint source pollution...State and federal officials told us that existing state water quality standards need to be supplemented because they were developed primarily to address point source problems and consequently have limited applicability in controlling nonpoint source pollution.<sup>57</sup>

Summary and Conclusions on the States' Poison Runoff Management Programs under the 1987 Clean Water Act

In summary, there are many reasons why the 319 program, as implemented over the past five years, has failed to heal waters and watersheds damaged by land uses and abuses:

- 1) lack of watershed basis for the programs;

- 2) lack of adequate funding, especially for program staff at all levels;
- 3) inadequate enforcement of the mandate for States to require water-sensitive practices to be adopted wherever monitoring indicates a problem, or where pristine conditions indicate the need for protection;
- 4) major monitoring gaps;
- 5) inconsistent goals of other powerful federal programs, which thwart poison runoff control efforts;
- 6) continued reliance by the States on ineffective voluntary compliance for the adoption by landowners of water-sensitive practices;
- 7) reluctance to create relevant water quality standards to make the program meaningful; and
- 8) diffuse responsibility for the program; often administered and overseen by agencies that lack a primary water quality focus.

As a result of these major obstacles, our national poison runoff policy is based upon a voluntary, piecemeal approach riddled with inconsistencies, ineffectiveness, and massive gaps in funding, monitoring and staffing. As a result, we now have 50 individual runoff assessment and management programs that are all over the map in terms of comprehensiveness, stringency, degree of public participation, accountability, funding commitments, and in-stream effectiveness. And most programs fall on the voluntary, all-carrots-and-no-sticks side of the spectrum. Major strengthening changes are required in order to transform 319 into a publicly accountable and ecologically and economically effective program; unless these changes are made, it is likely to continue to be ineffective.

F. The New Coastal Runoff Program Bears Promise, But Its Geographical Scope is Limited

As part of the 1990 Coastal Zone Act Reauthorization Amendments ("CZARA"), Congress welded two existing programs -- the States' Coastal Zone and Clean Water Act Section 319 programs -- into a single, powerful approach to preventing and reducing runoff pollution in coastal watersheds (including the Great Lakes). The centerpiece of CZARA is the implementation of enforceable management measures to reduce polluted runoff by specific land uses. Management measures are defined in Section 6217(g)(5) of CZARA as:

"economically achievable measures for the control of the addition of pollutants from existing and new categories and classes of nonpoint sources of pollution, which reflect the greatest degree of pollutant reduction achievable through the application of the best available nonpoint pollution control practices, technologies, processes, citing criteria, operating methods, or other alternatives."

The phrase "greatest degree of pollutant reduction achievable" is more stringent than the "maximum extent practicable" standard for BMPs under Section 319. Other important provisions of CZARA include:

- \* the extension of coastal zone boundaries farther inland, to control the land and water uses that have a significant impact on coastal waters;
- \* implementation of additional management measures, where necessary to meet or protect water quality standards and to protect the waters of critical coastal areas;
- \* use of enforceable policies and mechanisms to implement the management measures; and
- \* program coordination to ensure consistency of this new coastal zone program with Clean Water Act programs under Sections 208, 303, 319, and 320.

For those who had grown weary of the haphazard nature of the BMP lists in the State runoff control programs under Section 319, the CZARA program looked like it might provide fairly seamless coverage of water-sensitive practices across wide swaths of coastal zones. The second major advantage of CZARA over the 319 program is that it requires EPA to provide the States with definite guidelines for those water-sensitive practices. Under CZARA, States will have to implement management measures in their coastal zones that are consistent with EPA's minimum management measures, thus removing some of the randomness (and weakness) that characterizes many 319 programs. EPA's final CZARA management guidance was issued in January, 1993.<sup>58</sup>

Environmentalists and some progressive State administrators urged EPA and NOAA (who jointly administer the program) to base the management measures on objective, measurable criteria to ensure their effectiveness and accountability from state to state. Unfortunately, EPA and NOAA did not always heed this advice. For example, the draft guidance for controlling sediment pollution from farms originally would have required farmers to reduce erosion to the specified levels (the "T" soil loss tolerance standard). NRDC and several other organizations supported this standard. Although less than perfect, it would afford an objective performance standard around which each coastal zone farmer could structure site-tailored erosion controls. In the final guidance, however, EPA caved to pressure from commodities groups and other agricultural special interests,

and recast the agricultural erosion control measure as the "Alternative Conservation Systems" described in the Field Office Technical Guides of the SCS. ACSs are generally sound practices, but provide little objective guidance to judge whether a farm has adopted sufficient erosion control practices.

Despite this weakening of the performance requirements for some of the management measures, however, the CZARA program remains a model for strong State runoff reduction programs. State implementation of required management measures for each land use category would improve 319 programs greatly if it were adopted for all watersheds, not just those in the coastal zone.

The coastal zone runoff program also contains some management measures, like vegetated riparian buffers, designed to protect and restore urban waters. Urban watersheds are severely degraded by a multitude of runoff sources. Federal and State money and leadership are needed to create community programs that restore urban streams to full vitality; we describe these problems and solutions in part V below.

IV. The Draft Oberstar Bill Charts the Course for effectively stemming the flow of runoff and healing troubled watersheds

The heart of the polluted runoff prevention policy of the National Clean Water Network is whole-watershed restoration coupled with required site-level water quality planning in the target watersheds, backed up by citizen water quality monitoring efforts. Without each of the three parts of this policy, the success of future watershed restoration efforts will be in jeopardy.

Comprehensive requirements are critical to the effectiveness of both watershed targeting and landowner responsibility in the target watersheds. All watersheds of waters on the "sick lists" -- 305(b); 319(a); and 304(1) -- need to receive some kind of "care" to restore them to full health. And, in order to accomplish the restoration goals in each target watershed, all landowners and operators must be required to tailor water-sensitive practices to their particular site. This latter policy is consistent with the recommendation for farm-level planning in Water Quality 2000, which states

"Farm-level resource management plans should be mandatory for all farms in watersheds where surface waterbodies or groundwater systems are impaired or where there is a probability that these waterbodies or systems will become impaired. Further, in watersheds that are not determined to be threatened or impaired, if individual owner/operators are causing significant pollution or are clearly violating water quality standards and the situation cannot be resolved expeditiously by voluntary programs, these individuals should also be required to develop and implement farm-level resource management plans."<sup>59</sup> (Emphasis added.)

There were sixty organizations that ratified the overall Water Quality 2000 policy document that included this consensus statement on agriculture. The Clean Water Network applies this same watershed-wide, mandatory water quality planning policy to all land use categories in the target watersheds -- logging, mining, subdivision development, as well as farming. Far from singling farmers out for special regulation, we seek to include farmers as full partners, alongside all other land users, in multi-lateral watershed restoration programs.

Last month, Representative James Oberstar (D-Minnesota) circulated a Staff Working Draft of a bill entitled the "Nonpoint Source Water Pollution Prevention Act of 1993." This draft bill charts a well-conceived course for healing watersheds damaged and threatened by polluted runoff, on both private and federal lands. The draft Oberstar bill is strong on two of the Clean Water Network's three essential elements of watershed restoration: comprehensive targeting of impaired and threatened watersheds, and required citizen volunteer water quality monitoring programs as part of each State's revised 319 program.

In order to ensure that the target watershed programs actually accomplish their restoration goals, the draft Oberstar bill should be strengthened to require that all landowners and operators in the target watersheds undertake site-level water quality planning and implementation. We also recognize the need to allow States to exempt, under narrow criteria, land use categories that do not impact water quality in specific watersheds, as well as landowners under significant economic hardship not amenable to cost-sharing and other forms of assistance. The draft Oberstar bill, on the whole, gives the States the explicit guidance they require to craft effective polluted runoff prevention programs.

V. Blighted Urban Waters Mirror Urban Decay -- The Failure of Stormwater Programs and Need for Urban Watershed Restoration.

Urban waters are among the most degraded in the country. Urban streams are concretized and channelized, used as conduits

for stormwater runoff, industrial and municipal effluents, and raw sewage from leaking sewer pipes (often laid lengthwise in streambeds) or from combined sewer overflows. And as if all of this abuse were not enough, many urban streams are obliterated altogether, "enclosed," (a euphemism for transforming a stream into an underground sewer), or (as in the case of many groundwater springs and first-order and ephemeral streams) simply destroyed beneath the treads of earth-moving vehicles preparing the ground for new development.

A. The Degradation of Urban Waters and Watersheds.

According to a 1992 EPA study of the environmental impacts of stormwater discharges, urbanization degrades a disproportionate share of our nation's waters:

While urban population areas take up only about 2.5% of the total land surface of the country, stormwater pollution from these urban areas and associated urban activities (i.e., storm sewers/urban runoff, combined sewers, hydromodification, land disposal, construction, urban growth, etc.) accounts for a proportionately high degree of water quality impairment (i.e., 18% of impaired river miles, 34% of impaired lake acres, and 62% of impaired estuary square miles reported under 319) when compared to that from rural activities (i.e., agriculture, silviculture and mining) which take up approximately 53% of the total land surface.<sup>60</sup>

Urban stormwater pollution thus deserves high-priority attention by citizen activists, water quality officials and other watershed stewards.

The most comprehensive study of urban runoff quality to date is NURP, the Nationwide Urban Runoff Program. NURP was a joint project between USGS and EPA between 1979 and 1983, and it looked at stormwater quality in 28 cities across the country. NURP

found certain pollutants to be virtually ubiquitous in urban runoff, in average concentrations high enough to warrant concern over loadings in downstream sinks -- estuaries like Chesapeake Bay, and lakes like Lake Quinsigamond in Worcester, Massachusetts. Among NURP's key findings:

- \* copper, lead and zinc were each found in at least 91 percent of the samples;
- \* other frequently detected contaminants included arsenic, chromium, cadmium, nickel, and cyanide;
- \* significant average concentrations of total suspended solids, phosphorus, nitrogen compounds, oxygen-robbing organic matter (BOD), and fecal coliform were found.<sup>61</sup>

Using national average runoff pollutant concentration data derived from the NURP study, NRDC made coarse estimates of runoff pollutant loadings for heavy metals, oil and grease, BOD, nitrogen, and phosphorus for seven urban areas around the country: Baltimore, MD; Washington, D.C.; Harrisburg, PA; Tidewater, VA; Los Angeles, CA; Atlanta, GA; and Cleveland, OH. Although the results varied from city to city, these "Poison Runoff Indexes" showed that runoff rivals, and in some cases surpasses, factories and sewage plants as a source of these pollutants. For instance, in most of the urban areas modeled by NRDC, zinc loadings from runoff exceeded the loadings from factories in the State or region.<sup>62</sup>

The NURP authors described the water quality impacts of urban runoff as falling into three categories:

- \* short-term receiving water impacts during or following storm events (where pollutant concentration is important);

- \* longer-term downstream receiving water effects -- the buildup of contaminants in the sediments of "sinks" like river mouths, lakes, and bays (where seasonal or annual pollutant mass loads are important). (Although NURP did not examine in detail this phenomenon, NURP data enable coarse estimates to be made of runoff annual mass loadings from large urban areas.)
- \* physical effects of stormflows on the hydrology and geomorphology of urbanized watersheds -- including stream channel scouring (NURP did not examine this third type of effect, but acknowledged its existence.)<sup>63</sup>

One logical outcome of NURP's acknowledgement of this wide range in receiving water effects from urban runoff is the creation of comprehensive watershed restoration programs. An example is the program developed for the Anacostia River, which flows through Washington, D.C. and into the Potomac River after collecting urban stormwater from dozens of tributaries in suburban Maryland. The Anacostia is well-known both for its severe degradation, and for the extraordinary vision and commitment of the local governments now working for its restoration. The Six-Point Action Plan for the Anacostia's restoration is keyed to a list of six problems that could apply to dozens of urban watersheds nationwide:

- 1) Poor water quality: The tidal Anacostia estuary has some of the poorest water quality recorded in the Chesapeake Bay system...rapidly filling with sediment and debris...low dissolved oxygen levels...sediments contaminated with toxics...
- 2) Ecological degradation: Dozens of miles of stream habitat have been severely degraded by uncontrolled runoff, and in some cases by engineering "improvements." Urbanization has profoundly altered the flow, shape, water quality, and ecology of these streams, many of which possess only a fraction of their original biodiversity.

- 3) Loss of anadromous fish habitat: As many as 25 man-made barriers prevent the upstream spawning migrations formerly made by menhaden, yellow perch, herring, and striped bass.
- 4) Loss of wetlands: Over 98 percent of the once-extensive tidal wetlands and nearly 75 percent of the watershed's freshwater wetlands have been destroyed.
- 5) Deforestation: Nearly 50 percent of the forest cover in the basin has been lost due to urbanization. The most severe losses have occurred in the riparian zones, where trees play a critical role in maintaining stream water quality, preventing streambank erosion, and providing both aquatic and terrestrial habitat.
- 6) Lack of public awareness: The 600,000 residents of the basin are generally unaware that they live in the Anacostia watershed. They do not perceive their connection to the river and its unique natural features...the desire to take part in their watershed's restoration and to become stewards is largely unfulfilled.<sup>64</sup>

Despite all of this degradation, urban streams, lakes and bays are still oases of life for millions of urbanites. Jamaica Bay is one example. Like many city waterbodies, Jamaica Bay is oddly wild, given that it lies within the boundaries of New York City, is bordered by Brooklyn and JFK Airport, and its waters are affected heavily by a mixture of urban runoff and sewage effluent. According to some of Jamaica Bay's stewards,

"...fishing for sport and food has long been a favorite recreational activity in the park. Weekend fishermen line the railings of bridges and piers while others venture out in personal boats or charter fishing boats in hopes of a good catch."<sup>65</sup>

The City of New York Department of Parks and Recreation, and the managers of the Gateway National Recreation Area, recently surveyed 450 fishermen who fish from the shores and bridges of Jamaica Bay. The survey revealed that 304 of the fishermen, or two-thirds, eat the fish they catch, despite the fact that it is

contaminated with low levels of PCBs.<sup>66</sup> And Jamaica Bay is not unique. People of all ages can be seen fishing for crayfish in Sligo Creek, an Anacostia tributary, in Takoma Park, Maryland; and for catfish off of bridges over the Charles outside of Boston. People fish regularly in Lake Erie off of the 55th Street pier in Cleveland, and off of wharves in South San Francisco Bay. The fact that at least some of these people eat what they catch, even if it may be contaminated, is not a reason to shut these active fisheries down. It is a reason to work with a sense of urgency to reduce and eliminate the toxics now flowing into them.

B. Amending the Municipal Stormwater Permit Provision:  
Creating Meaningful, Affordable Stormwater Programs

The 1987 amendments to the Clean Water Act included section 402(p) (discussed in the previous section), which set forth stormwater permitting requirements for large and medium cities, and for all industrial manufacturing sites that discharge stormwater. Under EPA's implementation of 402(p), a total of 173 cities with populations of 100,000 or greater, and 47 counties with unincorporated populations of 100,000 or more were required to have stormwater permits by October 1, 1992.<sup>67</sup>

Most of these municipalities have now applied for their initial permits (Part I), and have conducted stormwater pollution studies to develop city-wide stormwater management programs (Part II). However, because EPA has not provided the States with substantive performance targets (such as the minimum urban area that must be covered by well-accepted stormwater management

measures) for the permits, urban citizens and stormwater utility ratepayers may have little or no assurance of permit program accountability and effectiveness. In addition, even EPA's own recent stormwater literature points out the need to expand the scope of regulation to additional large urban areas:

"The 220 Phase I NPDES municipalities have a combined urban population of 78 million. The remaining 80 million people located in urbanized areas are outside of Phase I municipalities. Most urban growth occurs in the urban fringe areas outside of core cities. For example, between 1970 and 1980, the population of incorporated cities with a population of 100,000 or more (Phase I cities) increased by only 0.6 million, with the population of many of these cities decreasing. Between 1970 and 1980, the population of urbanized areas outside of cities with a population of 100,000 or more increased 30 times more (an increase of 18.9 million) than the population of these core cities. This is important from a stormwater perspective as numerous studies (e.g., NURP) have shown that it is much more cost effective to develop measures to prevent or reduce pollutants in stormwater during new development than it is to correct these problems later on."<sup>68</sup>

Thus, there are as many large urban areas currently outside of the NPDES stormwater permitting system as there are cities beneath the NPDES umbrella. This "regulatory gap," as the quote from EPA above makes clear, is all the more crucial considering that the areas left out of the NPDES umbrella are experiencing the most rapid growth rates, and thus have the most urgent need for immediate establishment of water-sensitive master plans and site design practices, before excavation and building ever begin. As one recent EPA report on the environmental quality impacts of land use observed,

"...the significance of the [urban] sector is not how much land is in urban acres, but instead where the land is located, the implications and rapacity of recent development patterns, and the likelihood that future development will

draw land out of other uses valued by society -- agricultural lands, wetlands, or open space."<sup>69</sup>

The concept of "pollution prevention," a congressional mandate under the Pollution Prevention Act of 1990, ideally would work hand-in-hand with the Clean Water Act stormwater program the following runoff prevention and reduction hierarchy:

- 1) for new development: runoff prevention through mapping and preservation of natural drainageways, preservation of mature forest zones along waterways, and caps on the amount impervious surface;<sup>70</sup>
- 2) for redevelopment and retrofitting of existing developed areas: runoff reduction through revegetation, impervious surface reclamation (e.g. retrofitting parking lots with grass swales designed to capture and filter the lot's runoff, thus preventing or severely reducing the need to discharge to a nearby stream);
- 3) chemical source controls and toxics use reduction (e.g. policies that require lawn service companies to test lawns for nutrient content and pest problems before applying chemicals, in order to reduce lawn chemical use); and
- 4) conventional "end-of-pipe" stormwater treatment devices, such as extended detention ponds, infiltration trenches, and catch basins.

#### Effective Stormwater Programs Are Affordable and Cost-Effective

##### **New Development**

Prevention-based stormwater controls are known to be more cost-effective than the usual dominant reliance on end-of-pipe retention ponds that has characterized stormwater programs in such regions as suburban Maryland. The new town development project called Woodlands, Texas, pioneered "Design With Nature" as a stormwater management concept in the early 1970s and showed that the natural drainage/vegetative retention option saved over

\$14 million for the development, a four-fold savings over the estimated costs of conventional stormwater management.<sup>71, 72</sup> The lesson here is that cost-saving and water-protective measures have been known to the development community for at least two decades; the problem is that lax and fragmented local government planning and zoning procedures have thwarted the widespread use of these design principles. The new coastal nonpoint pollution control program contains a site design management measure that is a step in the right direction towards "prevention design" for stormwater management.

#### **Existing Development**

Recent testimony given before the Subcommittee on Water Resources referred to "unproductive permit application costs" and "unconscionable permit program costs" for the municipal stormwater permit programs.<sup>73</sup> It is important to examine the assumptions underlying the "unconscionable costs" referred to by a representative of the California Stormwater Quality Task Force. These costs cited in this case relied on a "worst-case," full-end-of-pipe stormwater capture and treatment scenario that includes "major structural controls for floatables, metals, microorganisms, and nutrient removal," and assumed that lime precipitation, filters, and chlorination/dechlorination were applied to stormwater detention basins in the permitted municipalities.<sup>74</sup> This is a highly unrealistic scenario, given current discussions about effective elements in municipal stormwater programs.

We acknowledge, and agree with the California Stormwater Quality Task Force, that the cited Annual Operation and Maintenance Cost figure for this worst-case scenario, roughly one-half trillion dollars for the nation, is absurd and unconscionable. Yet no environmental group to our knowledge has contemplated or advocated this "worst-case scenario;" in fact, representatives of NRDC and other groups in the National Clean Water Network have engaged in a constructive dialogue with representatives of the California Stormwater Quality Task Force aimed at crafting a compromise policy for the municipal stormwater permits.

This compromise policy is still being crafted, but centers on requirements for minimum management practices. Such practices could include pragmatic measures such as illicit discharge elimination; parking lot oil and grease filters or runoff reduction; local zoning and planning changes to incorporate prevention into stormwater management design; and regular catch basin cleaning. These practices, according to the same APWA study that included the "worst-case scenario," are well within the boundaries of "best-case" (more affordable) scenarios that range from roughly \$ one billion, to \$ 86 billion, in estimated total annual O&M costs.<sup>75</sup> Even the \$86 billion O&M figure for these more pragmatic approaches, that the APWA study calls "BMP Level 3" and includes construction of some source controls, is over six times less expensive than the estimate worst-case scenario.

These stormwater programs need not be financed solely through federal appropriations, though technical and administrative budgets need to be beefed-up for EPA and State stormwater programs. Quite the contrary, local funding mechanisms are well-known to stormwater managers, and include local or regional stormwater utilities, which rely on dedicated user charges related to the level of runoff management provided to parking lot owners, subdivision dwellers, and office park managers.<sup>76</sup>

#### Conclusion

For both new urban development, and existing development, prevention-based stormwater practices for Clean Water Act "402(p)" programs are available that are cost-effective, affordable, and amenable to financing through use of a variety of funding sources including stormwater utilities. The challenge to Congress, EPA, and the States is to articulate a stormwater permitting policy that contains cost-effective minimum mandatory practices known to protect urban waters, and to provide funding for sufficient technical and programmatic support to municipal managers.

C. On the Need for An Urban Watershed Restoration Program in the Clean Water Act.

Stormwater permit programs are but one element in effective comprehensive watershed restoration programs that highlight the importance of urban waters to inner-city dwellers, rely on local citizen groups and municipalities to initiate and structure long-term restoration strategies (that may include community-based

studies like surveys of urban fishing patterns, and locally-based skilled jobs like urban forestry), and channel federal dollars to priority urban watersheds to help fund the restoration work.<sup>77</sup> Such programs would help to focus the energies of urban activists into the work of "re-greening the urban landscape," enshrining this ecology goal as a critical part of the Clean Water Act's goal of "fishable, swimmable" waters for all Americans.

On the Need for Jobs Within Urban Watershed Restoration Projects

In restoring our degraded urban watersheds, we will help to build the skill level and the economic self-reliance of the inner city work force. New generations of skilled and semi-skilled workers are needed to restore damaged wetlands and floodplains and to design and build riparian buffer strips, runoff detention ponds, and combined sewer overflow storage tanks, all of which can be part of new urban watershed restoration programs.

It is critical that all urban watershed restoration programs, targeted to waters as diverse as the Anacostia in Washington, D.C.; the Los Angeles River, or Cleveland's Lake Erie tributaries, have three essential elements: a) primacy of local citizen group and local government leaders (with federal and State government in supportive roles); b) provision of jobs and career paths for inner city youths and skilled/semi-skilled workers seeking employment; and c) emphasis on "bioengineering" restoration, such as constructed wetlands and tree plantings on stream banks. Without these three essential elements, there is little guarantee that our investment in urban watershed

revitalization will yield long-term returns in the form of "self-reliant, green communities."

#### VI. Conclusion

Federal and State water quality managers have historically missed out on opportunities to stem the flow of poison runoff via implementation of several key provisions of the Clean Water Act, most of which were available prior to the 1987 amendments. These key provisions include: development and application of relevant water quality standards; whole-watershed planning and management; spreading the burden of load reductions through Total Maximum Daily Loads; and creating focused, effective State runoff management programs. As a result of the failure to evolve these and other tools into effective runoff reduction and prevention programs on a watershed basis, the waters of the United States continue to be degraded by poison runoff from virtually every category of land use.

New federal and State programs, including the Coastal Zone Nonpoint Pollution Control Program, and municipal and industrial stormwater permits, provide new opportunities for States and EPA to eliminate the foot-dragging and unfocused, piecemeal approach to runoff control that occurred in the past. Whole-watershed management approaches are needed to tie together urban and rural dwellers in the goal of restoring their common waterways to full health. Such programs offer the promise that we can correct the mistakes of the past and actually stem the flow of poison runoff. Crucial to the success of these programs is the formidable

political challenge of establishing enforceable requirements for water-sensitive land use practices and site designs that accrue to all of a watershed's landowners in a fair and equitable manner.

39. Another section -- 101(e) -- contains a broad mandate for public participation that has been grossly underemployed in the campaign to stem the flow of runoff. Without widespread public participation in the form of volunteer water quality monitoring programs and citizen involvement in the creation of whole-watershed management plans, runoff control programs may lack crucial public support and political momentum.

42. According to a longtime water policy activist with the League of Women Voters of the United States, there were "tens of thousands of meetings on 208 plans nationwide over a three-year period in the mid-1970s, and LWV members headed many of the 208 committees...virtually every local League was into the 208 process." Marilyn Reeves, former Board member, League of Women Voters of the United States. Personal communication, May 15, 1992.
43. Thompson, Paul, 1989. Poison Runoff: A Guide to State and Local Control of Nonpoint Source Water Pollution, Natural Resources Defense Council, 21-22.

44. To quote from Poison Runoff,

"...the degree to which poison runoff can be controlled dictates whether or not designated uses of individual waters are considered attainable:

'At a minimum, uses are deemed attainable if they can be achieved by the imposition of effluent limits...and cost-effective and reasonable best management practices for nonpoint source control. 40CFR 131.10(d), 131.10(h)(2); 33 U.S.C.1315(b)(1).'

In effect, a state cannot legally decide that the minimum fishable/swimmable goal of the Clean Water Act is not attainable in a particular surface water unless the state has developed a poison runoff control program that controls nonpoint sources to the maximum extent practicable, and still is unable to achieve fishable/swimmable water quality. Similarly, under EPA's antidegradation regulation, even where water quality is better than necessary to protect designated instream uses, allowing further degradation is prohibited unless, among other requirements, the state assures the achievement of "all cost effective and reasonable best management practices for nonpoint source control." 40 CFR 131.12(a)(2); 33 U.S.C. 1313(e).

**STATEMENT OF AMERICAN FARM BUREAU FEDERATION  
TO THE HOUSE PUBLIC WORKS AND TRANSPORTATION SUBCOMMITTEE  
ON WATER RESOURCES AND ENVIRONMENT  
REGARDING CLEAN WATER ACT REAUTHORIZATION**

**Presented by Keith W. Eckel  
President**

**Pennsylvania Farm Bureau  
and  
American Farm Bureau Federation Board Member**

**April 22, 1993**

Thank you Mr. Chairman. My name is Keith Eckel, and on behalf of the American Farm Bureau Federation we appreciate the opportunity to speak to you about the reauthorization of the Clean Water Act. Water quality is of great interest to Farm Bureau's nearly four million member families. Farm families have an inherent self interest in protecting water quality. Our families, our livestock and our crops and our land are usually the first to be affected by a degradation of water quality.

From the perspective of farmers and ranchers, there are three broad aspects to the Clean Water Act that need your attention. First, a non-point source program that retains the basic tenants of the current 319 program. Second, is the need for a clear, comprehensive wetland policy. And third, an adequate commitment of resources to make it work.

### **NONPOINT SOURCE**

This issue has been a priority for farmers and ranchers for many years and there is a tremendous amount of activity on farms and ranches across the country. Farmers are reducing erosion and increasing efficiency of chemical use. For example:

- ♦ Soil erosion has been reduced 90 percent or more on 35.5 million acres of land that is in the Conservation Reserve Program,
- ♦ Crop protection chemicals used by farmers are down 20 percent from 1982, and
- ♦ Corn's nitrogen fertilizer use efficiency is up 14 percent since 1980.
- ♦ Implementation of conservation compliance plans on highly erodible soils is slightly ahead of the expected rate with 58 percent of planned acres fully implemented. (See attachment #1 and #2.)
- ♦ Over 88 million acres of cropland are under conservation tillage systems providing residue cover of 30 to 90 percent,
- ♦ An additional 73 million acres of cropland has 15 to 30 percent residue cover providing substantial erosion control benefits, particularly in small grain production areas of the great plains.

- ♦ "No-till" farming practices soybean acres quadrupled between 1989-1992 to 8.2 million acres.

*"The assumption that American agriculture is incapable of far-reaching change is not true; the changes we have seen in tillage and pest control over the past 20 years would have been considered revolutionary in 1969." —Dr. R.G. Hoelt and E.D. Nafziger, University of Illinois*

As an industry, we are more mindful of the potential for adverse impacts of our activities. The process of education and promoting awareness began many years ago. Attached is a summary of several of the environmental initiatives that American Farm Bureau Federation has had on-going over the last 10 years which support the effort to protect our water resources. (See attachment #3.)

As with many issues, perception and reality often tend to reach different conclusions. Despite the perceptions, all indications are that surface water quality is improving and the trend will more than likely continue in that direction for some time. Senator Chafee has noted that 80 percent of the nation's waters now meet the Clean Water Act's goal of being fishable and swimmable. That is something we ought to be shouting about! We are making great progress!

We believe, Mr. Chairman, that it is important for the general public to know that whatever water problems exist in rural America they are manageable problems. We are not in a

water quality crisis situation.

Agricultural chemicals are also often perceived as one of the "major threats" to water quality. However, the EPA National Pesticide Survey went looking for 126 pesticides and or breakdown products in rural drinking water wells and community wells and **DID NOT** find 110 of them. Those that were found were generally present at levels that were not threatening to human health.

Our members have been testing their own wells in record numbers through cooperative programs developed by Farm Bureau. More than 40,000 wells in 19 states have been tested for nitrate. More than eighty percent of the tests showed nitrate levels in the range of what is normally considered naturally occurring background levels.

Mr. Chairman, modern agricultural technology should not be viewed as the problem, but rather the solution. The amount of cultivated land in the United States is approximately 340 million acres. That is approximately the same amount of land in production at the turn of the century. However, the U.S. population (consumers) has increased by 179 million people, while the number of farmers has steadily declined. Farmers account for less than one percent of population today. Despite these trends we have not only been able to meet the rising domestic demand for food consumption, but we are exporting approximately 30 percent of our production abroad. Furthermore, we are today idling more land to conservation than ever before and employing better conservation on the land we crop. If it were not for the advances in technology, our domestic demand for food could require as much as 800 million acres of additional cropland. It is **because of technology** such as pesticides and fertilizers and increased efficiencies produced through agricultural research, that land is **now available** for conservation set asides, wetland restoration, wildlife habitat, forest restoration, parks and

wilderness areas. And, similarly, 99 percent of the population is free to pursue occupations other than self-sustenance. Today we have more woodlands, more wildlife, more conservation, than at anytime in over a century. That has had and will continue to have a benefit to water quality.

When setting policy, it is important to look at the long-term trends and avoid decisions based on historical snapshots. In the state of Iowa for example, the use of commercial fertilizers have been blamed for elevated levels of nitrate in the Des Moines River. Ironically however, the Leopold Center for Sustainable Agriculture at Iowa State University has recently issued a report that calls this into question. Their research found that nearly 50 years ago, before commercial nitrogen fertilizers began to be used extensively, the nitrate level in the river was already nearly the same as it is today. It is important that we understand the nature of the problem in order to effect the right solution.

○ ○ ○

As this Committee prepares to reauthorize the Clean Water Act provisions addressing nonpoint source runoff, I would like to offer several observations that come from our experiences in working with landowners on water quality issues.

1. Farmers and ranchers want to do what is right for the environment. They will respond to problems when provided with sound, scientifically based information and reliable cost-effective solutions.
2. Our public policies affecting water quality should be based on fact, not perception. There is a critical need for continued research and a greater understanding of the site-specific linkages between farm practices and water quality. We ought to have the facts to support policy. The cost of being wrong is simple too great. Sound policy must be based on more than grab samples and generalizations.
3. We believe the programs and solutions that work best are those that come from the grass-roots up. Achieving improved water quality practices is best accomplished by voluntary, locally designed and implemented site-specific solutions. We should avoid the temptation to adopt "one-size-fits-all solutions". In looking at the successes of USDA's Rural Clean Water Program, it was clear that the more local people took control of the effort, the better the results.

It is equally important to realize that these practices must be put into use before any benefit is to be achieved. Therefore, we need a sound, trusted and reliable delivery system of information, technology, and assistance to the farm-gate. The concept of State primacy in Sec. 319 should be maintained.

*"We must realize that we cannot turn the clock back to the good old days of the 1930's when the world population stood at 2 billion people and few agricultural chemicals were used. Given current scientific knowledge, it is my belief that the judicious use of agricultural—especially chemical fertilizers—is absolutely essential to produce food needed to feed today's population of 5.3 billion, which is currently increasing at the rate of 88 million per year."*

*—Dr. Norman Borlaug, Nobel Laureate*

— 4 —

4. As I mentioned above, achieving water quality improvements is a process that takes time to show results. We should take a reasoned, long-term approach to water quality improvement and avoid the temptation to make decisions based on historical snapshots.

An assessment from Dr. George Halberg, of the Iowa Department of Natural Resources who has spent a decade on the widely known Big Spring water quality improvement project in northeast Iowa sums up the situation.

*"We need time. Even if we could do it—implement all known BMP's today—we'd still be a decade away from proving changes in water quality. —Dr. George Halberg, Iowa Department of Natural Resources"*

5. There is an urgent need to consolidate efforts. One of the major problems facing farmers today is the multitude of duplicate programs. We have, as a base, the voluntary Agricultural Conservation Program (ACP) and general conservation technical assistance. For farmers who voluntarily wish to receive USDA program benefits there's the Food Security Act's mandatory conservation compliance, sodbuster and swampbuster programs. There is the voluntary Conservation Reserve Program, the Water Quality Incentive Program, the Clean Water Act Sec. 319 programs developed by many states, and the there are the regional Gulf of Mexico, Chesapeake Bay, Great Lakes and Great Plains programs. In addition, farmers in many of areas will soon be responding to the Coastal Zone Act Reauthorization Amendments as their state begins implementation. We've had the Rural Clean Water Program, the Hydrologic Unit Area Projects Demonstration Program and many others.

Each of these can have a positive impact on water quality, but it makes no sense for a landowner to have to deal with the paperwork for what could be eight or more separate programs. And this is just the short list. Many are conflicting and redundant, virtually none are coordinated.

Representative English has introduced legislation that would enable farmers establish to a single conservation plan for their farms and ranches. The concept makes sense but should be expanded to apply to programs from EPA and other agencies as well. We urge that this Committee look carefully at what is already required and find ways to combine and consolidate efforts.

With regard to specific suggestions regarding the Sec. 319 program, Farm Bureau and other farm and ranch organizations have developed the attached Statement of Principles. We have met with Committee staff and look forward to working with you on this matter. (See attachment #4.)

○○○

In summary, we support the following concepts to address the issue of nonpoint source pollution:

- ✓ The central focus of NPS management solutions should be a reasonable and voluntary approach based on incentives, education, and site specific technical assistance. The nature of the problem differs substantially from that of point source pollution and hence requires different approaches. Best management plans and practices should allow maximum flexibility.
- ✓ NPS programs should retain the emphasis on State primacy and the development of locally designed, implemented and monitored best management practices.
- ✓ States should continue to have the authority to identify and resolve their priority water quality problems through administration of Sec. 319 funds.
- ✓ Management efforts funded by Sec. 319 money should be directed to priority watershed areas based on scientific assessments. Strategies should be developed on a watershed-wide basis.
- ✓ USDA and the Soil Conservation Service should have the primary role in developing plans and assisting landowners with implementation.
- ✓ Reauthorization of the Clean Water Act should include a strong financial commitment to further research, monitoring and assessment projects. More information is needed on the source, extent and impact of nonpoint source runoff, as well as the effectiveness, utility and economic feasibility of conservation practices.
- ✓ It is inappropriate for the Clean Water Act to extend citizens suit provisions to individuals participating in NPS management programs, nor is it appropriate to extend authority for citizen monitoring and oversight.

Our farmer and rancher members and other mainstream people realize that neither they, nor the nation, can afford the goals of zero pollution and zero risk when it comes to controlling soil erosion and agricultural runoff or any other human activity. However, they are willing to pursue excellence in conservation.

## WETLAND POLICY REFORM

### HISTORICAL PERSPECTIVE

For much of our history, wetlands have been viewed as a problem to be eliminated, rather than a resource to be managed and conserved. Wetlands were altered for purposes that provided many benefits to society, including flood control, protection of public health, agricultural production, road construction, government, education, and residential development.

Only recently has the emphasis shifted with a new focus on the unique and valuable functions of some wetlands in their natural state. This shift in public policy, and the view by some that wetlands are a "public" resource, does not always mesh with the fact that about 70 percent of wetlands are on private land, which individuals have purchased, mortgaged, and pay property taxes on. From an agricultural standpoint, one of the major shortcomings of the current wetland regulatory system is the failure to recognize and respect private property rights. Additional dry land and uplands have been swept into wetland categories by bureaucratic expansion.

A major part of the problem is that we have a wetlands program that grew not by design but by default, by bureaucratic expansion rather than congressional intent. In fact, the Clean Water Act does not even clearly and expressly direct the regulation of wetlands. Wetlands are not defined as "waters of the United States." Farmers and other natural resource users are now at the mercy of four federal agencies engaged in territory battles. Each has its own ideas about wetlands. None of them really cares what their decisions do to the livelihoods of landowners.

In less than 20 years, we have seen the Section 404 program go from regulating navigable waters, to regulating corn and soybean fields. Regulatory authority has expanded from restricting a few activities in the public waters of the United States, to federal planning and control without compensation. We have a regulatory policy that forsakes all other elements of ecosystems for wetlands. It rules blindly without weighing the importance of the wetland or the proposed project, the environmental value of the alternative site impacted, or for that matter, the cost to the property owners and the taxpayers. It is a policy that has required highway engineers to cut down, excavate and flood a mature maritime forest in Savannah, Georgia, in order to "compensate" for the minor wetlands lost during road-widening. It is a policy that for years has stifled local government officials in southeastern Virginia, where 80 percent of the land is hydric soils, from building a new drinking water reservoir for their residents. It is a policy that may cause a farmer to forfeit a third of his farm as "mitigation" because he could not afford the protracted legal costs of challenging the Corps of Engineers' allegation that his prior-converted cropland was still a wetland.

*"Outside of Alaska, the majority-65 million acres of the nations wetlands are owned by the private sector--individual farmers, ranchers, corporations, land trusts, and other private landowners."*  
—National Wetlands Policy Forum

*"The United States urgently needs a better system for protecting and managing its wetlands."* —The National Wetlands Policy Forum

Over the last several years, this Committee has had numerous hearings on wetland policy. Witnesses have included farmers, businessmen, bankers, local government officials, concerned citizens, realtors, transportation personnel, members of Congress and even former regulators at the U.S. Army Corps of Engineers. Their message contained a singularly

consistent refrain: Something is terribly wrong with wetland regulations. The regulators have overreached, the regulations have no design or coordination, and there is a lack balance and perspective with other policy goals. This concern is real and widespread.

This Committee must not let the opportunity pass to improve wetland policy, from both the standpoint of the resource and the landowners.

#### **WETLAND INVENTORY**

There has been much attention given to the loss of wetlands over the years and the importance of conserving wetlands. Central to this debate is the need to understand the current rate of conversion of wetlands, as well as where and why those conversions are occurring.

Recently, the U.S. Department of Agriculture updated its National Resource Inventory (NRI) which covers the years 1982-1991. It represents the most recent survey of our wetland inventory and offers the most up-to-date picture of the wetlands alteration. The inventory examined the conversion of wetlands on non-federal rural land in the United States, excluding Alaska.

The NRI shows that the total wetland losses between 1982 and 1991 have trended down to approximately 110 thousand acres annually on non-federal rural lands. This includes alterations from agriculture, development and other categories such as drought, change to open water and acquisition by the federal government. Keep in mind that there are no new large-scale farmland clearing projects currently under way. The last large scale farmland clearings occurred when government inflation policy ran commodity prices to very high levels.

Of particular importance is the clear downward trend of these alterations. The alterations attributed to agriculture are particularly worth noting. They have declined to an average of less than 30,000 acres per year. Furthermore, the inventory does not attempt to estimate the amount of wetland acres created or restored by farmers and ranchers which we believe is significant. Nor would this account for the millions of acres of cropland which has fallen out of production over the last decade.

We believe agriculture already is contributing to sizeable additions to our nation's inventory of wetlands. We strongly recommend that the federal government adopt a standard method for inventorying wetlands, conduct a national inventory, classify these wetlands on the basis of function and value, and require that all government agencies adhere to this single inventory. We also suggest that before any federal inventory of wetlands is conducted, the Congress should adopt a clear, consistent and common-sense definition of wetlands to minimize confusion.

#### **WETLAND DELINEATION MANUAL**

For years, Farm Bureau has argued that there must be a common-sense definition of wetlands. Wetland delineation has been a major part of the problem, in large part because currently, wetland delineation equals wetland jurisdiction. Hence, by expanding the scope of wetland delineation as was the case in the 1989 manual, jurisdiction was also

expanded—without any public review or input, or any attempt to gauge the added regulatory impact on landowners, small business, property values, bank portfolios or local governments.

The fact that the National Academy of Sciences (NAS) is currently reviewing the several of the scientific aspects of wetland delineation should not preclude this Committee from addressing the policy reforms that are needed. The fundamental question is not the lack of science, but how to apply the science we have in a rational manner.

There has been abundant science incorporated in the 1987, 1989 and the 1991 draft version of the wetland manual. The controversy stems from the inescapable fact that under current law, everything that is deemed to have any wetland characteristics is subject to regulation, regardless of its functional value. Once regulated, there is no provision in law to classify high or low value wet soils and apportion protection efforts accordingly. Consequently, the coastal marsh, bogs, swamps and the damp area in the center of a corn field are both subject to jurisdiction. Similarly, the lack of any appeals procedure, increased regulation of landclearing activities, and a strengthening of the Sec. 404(f) provisions regarding normal farming activities all need to be addressed.

These specific concerns, as well as the overriding issue of what land ought to be regulated, are all outside of the scope of the National Academy of Sciences study. Any resolution of these problems will only come from the Congress and originate within the Public Works Committee. Reform of Sec. 404 must be part of the reauthorization of the Clean Water Act in 1993.

#### **IMPACT ON AGRICULTURE**

Farmers and ranchers, like many other small businesses, have been significantly impacted by the current wetland regulatory program. Many farmers have unwittingly found themselves ensnared in a regulatory trap that unnecessarily delays and frustrates all attempts at good-faith compliance and is prohibitively costly to challenge over a protracted period of time. In farming or ranching, the agricultural value of the land rarely justifies the cost of regulatory burdens, which can run into hundreds of thousands of dollars and many years. As a result, win or lose, the viability of the farming or ranching operation is placed in jeopardy. Wetland regulations have the net effect of reducing the value of productive assets by restricting current economic uses and limiting future use opportunities. The incidents are frequent, and costly and underscore the need for major reform.

From the perspective of farmers and ranchers, most of the problem stems from an excessively broad federal definition that encompasses land exhibiting few if any true wetland characteristics. Attempts to regulate so-called "dry wetlands" as they are known to environmental advocates, has led to many landowners, government officials, small businessmen and others becoming embroiled in costly conflict.

Regulation of these lands has caused property values to fall and tax burdens to shift dramatically, limiting the ability to obtain critical financing for farming operations. Dry wetlands designations also have precluded farmers and ranchers from physically expanding many types of farming operations, causing inefficiency and reduced competitiveness. One farmer has had his property value reduce to zero since 1987.

Despite a clear statement of intent from Congress in Section 404(f) that normal and routine farming and ranching practices are not subject to individual permit requirements, the opposite is often the case. Regulators who are anxious to expand their control and power over private landowners frequently cite normal and routine farming practices as needing a Section 404 permit. Such activities could be as innocuous as extending a milking parlor into a dry pasture, cleaning overgrown fence and hedgerows, cleaning and maintaining drainage ditches, construction of farm and stock ponds, maintaining center-pivot irrigation systems, building rice levees and catfish ponds, maintenance of levees, or brush clearing.

These are just a few of the types of normal and routine farming activities that our members have reported being cited by federal regulators as requiring federal permits. These frequent attempts to circumvent and narrow the intent of Congress under Sec. 404(f) actions are not benign and can result in costly legal disputes. Often, landowners are given an "opportunity for settlement" that usually includes a severe financial penalty and forfeiture of some land as mitigation over the so-called violation. In short, the issue comes down to vague law, and unintelligible regulations that have eroded credibility of the 404 program among landowners who are law-abiding people.

Land often is the farmer's only tangible asset after a lifetime of work. It represents his retirement, children's education, source of credit and overall financial well-being. To deny a landowner reasonable and full use of his property is wrong.

Clearly, we can and should do better. The challenge is to construct a coherent, national policy that protects the rights of property owners. Good policy is policy that the average citizen understands what we as a self-governing people are trying to accomplish. Today, not one citizen can tell you what we are trying to do with wetlands policy. It simply makes no economic or political sense at all.

While we have attempted to briefly illustrate the impact of that program on farmers and ranchers, we offer the following suggestions for correcting the problem. Those most pertinent to agriculture include the following:

1. Wetland Definitions

The temporary return to the 1987 Wetland manual is an improvement over the 1989 manual, but it too contains some of the uncertainties that led to the original controversy. The conflict over wetland delineation stems from the lack of a clear public policy to apply good science. In that context we look forward to the product of the National Academy of Sciences, but we do not view the NAS study as a panacea. As members of the House of Representatives, you, not the NAS, must be the arbiter of that conflict, the source of the compromise. Eighteen more months of study will not resolve it.

2. Prior Converted Cropland

The Environmental Protection Agency and Corps of Engineers has promulgated rules to exclude prior converted cropland from the scope of Section 404. This was an important change and we commend the Corps for their action. Prior converted croplands are defined as lands brought into agricultural production before December 23, 1985 (enactment date of the

Swampbuster provisions of the 1985 Food Security Act). They are lands that have been physically altered such as ditched, tilled, leveled or drained for the purpose of food production. They no longer function as wetlands, nor as the Corps indicated in a regulatory guidance letter of September 26, 1990, do they "show important wetland values." The 1985 farm bill specifically excludes prior converted cropland, and we believe that a similar exclusion should be carried through in Section 404.

### 3. Normal Farming Practices

Section 404(f) of the Clean Water Act intended for farms, ranches and forestry operations to continue "normal" farming and ranching activities including, but not limited to plowing, seeding, cultivating, minor drainage, harvesting etc., without having to obtain individual permits. Despite that intent, many of the conflicts between farmers and regulators are due to attempts by field office regulators with no familiarity with agriculture to define what constitutes a normal farming practice.

In Louisiana, Arkansas and Missouri, for example, regulators attempted to restrict the construction of rice levees as practices that were not exempt under Section 404(f) and that a 404 permit would be required, along with the need for mitigation. It should be noted that this land is dry and has been in crop production and crop rotations for decades. To grow rice, the water had to be diverted onto the land. Nevertheless, it took the personal intervention of five U.S. Senators and several months of effort to convince the Corps of Engineers of its error. Imagine, all of those resources spent to prove that this one activity involving only one commodity in one part of the country was a routine one. You can begin to understand why an individual farmer feels totally helpless and intimidated by this process.

Similar problems have occurred over the construction of catfish ponds, haying and grazing high mountain meadows, maintenance of drainage ditches, and many other routine practices.

We believe the intent of Congress is clear that these activities are to be exempt from permit requirements. Because of the diversity of agriculture among commodities and regions of the country, Congress should restate and further clarify that intent.

### 4. Classification of Wetlands

Changes to Section 404 should include a system of classifying wetlands, recognizing that not all wetlands share the same ecological value or perform the same functions. Those that are truly unique may be deserving of greater protection, whereas those that are marginal or only technically meet wetlands criteria should be subject to less stringent oversight.

### 5. Private Property Rights

Central to the wetlands issue is the question of private property rights. More than 70 percent of wetlands are on private property. The 5th Amendment to our Constitution provides that private property may not be taken for public use without payment or just compensation. Historically, the landowner has borne the burden of protecting this resource, both in the form of direct cost, as well as restricted use of property. We suggest that there is a public obligation to help shoulder these costs, since the public at large is the beneficiary.

6. Exclusion of Man-Made Wetlands

Many wetlands are created, intentionally or unintentionally, as a result of man's activities. Wetland vegetation as a result of crop irrigation, saturation from broken drain tiles, flooding as a result of neglected stream maintenance, standing water from poorly designed public works projects, and the construction of farm and stock ponds are examples.

These artificially created wetlands should not fall under 404 jurisdiction because they are man-made and often unintentional. Landowners should be encouraged to create wetland areas and the prospect of regulatory entanglement is not an incentive to that objective.

7. Soil Conservation Service Role

The USDA Soil Conservation Service should have a consolidated role in delineating wetlands on agricultural land. Currently they are responsible for delineating and enforcing the Swampbuster program. We strongly recommend that authority for delineation of all wetlands on agricultural land be the sole responsibility of the Soil Conservation Service. It would provide much needed consistency greatly reduce the conflict.

8. Compatible Wetland Crops

Under certain circumstances, some types of agricultural production are entirely compatible with conserving wetland functions and values. Forestry, cranberry production, haying/grazing and some types of aquaculture are prime examples. Where such commodities can be produced in manner consistent with overall wetland functions, they should be encouraged and allowed to expand.

9. Establish Appeals Process/Consolidate Enforcement

Another serious problem with the 404 program is the lack of any appeals process. There must be an equitable, efficient and inexpensive means for average landowners to appeal a delineation or a decision without going to court. Similarly, the dual enforcement of Sec. 404 by the Corps of Engineers and the Environmental Protection Agency needs to be consolidated.

*“The National Wetlands Policy Forum strongly endorses the increased and coordinated use of compatible economic uses and other economic incentives to encourage landowners to manage, protect, restore and enhance the wetlands resources that they own.”*  
—The National Wetlands Policy Forum

We believe that the suggestions contained above will greatly improve the wetland regulatory program and reduce many of the inequities and difficulties faced by landowners and small businessmen. Many of these concepts are embodied in legislation currently introduced in the House of Representatives, H.R. 1330. We urge your support of this legislation.

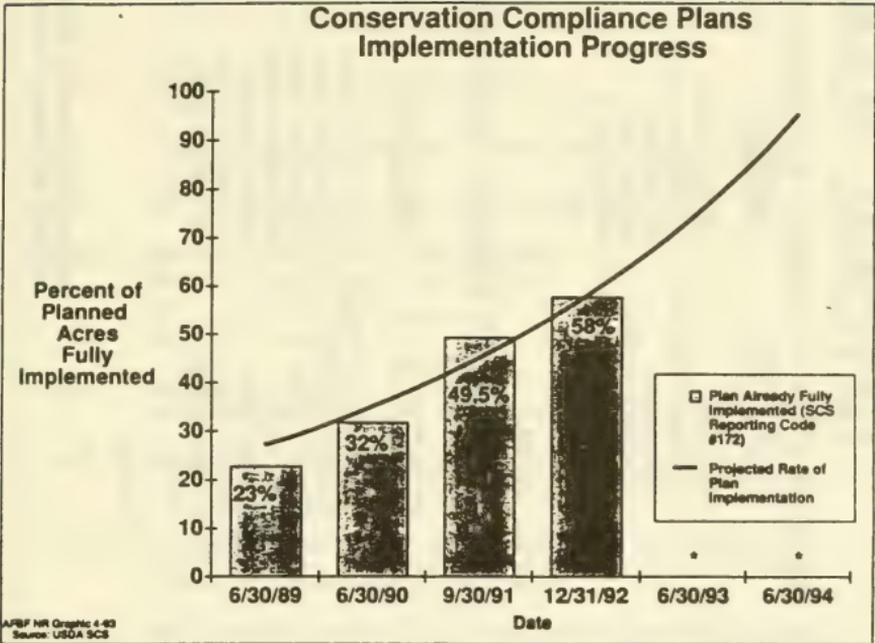

### Clean Water Act Funding Is Essential

The success of the efforts to address point source pollution is largely a result of the right tools coupled with the necessary resources to make it succeed. It is estimated that the total amount spent by the public and private sector to reduce point source pollution has cost more than \$160 billion over the last 20 years.

In our opinion, a similar and sustained commitment needs to be made if nonpoint source pollution is the priority that the Congress and the EPA say it is. While the diffuse nature of the problem requires a different policy approach, a commitment of financial resources and time are critical. Success will not occur without, in the case of agriculture, a cooperative approach that emphasizes technical assistance, grants and cost-sharing to the farm gate. It is a site-specific problem that requires site-specific solutions. All of the program building notwithstanding, nothing is gained in the form of improved water quality until something occurs on the ground. In some instances best management practices are simply too costly and represent an economic impediment to the landowner. Many small communities and small businesses faced the same kind of economic dilemma in coping with the point source requirements. As such, it will necessitate the same effort at developing **creative and cooperative** solutions.

One approach that we would strongly disagree with is a proposed tax on agricultural inputs. There is tremendous cost pressure on agriculture already to reduce the use and maximize the efficiency of agricultural production inputs. Little added benefit would be added by a so-called "green tax" on pesticides and nutrients. Conversely, the agricultural community is already financially strapped and it makes little sense to place further economic burdens on them that would further impede their ability to implement conservation practices.

We would encourage and assist any constructive and cooperative efforts to resolve the question of financing nonpoint source programs. The concept of extending the revolving loan fund or a version thereof, grants to local units of government, direct grants and/or cost-sharing, conservation credits on property or income taxes and market based approaches such as the trading concept all need to be thoroughly examined and considered. We look forward to working with you in this effort.

# NATIONAL SUMMARY

## **AFBF's ENVIRONMENTAL EDUCATIONAL PROGRAMS**

- 1983 Conservation Tillage Action Plan**
- 1984 Farm Partners: Have You Hugged Your Soil Lately?**  
Includes Leader's Guide, 10 page workbook, & slide/tape show for a 1/2-day workshop on soil compaction, and residue cover.
- 1987 Water Quality Self-Help Checklist**  
Now in its 7th edition with over 900,000 copies printed.
- 1988 Farmer Idea Exchange**  
20 top ideas showcased every year at annual meeting, many relate to soil conservation, and more efficient use of fertilizer and crop protection chemicals.
- 1989 LISA Tours in IL, IN and OH-** (led by state Farm Bureaus.)
- 1989 Cooperative Well Water Testing Program**  
23 state FB's involved, over 40,000 wells tested, video tape available describing program.
- 1990 Cooperative Conservation Tillage Transect Survey** for use by county Farm Bureaus
- 1990 WQ- FB's Computerized Water Quality Self-Help Checklist**
- 1990 FB's Professional Self-Help Education Series**  
Part I Agricultural Technology- 25 page booklet.  
Part II Chemical Use- 29 page booklet.  
Part III IPM- 33 page booklet.
- 1991 Crop Residue Placemats**  
2800 camera ready slicks distributed to state FBs-(one for each county FB.)
- 1991 Pesticide Recordkeeping Booklet**  
ND, NB & KS Developed their own- AFBF distributed another 4,000 copies as a test.
- 1992 Innovation and Technology Transfer: What County Farm Bureaus Can Do**  
Distributed 600 copies of this 80-page booklet outlining innovative conservation equipment, county programs and state laws to encourage its use, and public education programs that county FBs could use.
- 1992 RCWP Lessons Learned, Nonpoint Source Water Quality Project Checklist.**  
Distributed over 2,000 copies of this 6-page white paper and checklist to key federal, state, and local water quality officials and legislators. The paper was cosigned by AFBF, all state Farm Bureaus and 27 other major agriculturally related organizations.

CLEAN WATER ACT REAUTHORIZATION: NONPOINT SOURCE PROVISIONS

In the reauthorization of the Clean Water Act, Congress should adhere to the following principles:

1. The Clean Water Act (CWA) does not stand alone in protecting America's waters from nonpoint source (NPS) pollution. Other ongoing programs at the federal, state and local level must be funded fully, coordinated with and not superceded by the CWA. This includes, in particular, the soil conservation and water quality provisions of the 1985 and 1990 farm acts and the state groundwater and surface water protection programs of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).
2. Recognizing the 20-year commitment our country has had to eliminating point-source pollution, success in reducing the more complex and diverse NPS pollution will require similar time and resource commitments. However, management of this problem will require a different approach than that of point source pollution elimination because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities.
3. The central focus of NPS management solutions should be a reasonable and voluntary approach based on incentives, education and technical assistance as the primary means of managing NPS pollution.
  - NPS pollution management programs should (a) emphasize the protection of water resources and state-designated water uses, including state-designated agricultural uses, and (b) recognize the importance and needs of individual agricultural producers and other landowners affected by the CWA.
  - This approach emphasizes the use of locally designed and applied, economically feasible, site-specific best management practices which do not infringe on private property rights. Implementation of these farm management options over a realistic time frame will further the goal of reaching or maintaining designated uses of water bodies.
  - It is inappropriate to link USDA commodity, conservation or disaster program payments to the success or failure of management programs for NPS pollution authorized under the CWA.

4. Current CWA language contains valuable provisions for NPS management embodied in Section 319. Although this NPS section has been historically underfunded and has been hampered by bureaucratic roadblocks, all states now have approved Section 319 assessments and approved management programs. Within the CWA, it is the preferable vehicle for management of NPS pollution, and changes which occur during CWA reauthorization should reinforce these existing NPS provisions.
  - The proper management of NPS pollution lies in state and local efforts. As such, states should continue to identify and resolve their priority NPS water problems through administration of Section 319 funds. With state oversight and approval, local organizations should continue to carry out these NPS programs. Agencies at the federal and state levels should harmonize objectives and coordinate funding for national and regional NPS management programs.
  - State and local programs should provide for a mix of research, development, education and technical and financial assistance for both planning and implementing actions aimed at achieving state designated uses.
5. Management efforts funded by Section 319 of the CWA should be directed to priority areas based on scientific assessments that identify water bodies with impaired or threatened uses.
  - Priority, as determined by states, should be based on the magnitude of risk to human health, the protection of designated uses, and likelihood of further significant and unreasonable water quality degradation if no action is taken.
  - Strategies should be developed on a hydrologic unit, watershed-wide basis using an approach that includes the consideration of both surface and ground water quality.
  - Programs should focus on cost-effective, site-specific practices for individual operations with flexibility for implementation.
  - In order for Section 319 to work effectively for agriculture, USDA must play a lead role in the delivery of education and technical assistance at the state and local level.

6. An effective and cost-efficient response to water quality problems requires accurate and reliable information on (a) the source, extent, and impact of NPS pollution, as well as (b) the effectiveness, utility and economic feasibility of conservation measures and best management practices.
  - Any Clean Water Act reauthorization should include a strong financial commitment to further research, monitoring and assessment projects.
  - Monitoring should include before and after sampling as well as frequent sampling during storm events and assessment of natural and historic loadings.
  - Scientific research and monitoring projects should follow protocols developed by the U.S. Geological Service and should be conducted on a watershed basis with local and state input.
  - Representative pilot projects aimed at achieving market based incentives on a watershed or regional level should be encouraged.
7. The Clean Water Act Reauthorization should not directly or indirectly create a federal water quality law or program which supersedes, abrogates or impairs state water allocation systems and water rights.
8. Section 319 management programs on federal lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.
9. It is inappropriate for a reauthorization of the Clean Water Act to provide the authority for citizens suits against individuals participating in NPS management programs.

SUPPLEMENT TO WRITTEN TESTIMONY OF THE  
AMERICAN FARM BUREAU FEDERATION  
TO THE HOUSE PUBLIC WORKS AND TRANSPORTATION SUBCOMMITTEE  
ON WATER RESOURCES AND ENVIRONMENT  
REGARDING CLEAN WATER ACT REAUTHORIZATION

April 30, 1993

The House Public Works and Transportation Subcommittee held hearings on April 22, 1993, and solicited testimony from the agricultural and environmental communities concerning reauthorization of the Clean Water Act. The following supplements matters raised in Farm Bureau's testimony and addresses issues raised in questions from the committee.

**PROPERTY RIGHTS IMPLICATIONS OF THE CLEAN WATER ACT**

The Clean Water Act was designed for the laudable public purpose of controlling pollution of streams, rivers and coastal waterways. Along the way, however, regulators have turned it into a vehicle for imposition of restrictions on the use of private property that are so significant that they often diminish the land's value. Regulators offer no compensation to the landowner for these takings. Instead, the landowner is put to the trouble and expense of pursuing a legal action if he is to recoup his losses. The Act and its regulatory framework have become a prime example of confiscatory government action that the Takings Clause of the Fifth Amendment was designed to prevent: regulations that "force some people alone to bear public burdens which, in all fairness and justice, should be borne by the public as a whole." Armstrong vs. United States, 364 U.S. 40, 49 (1960).

The chief culprit in depriving landowners of the full economic use of their land without payment of compensation is the over-complex -- indeed, for the ordinary farmer, impenetrable -- array of wetlands regulations. Through their control of "wetlands," a term nowhere defined in the enabling statute, the Environmental Protection Agency and the Army Corps of Engineers impose an undue regulatory burden on how farmers and other property owners may use their land. All too often these restrictions have the effect of preventing valuable uses -- and sometimes the only valuable use -- of the property.

These regulatory takings deplete the economic base of our nation's economy, complicate the lives and even destroy the livelihoods of farm owners and operators, and too often result in long-drawn, wholly unproductive, and expensive litigation over whether government must compensate the landowner. When the landowner succeeds in a takings claim, the direct compensation costs to government (and taxpayers) can be substantial: \$2.5 million, for example, for the confiscatory wetlands regulation in the Loveladies Harbor case. The \$100 million plus awarded against the government in the Whitney Benefits case arose under a different statutory scheme, but could as easily have resulted from the excessive zeal of EPA or the Corps of Engineers in interpreting the Clean Water Act.

The Clean Water Act, especially § 404 (33 U.S.C. § 1344), incorporates broad standards that have defied clear delineation and interpretation. The statute fails to define jurisdictional "wetlands" in the first instance, and fails to distinguish what kinds of wetlands are truly crucial to the statutory scheme. As a result, the statute fails to provide the necessary guidance to the accompanying regulatory regime. The breadth of the regulations issued pursuant to the Clean Water Act demonstrates the statute's imprecision. Because this imprecision costs the government a significant amount of money (in constitutionally-required compensation for takings, litigation costs, loss of production, and depletion of the tax base, for example) -- and because it infringes centrally important constitutional rights that government is supposed to protect -- Congress should not permit this unwieldy and cumbersome regime to continue unchecked. It must strike a more precisely defined, more economically sane, and fairer balance between the environmental interests we all share and the property rights of landowners, including the farmers who produce our food.

Farm Bureau supports efforts by Congress to reform wetlands regulations and the permitting process. Two necessary parts of any reform package would be a comprehensive definition of jurisdictional wetlands and the distinction based on the importance of particular kinds of wetlands to the national environment.

#### **SITE-SPECIFIC RESEARCH CONCERNING NONPOINT SOURCE POLLUTION**

It is important that scientific evidence be gathered concerning the existence of nonpoint source pollution. Such scientific inquiries are currently in progress and include the Beaver Creek Watershed Project and the Lower Salinas River Basin Project.

##### **Beaver Creek Watershed Project**

The Beaver Creek Watershed Hydrologic Unit Area in Western Tennessee is a research project initiated by farmers in the watershed to scientifically assess the impact of agricultural practices on runoff (surface) and underground water. The U.S. Geological Survey is the lead research agency. Several other federal, state and local government agencies are supporting this research project.

One of the principal contributions of this research project has been to establish a scientific sampling methodology to measure potential pollutants in relationship to runoff water volume during actual storm events.

Runoff water sampling methodology prior to the Beaver Creek project was nothing more than one or two "grab" samples per hour during storm events. This sampling process produced errors of 100 to 500 percent. USGS researchers use continuous flow hydrographs and water samples collected at intervals of five minutes or less.

The Beaver Creek watershed is an intensively farmed agricultural region. Principal crops are cotton, corn, soybeans and wheat. Cattle are also produced in the watershed. The soil type is unstable unless properly managed.

Unpublished research data from the project, which is in its third year, are favorable to agriculture. The research has not found increased levels of phosphorous in either ground or surface water supplies. Nitrogen found in surface water is not directly related to fertilizer application. It is in organic form--leaves, stalks and crop residues.

Pesticides found in surface water appear to be directly attributable to time of application and occurrence of a storm event. After storms, pesticide levels found are well below EPA limits. Managing pesticide applications to avoid storm events has led to no pesticide loadings in the stream.

Soil erosion from stream banks and stream bottoms has emerged as a contributor to sediment loadings. This finding is contrasted with the conventional view that soil erosion from farmed fields is the source of sediment buildup.

Finally, a most important dimension of the Beaver Creek project is the measurement of the actual effectiveness of Best Management Practices (BMPs) which farmers are being urged to adopt. The fact of the matter is that researchers do not know whether BMPs will do anything to resolve nonpoint source contamination problems.

Beaver Creek should lay to rest once and for all the popular allegation that agricultural operations are the largest contributors to water quality degradation. Without a sound scientific basis, water quality problems will not be accurately identified. Mandated changes in farming practices to correct undocumented and unproven site-specific nonpoint source contamination problems will raise farm costs and force farmers out of business.

#### Lower Salinas River Basin Initiative Pilot Project

The Association of Monterey Bay Area Governments (California), through a grant from the U.S. EPA, contracted with Kleinfelder to perform the Lower Salinas River Near Coastal Waters Initiative Pilot Project. Kleinfelder performed the project by completing the following tasks:

- 1) Assess off-site movement of pesticides in a production agriculture setting,
- 2) Recommend, implement, and test economically and technically feasible Best Management Practices (BMPs) to mitigate off-site pesticide movement. The use of appropriate BMPs was promoted as a method to reduce off-site migration of pesticides, and
- 3) Assess off-site movement of pesticides after BMP implementation.

Kleinfelder prepared a Quality Assurance Project Plan and a revised work plan that established a two-year field study on two separate 30-acre blocks adjacent to each other in the Blanco District of Salinas, California. Beginning in March 1990, the study sampled for pesticides

commonly used on the fields and included some that were not used but have historical significance such as the organochlorine pesticides DDT and Dieldrin. (The use of DDT and Dieldrin is no longer allowed.) These projects have demonstrated that the role agriculture plays in nonpoint source pollution is much less than has been previously argued by the EPA.

Sampling included primarily subsurface drain water, but also assessed surface water runoff, surface soil, and Blanco Ditch water and sediment. Approximately 115 samples were analyzed for organochlorine, organophosphate, and carbamate pesticides. As expected however, isolated subsurface drain and surface water runoff samples contained Dieldrin, DDT, DDD, and DDE in the part per billion range. But, concentrations of pesticides currently used in production were below laboratory reporting limits in subsurface and surface water runoff samples collected during the study period.

When this particular study was first commissioned, the EPA and many environmental groups saw an opportunity to decisively implicate agriculture for run-off of agricultural chemicals. Through this project, local agricultural interests have demonstrated their concern to know, correct and/or minimize any and all environmental impacts which may occur due to farming.

Both the Beaver Creek Project and the Lower Salinas River Basin Project illustrate two important points: (1) farmers are willing to find the truth with regard to the impact of their farm practices on water quality and (2) there is a pressing need for scientific evidence to measure the actual impact of farm practices on water quality. Both of these points argue for calm, not panic, with regard to dealing with agricultural nonpoint source problems.

In support of the foregoing discussion, particularly with reference to the Beaver Creek Project, please see the attached letter of April 14, 1993, to Dean R. Kleckner, AFBF President, from Messrs. Jerry Lee, Mike Countess, John Wilson, Angel Roman-Mas and Stephen Klaine of the U.S. Department of the Interior, Geological Survey, Nashville, Tennessee. Also, please reference your files for a letter dated April 7, 1993, from Mr. Kleckner to Chairman Applegate and Subcommittee members wherein Farm Bureau states its support for increased funding of USGS efforts to scientifically assess water quality.

#### SITE SPECIFIC ASSISTANCE TO FARMERS

In Farm Bureau's April 22 statement before the House Public Works Committee we stated that the Soil Conservation Service should have a primary role in nonpoint source water management. AFBF would like to emphasize that we also support a role by the Extension Service for educational support and a role in cost-sharing practices by the ASCS.

**EPA WATER QUALITY CONFERENCE**

We also submit for the hearing record a paper presented by AFBF Chief Economist John Hosemann at the October 1992 EPA water quality conference. The paper discusses the principal economic issues farmers will face in the upcoming rewrite of the Clean Water Act.

**REBUTTAL TO THE STATEMENT OF MR. ADLER, NATURAL RESOURCES DEFENSE COUNCIL**

Mr. Robert Adler's recent testimony (April 22) on the reauthorization of the Clean Water Act, contained a serious error that inaccurately portrays the conditions of our nation's rivers, lakes and estuaries.

The error is in Item #1, second paragraph of his summary statement. It states "At least a third of our rivers, half of our estuaries and more than half of our lakes are not meeting designated uses, that is not safe for swimming, fishing and other uses."

The 1990 EPA Report to Congress absolutely does not say that. It says, rather, that "one-third of the assessed stream miles do not meet designated uses." (emphasis added).

This is a frequently misstated and misinterpreted point. In fact, only about 36 percent of our nation's stream miles have been assessed, (however inadequately). Even EPA, when asked, will admit that the 36 percent figure is not representative of total U.S. stream and river miles, but rather of assessed miles. Similar clarification needs to be made when talking about lakes and estuaries as well.

From an agricultural viewpoint clarification is very important, since agriculture is frequently cited as a major contributor to nonpoint source runoff. The difference is important to this debate and the manner in which the Committee responds with policy. It is a question of actual impairment of total assessed stream miles, one-third of 647 thousand miles, rather than one-third of total miles (@2 million miles) as Mr. Adler said.

It is important to agriculture, to public understanding and to good policy making that accurate and realistic information be used. This kind of data and problems with interpretation underscore our previous points about the need for accurate monitoring and data collection.

Dean Kleckner  
President  
American Farm Bureau Federation  
225 Touhy Ave.  
Park Ridge, Illinois 60068

Dear Mr. Kleckner:

Following are the views and thoughts of representatives of the USGS, SCS, Tennessee Department of Agriculture and other participating groups in the Beaver Creek Watershed Hydrologic Unit Area Project on the issues of assessing nonpoint source (NPS) pollution associated with agricultural activities and implementing best management practices (BMPs).

The Clean Water Act of 1987 contains directives for the correction of NPS pollution problems. State and Federal agencies as well as the farming community have recognized the importance of identifying and correcting nonpoint pollution problems associated with agricultural activities. Paramount to the reduction of agricultural NPS pollution is the successful implementation of conservation systems also known as BMPs.

The efficiency of BMPs in reducing agricultural NPS pollution has been extensively documented in experimental fields. However, their overall effectiveness in protecting and improving water quality has yet to be fully assessed on production fields or at the watershed level. Furthermore, the success of BMPs has been compromised by the absence of scientific information to support the BMPs selection process. If successful control of agricultural NPS pollution through the implementation of BMPs is expected, current and future research should be geared toward:

- (1) improving our ability to determine the nature and extent to which agricultural activities impact water quality and threaten environmental integrity;
- (2) improving our ability to differentiate agricultural NPS pollution from other forms of pollution and from natural conditions;

- (3) developing and evaluating monitoring and sampling strategies;
- (4) understanding better the processes and factors that control the fate and transport of agricultural pollutants;
- (5) assessing validity of current standard setting criteria, i.e. total maximum daily loads, biological communities, maximum contamination levels; and
- (6) calibrating and validating model, i.e. HSPF, AGNPS, GLEAMS.

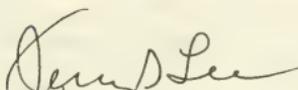

Current agricultural programs addressing water quality are conducted through farmers' voluntary participation. State, Federal, and local agencies provide technical, financial, and educational assistance to farmers for the implementation of BMPs. Most of these programs do not provide adequate funding for research and monitoring activities. The BMPs selection process in these agricultural water-quality programs is biased by: (1) data availability, (2) approaches to the data collection, and (3) uncertainties in the conclusions derived from available data sets.

Most of the current water-quality monitoring programs addressing agricultural NPS pollution have adopted an occurrence and distribution approach. Data generated using this approach is of limited value in the assessment of agricultural NPS pollution, the BMPs selection processes, and the calibration of mathematical models. Furthermore, the accuracy with which these data sets characterize the temporal and spatial variabilities in the concentration of selected pollutants is questionable. Typically no provisions for uniformity in the collection of chemical and physical data are made. The inconsistency in the data collection protocols limits the opportunity to compare and contrast the data sets and results within and across regions. Uncertainties in the conclusions derived from available data sets, (e.g. errors in load calculations), must be addressed before encouraging landowners to adopt specific BMPs. Other monitoring programs have relied on the use of biological indicators. The application of the same criterion without considering regional variabilities, site specific conditions, and data from control sites limits the applicability of bioassessments.

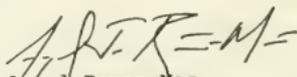

The development of scientific information required for a thorough and accurate assessment of agricultural NPS pollution and for the sound implementation of BMPs is difficult and expensive. Intergovernmental teams are needed. The participation of the farming community and environmental groups is essential as well. Multiagency participation is necessary in the development of the needed information to guarantee a broad scope in assessing and solving agricultural NPS problems. In addition, the multiagency approach helps to overcome the financial burdens associated with developing the needed scientific information.

The use of a holistic/deterministic approach guarantees the systematic collection of the needed data for a more complete and accurate assessment of agricultural NPS pollution and more sound implementation of BMPs. This approach is being successfully implemented in the Beaver Creek Watershed Hydrologic Unit area Project in West Tennessee. The systematic replication of this study elsewhere would result in the development of the data needed for the development, calibration and validation of mathematical models with effective transferable values which could be used for planning purposes.

**ECONOMIC ISSUES FOR FARMERS IN THE  
REWRITE OF THE CLEAN WATER ACT**

**Paper presented by John K. Hosemann, AFBF Chief Economist, at the "Clean Water and the American Economy" Conference sponsored by EPA and Resources For the Future in Arlington, Virginia, October 19-21, 1992.**

**"Taking action without knowledge is like throwing darts with a blindfold." Meiners/Yandle**

### Introduction

Sorting out the economic issues to be dealt with in the rewrite of the Clean Water Act is a humbling experience. The approach in this paper is to focus on some fundamental economic issues. Should the fundamental economic issues get swept aside, there are obviously still many serious issues with which farmers must struggle.

Partial review of technical research and earlier economic papers reveal certain point source pollution issues pertinent to nonpoint source pollution. Technology-based, command-control, "zero-based" policy and regulatory approaches have not worked effectively or efficiently for point source pollution problems. These approaches are not likely to work for nonpoint source problems either. It is time to abandon the status-quo and move on to bolder, more creative solutions that put water quality improvement as the central policy focus rather than federal micro-management of farm inputs and resource uses.

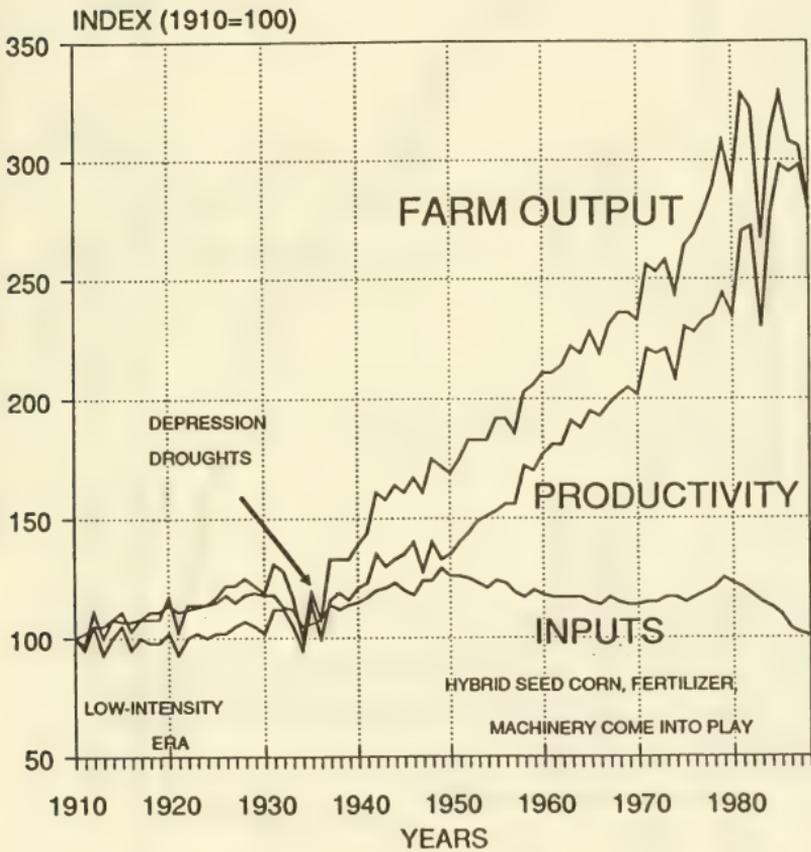

A new approach based on water quality outcome standards requires some recognition of the basic economic relationships that have made U.S. agriculture what it is today, a science driven and highly efficient industry facing the challenges of a competitive world marketplace. If policymakers insist on applying the discredited command-control, technology-based regulatory controls to the farm sector they should understand that there will be substantial economic implications and the weakening of one of the last world-class industries in the United States.

One reason for including figures 1,2 and 3 is to point out that had U.S. farm technology been frozen at the 1910 level, the U.S. would have to cultivate 1.222 billion acres to produce the output that U.S. farmers currently produce on 300-400 million acres. Technology and innovation is pro-environment. It has released vast land and water resources for other activities. Goklany and Sprague<sup>1</sup> discussed this point in detail.

Another reason for including these productivity perspectives upfront is to remind ourselves what this policy debate is all about -- raising farm costs and lowering these positive trends.

FIGURE 3

PEOPLE FED BY  
ONE U.S. FARM WORKER  
1870 TO 1988

Source: USDA

Long-standing increases in U.S. farm productivity are based on a massive investment in scientific discovery, trial and error on and off farms, with both private and public research and development. In addition, over the last 100 years billions of dollars of private and public money have gone into technology transfer that positions U.S. agriculture as the world-class competitor it is today.

Finally, the central point here is that farmers simply do not have a similar scientific basis on which to make business judgments and decisions about what they are/are not contributing to nonpoint source contamination. We simply do not know, in site-specific farm-level terms, the linkages between modern farm practices and water quality. This detail data is absolutely essential in order to evolve the policy options--and ultimately the common law legal remedies--which can improve water quality where serious problems do exist.

It is simply not good enough to make sweeping allegations and generalizations about the possible links between modern U.S. farm practices and water quality without scientific proof of cause and effect at the site-specific farm level.

In simple terms, an individual farmer has the scientific data and know-how to produce 75 bushels per acre wheat on his land and similar land. What he/she now needs is access to the scientific data and know-how to produce 75 bushel/acre wheat and a specified quality of runoff and groundwater from that same acre of wheat.

Figure 4 depicts the principal challenge which U.S. farmers will face in the decades ahead. By the year 2000, world population will increase by 1 billion people. In 50 years, world population is expected to double from 5.5 to 11.0 billion people. New technology will no doubt play a major role in meeting this fundamental challenge. But so will land and water resources in the United States.

Figure 5 illustrates the 1975-1990 trends in world grain production and utilization. If world grain consumption increases only by population growth at 1.4 percent per year, by the year 2000 the world will need 16 percent more grain. How will this be done?

Figure 6 illustrates the 1975-1990 trends in world grain acreage and world grain yields. World grain acreage increased between 1975-1982 and declined steadily thereafter. In fact, the longer term trend shows a steady decline in world grain acreage. World grain yields, on the other hand, with a few exceptions have trended steadily upward over the 1975-1990 period. Yield increases have offset the decline in the grain production area.

# WORLD POPULATION GROWTH

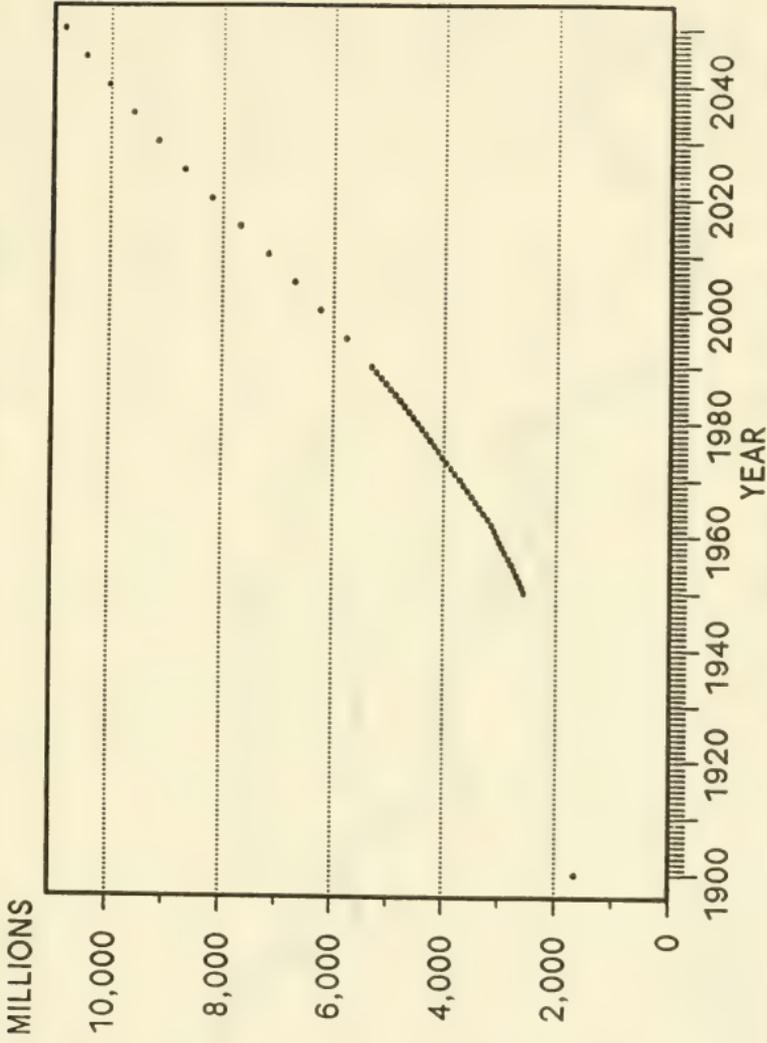

FIGURE 4

SOURCE: Nat'l Council of Farmer Cooperatives

FIGURE 5

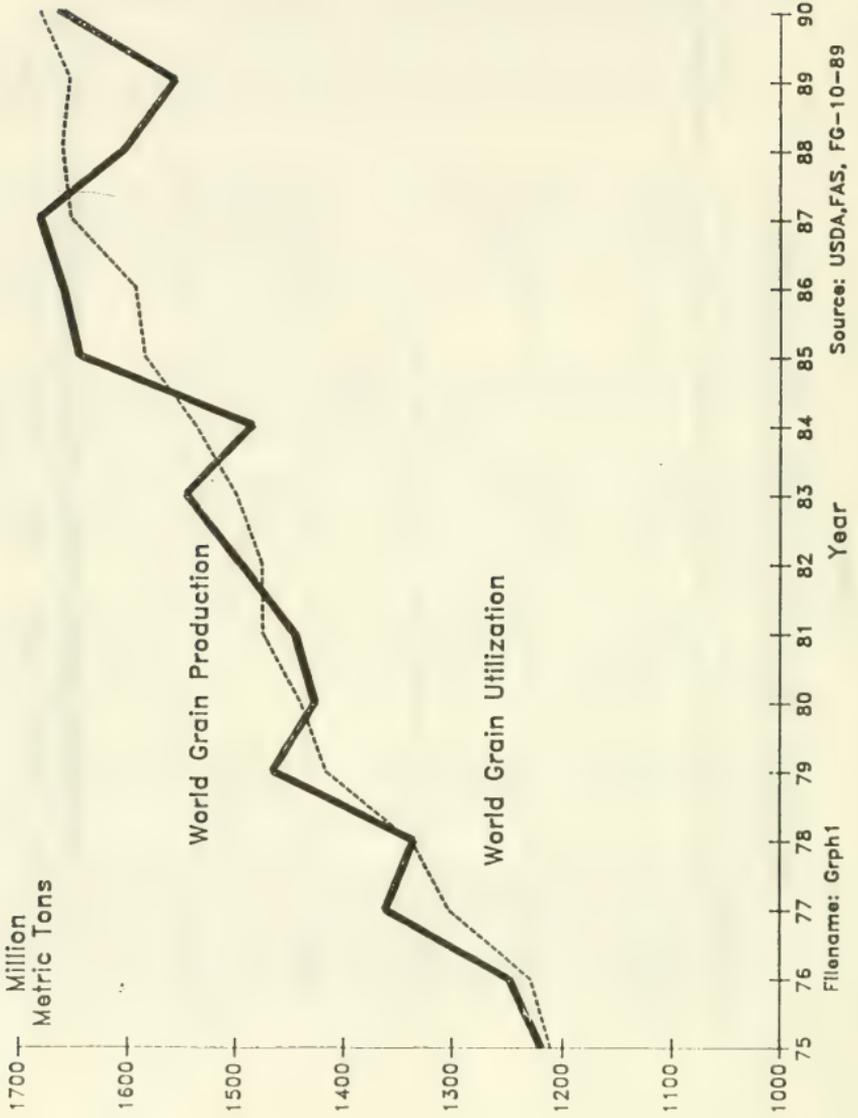

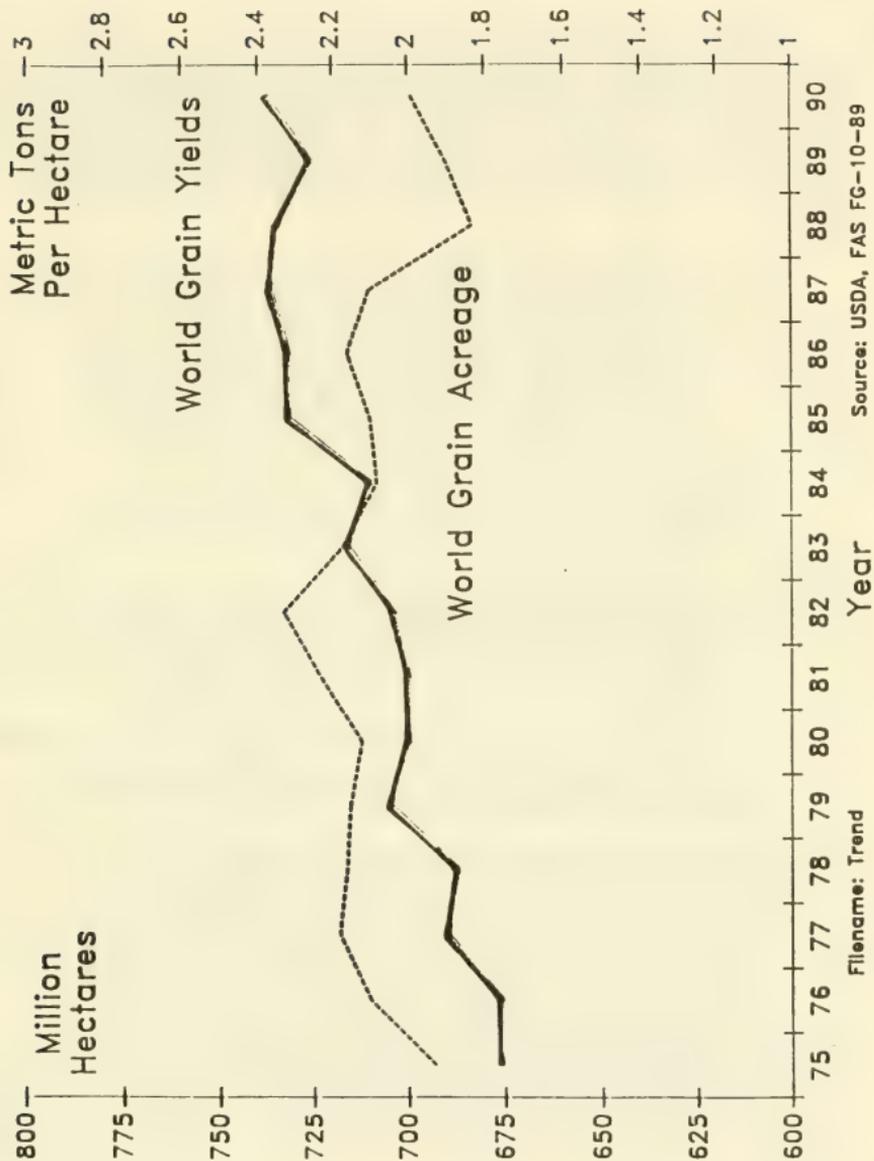

FIGURE 6

Filename: Trend

Source: USDA, FAS FG-10-89

To meet the world population--and hopefully income--increases in the years ahead some combination of yields and acreages will need to increase. Environmental pressures worldwide will surely continue to put downward pressure on increasing acreages for production. To close the gap, yields will have to increase even more so, but there are no dramatic breakthroughs on the horizon and there are numerous obstacles in areas, like biotechnology, which hold potential for farm productivity and environmental gains.

Ruttan<sup>2</sup> assesses the situation and prospects as follows:

Now in the closing years of the 20th century we are completing one of the most remarkable transitions in the history of agriculture. Prior to this century almost all of the increase in food production was obtained by bringing new land into production.... Yet in the next century, almost all increases in world food production must come from higher yields--from increased output per hectare. This shift from expanding crop area to increasing land yields has been underway in most of the developed world since the turn of the last century....

As we look toward the future, however, we know that the demand increases will be large. The demands related to population growth and improved incomes in the developing economies will be exceedingly high. During the next several decades growth in food and feed demand rising from growth in population and income will run upwards of 4.0 percent per year in many developing countries. Many will experience more than a doubling of food demand before the end of the second decade of the next century....

Several developments suggest that gains in agricultural production required over the next quarter century will be achieved with much greater difficulty than in the immediate past. Difficulty is currently being experienced in raising yield ceilings for the cereal crops which have experienced rapid yield gains in the recent past. The incremental response to increases in fertilizer use has declined. Expansion of irrigated area has become more costly. Maintenance research, the research required to prevent yields from declining, is rising as a share of total research effort.

Further, the institutional capacity to respond effectively to these developments is limited, even in the countries with the most effective national research and extension systems. Indeed, during the 1980s, many countries have had difficulties maintaining their agricultural research capacity at levels achieved in the 1970s....

.... Almost all increases in agricultural production over the next several decades must continue to come from more intensive use of land currently in use. Improved crop and animal productivity will come from better plant and animal breeding, more effective animal nutrition, and more efficient use of technical inputs including chemical fertilizers and pest control chemicals. *[Emphasis in all quotes in this paper were added by the writer.]*

Even so, the productivity gains from conventional sources are likely to come in smaller increments than in the past....

Policymakers rewriting the Clean Water Act will need to make sure that they recognize the economic pressure on U.S. farmers from these underlying trends. The world food balance is too precarious to adopt policies which will adversely impact U.S. yield and acreage opportunities in the years ahead.

#### Issue #1 -- Property Incentives

The first major economic issue that all farmers now worry about is the right to own property and to use it efficiently.

The confusion about federal wetland delineations among at least four federal agencies, the passage and now implementation of the Coastal Zone Management Act (CZMA) amendments, endangered species, FIFRA and Senate Bill 1081 to rewrite the Clean Water Act all have command-control regulations for farm activities and have added to the risk and uncertainty in the U.S. farming business.

Farmers respond to incentives. The incentives to own and manage private resources is probably the most powerful economic incentive from the farmer's perspective. The idea of owning and improving the farm resource base, motivates farmers to take the risks that lead to long-term farm productivity gains. The incentive to pass on a productive farm unit to heirs or to sell the unit based on its productive value is a powerful motivation for farmers.

Ownership of property is the right above all others that enabled the common man to ascend from serfdom. It is the most basic of human rights which are essential to freedom and progress. Property ownership and its use is essential as a stimulant to productive effort. Unless people can feel secure in their ability to retain the fruits of their labor, there is little incentive to save and expand the fund of capital--the tools and equipment for production and higher living standards. Farmers are feeling less and less secure in their rights to property and, as a result, their incentives are diminished.

Markets cannot exist without property ownership. Private property produces an efficient use and allocation of scarce resources. Any infringement on property rights reduces the efficiency of our economic system, raises output costs, and lowers living standards.

The right to own and use property causes individual farmers to better cope with variations in annual income in order to accumulate wealth by building a productive asset base over time. Ownership and control motivate farmers to create wealth through innovation.

The systematic erosion of the right to own and use property is now causing farmers to seriously wonder if they will only be left with the ownership responsibilities of paying taxes, mortgages and insurance, but without the right to use the resources efficiently. Do policymakers wish to trade off farm productivity gains for uncertain surface and groundwater improvement? Rewriting the Clean Water Act will strike at the heart of the economic incentive structure on which U.S. agriculture depends.

Command-control policy approaches where government specifies "the correct" technology, if applied to nonpoint source problems in agriculture, will have serious negative farm productivity implications for the longer term. Negative motivation stifles innovation, raises costs, and reduces productivity.

If anything has been learned from recent developments around the world, it should be that central command-control approaches do not work. Now is the time to invigorate, not denigrate, the institution of private ownership and control and use it to everybody's benefit in solving water quality problems. This is at the heart of the economic incentive structure of U.S. agriculture. Solving nonpoint source pollution problems must work in harmony with private property values and the incentives of ownership.

Current wetland regulations are the antithesis of using the incentives of property ownership. Farmers have been penalized for good faith efforts to construct and conserve bona fide wetlands. Others have been left with no use of their property, substantial fines, hours of red tape, confusion and lost productivity. The new Clean Water law must reject these precedents.

### Issue #2 -- Science Missing

A second economic issue in the Clean Water Act rewrite is the fact that we simply cannot prove the cause/effect linkage between specific farm level activity and water quality. Broad generalizations, allegations and nonscientific monitoring (Clean Water Act, Section 305B State Reports to EPA) are not sufficient to make policy recommendations for widespread changes in farm practices. We must do better.

It is not good enough to say that answering the scientific cause/effect relationships is "too costly" or "impossible." It will be even more costly to not discover the scientific relationships between activities and practices on individual farms and water quality. This point is made frequently in the literature by economists who have avoided the trap of aggregation and focused on the micro implications of farm level water quality policy issues.

In the textbook, *Environmental and Natural Resource Economics*,<sup>3</sup> Tietenberg, argues as follows:

One way to tailor the policy is to focus, at least initially, on those pollutants causing the most damage. Unfortunately, there is very little hard information available on the damages caused by nonpoint pollution. This makes it difficult not only to set priorities for controlling various categories of nonpoint pollution, but also to secure the efficient balance between controlling point and nonpoint sources.

How should policy makers react to this uncertainty? Watson and Ridker [1982] set out to answer this question by quantifying the costs associated with various policy approaches. **They specifically considered the cost of being wrong in the sense of making one policy choice (a strict focus on point sources) when another choice (a balanced program of controlling point and nonpoint sources) was appropriate.**

Their results indicate that **the cost of being wrong is so high that the government would benefit from investing time** (by delaying implementation of the most stringent point source controls) **and resources (by conducting research on the intensity of nonpoint pollution damages and costs)** before making a specific policy choice that could prove to have been a serious mistake. **Sometimes procrastination can be efficient!**

In a paper, "The Impacts of Nonpoint Source Pollution Regulations on Mississippi Agriculture"<sup>4</sup>, Hurt and Reinschmiedt give the farm-level application of Tietenberg's argument:

Ultimately, the question of what constitutes acceptable levels of erosion control and water quality will be the overriding issue facing agriculture and society. **Resolution of this issue will require substantial increases in both technical and economic research.** Technical research is needed to provide more and better information about the physical parameters of the water quality-agricultural production relationship. Economic research is needed to provide more and better information about benefits-costs and their distribution among the various segments of society and over time. The penchant of agricultural economists is to address the aggregative, longer term, broad, general policy type issues regardless of the quality of technical information available....

Many specific tasks and questions must be identified prior to designing and conducting the research. One of the first tasks is to specify in detail the practices and activities included in each **crop production/erosion-pollution control system**. For example, the following items must be specified:

- each tillage practice and its timing.
- each pesticide application and its timing.
- each fertilizer application and its timing.
- harvesting procedures and residue management, and
- other erosion-pollution-production practices affecting the variables of interest.

Ideally, a set of systems would be specified spanning the range of alternatives available....

Once a practical set of alternative systems has been identified the research must be designed to address certain questions about each system in the set. Some of these questions are:

1. What are the expected yields and costs per acre and their variability and distribution over time?
2. What is the expected erosion, what is its distribution within a year and over years, and what is its relationship to water quality?
3. What is the expected sediment, nutrient, pesticide, and toxic chemical content of runoff and its distribution spatially and temporally?
4. How would the answers to the preceding questions differ for alternative soil-slope-rainfall situations?
5. What are the relationships among the variables identified (interaction)?

Ribaudo in his article "Agriculture and Water Quality"<sup>3</sup> further clarifies the issues:

The contribution of cropland or other nonpoint sources to pollution varies from one location and time to another. Identifying which land and land use is subject to substantial loss of sediment, nutrients, and pesticides is difficult without expensive monitoring systems. The variability of climate, soil traits (erodibility, hydrological features, ability to bond with chemicals, productivity for crop production), a watershed's ability to absorb pollution, and other factors make it difficult to evaluate how much a single field or farm affects water quality downstream....

All factors affecting water quality and resulting economic damage must be considered before implementing water-pollution control efforts. For example, the Corn Belt generates substantial erosion and sediment because it uses land

extensively for farm crops. However, regions with dense populations, high incomes, and concentrated industry such as the Northeast and the Lake States will feel the effects of water pollution more than a region like the Corn Belt that may have greater erosion problems but fewer people to feel its effects. **But, off-site damage associated with water pollution cannot be measured directly and the links between farming and affected water uses are not well defined. Many assumptions are made to estimate off-site damage, and both methods and data for estimating damage need to be improved....**

Ground water contamination occurs only in certain places, making it difficult to draw a broad perspective on pollution issues. Sites cannot be compared because data for individual wells are inconsistent. Evaluating the full extent of ground water pollution is made even more difficult by variations in well depths, sampling periods, chemicals tested for, land uses above contaminated sites, soils, and biologic, hydrologic, and geologic characteristics....

The facts of the matter are that the variability among practices on farms, among different farm units, among different farm regions is so great that applying the "one-size-fits-all," command-control regulatory approach to nonpoint source problems will erode farm productivity gains and ultimately reduce U.S. agriculture to a second-rate international competitor. The rest of the agricultural world will not remain idle while the U.S. plays trial and error with water quality policy for farmers.

Appendix A contains the maps and well testing data for two Ohio counties. These maps and data clearly illustrate how command-control, centralized rules for water quality will not work even within a township, much less within a county or within a state, region or the nation. Flexibility and positive incentives should be the key words in the Clean Water Act rewrite.

All agricultural systems must be site-specific and flexible enough to allow changes in management practices when Mother Nature throws a curve. This year's crop season has been an excellent example of widely variable weather events with which the farmer must cope. If a farmer plans to "no-till" a field but excess rain causes harvest machinery to leave ruts, the farmer needs to be able to smooth out the ruts with tillage without being charged for violating a conservation compliance plan. This kind of environmental enforcement has lost credibility with farmers. The environment is not improved, but the farmer's costs are increased.

**Issue #3 -- Diversion of Human Capital**

The regulatory pressures of wetlands, clean water, endangered species, coastal zone management, and the anti-technology media hysteria that currently drives the policy debate are already imposing costs on farmers in terms of the human intellectual capital that is now diverted to unproductive regulatory activity.

More and more time and resources are being diverted from finding better ways to produce the bushel, bale, pound and hundredweight to regulatory compliance. This is a cost not captured by most analysts. It is not captured in conventional data series. A day spent discussing whether a parcel of land is/is not a wetland is a day lost from thinking, planning, anticipating, studying the farm enterprise. A day spent worrying about future legal liabilities because current farm practices may not satisfy future federal regulators is a day lost for improving the farm business.

Command-control regulatory mandates for farmers are at odds with the basic nature of the business--production, enthusiasm and excitement for what lies ahead. Command-control is negative, unproductive and backward looking. More and more farmers of all ages, particularly younger operators, are being turned off or away by the obstacles they now have in land and water regulations. An industry cannot grow when its intellectual capital and entrepreneurs are discouraged by a clouded and risky regulatory future.

**Issue #4 -- Lower Asset Values**

Constraints on farm resource ownership and uses will sooner or later translate into a lower income stream as land uses are restricted. With income potential reduced, asset values will surely decline. This economic issue poses substantial considerations for farm financial institutions, rural schools and other institutions dependent on the tax base. Rural development will be penalized in the process of more federal water quality micro-management.

It is not true that farmers can find economic Utopia through restrictions in asset uses with the prospect for longer term, higher commodity prices. This is not the way the world works. These lessons were learned through the production and marketing programs in the 1950s and 1960s and relearned in the early 1980s, as U.S. market shares declined, stockpiles accumulated, and government costs increased.

In the very short run, the idea of causing farm resources to be used less in order to drive up prices may hold. But longer term, a new equilibrium will be found unless all players in the world marketplace are forced to obey the same U.S. nonpoint source land and water rules. This is not a likely prospect.

Reichelderfer recognized the basic economic tradeoffs in her paper "Water Quality Legislation Affecting Agriculture." She stated:

As the prevalence of stricter environmental legislation increases, tradeoffs among the following sector-wide consequences will need to be considered:

- \* Higher commodity and consumer prices.
- \* Lower direct government expenditure for commodity price support.
- \* Changes in farm income distribution, including:
  - higher feed costs and lower income for livestock producers;
  - higher aggregate income from crop production, but with;
  - **reduced income for producers directly affected by restrictions.**
- \* Reduced demand for the services of upstream agricultural services (farm input industries).
- \* Less business for downstream agricultural industries (eg: food processing).
- \* Improved environmental quality, including safer drinking water for farm households and livestock.

Policymakers who fail to learn the lessons of resource use restrictions via regulatory controls or outright limits on farm production have not accepted the realities of the globalization of agriculture. Nor have they learned the economic lesson that living standards for all citizens cannot be improved by redistributing a smaller farm production pie. The pie must be made larger through the incentives of the marketplace and the

spur of competition that allows free individuals to evolve creative low-cost solutions to water quality problems and at the same time fully participate in the increasing world demand for food, feed and fiber.

#### Issue #5 -- Zero Must Go

Extending the technology-based, command-control policy and regulatory regimes to nonpoint source problems raises the fundamental economic issue of zero pollution. Zero pollution is simply an uneconomical and impractical policy goal.

In a forthcoming paper "The 1991 Clean Water Act: Reauthorize, Reform, or Repeal?" Meiners and Yandle write: Scientific evidence about the consequences of pollution tells us that we can stop short of zero discharge for many pollutants, but that we should strive for zero for certain toxic materials. **The old fixation on zero pollution is a barrier to effective, lower cost control.** If ambient quality standards are set for receiving waters, or the amount of pollutants that may be discharged are established, decision makers can solve the resulting problem. They know where they are headed; they must then find the most effective way of getting there.

The overall environmental debate and the water quality debate seems to have matured beyond the naive notion that zero pollution is a workable policy goal. The debate seems to be refocusing not on the "either/or" questions, but rather the "how" question.

"How" do producers solve serious environmental problems where these do exist at the lowest possible cost? With this question now being asked by mainstream policymakers, the debate has shifted away from the policy goal of zero pollution. This long-standing policy goal implied that producer and consumer costs do not matter. A shift from the goal of zero pollution to a goal of water quality improvement will be welcomed by farmers.

We now know that in the case of surface waters, streams can assimilate certain levels of pollution naturally. This should mean that scarce resources can now be allocated where these would yield the largest water quality improvements (and environmental gains).

In summary, abandoning the zero discharge and policy goal, except for proven toxic substances, should go a long way toward evolving real solutions to serious nonpoint source water quality problems. Establishing realistic standards for water

quality improvement is a substantially different objective than chasing the goal of zero pollution with ever-broadening command-control regulations and government mandated technology.

Once realistic standards are set for runoff-water from farm operations all participants will have a clearer idea of where they are headed. Ideas for "how to get there" will soon emerge if other economic fundamentals like respect for private ownership are not violated and incentives are in place to find low-cost remedies.

Shifting away from the unrealistic goal of "zero discharge" and on to performance standards will mean a shift by regulators away from trying to micro-manage inputs to monitoring output. Competition forces cost minimization. Competition rewards genius, creativity and entrepreneurship of those who innovate to meet the specified water quality standards. It punishes those with higher costs.

Farmers will respond as they always have to competitive forces provided the incentives are in place. In rewriting the Clean Water Act, policymakers would see substantial environmental gains to real problems if they make it clear that the policy is aimed at output results not input controls and that competition will be the driving force.

#### **Issue #6 -- Cost and Environmental Effectiveness**

The Coastal Zone Management Act amendments made very detailed management recommendations for farmers for grazing, erosion, nutrients and pesticides, irrigation and confined animal facilities. These measures and practices are well on their way to becoming the "farming law" in the states impacted by the CZMA. Policymakers are likely to extend these rules to the rest of the nation via the Clean Water reauthorization. At least two points need to be made.

First, it is not enough to look at the "macro" impacts of the proposed changes in farming practices in CZMA states. Totalling up the aggregate costs of Best Management Practices (BMPs) will in all likelihood mislead policymakers to believe that CZMA will not "cost very much."

The real cost of the CZMA regulations of land and water used in farming will be the cost imposed at the farm (firm) level of decisionmaking. For example, what will the new regulations do to the crop-livestock mix on a particular farm, the timing of field operations, production practices, size and structure of the farm unit? And to what alternative uses might the capital cost of the new regulations been used to make the farm more competitive? Perhaps more significantly from the standpoint of

many producers, the potential risk and liability of "being wrong," has proven to be a high cost in trying to comply with wetland regulations.

Secondly, the environmental effectiveness of the proposed regulatory measures have not been proven. Before imposing the proposed regulatory costs on the CZMA farming region (or the nation's farmers via the Clean Water reauthorization) policymakers should know whether these actions will, in fact, improve water quality. For example, the 100 horsepower tractor pulling the appropriate tillage equipment has proven far superior for runoff water control than terracing.

Given the lack of understanding of the real costs of more land and water restrictions on farmers and the uncertainty about the environmental effectiveness of various regulatory prescriptions should cause policymakers to look for superior approaches which will: (a) discipline cost and (b) evolve the best and lowest cost methods for improving water quality. This would mean a complete shift in regulatory focus from micro-management of all farm activities that involve land and water to management of output, i.e., setting realistic water quality standards, a timetable and incentives for achieving these new standards.

#### Issue #7 -- Risk Assessment

It has been said before but it is worth noting again that once the links between water quality and nonpoint source problems have been identified in site-specific terms, the next step should be to determine what the risks are to both human health and to well-defined environmental values. Simply put, farmers cannot stay in production if zero remains the federal policy goal of acceptable risk for humans, plants and animals.

As things now stand, the levels of chemicals allowed in the water are based on standards which have no scale for comparing relative risks from manmade chemicals to risks from "natural" chemicals. Present methods of risk assessment must be revised based on science and not the politics of the promise of risk-free living.

#### Issue #8 -- Economic Impact/Implications for New Entrants

Those who fail to accept the globalization of the U.S. economy and particularly of U.S. agriculture will insist on extending the command-control technology-based prescription to nonpoint source contamination problems. Absent scientific proof of the cause-effect linkages between site-specific farm-level activities and production practices, such a generalized approach

will penalize those farmers who for whatever the reasons, are already at or below common sense acceptable discharge levels. If this happens, one can expect the cost of production to rise unnecessarily for those who are already doing a "good job."

The example of mandating concrete bunkers for fertilizer and fuel storage facilities comes to mind. For those producers (and/or their supply cooperatives) who have superior management plans and practices and who have never had spills or leakage this is an unnecessary and added cost. It contributes nothing to farm-level productivity improvement. A more enlightened approach would be to enact policies which reward, not punish, better managers. Markets are much more efficient at the reward/penalty process than regulators.

Farm structure will definitely change if command-control, technology mandates are extended to nonpoint source problems. New entrants--those without accumulated capital resources--will be forced to chose between investing in innovative farm production methods or pollution control investments which add nothing to farm productivity.

Increased federal pollution control mandates will translate into farm consolidations. Fewer and larger farm units which are financially equipped to "do what the regulators tell them to do" will soon emerge. This process is already underway. Many farmers are already to this point when they contemplate the cumulative effect of wetlands and fertilizer and pesticide aspects of their operations. Given the age of some farmers, present costs and future liabilities are not worth staying in business.

Instead of the traditional competitive, family-farm diversified structure, U.S. agriculture will be headed toward a corporate-state centralized large-scale farming system of a public utility variety.

Prescribing technology for pollution control will ultimately lead to federal regulators prescribing crop and livestock practices, and production and marketing controls. The only unregulated farm activity that will remain will be rates of return. Regulation of returns will surely follow once the centralized food production system leads to politically unacceptable food prices or unavailable supplies.

U.S. agriculture, will, by discouraging young creative producers, be left with the exact opposite outcome--producers who know little about the art forms of food production and a lot about responding to federal regulators. Such an outcome is not indicative of growth industry status. Several analysts have noted the unequal distribution and impact of environmental

regulations. These costs will fall disproportionately large on small and mid-sized farm operations.

Ribaudo<sup>o</sup> captures many of these points:

Laws aimed at protecting water quality will affect farmers' pocketbooks. Farmers in critical or sensitive watershed areas could be faced with such actions as:

- Taxes on nitrogen fertilizer and pesticides.
- Mandatory soil conservation management practices, with or without Government cost sharing.
- Bans on certain pesticides known to leach into ground water in significant quantities or known carcinogens.
- Regulations on land uses, on types of land on which chemicals can be applied, and on the quantity of chemicals used.
- Mandatory management practices for applying chemicals (for example, requiring injection instead of mixing chemicals with irrigation water).

Any of these actions could change farmers' operations. They could have to:

- Reduce inputs, particularly nutrients and pesticides.
- Use structural practices such as grassed waterways to reduce runoff and associated pollutants.
- Change tillage or other management practices.
- Change land use, such as altering the intensity of the crop rotation or converting land from row crops to hay.

**Any of these changes could cut incomes if production costs increase, yields decline, or both.** If fertilizers and pesticides are taxed, farmers will face higher production costs.

Constrained fertilizer use will reduce crop yields. If specific pesticides are banned, farmers will have to shift to either more expensive or less effective chemicals, or cultivate more land.

Curtailing nitrogen use or banning heavily used pesticides **could mean yield losses for most major crops**. Pesticide suppliers could be hurt sharply by widespread bans on some chemicals. And, **farm income and corporate profit losses could be substantial....**

**Restrictions on farming could affect local economies and the distribution of cropping activities.** For example, some regions would face considerably greater yield losses than others if wide-ranging pesticide, fertilizer, or sediment restrictions are imposed. Regions affected less by environmental controls would acquire a competitive advantage over more affected regions, and production of crops that are affected by bans would shift to less affected regions. **Sensitive watersheds targeted for control would become less competitive as production costs rise for affected crops.**

Widespread changes in agricultural production, brought about by legislation to protect water quality, could affect crop prices. For example, banning important pesticides such as the triazine herbicides could significantly reduce corn yields and increase corn prices. Farmers would benefit from the higher prices, but consumer costs for food would rise from current levels. However, most steps taken to protect water quality likely will be local, not national, in scope....

Richardson<sup>10</sup> explained what would happen to the economic viability of a representative 1,360 acre dryland Texas cotton farm under alternative conservation compliance regulations. Farms forced to comply with the High Residue-Basic System (planting a low residue crop in combination with a high residue crop) were shown to experience substantial reductions in net farm income, net worth, and their probability for survival. The approach by Richardson, et al, should give policymakers a clue as to what will happen to farm income, agribusiness and the rural economy through water quality mandates at the farm level. In summary, if higher water quality is pursued through policies that change farming systems--crop mixes and cultural practices--there will be reductions in farm income. The economic reason for this

outcome is that farmers are already profit maximizers. Farm system changes will increase upfront costs, likely mean higher annual operating cost and increase yield risks.

#### Issue #9 -- Rural Development

A regulation induced reduction in farm numbers will surely translate into reduced opportunity off the farm in rural areas and communities. Larger farm units are not as likely to do business locally. These units will be large enough to buy direct from input suppliers, bypassing the services of local farm input suppliers. Maintaining the competitive family farm structure through a new focus on water quality standards would not have this negative impact.

#### Where From Here?

Extending the proposals in S. 1081 and the Coastal Zone Management Act amendments to the Clean Water Act reauthorization will not be in the economic interest of the nation or farmers. Water quality improvements will be meager for the tax money spent and costs imposed on farmers and the private sector generally. These provisions violate the fundamental principles of property ownership and common sense knowledge about the nature of the farm business. Water quality will not improve in proportion to the money spent and there will be extensive restructuring and dislocation among farmers and within rural America.

Citizen controls, controls on technology and farm practices, task forces without farmers (who have a major stake in the legislation), controls on conservation reserve program acreages and animal waste facilities, controls on fertilizer sales and use--these are the basic tenets of S. 1081.

S. 1081 simply follows along the same command-control path as the Coastal Zone Management Act amendments which have already extended the heavy regulatory hand of the federal government. The Coastal Zone Management Act considers livestock production not as an end in itself, but rather as a tool in overall "ecosystem" management. New production facilities will be expected to be built according to new management measures. There is no administrative vehicle for farmer input in the gamut of provisions that will negatively impact their lives and businesses. Both the CZMA and S. 1081 ignored the economic fundamentals discussed in this paper. We hope that Congress will not sweep these aside in the Clean Water Act reauthorization.

Given the significant economic implications for farmers and rural America, farmers are very concerned that the Clean Water rewrite should have substantial input from the Senate and House

Agriculture Committees. Those bearing the economic brunt of this new law should have something to say about its provisions. There will not be a farm or rural community that will not be adversely affected by this forthcoming legislation. At a minimum, there should be extensive field hearings on this legislation.

Should Congress fail to recognize the fundamental economic issues raised in this paper, at a minimum, lawmakers should consider the following practical issues as it rewrites the Clean Water law.

Nonpoint source programs should be voluntary and emphasize the use of cost/benefit effective best management practices.

Nonpoint source information, incentives, technical assistance and cost share programs with landowners are essential to success of a nonpoint source program. Limits on agricultural conservation payments should be removed. The concept of "trading" to reduce overall discharges should be considered as a potential incentive to land owners.

Water quality programs should be on a watershed basis using a "worst case first" approach.

Increased scientific research and evaluation is needed to determine the true extent and sources of pollution.

States should retain primacy for designating uses, determining impaired waters, establishing standards and criteria, and developing and implementing appropriate response programs and plans. Site specific problems require site specific responses. Development of state plans should rely heavily on local input.

State water rights and water allocation systems should be preserved for existing and future projects.

The current scope of the Clean Water Act should remain that of clean water and should not be expanded to one of biological diversity.

Any Clean Water Act reauthorization should include reform of Sec. 404 provisions affecting wetlands.

### Concluding Comments

The real agenda in the national water quality debate is that the cost of further restrictions on point sources is very high relative to potential environmental gains and, therefore, it will be "cheaper" to impose restraints on agricultural activities (nonpoint sources). This naive assessment could produce substantial unintended economic consequences and little water

quality improvement if policymakers fail to account for the importance of fundamental economic issues for the typical farm enterprise.

Further, in a recent *Resources for the Future*' assessment of the nation's renewable resource base, Frederick stated:

The quality of a water body can be defined in various ways, including the effluents it receives; its chemical, physical, and biological attributes; and the socioeconomic benefits and costs associated with specific uses. The *National Water Quality Inventory: 1986* (U.S. Environmental Protection Agency, 1987) assessment of surface-water quality is based on state reports indicating whether state water resources are capable of fulfilling the uses designated by the states. The results of the inventory suggest that nearly 18 percent of the assessed rivers, lakes, and estuaries were capable of only partially supporting their designated uses, and that 7 percent were too polluted to support any designated uses. These percentages may overstate the national magnitude of the water-quality problem because the states tend to focus their monitoring resources on the waters most likely to have problems. Only 21 percent of the nation's rivers, 32 percent of the lakes, and 55 percent of the estuaries actually were assessed for the 1986 inventory. **If all the water bodies that were not assessed for the 1986 inventory had fully supported their designated uses, then 95 percent of the river miles, 92 percent of the lake acres, and 86 percent of the estuary areas would have supported their designated uses** (Fedkiw, 1989). Although this conditional calculation probably understates the extent of the nation's surface-water quality problems, it does help establish a range that suggests from 74 to 92 percent of all surface waters fully supported their designated uses.

If Frederick's analysis is correct, now is hardly a time for policymakers to panic by adopting massive federal command-control policies and programs to further improve a relatively small percentage of the nation's surface water. Surely more cost-efficient and environmentally effective policies can be found which build on the long-standing conservation ethic of farmers, property ownership and control, market-based incentives, competition, and scientific research.

# AUGLAIZE COUNTY

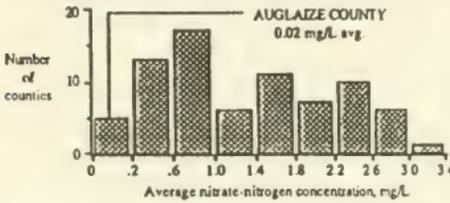

## A Summary of Nitrate Concentrations in Private Wells

SAMPLES COLLECTED MARCH 1988

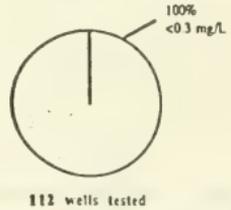

The concentrations of nitrate + nitrite-nitrogen, given in milligrams per liter (mg/L), were measured in 16,166 private wells from 76 Ohio counties. The following bar graphs indicate how Auglaize County compares with the other counties in terms of average concentration, number of wells tested, and the number of wells registered. The pie charts indicate the proportions of wells falling within four nitrate concentration ranges for Auglaize County and for all wells tested.

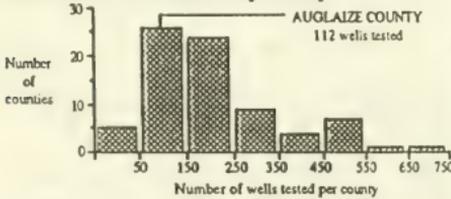

Average nitrate concentrations by county

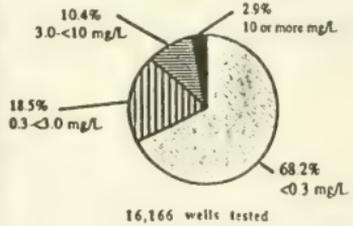

Nitrate concentrations in Auglaize County (average 0.02 mg/L)

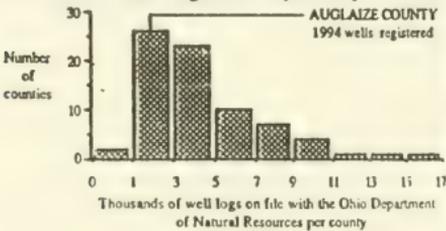

Number of wells tested by county

Nitrate concentrations in all wells tested (average 1.32 mg/L)

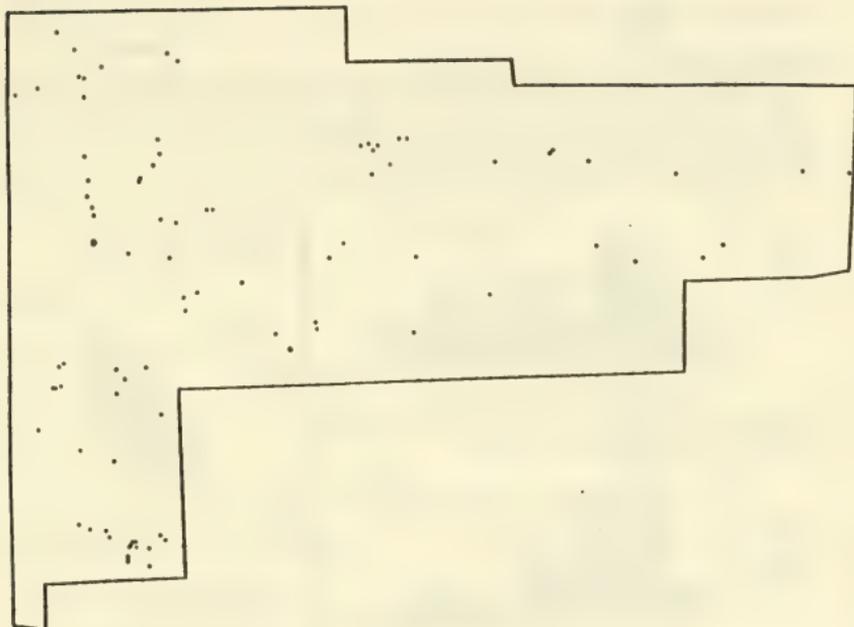

Number of wells registered by county

---

The National Cattlemen's Association is the national spokesman for all segments of the beef cattle industry--including cattle breeders, producers and feeders. The NCA represents approximately 230,000 cattlemen. Membership includes individual members as well as 46 affiliated state cattle associations and 29 national breed associations.

The National Cattlemen's Association (NCA) represents 230,000 affiliated cattlemen from 42 states in this country. NCA has worked closely with other agricultural organizations over the last year and a half. These organizations under the rubric of the Clean Water Act Working Group have formulated a Statement of Principles for reauthorization of the non-point source provisions of the Clean Water Act (CWA). NCA and the 20 organizations listed on the attached statement strongly support these principles for effective NPS programs on agricultural land. NCA also supports the testimony offered today by the National Waters Resource Association on state primacy in water allocation and administration.

Cattlemen across the country are vitally interested in this reauthorization of the Clean Water Act. There has been no other CWA reauthorization or any other federal statute for that matter, which potentially could have such pervasive impact on land and water use fundamental to agriculture. Cattlemen own and operate on land which encompasses over half the U.S. land mass...land in widely varied geographical settings. Approximately 85% of U.S. cattle are finished in feedlots which have been permitted under Section 402 of the CWA since 1972. From Florida through Iowa to even arid areas of Nevada and further West, many cattlemen use wetlands for haying and grazing. Although NCA and the entire agricultural community have vital interests in the CWA's treatment of non-point source issues, there are several other areas of the CWA of direct importance to cattlemen. NCA's written testimony covers the following six general areas:

1. Goal and Purpose of CWA
2. State Primacy
3. Point Source Provisions
4. Non-Point Source Provisions
5. Wetlands
6. Private Property Rights

## 1. GOAL AND PURPOSE OF THE CLEAN WATER ACT

NCA's policy holds that the CWA should maintain its original and current focus on the control of discharges of pollutants to "water of the U.S." as necessary to protect classified uses of a particular water body as are designated by states. This goal should not be changed, directly or indirectly, to create a federally driven program for restoration of aquatic habitats as measured by pristine standards of "biological integrity." Human modification of "aquatic habitat" should not be viewed as pollution unless the modification prevents attainment of the state designated use based standards. Water withdrawals, in particular, will inevitably alter some aspect of the physical or biological "integrity" of the stream because the water course will no longer have the same amount of water.

## 2. STATE PRIMACY

States should clearly retain primary authority in designating water use, establishing water quality standards, and in allocating quantities of water. States should also retain clear authority on land use decisions. To the end of controlling or preventing nonpoint source pollution, the CWA should not be used as a vehicle for imposing EPA driven land use planning. Questions of the regulation of land and water use should remain the prerogative of state and local governments. This is not only a constitutional principle; it is one that makes economic and environmental sense. State governments familiar with their own geographical, economic, and ecological particularities are best equipped to make decisions about land and water use.

## 3. POINT SOURCE PROVISIONS

Section 402 of the Clean Water Act (CWA) identifies point sources of pollution, and requires that water and process-generated waste water being discharged from these facilities be controlled. Many of these facilities are required to obtain a National Pollutant Discharge Elimination System (NPDES) permit. These point sources of pollution usually utilize an easily identified discharge system which directs effluents to "waters of the United States." For this reason, point sources of pollution have been the focus of the CWA during the majority of its first twenty years.

Traditionally, general agriculture has been considered a non-point source of pollution and has remained outside the purview of Section 402. On the contrary, one segment of agriculture has been regulated under Section 402 since the passage of the CWA (and even longer in some

states.) These facilities, labeled "Concentrated Animal Feeding Operations" (CAFO) are required to contain water and process generated waste water up to and including the greatest 25 year, 24-hour storm event and also required to obtain NPDES permits. CAFO's are a subset of "Animal Feeding Operations" which may or may not require NPDES permits. The broader group of Animal Feeding Operations are defined as a lot or facility where:

- 1) Animals will be stabled and maintained for 45 or more days each year, and
- 2) Vegetation is not sustained during the normal growing season over any portion of the lot or facility.

There are also three criteria which distinguish a CAFO from an "Animal Feeding Operation." An "Animal Feeding Operation" is considered to be a CAFO with regard to beef cattle if:

- A. More than 1,000 head of beef feeder cattle are maintained on the site; or
- B. More than 300 head of beef feeder cattle are maintained on the site and either of the following two conditions are met:
  1. Pollutants are discharged into navigable waters through a man-made ditch, flushing system, or similar man-made device; or
  2. Pollutants are discharged directly into "waters of the United States" which originate outside of and pass through the facility; or
- C. As determined by the Director on a case-by-case basis, an "animal feeding operation" is determined to be a significant contributor of pollution to "waters of the United States." Factors to be considered in making this determination include:
  1. The size of the facility and the amount of wastes reaching "waters of the United States";
  2. The location of the facility relative to "waters of the United States"; and
  3. The means of conveyance for waste water into "waters of the United States."

As was stated earlier feedlots are allowed no discharge under the NPDES permit program, except in the case of 25 year, 24-hour or greater storm event. For most industries, however, the NPDES program sets much different requirements. Most industries are allowed to discharge effluents to "waters of the United States," provided that effluent quality is within limitations of

the permit. Once again, agriculture is a round peg trying to be forced into a square hole. NCA would like to demonstrate how inappropriate permits are for beef cattle feedlots. As we have described earlier, the CWA requires all feedlots 1,000 head and greater in capacity, to control runoff and obtain NPDES permits, regardless of whether they contribute pollution to "waters of the United States." On the other hand, 40 CFR Part 122, Appendix B, goes on to state that those facilities which discharge only in the case of the greatest 25 year, 24-hour storm event are not required to obtain NPDES permits. The paragraph states:

*Provided, however, that no animal feeding operation is a concentrated animal feeding operation as defined above if such animal feeding operation discharges only in the event of a 25 year, 24-hour storm.*

NCA agrees with the later; those facilities which discharge only as the result of a storm of significant magnitude (25 year, 24-hour event) should not be required to obtain NPDES or other permits. This is a common-sense approach that realizes that the weather cannot be controlled through legislation or regulatory measures.

According to USDA/Economic Research Service, in 1990 nearly 85% of the fed cattle marketed were raised in feedlots of 1,000 head capacity or greater. This compares to slightly over 72% in 1980. Additionally, marketings of fed beef cattle decreased by almost 3% during this ten-year period, making the 13% increase even more significant. This is the highest percentage of any animal species regulated by the NPDES program. As the statute is currently written, a significant majority of fed beef cattle are being raised in feedlots subject to Section 402 requirements. For this reason, few gains could be made in water quality by expressly regulating smaller beef cattle facilities. As indicated above, current authority allows regulation of any CAFO of any size if determined to cause significant pollution. NCA supports the current Section 402 provisions and would offer several clarifying amendments to make Section 402 more effective for large feedlots.

NCA would propose changes be made to the existing Section 402 of the CWA, as it pertains to CAFO's which would help achieve the existing goals of the CWA. These changes are briefly outlined below, along with a brief explanation in italics:

- Livestock manure facility design criteria should not be limited by federal mandates. States shall be allowed to promulgate state guidelines which meet the federal effluent guidelines (no discharge for a specified precipitation event.) *Based on climate, geography and other physical characteristics, states are best suited to determine appropriate facility design criteria which meet federally-mandated "no discharge" requirements. In many cases, a settling basin, used in conjunction with grass filter strips, may adequately control runoff from beef cattle feedlots.*
- The federal statute should be consistent with regulations (40 CFR Part 122, Appendix B) which confirm that facilities which do not discharge to "waters of the United States" are not required to obtain a permit. *The jurisdiction of the CWA is limited to "waters of the United States." Therefore, facilities which do not discharge to these waters should not be subject to NPDES permits.*
- Feedlots which do not discharge to "waters of the United States" should not be required to obtain Stormwater Discharge permits. *Stormwater permits or other similar permits are inappropriate for facilities which do not discharge to "waters of the United States."*
- Permits, once obtained, shall be valid until considerable changes are made to the facility which require that they be modified. *Unless significant structural changes are made, reissuance of permits is unnecessary.*
- An Environmental Impact Statement should not be required for NPDES permitted livestock facilities.
- In the event of a permitted discharge, no effluent toxicity testing shall be required. Facility design criteria reduces the toxicity of the "first flush" from these facilities. *Beef cattle feedlots typically do not utilize a flush system to transport manure from the feeding area. As a result, the majority of the manure remains in the feedlot and is managed as a dry product and applied to soil, providing nutrients and increasing soil tilth.*
- States should be delegated authority to implement all or selected portions (NPDES program for CAFO's) of CWA programs. *State authority to administer the NPDES program for CAFO's should not be held up by other NPDES program delays.*

- CWA regulations should recognize unique, catastrophic precipitation events which cause a discharge do not constitute a violation of the CWA. *In limited instances, significant precipitation events may occur in successive days which, while never exceeding the greatest 25 years, 24-hour storm event, cause discharges from NPDES regulated facilities. These infrequent discharges should not be considered a violation of the CWA.*
- The jurisdiction of the CWA should not be expanded to include groundwater, conveyance canals, ditches, or other non-navigable structures. *The jurisdiction of the CWA should continue to focus on navigable "waters of the United States," rather than being expanded to include isolated or intermittent waters.*

#### 4. NON-POINT SOURCE PROVISIONS

##### A. Section 319 is Basically Sound

As explained in the Statement of Principles attached to NCA's written testimony, NCA generally supports the current non-point source provisions in Section 319 of the CWA. NCA believes these provisions should be given additional time and adequate funding, with better targeting to impaired areas, before their effectiveness is judged. NCA's written testimony and others testifying today document the many USDA programs and state non-point source programs currently working to reduce agricultural runoff. Substantial progress already has been made.

##### B. NPS Benefits in Current Programs

NCA believes agriculture producers and USDA have already made significant strides in reducing agricultural runoff. We support the approach in the many USDA programs devoted to water quality. Just the Conservation Reserve Program (CRP) alone, from the 1985 Farm Bill, has prevented approximately 750 million tons of soil annually from entering streams and other surface waters. USDA estimates that when the CRP and Conservation Compliance Plans are fully implemented, cropland erosion will be reduced 50%. No less than six programs authorized by the 1990 Farm Bill will facilitate prevention of agricultural runoff. They include 1) Agriculture Water Quality Incentive Program, 2) Integrated Farm Management Program, 3) Sustainable Agriculture Research and Education

Program, 4) Integrated Management Systems Program, 5) Sustainable Agriculture Technology Development and Transfer Program, and 6) the Water Quality and Nutrient Management Research.

Many other USDA programs address this issue. USDA administers the President's Water Quality Initiative with projects in 74 Hydrologic Unit Areas in all fifty states. USDA's Small Watershed and Flood Prevention Program; Great Plains Conservation Program; Resources Conservation and Development Program; and the Cooperative River Basin Program - all directly or indirectly address water quality. USDA's participation in EPA's Rural Clean Water Program and in other state NPS programs from Section 319 of the Clean Water Act are other examples of USDA's active and effective efforts to prevent agricultural runoff.

An illuminating example is SCS' and Extension's leadership roles in California's Rangeland Water quality Management Program. This program will use field research, education and technical assistance to identify local rangeland water quality issues, develop best management practices, educational materials, conduct field days, workshops, and demonstration projects. An attached Fact Sheet on this program provides details.

This state program initiated through the NPS provisions of the current Clean Water Act is like many in other states. Most are new programs just now getting underway because of the delay in receiving federal funds for Section 319 programs. However, they are underway and they are voluntary, site-specific, locally implemented and USDA has a lead role on agricultural land.

### C. Approach to NPS

NCA believes the central focus NPS management programs authorized by the CWA should be a voluntary approach based on incentives, education, and technical assistance. This approach should emphasize locally designed and applied, economically feasible, site-specific management practices. Effectiveness testing needs to be built into these programs with goals based on a realistic time frame.

NPS management requires a different approach than point source pollution. Unlike point source, NPS is primarily a weather related phenomenon that can be managed but not eliminated. Sediment, the primary alleged constituent of NPS, is naturally occurring to say

the least. There will always be some amount of sediment movement across land as a result of water, wind, geological forces, and human use. Agriculture will always be the major source of runoff because of the patently obvious amount of land used by agriculture.

#### D. Agriculture's Role in Non-Point Source

This CWA's reauthorization consideration of non-point source is being driven by EPA's recent National Water Quality Inventories which claim agriculture is the cause of over half of non-point source pollution. NPS is viewed as the major remaining problem for water quality in the U.S. NCA strongly urges this committee to scrutinize the actual magnitude of agriculture's role by a careful, analytic review of the data upon which EPA issues this national summary. This data is contained in reports prepared by each state every other year (305.B reports).

A closer look even at EPA's own figures provides an important perspective, usually lost in repetitious claims about agriculture's major role. Using figures from EPA's most recent 1990 report, states reported impairments from NPS (of three different degrees) on 11% of total river miles. Agriculture's alleged role was 6.6% of this total. That 6.6% is even more than 50% of the problem, but it is not a problem on 50% of the river miles. This is the usual implication of this claim. When threatened and partial impairments are subtracted, the amount of complete impairments to designated uses caused by agriculture is from 2-4%.

States only provided data on 35% of total river miles. Would the rest of the data provide more or less blame for agriculture? According to EPA, impairments in unassessed waters are likely to be much less. States concentrated their limited resources for monitoring on priority waters, known or suspected to have water quality problems.

#### E. NCA Water Quality Information Project

NCA would really like to know where and what the problems are. Where there are genuine problems related to livestock production, cattlemen intend to do something about it. To this end, NCA has begun a Water Quality Information Project to review state 305.B reports. Our purpose is to determine exactly where there are NPS problems associated with beef cattle, the magnitude of the problem, cause, and means of remediation. The first year of this project will concentrate on 15 key states.

NCA's initial review of these reports, unfortunately, reveals just how little hard data there is in most of the reports. Where impairments are identified, there is usually only vague connection between the problem and the source. Typically, these reports merely identify the predominant land use, i.e. grazing or crops production, and label it as the cause of the impairment. NCA urges this committee to strengthen the monitoring and assessment activities in all NPS programs and to require uniform monitoring protocols such as those used by the US Geological Survey.

#### F. NPS and "Biological Integrity"

It is important to note that the prevailing impacts from this NPS attributed to agriculture are, according to EPA's Inventories, ecological...impacting uses associated with recreation, fishing, and wildlife. NCA urges this committee to realize that any elevation of federal mandates for water quality standards based on "biological integrity" will steeply increase the ante for NPS management. EPA's "Biological Criteria: National Program Guidance" would measure "biological integrity" on the basis of "natural" aquatic habitat devoid of any human impacts, i.e. use. In other words, a strengthened NPS program in the CWA might be feasible under current provisions for state designated uses. However, if this reauthorization gives EPA authority to compel states to establish "fishable and swimmable" standards for all water courses, the same NPS programs would become much more restrictive, i.e. precluding some land uses in certain areas.

#### G. Meaningful Targeting

This perspective on the actual known magnitude of NPS is not meant to deny that there are significant NPS problems caused by agriculture. However, on the basis of current data, it appears these genuinely, severe problems are limited to certain areas and not pervasive across the country. NCA believes the CWA programs on NPS should parallel this situation as it nearly now does with targeted programs such as the Great Lakes and Chesapeake programs. We urge Congress to provide meaningful targeting provisions with more criteria than any area with a reported impairment.

#### H. CZMA Approach is Inappropriate

Although coastal areas and estuaries are waters for which there is more meaningful data, reported problems and thus worthy of targeted programs, NCA opposes the approach

taken in recent amendments to the Coastal Zone Management Act. Under the sensible rubric of pollution prevention, these amendments have created a federally driven land use control program with minimum management standards. As written into law, the standards would be ENFORCEABLE for all land users in the coastal area. Particularly without any determination of whether a particular property owner is a cause of a problem, this kind of land use control is a serious infringement of property rights. With management standards issued by a federal agency, it is also a questionable arrogation of state's constitutional rights to control land use.

## 5. WETLANDS

NCA's policy on wetlands is attached. NCA urges this committee to confront and finally resolve this wetlands controversy. It is time to clearly establish precisely what is federal jurisdiction on wetlands. The current regulations are not supported by explicit legislative authority. Rather they are fueled by nebulous policy, conflicting court decisions, out of court settlements, and agency arrogance. A telling example of the insubstantial legislative foundation of current Section 404 authority recently occurred in a federal district court in Missouri. After reading the alleged statutory provisions and regulations authorizing the Corps of Engineers, the Court dismissed the case because of inadequate legal authority in the statute. It is well time for Congress to debate this issue and vote.

NCA feels there are a number of issues which must be resolved during this reauthorization of the CWA. These include recognition of agricultural practices which are exempted from permit requirements by Section 404(f), ranking wetlands according to their function and value, a definition which clearly delineates true wetlands from wetlands which exist only on paper, and recognition of the rights of property owners as guaranteed by the Constitution.

It is also important to note that while the Clinton Administration has not yet developed a clear policy position regarding wetlands, President Clinton has made significant comments recently which may provide insight to the Administration's position. President Clinton has indicated that a pledge of "no net loss" of wetlands is unnecessary and "becomes an incredible exercise in arithmetic." He has also identified a need for ranking wetlands in order of importance and that wetlands protection programs would be based on this ranking. NCA agrees with President Clinton that "no net loss" of wetlands is not the basis for sound policy decisions, nor should all wetlands be considered equal in terms of the functions, benefits and values that

they may provide to society. A balanced approach must be undertaken in wetlands policy which considers equally the protection of true wetland with the impact of these policies on landowners.

Section 404(f) of the CWA, more commonly referred to as the "agricultural exemption," has not been enforced on the ground as it has been written in statute. Practices as basic to cattle production as haying, grazing and normal maintenance activities have in many cases been stopped by Army Corps of Engineer field staff who have determined that Section 404 permits are required and in some cases denied. These activities do not represent significant changes in the use of these lands, nor do they constitute "dredge and fill" activities which have traditionally been the scope of Section 404 permits. Examples of activities which have been halted in lieu of permits include tilling hay and pasture lands in order to re-establish forage crops; maintaining stockponds, irrigation and drainage ditches in order to improve their efficiency; and the periodic removal of low growing shrubs and brush which reduce productivity of hay, pasture and range lands and limit these lands' ability to function as true wetlands. It is also important to note that haying, grazing and normal maintenance activities are beneficial, maintenance uses of wetlands which increase these lands' ability to provide wetlands benefits. Regular haying and grazing of wetlands vegetation during the drier portions of the year help maintain the vigor and health of wetlands vegetation. NCA urges this committee to include "haying, grazing and normal maintenance activities" specifically in Section 404(f) as examples of normal agricultural activities which are exempt from Section 404 permits.

One of the single most contentious issues surrounding the wetlands debate is the definition of a true wetland. Wetland definitions are certainly not consistent between the four federal agencies with wetlands jurisdiction, and have also been significantly changed with regard to which Federal Manual for Delineating Jurisdictional Wetlands is being enforced at any specific time. The recent shift to the 1987 manual by the U.S. Army Corps of Engineers and the Environmental Protection Agency is a step in the right direction.

NCA feels that it is imperative to statutorily define wetlands as areas which demonstrate all three definitive wetlands criteria (hydrology, hydrophytic vegetation and hydric soils) during the growing season. Adequate hydrology is essential for any wet area to be considered a wetland; therefore wetlands delineation should begin by identifying those areas where inundation of the surface occurs during a significant portion of the growing season. Additionally, hydric soil types and wetlands plants typically adapted to wet areas should be the predominant soils and plants present. This sound definition will help reduce the ambiguity under which most landowners currently exist.

Similarly, NCA opposes regulation of man-made wetlands resulting from irrigation and other water developments. Cattlemen and farmers have created thousands of acres with wetlands values, especially in arid western areas. Yet, the current program provides a disincentive for this environmentally valuable activity.

NCA believes that wetlands legislation should include provisions for wetlands definition and delineation. The pending National Academy of Sciences Study will likely throw scientific light on the issue. However, the question is to what extent the federal government has regulatory authority on what is well over 100 million acres of land. This question of federal jurisdiction on private land will not, and should not, be resolved by scientists. NCA believes this is a question that elected representatives must deliberate and decide.

Additionally, an appeals process should be added to the statute, whereby property owners without substantial means can appeal wetlands decisions made by regulatory agencies without having to engage in costly and often lengthy court battles. Under existing law, a landowners' only form of recourse is through the court system. Landowners must be afforded an opportunity to appeal wetlands decisions directly to the agency who made said decision.

Many of the aforementioned issues are embodied in H.R. 1330, The Comprehensive Wetlands Conservation and Management Act of 1993 (Hayes, D-LA.) This measure had received wide, bipartisan support during the 102nd session of Congress, and once again is being praised as a comprehensive wetlands reform measure which will balance wetlands protection with the right to own and manage wetlands. NCA supports H.R. 1330 as the vehicle for legislative reform.

## 6. PRIVATE PROPERTY RIGHTS

Finally, NCA urges this committee to keep in mind private property rights protected by the Fifth Amendment in your deliberation of wetlands and non-point source issues. NCA joins with a growing number of landowners seeking legislative guarantee for financial compensation from regulatory takings of property value and use. In recent years the Supreme Court and the U.S. Claims Court have continuously upheld the compensation requirements of the Fifth Amendment in what is now a series of cases. Yet the cost of litigation makes judicial relief an impossibility for a huge majority of landowners.

NCA also urges Congress to codify the general requirements of Executive Order 12630 which require federal agencies: 1) to assess the extent to which proposed action may infringe on property rights and 2) to minimize such infringement as much as is statutorily possible. We add that many of the regulatory proposals for NPS would meet with keen resistance from landowners which, given the greater numbers involved, probably dwarf the heated contention around wetlands.

## CLEAN WATER ACT REAUTHORIZATION: NONPOINT SOURCE PROVISIONS

In the reauthorization of the Clean Water Act, Congress should adhere to the following principles:

1. The Clean Water Act (CWA) does not stand alone in protecting America's waters from nonpoint source (NPS) pollution. Other ongoing programs at the federal, state and local level must be funded fully, coordinated with and not superceded by the CWA. This includes, in particular, the soil conservation and water quality provisions of the 1985 and 1990 farm acts and the state groundwater and surface water protection programs of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).
2. Recognizing the 20 year commitment our country has had to eliminating point-source pollution, success in reducing the more complex and diverse NPS pollution will require similar time and resource commitments. However, management of this problem will require a different approach than that of point source pollution elimination because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities.
3. The central focus of NPS management solutions should be a reasonable and voluntary approach based on incentives, education and technical assistance as the primary means of managing NPS pollution.
  - \*NPS pollution management programs should (a) emphasize the protection of water resources and state-designated water uses, including state-designated agricultural uses, and (b) recognize the importance and needs of individual agricultural producers and other landowners affected by the CWA.
  - \*This approach emphasizes the use of locally designed and applied, economically feasible, site-specific best management practices which do not infringe on private property rights. Implementation of these farm management options over a realistic time frame will further the goal of reaching or maintaining designated uses of water bodies.
  - \*It is inappropriate to link USDA commodity, conservation or disaster program payments to the success or failure of management programs for NPS pollution authorized under the CWA.
4. Current CWA language contains valuable provisions for NPS management embodied in Section 319. Although this NPS section has been historically underfunded and has been hampered by bureaucratic roadblocks, all states now have approved Section 319 assessments and approved management programs. Within the CWA, it is the preferable vehicle for management of NPS pollution, and changes which occur during CWA reauthorization should reinforce these existing NPS provisions.
  - \*The proper management of NPS pollution lies in state and local efforts. As such, states should continue to identify and resolve their priority NPS water problems through administration of Section 319 funds. With state oversight and approval, local organizations should continue to carry out these NPS programs. Agencies at the federal and state levels should harmonize objectives and coordinate funding for national and regional NPS management programs.

- \*State and local programs should provide for a mix of research, development, education and technical and financial assistance for both planning and implementing actions aimed at achieving state designated uses.
5. Management efforts funded by Section 319 of the CWA should be directed to priority areas based on scientific assessments that identify water bodies with impaired or threatened uses.
    - \*Priority, as determined by states, should be based on the magnitude of risk to human health, the protection of designated uses, and likelihood of further significant and unreasonable water quality degradation if no action is taken.
    - \*Strategies should be developed on a hydrologic unit, watershed-wide basis using an approach that includes the consideration of both surface and ground water quality.
    - \*Programs should focus on cost-effective, site-specific practices for individual operations with flexibility for implementation.
    - \*In order for Section 319 to work effectively for agriculture, USDA must play a lead role in the delivery of education and technical assistance at the state and local level.
  6. An effective and cost-efficient response to water quality problems requires accurate and reliable information on (a) the source, extent, and impact of NPS pollution, as well as (b) the effectiveness, utility and economic feasibility of conservation measures and best management practices.
    - \*Any Clean Water Act reauthorization should include a strong financial commitment to further research, monitoring and assessment projects.
    - \*Monitoring should include before and after sampling as well as frequent sampling during storm events and assessment of natural and historic loadings.
    - \*Scientific research and monitoring projects should follow protocols developed by the U.S. Geological Service and should be conducted on a watershed basis with local and state input.
    - \*Representative pilot projects aimed at achieving market based incentives on a watershed or regional level should be encouraged.
  7. The Clean Water Act Reauthorization should not directly or indirectly create a federal water quality law or program which supercedes, abrogates or impairs state water allocation systems and water rights.
  8. Section 319 management programs on federal lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.
  9. It is inappropriate for a reauthorization of the Clean Water Act to provide the authority for citizens suits against individuals participating in NPS management programs.

**Free Market Environmentalism**

WHEREAS, the political objectives of most of the influential national environmentalist organizations promote governmental control of natural resources through ownership or regulation as the only effective way to protect or enhance the environment; and

WHEREAS, the National Cattlemen's Association's (NCA) policy opposes such increased government control of natural resources because this is an inefficient and often counter-productive method of protecting natural resources which stymies sustained or increased economic productivity in the private sector; and

WHEREAS, NCA policy holds that the private sector, through private ownership, private enterprise, and individually controlled diverse management, offers the best arena for optimal, enduring, cost effective protection and enhancement of the environment; and

WHEREAS, Free Market Environmentalism is a policy that promotes environmental protection through the private action of individuals operating within a system of well-defined property rights, individual choice and responsibility, positive incentives, voluntary market exchange, and limited government,

THEREFORE BE IT RESOLVED, that the National Cattlemen's Association enthusiastically endorses Free Market Environmentalism as the most effective means of establishing environmental protection that emphasizes private ownership, and will undertake action based alliances with organizations that promote this policy.

**Clean Water Act Reauthorization**

WHEREAS, the current Clean Water Act provides broad federal authority through EPA impacting all segments of the cattle business; and

WHEREAS, the pending reauthorization of the CWA will directly focus on agricultural runoff and cattle production in particular as the alleged source of the majority of non point source (NPS) pollution of U.S. surface waters; and

WHEREAS, EPA does not have substantial data to factually verify this claim,

THEREFORE BE IT RESOLVED, that the National Cattlemen's Association (NCA) supports the following principles for the CWA's Goal, State Primacy, Water Quality Standards, Point Source Provisions, and Non Point Source Provisions:

**The Goal of the Clean Water Act**

The CWA should maintain its original focus on the control of discharges of pollutants to waters of the U.S. as is necessary to protect the classified uses of a particular water body which are designated by states. The purpose of the CWA should not be changed from current protection of state designated uses based on an analysis of use attainability to a broad goal of protection of "ecological integrity." Approaches that reach across multiple resources (air, soil, groundwater) for pollution prevention should not be included in reauthorization.

**State Primacy**

States should clearly retain primacy in designating water uses, establishing water quality standards, and in allocating quantities of water. Any reauthorization of CWA should clearly recognize state authority to protect rights to water established under state law.

**Water Quality Standards**

The standard of "fishable/swimmable" is inappropriate as a federal standard applied unilaterally in all states. EPA should not have the authority to force states to change use designations and standards of state waters. Maximum contaminant levels or effluent guidelines for alleged NPS pollutants such as sediment should not be developed by EPA. Sediment is naturally occurring and is often critical to the health and stability of ecosystems. The widely fluctuating movement of sediment into and within water courses is often determined by natural forces.

### Non Point Source Provisions

The current provisions on NPS in Section 319 of the CWA are fundamentally sound. They should be retained and given sufficient time and funding to operate before the current approach is eliminated in favor of more regulatory authority.

Non point source pollution is primarily a weather-related phenomenon that can be managed but not feasibly eliminated. Management of alleged NPS pollution will require a different approach than point source pollution.

The central focus of NPS management programs should be a practical, voluntary approach based on incentives, education, and technical assistance. This approach should emphasize the use of locally designed and applied, site-specific management practices implemented over a realistic time frame which do not infringe on private property rights.

Management programs authorized by Section 319 of the CWA should be targeted to priority areas based on scientific assessments that identify serious impairments capable of economically feasible remediation.

USDA should play the lead role in the delivery of education and technical assistance for these NPS programs designed and implemented at the state and local level.

CWA reauthorization should include a commitment to monitoring and assessment projects which identify a) the source, extent, and impacts of NPS pollution and b) the effectiveness and economic feasibility of conservation measures and management practices used to control NPS pollution.

Monitoring and research should follow the protocols developed by the U.S. Geological Service. Monitoring should include before and after sampling as well as sampling during storm events and assessment of natural and historic loadings.

Section 319 management programs on federal, state, and other publicly held lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.

### Point Source Provisions

Concentrated Animal Feeding Operations (CAFO's) of 1,000 head or greater in capacity and having the potential to discharge to "surface waters of the U.S." must obtain National Pollutant Discharge Elimination System (NPDES) permits under the CWA.

States shall be allowed to promulgate facility design criteria which meet the federal effluent guidelines (no discharge for a specified precipitation event). Facilities which do not discharge to "surface waters of the U.S." are not required to obtain NPDES permits or Stormwater Discharge permits. Permits, once obtained, shall be valid until considerable facility changes are made to warrant their revision.

In the event of a permitted discharge, no effluent toxicity testing shall be required, since facility design criteria reduces the toxicity of the "first flush" from these facilities. CWA regulations should recognize that unique, catastrophic precipitation events which cause a discharge do not constitute a violation of the CWA. Any artificially created wet areas which are the result of compliance with federal effluent guidelines should not be subjected to further regulation under the CWA or any other federal law.

PL/EM-6  
1993

### Coastal Zone Management Act

WHEREAS, 1990 amendments to the Coastal Zone Management Act established a program implemented by EPA and the National Oceanic and Atmospheric Agency (NOAA) to control non-point source (NPS) pollution through enforceable "Management Measures" for multiple agricultural practices including grazing and confined livestock feeding; and

WHEREAS, these EPA "Management Measures" are enforceable in state programs for areas well beyond the legal coastal zones in all coastal states; and

WHEREAS, these "Management Measures" may be economically prohibitive for some producers and even if implemented may not result in diminishing runoff or improving water quality,

Therefore Be It Resolved, that the states confine implementation of these NPS control "Management Measures" to clearly targeted areas demonstrated to be a source of impairments to coastal water quality and demonstrated to be capable of improvement without economic hardship to individual producers.

**Wetlands: No Net Loss**

WHEREAS, the federal government current policy of "no net loss" of wetlands affects the use, value, and private property rights on millions of acres of privately owned agricultural land; and

WHEREAS, the "Federal Manual on Identifying and Delineating Jurisdictional Wetlands" as the federal government's official method of delineating wetlands is gravely flawed and leads to wetlands delineation of millions of acres of ranch and farm land which should not realistically be considered wetlands; and

WHEREAS, the major instruments of this federal policy are not authorized by federal law and have not been subject to public review through the formal rulemaking process required by the Administrative Procedures Act (APA); and

WHEREAS, the U.S. Army Corps of Engineers now through Section 404 of the Clean Water Act has the authority to regulate or outright prevent the normal, established use of ranch and farm land; and

WHEREAS, the U.S. Fish and Wildlife Service seeks to acquire thousands of acres of wetlands many of which are on ranch and farm land; and

WHEREAS, cattle grazing is a beneficial, maintenance use of wet areas and thereby protects natural wetland values,

THEREFORE BE IT RESOLVED, that the National Cattlemen's Association act to accomplish a change in the current federal wetlands policy by a statutorily codified definition of wetlands that stipulates the simultaneous actual presence of three criteria: hydric soils, hydrophytic vegetation, and surface inundation for a significant portion of the growing season of every year under normal precipitation and that excludes all man-made, created wet areas from any governmental authority.

BE IT FURTHER RESOLVED, that revisions in the Federal Manual that reflect this definition be subject to the full rulemaking procedures of the Administrative Procedures Act with hearings and a public comment period.

BE IT FURTHER RESOLVED, EPA and the Corps of Engineers issue in writing a formal specification by EPA and the Corps of Engineers of the "normal agricultural activity exemption" from Section 404 of the Clean Water Act as it pertains to pasture, range, and hay lands and such that it clearly exempts all normal, usual, established maintenance practices.

BE IT FURTHER RESOLVED, that all jurisdictional wetlands that are delineated include a scientific documentation of the exact environmental function and value of each wetland with a ranking of the relative importance, to include a minimal value category which is fully exempt from all governmental jurisdiction.

BE IT FURTHER RESOLVED, that legislation or regulations that ensure approval from one federal agency regarding wetlands would not be overruled or changed by other federal agencies.

BE IT FURTHER RESOLVED, that the federal agencies fully comply with Executive Order 12630 on Takings in all wetland policy, programs, and action by government.

BE IT FURTHER RESOLVED, that all federal policies, action and laws on wetlands be subject to state water laws and private water rights and all private property rights.

Impairment of Surface Waters<sup>1/</sup>Rivers (% Assessed is 35.9% of 1,800,066 miles)

<sup>1/</sup> U. S. Environmental Protection Agency, National Water Quality Inventory, March 1992 and The Quality of Our Nation's Waters: 1990, June 1992.

<sup>2/</sup> Assumes zero impairment of unassessed portions of surface waters. EPA reports: "States are generally constrained by diminishing resources and competing needs to monitor most often in those waters with known or suspected problems". Thus, impairment in unassessed water is likely to be much less, especially on that third of U.S. in federal ownership.

## NATIONAL CATTLEMEN'S ASSOCIATION WATER QUALITY INFORMATION PROJECT

### PURPOSE

Provide the cattle industry with an assessment of the scope and accuracy of existing information related to claim of the role of beef cattle production in non-point source pollution. Available information will be assessed in terms of the stated extent and nature of beef production impacts, and the locations of problem areas. Sources of management practices preferable for abatement of water quality problems will be identified. Effective participation in water quality management processes by state cattle industries will be encouraged, specifically in establishing water quality standards, state assessments, program implementation and monitoring.

### OBJECTIVES

- Provide summary analysis of:
  - 1) water quality assessment reports,
  - 2) state assessment, standard setting, confined animal permit, and NPS process,
  - 3) types and degree of problems on an EPA Regional basis.
- Describe agency structure, responsibilities and applicable programs relating to beef cattle water quality situations.
- Suggest a framework for state association and NCA involvement in water quality process and to share educational information resulting in a draft Cattleman's Environmental Management Guide.
- Provide information for the emerging NCA data base.

### APPROACH

Working through NCA headquarter offices (Washington, D.C.) identify key agency divisions, staff and relevant documents for the primary agencies - Environmental Protection Agency (EPA), USDA Soil Conservation Service (SCS), and Cooperative Extension Service (ES). Continue the identification of key staff, materials and approaches at the federal agency regional levels and State Land-Grant Universities.

Use three pilot states (California, Florida, Texas) to test an approach then select 12 additional representative states to conduct personnel contacts with:

- 1) *the state water quality agency* for their process for: setting water standards, issuing NPDES permits to confined animal facilities, NPS Assessments, and implementation plan.
  - 2) *State Beef Cattle Association(s)* for their involvement in state water quality processes and information/educational materials.
  - 3) *State USDA-SCS offices* for related programs and materials.
  - 4) *State Cooperative Extension Service* for related programs and materials.
- Conduct a survey of the above institutions for similar information in the remaining states.

### PRODUCTS

Reports and Information papers for NCA use. A draft outline of a Cattlemen's Environmental Management Guide.

### FUNDING AND STAFFING

Funding for this project is being provided through the Beef Checkoff funds for Industry Information. The project contractor is Jim Clawson, Extension Range Specialist, University of California, Davis with the assistance of selected beef cattle association staff and academics.

## Rangeland Watershed Program

*A Water Quality Education & Technical Assistance Program for California Rangelands*

# FACT SHEET

*U.C. Cooperative Extension and U.S.D.A. Soil Conservation Service*

No. 2

August 1991

### Rangeland Watershed Program

The Range Management Advisory Committee to the State Board of Forestry has identified water quality protection as a major rangeland issue and has assumed a lead role in presenting a program for developing and implementing a Water Quality Management Plan on private rangelands in California. The UC Cooperative Extension Service and USDA Soil Conservation Service have the responsibility for delivery of education, applied research and technical assistance programs that facilitate water quality management planning. Cooperative Extension and the Soil Conservation Service will jointly deliver this Rangeland Watershed Program. The goal of the Rangeland Watershed Program is to develop public understanding of proper rangeland watershed management, to inform rangeland owners and managers how clean water legislation affects private rangeland management and to facilitate development and implementation of a Rangeland Water Quality Management Plan in California.

#### Education Objectives

- Acquire, organize, and synthesize currently available and newly emerging information.
- Disseminate information using time-tested Extension education methods.
- Develop watershed management demonstration areas.
- Provide organizational and technical support to water quality management planning at the state, regional, and local levels.
- Deliver educational programs to expanded audiences—landowners, state and county agencies, resource professionals, and conservation organizations.

#### Applied Research Objectives

- Develop minimum watershed monitoring criteria to standardize parameters and methods, thus facilitating comparisons and interpretations between projects and locations.
- Conduct baseline monitoring of water quality and associated watershed parameters.
- Monitor the long-term effectiveness of management measures (BMPs) on demonstration watersheds and riparian areas.
- Validate erosion prediction models (USLE, MUSLE, WEPP) using monitoring data collected from demonstration watersheds.

In accordance with applicable State and Federal laws and University policy, the University of California does not discriminate in any of its policies, procedures, or practices on the basis of race, religion, color, national origin, sex, marital status, sexual orientation, age, veteran status, medical condition, or handicap. Inquiries regarding this policy may be addressed to the Affirmative Action Director, University of California, Agriculture and Resources, 300 Lakeside Drive, 6th Floor, Oakland, CA 94612-3560, (510) 987-0087.

University of California and U.S. Department of Agriculture cooperating.

### Technical Assistance Objectives

---

- Active participation in the Rangeland Water Quality Plan Development Task Force.
- Collection and analysis of soils and vegetation data to identify potential statewide water quality problems.
- Develop statewide Field Office Technical Guide procedures for writing and reviewing state level practice standards and specifications.
- Field office participation in workshops to develop local management measures (best management practices).
- Update the Field Office Technical Guide as a basis for management measures (best management practices).
- Conduct local Conservation Planning workshops to assist with planning and individual technical assistance.
- Support activities of Resource Conservation Districts addressing water quality management.

### Program Activities

---

**Developing Management Measures:** The Soil Conservation Service will describe management measures (best management practices) using their existing technical guides. They will conduct a review of these management measures by appropriate agencies and landowners groups. Standards and specifications will be reviewed locally as part of the local water quality management planning process to insure ecological and economic feasibility.

**Education Program:** The Rangeland Watershed Program will develop fact sheets, news releases, training packages, and other media that will be used for staff training, landowner and public education programs, and public policy background information. Information packages will include policy and technical information to facilitate water quality management planning on rangeland watersheds and their associated streams and riparian areas.

**Demonstrations:** There are many watershed and riparian management projects throughout the state developed by various agencies and local groups. Cooperative Extension and the Soil Conservation Service are cooperators on several of these projects. New projects will be developed in response to local and regional priorities. These projects will be used to demonstrate rangeland watershed problems, solutions, and monitoring methods. The program will coordinate the flow of information and activities among the demonstration projects.

**Applied Research:** This program will develop research needs and pursue joint research with the Agricultural Experiment Station, Agricultural Research Service, and other agencies. Development and testing of rangeland watershed monitoring methods to establish baseline conditions and document changes due to management and natural phenomena has been identified as a research need. Development and testing of erosion prediction models for the purpose of disseminating information from local situations to a wider array of similar situations is an additional need.

### Program Contacts

---

**Cooperative Extension:** W. James Clawson, Extension Range Specialist, (916) 752-3455  
 Melvin R. George, Extension Range & Pasture Specialist, (916) 752-1720  
 Dept. of Agronomy & Range Science, University of California, Davis, CA 95616-8515

**Soil Conservation Service:** Joel R. Brown, State Range Conservationist, (916) 449-2854  
 Leonard Jolley, (Acting) State Range Conservationist, (916) 449-2854  
 USDA Soil Conservation Service, 2121 C Second St., Suite 102, Davis, CA 95616

**Program Funding Sources:** This program has funding support through 1993. Sources of funding include the Renewable Resources Extension Act (USDA), State Water Resources Control Board, and the Environmental Protection Agency, University of California Division of Agriculture and Natural Resources and USDA Soil Conservation Service.

## Rangeland Watershed Program

*A Water Quality Education & Technical Assistance Program for California Rangelands*

### PROGRAM UPDATE

*U.C. Cooperative Extension and U.S.D.A. Soil Conservation Service*

November 1991

#### Program Introduction

This Program Update introduces you to a 5-year educational and technical assistance program conducted jointly by the University of California Cooperative Extension and the USDA Soil Conservation Service — **The Rangeland Watershed Program**. Recognizing that there are many efforts addressing watershed management in California, this program does not intend to duplicate existing efforts but rather be directed to rangeland watershed management on private lands with an emphasis on water quality management planning. We also recognize the need to involve other lands (forest, cropland, and urban) when dealing with watershed management and will coordinate with existing programs as appropriate in developing local water quality management plans. This program can provide a means of information flow among current watershed projects on rangelands that appears to be lacking at this time. Our first efforts are directed to making people aware of rangeland water quality issues and to existence of this program.

The Rangeland Watershed Program (Fact Sheet No. 2) is designed to support a broader statewide water quality management plan being developed by the Range Management Advisory Committee (Fact Sheet No. 1). The key points of this program are:

- It is a joint SCS and CE effort
- It is directed to privately owned rangelands
- It supports the Statewide Rangeland Water Quality Management Program
- It uses time-tested technical assistance, education and field research approaches:
  - Assists with identification of local rangeland water quality issues and solutions
  - Develops an approach to Best Management Practices
  - Prepares Educational materials
  - Conducts field days, workshops, demonstrations
  - Develops and tests monitoring methods

#### Program Support

Program activity has started by redirection of individual efforts of the Extension Range Specialists and the SCS State Range Conservationist along with a growing redirection of county and field staff time. While additional staff would allow for more rapid and extensive implementation of the program, budget and staff constraints suggest we have to be more efficient through this joint effort. However, there is a critical need identified for a statewide rangeland watershed hydrologist in Cooperative Extension to assist with the networking among hydrologists within the University of California and elsewhere to complement the vegetation management expertise we now have.

In accordance with applicable State and Federal laws and University policy, the University of California does not discriminate on the basis of race, religion, color, national origin, sex, marital status, sexual orientation, age, ancestry, ethnic, national, or linguistic background, or handicap. Inquiries regarding this policy may be addressed to the Affirmative Action Officer, University of California, Agriculture and Resources, 300 Lakeside Drive, 4th Floor, Oakland, CA 94612-3560, (510) 987-0297.

University of California and U.S. Department of Agriculture cooperating.

Supplemental program funding support comes from a 2-year project agreement—"Rangeland Water Quality Education and Technology Assistance"—with the State Water Resources Control Board and allocations from the Renewable Resources Extension Act funds.

### Program Plans

---

To carry out the program over the next two years the following tasks are stated in the agreement with the State Water Resources Control Board. These are the plans at this point of time which allow for modification as needs arise.

#### *Acquire and Organize Information*

A major task is the acquisition and organization of information relating to rangeland watershed and water quality management from agencies, universities, demonstration projects, and personal contacts throughout the U.S. The information will be organized into files and cataloged in a computer data base to ease access to specific information. The location of the files will be in the Agronomy and Range Science Department, UC Davis.

#### *CE and SCS Training*

Internal training is directed to keep the field staff informed of program developments, their role in program implementation, and technical proficiency in watershed management and planning processes. The general topics to be presented are as follows:

March 1992	Program update and implementation at Red Bluff, Santa Rosa, Fresno, Riverside, and Davis
May/June	Field workshops on conservation plans and use of BMPs in Ukiah, Fresno, and Susanville areas
Fall 1992	Watershed and water quality research and demonstrations in California
Spring 1993	Riparian Management and Monitoring
Fall 1993	Watershed Hydrology and Monitoring

#### *Workshops, Field Days, and Short Courses*

Local workshops and field days for landowners and other interest groups will be delivered by CE Specialists, CE farm advisors, and SCS Conservationists for the purpose of: 1) recognizing the water quality problems and their solutions, and 2) supporting the development and implementation of local, regional, and state water quality management plans. These educational efforts will include aspects of nonpoint source pollution assessments, healthy watersheds/rangelands, conservation (including water quality management) planning, the development and use of Best Management Practices, and dealing with watershed level planning problems. Ranch Planning and Analysis and Grazing Management Short Courses will continue to be delivered at local levels, often involving two or three counties.

#### *Educational Materials*

**Fact Sheets:** The fact sheets will be a major part of the educational materials. They will be short, easy to read treatments on a number of topics directed at explanations of laws, regulations, and terms; technical aspects of watershed management; and approaches to water quality management plans. We are interested in

### Proposed Water Quality Management Plan Sections

#### Program Phases

**Development** — Organizing efforts which will terminate with the submission of a State Rangeland Water Quality Management Plan to the State Water Resources Control Board (18 months to 2 years).

**Implementation** — Agencies, organizations, groups, and individuals at state, regional, and local levels carry out water quality management efforts.

1. Status of Water Quality and Soil Stability on California Rangelands
2. Statutory Authorities, Mandates and Programs for Water Quality and Watershed Protection
3. Local (watershed) Water Quality Management Planning Guidelines
4. Sources of Assistance
5. Development of Management Measures (BMPs)
6. State Agency Water Quality Responsibilities
7. Monitoring Program and Practice Performance

#### Program Activities

##### *At the Local Level*

- Identify local water quality problems and causes
- Facilitate Coordinated Resource Management Programs
- Access to assistance and funds for local projects
- Refine management measures for local application
- Assist landowners in developing management plans
- Provide for localized monitoring

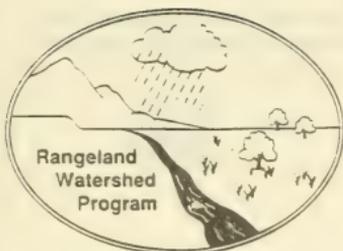

##### *At the State Level*

- Assess and prioritize quality problems and risks
- Provide program administration and local assistance
- Provide program monitoring, evaluation, and reporting
- Draft State Plan

#### Program Task Force

Jim Clawson, Extension Range Specialist, Agronomy & Range Science, University of California, Davis, (916) 752-3455  
 Cathy Bleier, Exec. Secty, RMAC, CDF&FP, FRRAP, P. O. Box 944246, Sacramento, (916) 322-0623  
 Mel George, Ext. Range/Pasture Specialist, Agronomy & Range Science, University of California, Davis, (916) 752-1720  
 Leonard Jolley, State Range Conservationist, USDA-SCS, 2121 C Second St., Suite 102, Davis, CA, (916) 449-2854  
 Greg Greenwood, CDF&FP, FRRAP, P. O. Box 944246, Sacramento, CA (916) 327-5780

## Rangeland Watershed Program

*A Water Quality Education & Technical Assistance Program for California Rangelands*

# FACT SHEET

*U.C. Cooperative Extension and U.S.D.A. Soil Conservation Service*

No. 1

August 1991

### California Rangeland Water Quality Management Program

#### Range Management Advisory Committee Priority

In response to the Federal Water Pollution Control Act (Clean Water Act) and the California Porter-Cologne Act mandating control of nonpoint source pollution, the Range Management Advisory Committee to the State Board of Forestry has identified water quality protection as a major rangeland issue and has assumed a lead role in presenting a program for developing and implementing a Water Quality Management Plan on private rangelands in California.

#### Program Purpose

To maintain and improve the quality and beneficial uses of surface water as it passes through and out of California's private rangelands.

#### Program Objectives

Develop and implement a water quality management plan that complies with the Clean Water Act requirements and includes:

- voluntary implementation
- local management decisions
- public involvement
- using existing technology
- cooperation with landowner assistance agencies
- a strong education and technical assistance support
- monitoring of adoption, performance of management measures, and program goals

#### Background

Rangeland is the most extensive land-type in California, more than 40 million acres of the state's 101 million acres with about one-half (20 million acres) in private ownership (but representing 90% of the forage base for the state's range livestock). Eight of California's 12 major drainage basins are dominated by vegetation-types that are commonly grazed. The precipitation that falls on California rangeland represents only about 15% of the total surface water source (7.9 million acre feet), but the location of rangelands between the forested areas and major river systems means that almost all surface water in California passes through rangeland. In addition, two-thirds of the major reservoirs are located on rangeland. The quality of California's surface waters is, therefore, greatly influenced by the hydrology of rangelands. Erosion assessments in California estimate erosion averages of 3.3 tons/ac/yr from sheet and rill erosion on one-third of private rangelands, while streambank erosion is another potential source of sediment on over 9,000 miles of streambanks.

acquiring, organizing, synthesizing, and distributing information for a better understanding of this issue. Please feel free to contact us on possible topics. The proposed group titles give you an idea of information to be covered by the fact sheets:

1. Water Quality and Nonpoint Source Pollution Regulations
2. Water Quality Management Planning
3. Riparian Area Management
4. Research and Demonstration Updates
5. Watershed Hydrology
6. Watershed Monitoring
7. Riparian Area Monitoring
8. Range and Ranch Management

**Visual Media:** Materials supporting the information in the fact sheets and field programs will be developed for use by Cooperative Extension and the Soil Conservation Service in the implementation of this program.

**Program Updates:** Periodic "updates" of program activities will be distributed to all interested as the major means of keeping you informed.

**News Releases:** News releases and news stories will be developed as part of the public education efforts of the program and be distributed to a network of newspapers and interest publications.

CLEAN WATER ACT REAUTHORIZATION  
APRIL 22, 1993

I.) INTRODUCTION

II.) STRENGTHENING ENFORCEMENT OF THE CLEAN WATER ACT

A.) THE PROBLEM: CLEAN WATER ENFORCEMENT  
IS "WEAK AND SPORADIC"

B.) TOUGHER ENFORCEMENT IS WORKING IN NEW JERSEY

C.) THE SOLUTIONS:

1. IMPROVE GOVERNMENT ACCOUNTABILITY
  - a) SET MANDATORY MINIMUM PENALTIES
  - b) PROHIBIT PROFITING FROM POLLUTING
  - c) IMPROVE INSPECTIONS AND DISCHARGE REPORTING
  - d) LIMIT ISSUANCE OF PERMITS TO "BAD ACTORS"
2. STRENGTHEN CITIZEN SUIT PROVISIONS
  - a) CITIZENS SHOULD BE ABLE TO SUE FOR PAST VIOLATIONS
  - b) DEFINITIONS OF STANDING SHOULD BE CLARIFIED
3. INCREASE CITIZEN'S RIGHT TO KNOW THROUGH WATER POSTINGS

III.) PREVENTING TOXIC POLLUTION

A.) THE PROBLEM: CLEAN WATER ACT FAILS  
TO PREVENT POLLUTION

B.) THE SOLUTIONS

1. PHASEOUT THE MOST HAZARDOUS SUBSTANCES
2. REDUCE THE USE OF ALL OTHER TOXIC CHEMICALS
  - a. REQUIRE POLLUTION PREVENTION PLANS
  - b. REQUIRE THAT POLLUTION PREVENTION BE TAKEN INTO CONSIDERATION WHEN SETTING PERMIT LIMITS

## I.) INTRODUCTION

My name is Carolyn Hartmann. I am a staff attorney with the U.S. Public Interest Research Group (U.S.PIRG). U.S.PIRG is the national lobbying office for state PIRGs in over 30 states. PIRGs are nonpartisan, nonprofit environmental and consumer advocacy groups with over 1 million members nationwide.

For over two decades, State PIRGs have fought to clean our waterways. PIRGs have played a key role in helping to pass pollution prevention and toxics use reduction laws in Massachusetts, New Jersey, Vermont and Oregon. We have filed over 60 Clean Water citizen suits and helped to pass the country's strongest Clean Water enforcement law in New Jersey.

We urge Congress to bring some of these lessons learned at the state level up to the national level and incorporate them into the federal Clean Water Act. Although my written testimony covers a number of these programs, I will focus my statements today on our recommendations for strengthening the enforcement provisions of the Clean Water Act.

## II.) STRENGTHENING ENFORCEMENT OF THE CLEAN WATER ACT

### A. THE PROBLEM: CLEAN WATER ENFORCEMENT IS "WEAK AND SPORADIC"

Strong enforcement of the Clean Water Act is fundamental to the success of the program. Unfortunately, studies conducted by the General Accounting Office, the Inspector General's office, states and environmental groups demonstrate that discharge violations are routinely ignored even for serious and chronic violators. In addition, economic benefits are often not taken into consideration when penalties for violations are determined.

This lax enforcement of the Clean Water Act greatly reduces incentives to comply with the law. Richard Hembra, Director of Environmental Protection Issues at the U.S. General Accounting Office, testified before this subcommittee during the last congress. In describing GAO's findings regarding enforcement of the Clean Water Act, Mr. Hembra said the following:

"Our work...clearly indicates that enforcement of our Nation's water quality laws continues to be weak and sporadic. Despite serious and longstanding violations, most enforcement actions are informal slaps on the wrist rather than formal actions, such as administrative fines and penalties. Further, even in the relatively few cases where penalties have been assessed, they are often significantly reduced or dropped without adequate documentation." (May 14, 1991)

Mr. Hembra concluded by stating:

"the ability of our Nation's environmental laws to protect health and the environment depends greatly on effective enforcement programs. Without enforcement, dischargers have little incentive to incur the cost of pollution control. At the same time industrial discharges that do abide by program requirements are unfairly placed at a competitive disadvantage with those who choose not to invest in pollution control equipment and practices."

John Martin, Inspector General U.S. Environmental Protection Agency testified before the Senate Environmental Protection Subcommittee last congress (July 18,1991) on enforcement under the Clean Water Act. The Inspector General's office conducted a

series of audits to examine the effectiveness of the NPDES permit enforcement program and "concluded that enforcement actions taken by the EPA and the States were frequently ineffective in returning major municipal and industrial violators to compliance." Some of the examples of serious and chronic violators from the IG's audit are startling:

"...a wood preserving operation in Virginia had a history of environmental problems that caused surface and groundwater contamination. Although five enforcement orders were issued for violations of its NPDES permits, not one penalty was assessed in 13 years of operation. Eventually, this facility was listed as a Superfund site, but it was not until two years later that its discharge permit was finally revoked."

"...a municipality paid only \$7,800 for numerous NPDES permit violations over several years. This included \$3,200 for two instances in which more than 1600 fish are killed because of the violations. For exceeding a discharge limitation, this municipality was fined \$1,000; we estimated the penalty could have been \$390,000."

This is not to say that the maximum penalty is always in order, but that the penalty must reflect the severity of the violation and create an incentive to comply with the law. The IG's audits found that in 46 of the 69 NPDES cases evaluated, the penalty assessments were not sufficient to recover the economic benefit gained by noncompliance. The Inspector General concluded that "[w]hen penalties are reduced to below what it would cost to comply with the environmental laws, they encourage rather than deter noncompliance. Small fines and lengthy time limits to achieve compliance promote a pay-to-pollute mentality."

The Clean Water Act enforcement program should be strengthened to create greater incentives to comply with the law by setting mandatory minimum penalties for serious and chronic violators, prohibiting profits from polluting, strengthening the reporting and inspection requirements, and strengthening the citizen suit provisions in the law.

## B.) TOUGHER ENFORCEMENT IS WORKING IN NEW JERSEY

In May 1990 Governor Jim Florio signed into law the New Jersey Clean Water Enforcement Act. U.S. PIRG believes that this law provides a model for improved enforcement of the federal Clean Water Act and is working with Congressman Frank Pallone (D-NJ) to introduce legislation modeled on the New Jersey law.

The New Jersey Clean Water Enforcement Act requires---

- The New Jersey Department of Environmental Protection and Energy (NJDEPE) to increase inspections at permitted facilities and assess mandatory minimum penalties for certain violations; and
- Permittees to submit monthly discharge monitoring reports.

Just last month, the NJDEPE released their "Second Annual Report of the Clean Water Enforcement Act." The Executive Summary of this report is attached at Appendix I of this testimony.

The NJDEPE report found the following:

Inspections of facilities show that more facilities are attaining compliance. The number of facilities which inspections found "unacceptable" decreased from 792 in 1991 to 505 in 1992.

The average penalty assessed in each formal enforcement action has decreased. Because the Act requires the NJDEPE to conduct more frequent inspections of facilities operated by "significant noncompliers," the agency finds violations more quickly and takes timely action. This results in reduced average penalties.

Compliance with the self-reporting requirements is improving. The number of violations for failure to submit discharge monitoring reports (DMR) decreased from 59 in the last six months of 1991 to 38 for all of 1992.

Permit actions by the NJDEPE increased by nearly 140% over 1991. Permit actions, which include issuing new permits, renewing permits, and modifying or terminating permits, went from 265 in 1991 to 630 in 1992. New permits more than doubled---162 in 1992 compared with 73 in 1991---and permit modifications more than quadrupled---317 in 1992 compared with 75 in 1991.

## C.) THE SOLUTIONS

Enforcement of the Clean Water Act should be strengthened to improve government accountability and remove current obstacles to citizen suits.

### 1.) IMPROVE GOVERNMENT ACCOUNTABILITY

#### a.) SET MANDATORY MINIMUM PENALTIES

Noncompliance must be addressed quickly rather than waiting for patterns of chronic violation to develop. Uniform minimum responses to violations by regulators will decrease average penalties assessed and bring violators into compliance more rapidly. Uniform minimum penalties which do not favor some discharge methods over others, also reduces incentives to shift discharges from surface or ground water or sewage treatment facilities, for example.

To address the issue of chronic significant violations of the Clean Water Act we recommend that state programs be required to establish mandatory minimum penalties for "serious violations" of and for "significant noncompliance" with the Act based on current U.S. EPA and New Jersey's Clean Water Enforcement Act definitions.

Congress should amend the Clean Water Act to require that a mandatory minimum penalty of \$1,000 per violation be assessed for "serious violations" which includes--

- (1) discharge violations of a toxic substance that is 20% or more over the permitted limit or
- (2) discharge violations of a nontoxic substance that is at least 40% over the permitted limit.

In addition, the Clean Water Act should be amended to require that any facility determined to be in "significant noncompliance" be assessed a mandatory minimum penalty of \$5,000 per day per violation. We recommend that the definition of "significant noncompliance" be based on EPA's current criteria<sup>1</sup> and would apply if any of the following occur:

- 1) Two serious violations of any pollutant during any 6-month period;
- 2) Four exceedances of a monthly average limit for any pollutant, by any amount, in any 6-month period; or
- 3) Two instances of failure to submit Discharge Monitoring Reporting within any 6-month period.

#### **b.) PROHIBIT PROFITS FROM POLLUTING**

The existing Clean Water Act allows "economic benefits" to be taken into consideration in assessing penalties. Unfortunately, this authority is greatly underutilized. In June 1991, the GAO released findings from their review of the use of economic benefits in penalty assessments which found that "in nearly two out of three penalty cases concluded in fiscal year 1990 in EPA's air, water, hazardous waste, and toxic substances programs, there was no evidence that economic benefits had been calculated or assessed."<sup>2</sup>

To recoup economic benefits and create disincentives to violate the law, we recommend that penalty assessments for violations by direct and indirect dischargers proceed in two steps:

---

<sup>1</sup>. The criteria used by EPA to define "significant noncompliance" are: 1) two exceedances of a monthly average limit in any 6-month period that meet the following criteria: 40% over limit for conventional pollutants and nontoxic metals, 20% over limit for toxic pollutants; or 2) four exceedances of a monthly average limit in any amount in any 6-month period.

<sup>2</sup>. Environmental Enforcement: Penalties May Not Recover Economic Benefits Gained by Violators, GAO/RCED-91-166, June 1991.

i) Any economic gain enjoyed by the violator should be determined. The penalty should not be reduced below the portion of the penalty that represents economic gain.

ii) The punitive portion of the penalty should be determined but should not be reduced through compromise by more than 25%.

### c.) IMPROVE DISCHARGE REPORTING AND INSPECTIONS

Access to accurate and consistent reporting is fundamental to the success of the Clean Water Act's permitting and enforcement programs. Without accurate monitoring and reporting of discharges, protection of waterways is impossible.

Currently, there are great discrepancies between the National Pollutant Discharge Elimination System (NPDES) for direct dischargers to surface waters and the National Pretreatment Program requirements for industrial users of publicly owned sewage treatment plants (POTWs). Monitoring and reporting requirements are often less stringent for indirect discharges to POTWs. This creates incentives to discharge to POTWs. In addition, public access to both types of reporting is poor.

NPDES permit holders file their monitoring reports with the states. Filing of these reports occurs months after they are submitted, and are filed in district offices rather than in one central location. Indirect dischargers to POTWs generally file monitoring reports with the relevant municipality, and the data is not compiled in a national computerized database.

The lack of adequate information on discharges remains a problem for regulators and citizens. All dischargers to surface waters, ground waters, and publicly owned treatment works should be required to increase frequency of data reporting. This would serve to increase timeliness of the data and prevent violators from masking the severity of their violations through averaging of data points over long periods of time.

To improve access to discharge reporting, Congress should amend the Clean Water Act to require--

(1) all facilities discharging to ground waters, surface waters or treatment works facilities to submit discharge monitoring reports (DMRs) on a monthly basis;

- (2) DMRs be signed by the highest ranking official at the plant with day to day operational responsibilities;
- (3) all Significant Industrial Users (SIUs) of POTWs should be required to file their monitoring reports with the states and with EPA regional offices, and states should be required to input this data into the EPA Permit Compliance System; and
- (4) EPA to make compliance data on EPA's computerized Permit Compliance System available to the public by computer telecommunication, similar to the existing citizen access to Toxics Release Inventory data under the Emergency Planning and Community Right to Know Act.

Inspections of permitted facilities tend to be superficial "walk throughs" that do not require independent sampling to verify the accuracy of discharge data submitted by the permittee. In some instances, facilities receiving permits for the first time are not even inspected before the permit becomes effective. The reliance of the Clean Water Act on self-reported information makes verification an important component of successful implementation.

Congress should amend the Clean Water Act to require that---

- (1) Permitted facilities be inspected once a year and that the inspection should, at a minimum, include a review of housekeeping measures, sampling techniques, maintenance records and independent sampling of the permittee's effluent;
- (2) If a facility is in "significant noncompliance of the Act or is renewing a permit, an inspection should be conducted within 3 months; and
- (3) If a facility is being permitted for the first time, an inspection should be conducted prior to the effective date of the permit.

New Jersey has implemented this improved inspection program and have credited it with bringing compliance up and average penalties down because the most serious violations are caught earlier.

**(d) LIMIT ISSUANCE OF PERMITS TO "BAD ACTORS"**

"Significant noncompliers," as defined in the discussion on mandatory minimum penalties, should be considered "bad actors" under the Clean Water Act and as such, Congress should prohibit issuance of new permits to any person who has been identified as a "significant noncomplier" until the Administrator or the States in which the violations occur determine that the conditions giving rise to such violations have been corrected.

**2.) REMOVE CURRENT OBSTACLES TO CITIZEN SUITS**

Citizen suits are a tried and true method of bringing polluters into compliance with the Clean Water Act. The 1972 Clean Water Act included authority for citizens to sue polluters, thereby, recognizing that the U.S.EPA and states might be unable or unwilling to aggressively pursue all violators.

The U.S. Department of Justice's Statistical Report for Fiscal Year 1992 acknowledges the "dedication, hard work and effort put forth by the private citizen groups and others who sue non-government polluters for violating the nation's environmental laws." The report goes on to say---

These groups perform a valuable public service by joining the Federal Government in seeking compliance with a host of environmental statutes, particularly the Clean Water Act. Over the past 4 fiscal years, they have collectively recovered for the United States Treasury over \$9 million in penalties and interest.

The penalties recovered are listed Table I.

While the existing citizen suit provisions have allowed significant enforcement activity, they contain a number of obstacles to citizen enforcement that should be removed.

**a.) CITIZENS SHOULD BE ABLE TO SUE FOR PAST VIOLATIONS**

A 1987 Supreme Court case, Chesapeake Bay Foundation v. Gwaltney of Smithfield, Ltd., 484 U.S.49 (1987), seriously weakened the deterrent effect of civil actions.

Table I - from the U.S. Department of Justice Statistical Report FY 1992

## CITIZEN ENFORCEMENT SUITS

The Division gratefully acknowledges the dedication, hard work and effort put forth by the private citizen groups and others who sue non-government polluters for violating the nation's environmental laws. These groups perform a valuable public service by joining the Federal Government in seeking compliance with a host of environmental statutes, particularly the Clean Water Act. Over the past 4 fiscal years, they have collectively recovered for the United States Treasury over \$9 million in penalties and interest. These groups are recognized below with our thanks and appreciation.

Public Interest Research Group of New Jersey	\$5,915,161.97
Sierra Club Legal Defense Fund	1,184,214.00
Atlantic States Legal Foundation	1,039,133.25
Natural Resources Defense Council (NRDC)	645,500.00
Chesapeake Bay Foundation	299,822.00
Public Interest Research Group of Massachusetts	122,650.00
Public Interest Research Group of Ohio	100,000.00
State of Missouri	100,000.00
Westchester Fish, Game & Wildlife Association	60,000.00
Friends of the Earth	27,013.70
Hudson River Fishermen's Association	25,000.00
Public Interest Research Group of Illinois State	25,000.00
Save the Bay (Rhode Island)	22,450.00
Pennsylvania Environmental Defense Foundation	20,000.00
Ohio Environmental Council	15,000.00
Connecticut Fund for the Environment	10,000.00
Village of Kildeer	10,000.00
Braxton Citizens for a Better Environment	8,000.00
Arkansas Wildlife Federation	5,000.00
State Line Fishing & Hunting Club	5,000.00
Tennessee Environmental Council	5,000.00
National Environmental Foundation	2,000.00
American Littoral Society	1,000.00
City of New York	1,000.00
State of Rhode Island	1,000.00
<b>TOTAL:</b>	<b>\$9,648,944.92</b>

Section 505(a) (1) of the Clean Water Act provides that any citizen may commence a civil action against any person "alleged to be in violation of" the Act. The Supreme Court, in Gwaltney, interpreted those words to mean that citizens cannot sue for "wholly past" violations, i.e., a case in which all violations occur before the complaint is filed and citizens can not allege in good faith that violations may be continuing.

The result of Gwaltney is that companies have an incentive to delay compliance until citizens notify them of intent to sue. The company then has 60 days to get itself into compliance and avoid all penalties and keep any economic benefit from the violation. This greatly undermines the deterrent effect of citizen suits.

The Congress amended the Clean Air Act in 1990 to allow citizens to commence action against any person "who is alleged to have violated (if there is evidence that the alleged violation has been repeated) or to be in violation" of the Act.<sup>3</sup> We urge Congress to make similar amendments to the Clean Water Act. Congressman Pallone's Clean Water Enforcement Act would amend the Clean Water Act to allow citizens to sue for past violations and remedy the effects of Gwaltney.<sup>4</sup>

#### **b.) CITIZEN SUITS SHOULD NOT BE PRECLUDED BY STATE ENFORCEMENT ACTIONS**

Since 1972, the Clean Water Act has barred citizen suits if they would duplicate earlier-filed judicial enforcement proceedings by the state or the EPA. In 1987, Congress gave EPA new authority to assess administrative civil penalties and extended the

---

<sup>3</sup>. 1990 Clean Air Act Amendments, section 304(a).

<sup>4</sup>. Congressman Pallone's Clean Water Enforcement Act would amend Section 505(a) to authorize suits against persons "alleged to have violated, or to be in violation" of the Act. In addition, Section 505(f)(6) which allows citizen suits only for violations of a permit "which is in effect under this Act" would be changed to include a permit "which has been, or is, in effect under the Act. Section 505(b)(1)(A) which currently requires citizen's to give 60-days' advance notice of suit to the alleged violator, EPA and the State in which the alleged violation "occurs" would be changed to the State in which the alleged violation "has occurred or occurs." And Section 505(g) which provides that the "term 'citizen' means a person or person having interest which is or may be adversely affected" would be changed to include an interest "which has been, is, or may be adversely affected."

preclusive effect to these EPA actions.<sup>5</sup> In addition, Congress extended the preclusive effect to state administrative actions "under a State law comparable to this subsection."<sup>6</sup> The latter provision can bar both citizen and EPA prosecutions.

The question of whether a citizen suit is precluded by a government action depends on (1) the timing of the citizen suit, (2) whether the government is diligently prosecuting an action, and (3) whether the state law is comparable to the federal law.

For government judicial enforcement actions, citizens are not precluded if they wait for 60 days after the sending of the notice letter and file their complaint in court before the government.<sup>7</sup> However, for government administrative actions, citizens are not precluded if they send their notice letter or file the complaint before the administrative proceeding is commenced.

The Clean Water Act allows duplicative EPA or citizen suits, along with state administrative actions, to be prosecuted simultaneously where the state has failed to diligently prosecute an action or where state law is not comparable to the federal Clean Water Act, regardless of when the state action was filed. [section 309(g)(6)(A)]

Recent court decisions have overbroadly interpreted the ability of state actions to preclude citizen suits under the Clean Water Act.<sup>8</sup> These decisions severely undermine both federal and citizen enforcement and encourage violators to negotiate private, sweetheart deals with state governments that may impose inadequate penalties.

EPA determined that "these decisions disregard the plain language of the Clean Water Act, relevant legislative history, and the contemporaneous EPA interpretation of"

<sup>6</sup>. 33 U.S.C. sec. 1319(g)(6)(A)(ii).

<sup>7</sup>. 33 U.S.C. sec.1365(b)(1)(B).

<sup>8</sup>. See North and South Rivers Watershed Association v. Scituate, 949 F.2d 552 (1st Cir. 1991); Connecticut Coastal Fisherman's Ass'n v. Remington Arms Company, Inc., 777 F.Supp 173 (D. Conn.1991); ASLF v. Eastman Kodak Corp., 933 F.2d 124 (2nd Cir. 1991); New York Coastal Fishermen's Ass'n v. New York City Department of Sanitation, 772 F.Supp. 162 (S.D.NY 1991).

the law.<sup>9</sup> EPA recommended that the Clean Water Act should be amended to clarify or delete the provision by which some State enforcement actions bar the imposition of a Federal civil judicial penalty. We agree with this recommendation.

Congress should amend the Clean Water Act to delete the provision by which some State enforcement actions bar citizen suits.<sup>10</sup>

### c.) DEFINITION OF CITIZEN STANDING SHOULD BE CLARIFIED

The definition of "citizen standing" determines who has the authority to sue violators. Congress intended to confer to citizens standing to the limits of the Constitution. Section 505(g) of the Clean Water Act provides that the "term 'citizen' means a person or persons having an interest which is or may be adversely affected."

The court in PIRG v. Powell Duffryn Terminals [913 F.2nd 64 (3rd Cir. 1990), Cert. denied, 111S.Ct 1018(1991)] held that plaintiffs must show that defendants discharged a pollutant which "causes or contributes to the kinds of injuries alleged by the plaintiffs." [931 F2nd at 72-73] This standard not only places an improper burden on plaintiffs to demonstrate harm to water quality but is also contrary to both congressional intent and Supreme Court decisions.

The Congress decided in 1972 that government regulators "need not search for a precise link between pollution and water quality." [S.Rep.No. 414, 92nd Cong.,1st Sess. 7 (1971)] Congress determined that all pollution is harmful, no one has a right to pollute and pollution is temporarily permissible only because of technological limitations. Citizens should not have to meet a test for standing that is more stringent than the test for holding polluters liable for permit violations.

The Supreme Court held in Valley Forge Christian College v. Americans United for Separation of Church and State [454 U.S.464, 472 (1982)] that, under Article III of the Constitution, a plaintiff must show (1) injury in fact (2) which is fairly traceable to

---

<sup>9</sup>. U.S.EPA, Discussion Paper: Analysis of Possible Revisions to the Clean Water Act, March 27, 1992.

<sup>10</sup>. The Pallone Clean Water Enforcement bill would strike section 309(g)(6)(A)(ii) and amend section 309(g)(6)(A)(iii) by striking the "Secretary, or the State" and inserting "or the Secretary" and "or comparable State law, as the case may be."

defendant's illegal conduct and (3) which is likely to be redressed by a favorable decision. Courts have found that the "injury in fact" requirement has been met by evidence that persons use the water downstream from the defendant's discharge, or would use the water if it were not polluted. In addition, courts have held that the "fairly traceable" requirement does not mean that plaintiffs must show to a scientific certainty that defendant's pollution caused plaintiff's injuries.

To clarify Congressional intent, Congress should add the following "finding" to the statute:

Congress finds that a discharge which results in a violation of this Act or a regulation, standard, limitation, requirement, or order issued pursuant to this Act interferes with the restoration and maintenance of the chemical, physical, and biological integrity of the water system into which the discharge occurs, including any downstream waters, and, therefore, harms users of such water system.

In addition, Congress should amend the definition of "citizen" in Section 505(g) of the Clean Water Act by adding the following language:

...including a person who uses the water system (or associated natural resources) into which the discharge occurs or who would use that system if it were less polluted, or was otherwise adversely affected by the discharge."

**d. COURTS SHOULD HAVE GREATER FLEXIBILITY IN DETERMINING THE DISPOSITION OF PENALTIES AND SETTLEMENT FUNDS.**

The Department of Justice has objected to numerous settlements on the ground that payments have been made to environmental projects rather than the U.S. Treasury. Congress intended there to be greater flexibility in determining the disposition of penalties and settlement funds. The conference report on the 1987 amendments to the Act states that these mitigation projects "preserve the punitive nature of enforcement actions while putting the funds collected to use on behalf of environmental protection." [H. Rep. No. 1004, 99th Cong., 2nd Sess.139 (1986)]

The Clean Water Act should be amended to clarify the intent of Congress. The following language should be added to Section 309(d) and 505(a): "The court may, in the court's discretion, order that a civil penalty be used for carrying out mitigation projects

which are consistent with this Act and which enhance the public health or the environment."

### 3.) INCREASE CITIZEN'S RIGHT-TO-KNOW THROUGH WATER POSTINGS

Citizens have a right to know when significant threats to their health or environment are present in their communities. The public should have access to information regarding the discharge of toxins and other pollutants into the waterways in which they swim and fish. One-third of the nation's remaining productive shellfish waters are closed on any given day because of pollution.<sup>11</sup> In addition, in 1991, U.S. ocean and bay beaches were closed or advisories issued against swimming on more than 2,000 occasions in the coastal states that monitor beach water quality. High levels of bacteria--primarily from raw human sewage---are responsible for the overwhelming majority of these closures and advisories.<sup>12</sup>

Despite these facts, there are no federal requirements that the public be notified when water quality standards are violated. Nor are there uniform requirements for determining the nature and extent of fish and shellfish bans, advisories and consumption restrictions. Congress should amend the Clean Water Act to---

- (1) Require public postings at waterways that do not meet applicable water quality standards or are subject to a fishing or shellfish ban, advisory or consumption restriction;
- (2) Require NDPES permit holders to maintain clearly visible signs indicating that the facility discharges into waterways and other information helpful for gaining greater information regarding those discharges;
- (3) Require POTWs to include, in customers' quarterly bills, information regarding their permit including a list of their violations over the preceding 12-months; and
- (4) Require the EPA to develop uniform standards for posting bodies of water and requirements for determining fishing and shellfish advisories.

### III.) PREVENTING TOXIC POLLUTION

#### **A.) THE PROBLEM: CLEAN WATER ACT FAILS TO PREVENT POLLUTION**

The 1972 Clean Water Act set a goal of eliminating the discharge of pollutants by 1985, and a policy of prohibiting the discharge of toxic pollutants in toxic amounts. The current Clean Water Act is far from reaching these goals.

- According to the EPA, 30 percent of our rivers and more than 50 percent of our streams are not safe for swimming, fishing or other uses.
- 50% of our states have issued health advisories urging only limited consumption of fish from their waters due to mercury contamination.
- U.S. industries report sending an estimated 448 million pounds of toxic chemicals down drainpipes and sewers each year.

These problems are due, in part, to the Clean Water Act's failure to include requirements and programs for preventing pollution at the source and reducing or eliminating the use of toxic chemicals. The current permitting process allows companies to shift toxics from one environmental media to another (from water to air, for example) rather than encouraging companies to reduce their use of toxic chemicals. Congress should incorporate pollution prevention into the framework of the Clean Water Act.

#### **B.) THE SOLUTIONS**

##### **1. PHASEOUT THE MOST HAZARDOUS SUBSTANCES**

Some substances are so hazardous to human health and the environment, even in infinitesimally small quantities, that they should be phased out (or sunsetted) over time and replaced with safer alternatives. The current NPDES system is based on the assumption that waterways are capable of absorbing certain quantities of toxic materials. This simply does not hold true for some substances.

Toxic substances that persist in the environment over long periods time, for example, should be targets for sunseting. In addition, toxic substances that bioaccumulate or increase in the body tissue of organisms as we move up the food chain should be targets for sunseting.

Congress should amend the Clean Water Act to set up a program for targeting sunset candidates. Toxicity, persistence, and ability to bioaccumulate should be used as criteria for identifying the sunset candidates. The identification of sunset candidates should be separate from the establishment of the sunset process.

## 2. REDUCE THE USE OF ALL OTHER TOXIC CHEMICALS

### a. REQUIRE POLLUTION PREVENTION PLANS

All NPDES permittees who currently report on their toxic releases and hazardous waste byproducts under the Emergency Planning and Community Right to Know Act should be required to develop pollution prevention plans as a condition of obtaining a new or undated permit. A number of states, including Massachusetts, New Jersey, Oregon, Indiana, and Vermont have already started to require large toxic chemical users to develop pollution prevention plans.

A 1992 survey of companies' pollution prevention activities conducted by the research organization<sup>13</sup>, INFORM, found the following:

- One-quarter of the source reduction projects required no capital investment and just under half required investments of \$100,000 or less.
- Nearly two-thirds of the projects were completed in 6 months or less including research and development.
- Over 60 percent of the projects had payback periods of six months or less.

Despite these promising findings, INFORM also found that the prevailing corporate focus continues to be on traditional end-of-pipe controls for toxic pollution. By requiring companies to examine their production processes and look for pollution prevention options, the Clean Water Act can start to shift this focus. Pollution prevention planning combined with public reporting on toxic chemical production and use should be incorporated into the Clean Water Act's permitting process.

The pollution prevention planning program should require facilities to complete

---

<sup>13</sup>. Environmental Dividends: Cutting More Chemical Wastes, INFORM, Mark Dorfman, Warren Muir, Catherine Miller, 1992.

the following as a condition of receiving a NPDES permit:

- 1) Identify their production processes;
- 2) Determine the "flow" of chemicals on both a facility-wide and production process level;
- 3) Review pollution prevention options;
- 4) Set goals for reducing the use of toxic chemicals; and
- 5) Make their goals, certain toxic chemical use data and a summary of their plans available to the public.

**b. REQUIRE THAT POLLUTION PREVENTION BE TAKEN INTO CONSIDERATION WHEN SETTING PERMIT LIMITS**

To date, the EPA has failed to make effective use of effluent guidelines and pretreatment standards as a mechanism for promoting pollution prevention. To shift the focus of the permitting process toward prevention and prevent cross media pollution shifting, Congress should amend the Clean Water Act to require EPA to consider pollution prevention options when setting effluent guidelines and pretreatment standards.

## EXECUTIVE SUMMARY

New Jersey's Water Pollution Control Act ("WPCA") is intended to restore, enhance and maintain the integrity of New Jersey's waters. Under the WPCA, the Department of Environmental Protection and Energy ("DEPE" or "the department") administers the New Jersey Pollutant Discharge Elimination System ("NJPDDES") to regulate discharges of pollutants to these waters. The United States Environmental Protection Agency ("EPA") has approved the NJPDDES program and thereby delegated to New Jersey the authority to implement the water pollution permit system required under the Federal Clean Water Act.

In 1990, Governor Florio signed substantial amendments to the WPCA, known as the Clean Water Enforcement Act ("CWEA"). The CWEA strengthened enforcement of New Jersey's water pollution control and prevention program by requiring the department to assess mandatory minimum penalties for certain violations, increasing the accountability of NJPDDES permit holders and operators of publicly-owned treatment works, and providing for greater citizen participation in water pollution prevention and enforcement activities. The requirements of the CWEA which are relevant to this report became operative on July 1, 1991.

This executive summary presents the highlights of the Department's implementation of the WPCA in 1992 and the plans for further improvements in 1993 and beyond.

### *Enforcement*

The department seeks to improve New Jersey's water quality by encouraging increased compliance with the water pollution control laws. The department's enforcement efforts have several facets designed to serve that goal, such as inspecting and monitoring dischargers; working with dischargers to identify and resolve potential and actual compliance problems; taking enforcement action when those efforts reveal violations of the law; and frequently negotiating resolutions of enforcement actions so that the permittees agree to upgrade their treatment works and processes to prevent future violations. The following findings show that these efforts are bearing fruit in the form of greater compliance.

#### *Inspections of facilities show that more facilities are attaining compliance.*

The 1992 data concerning inspections show a trend toward compliance by more facilities. The department performed 2,919 inspections of facilities in 1992, compared with 1,406 in the last six months of 1991 (as noted above, the CWEA did not become operative until July 1, 1991). Following an inspection, a facility receives an "acceptable" or "conditionally acceptable" rating if it has valid permits for all of the discharges which require permits; it performs the monitoring required under the permits; it submits completed discharge monitoring reports ("DMRs"); no serious violations have occurred; it is not considered a "significant noncomplier" as a result of its record of recent

violations; and a licensed operator operates the facility's treatment works. The number of facilities which the inspections found "unacceptable" decreased significantly in 1992. In 1991, 792 facilities earned "unacceptable" ratings, compared with 505 facilities in 1992.

Compliance with the self-reporting requirements which are the heart of the NJPDES permit system is improving.

The NJPDES permit system is based upon each permittee's own timely and accurate reporting of compliance with permits through the submission of discharge monitoring reports ("DMRs"). Compliance with DMR requirements is therefore central to compliance with the WPCA.

In 1992, permittees moved toward more substantial compliance with the DMR requirements. The number of violations for failure to submit DMRs decreased from 59 in the last six months of 1991 to 38 for all of 1992. The bulk of the DMR violations in 1992 consisted of omissions in otherwise complete DMRs, rather than failures to submit DMRs at all.

In addition, during 1992 a trend toward better compliance with all aspects of the DMR requirements began to develop. The number of DMR-related violations dropped from 301 in the first half of 1991 to 107 in the second half of the year.

The average penalty assessed in each formal enforcement action has decreased.

The department undertook 339 penalty assessment actions in calendar year 1992 compared with 233 in calendar year 1991. At the same time that the department increased the number of penalty assessments, the total dollar amount of the penalty assessments decreased from \$23.7 million in 1991 to \$17. million in 1992. Accordingly the average penalty assessed in each formal enforcement action decreased. The decrease continues a trend reported in the 1991 CWEA Annual Report.

The continuing decrease in penalty assessments reflects the department's application of the statutory criteria established in the CWEA, detailed in revised penalty regulations. The revised penalty regulations promulgated in August 1991 establish the uniform penalty policy required under the CWEA. In implementing that uniform penalty policy, the department employs penalty assessment procedures which require fact-specific determinations of penalty amounts. Through these measures, the department works to assess penalties which are rational, tailored to the facts of particular violations, and legally sustainable.

The department expects the application of this approach to penalty assessment to affect penalty collections in two ways. The decrease in penalty assessments tends to decrease total penalty collections. At the same time, however, the percentage of penalt

assessments which the department actually collects should increase; as penalty assessments are viewed as more legally sustainable, the incentive to contest the assessment decreases, and a larger percentage of those penalties which are contested will be upheld on appeal. The net effect of these two influences in 1992 was to decrease penalty collections to \$10.8 million, compared with \$13.1 million in 1991.

*The efforts of the Attorney General and the County Prosecutors continued to contribute to effective enforcement.*

The Attorney General and the County Prosecutors are responsible for criminal enforcement of the WPCA. 1992 saw the resolution of several criminal actions filed under the WPCA. Most prominent, Ciba-Geigy Corporation and two of its officials entered into a plea agreement under which the company agreed to pay \$3.5 million in fines and the officials were each fined \$25,000.

*Permits*

In addition to an effective enforcement policy an efficient and thorough permit process is also essential to achieving the WPCA goal of improved water quality. The following findings describe improvements in the NJPDES permit process that serve this goal.

*The department increased its total number of permit actions by nearly 140% over 1991.*

In 1992 the department substantially increased the pace of its actions on NJPDES permits. The total number of permit actions (issuing new permits; renewing, modifying or terminating existing permits; and issuing discharge allocation certificates for new discharges or major expansions of municipal facilities) increased by nearly 140% over 1991, from 265 in 1991 to 630 in 1992. This increase included more than twice as many new permits (162 in 1992 compared with 73 in 1991) and more than four times as many permit modifications (317 in 1992 compared with 75 in 1991).

The department expects environmental benefits to result from the substantial increase in the number of new, modified and renewed permits issued. When action on a permit is completed, the permittee becomes subject to the most current standards available. Incorporating the most current standards into the permit generally results in the permit becoming more protective of water quality. In contrast, when a permit renewal or modification is delayed, the permittee may be operating in accordance with less stringent standards adopted several years earlier.

The department expects the increase in permit actions to bring economic benefits as well. Issuing more permits provides the permittees with greater certainty concerning

regulatory requirements, and enables them to anticipate expenditures that they will need to undertake to improve water quality.

The department is developing an extensive restructuring of the NJPDES permit system.

The current NJPDES permit regulations have remained largely unchanged since they became effective in 1981. The regulations have not kept pace with developments in the Federal and State statutes, rules, policies and procedures affecting the issuance of permits. To address this problem, the department made substantial progress during 1992 in readying a substantial overhaul of the regulations governing the NJPDES permitting system.

The primary goal of the restructuring is to enable the department to address water quality issues comprehensively, with particular concentration upon issues which affect water quality over an entire watershed or basin. The primary means to this end is a watershed approach to permitting (rather than the existing site-specific approach) which will enable the department to focus attention upon specific pollutants in each water body and better evaluate the impact of control measures. On February 1, 1993, the department requested public comments regarding the policies, technical issues and administrative reforms that this restructuring entails.

Another goal of the restructuring of the NJPDES rules is to improve the efficiency of the permit application and permit issuance procedures. Some of the changes upon which the department has requested public comment include the following:

1. Allowing permit applicants to submit their applications in the form of draft permits to be reviewed and revised by the department. This change eliminates one step from the permit process in which the department prepares a draft permit based upon a traditional permit application;
2. Expanding the scope of changes to existing permits which can be accomplished through minor modifications;
3. Providing for automatic permit renewal when a new permit review would provide no environmental benefit;
4. Allowing concurrent review and processing of water quality management plan amendments and NJPDES permit applications; and
5. Increasing the use of general permits and permits by rule, instead of individual permits for each applicant.

The department eliminated duplicative NJPDES permits for 87 permittees.

Twenty-three delegated local agencies in New Jersey operate municipal treatment works under pretreatment programs approved by the department. Under these pretreatment programs, the delegated local agencies regulate discharges to their treatment works.

In December 1992 the department adopted amendments to the NJPDES rules to comply with the mandates of CWEA and the Federal pretreatment regulations. One important goal of those amendments was to eliminate the duplication of permitting and enforcement efforts between the department and the delegated local agencies. The CWEA granted the delegated local agencies enforcement powers equivalent to those of the department; the department therefore determined that it was unnecessary to require industries with permits issued by delegated local agencies to obtain permits from the department as well.

As a result of this rule change, 87 permittees had their NJPDES permits terminated and no longer pay fees to the department for those permits. In addition, eliminating the duplicative permits enabled the department to concentrate its permitting and enforcement efforts more efficiently and more effectively in those areas in which there was no duplication of effort.

*Delegated Local Agencies*

A significantly smaller proportion of the violations reported by delegated local agencies were serious violations.

The delegated local agencies have reported information showing that they are continuing to perform compliance monitoring and inspections of their permittees actively and in a highly visible manner. The delegated local agencies reported a total number of violations in 1992 which was proportional to the number of violations they reported in the last six months of 1991. However, a significantly smaller proportion of the 1992 effluent violations qualified as "serious violations." The percentage of effluent violations which were serious violations decreased from 50.5% in 1991 to 41.4% in 1992.

*Water Quality Assessment*

The department will analyze the effects of permitted discharges upon water quality.

In its first eighteen months implementing the CWEA, the department focused upon the permitting, enforcement, criminal and fiscal aspects of the law. To evaluate how those efforts have affected water quality, in 1993 the department is commencing a study of water quality both upstream and downstream of selected discharge sites. The

study will enable the department to evaluate the effect of those selected discharges upon water quality. The study will encompass both surface waters and ground waters. The results of the study will assist the department in gauging the effectiveness of its entire NJPDES program and in planning future initiatives.

#### *Use of Penalty Revenues*

The funding of the NJPDES permit program has been the subject of ongoing discussion and debate. In July 1992, DEPE Commissioner Weiner convened a task force to evaluate the system under which NJPDES fees are assessed, with a view toward making that system more fair and rational. Former Senator Laurence Weiss chairs the task force, which includes representatives of the Chemical Industry Council, the Association of Environmental Authorities, local governments and other interested parties. The department will continue to engage in dialogues with Senator Weiss and others in an effort to keep improving the NJPDES program.

#### *CWEA penalty revenues contributed substantially toward the cost of the NJPDES program.*

The NJPDES program is funded primarily from fees paid by permittees. However, the CWEA provides for penalty revenues to be used exclusively for enforcement and implementation of the WPCA, except when otherwise specifically provided by law. Penalty revenues applied to enforce and implement the WPCA reduce the amount which must be raised through fees, dollar for dollar. The result is a reduction in the portion of the program costs funded by those permittees who comply with the law, and a shift of a substantial portion of the cost to permittees who do not attain compliance.

As a result of the application of penalty revenues, there will be no increase in the portion of NJPDES permit program costs funded with fees in the year ending June 30, 1993. For the majority of NJPDES permittees, 1993 fees have been reduced, with the average reduction amounting to five percent.

As noted above, the department expects penalty revenues to continue decreasing as compliance with the WPCA increases. For this reason the department cautions against relying upon penalty collections to continue providing this level of funding toward the permit program over the long term.

The report which follows this Executive Summary presents detailed information under the following subject headings: Enforcement, Permitting, Delegated Local Agencies, Criminal Actions, Fiscal, and Water Quality Assessment. The report also includes an Introduction which outlines the relevant requirements of the WPCA and the CWEA.

PRINTED ON UNBLEACHED 100% POST-CONSUMER WASTE

I would like to thank the committee and the chairman for holding this hearing and for leading the effort to clean up the nation's waters.

My name is Brett Hulsey and I am the Sierra Club's Midwest Representative and direct its Great Lakes Program. I am testifying on behalf of the Sierra Club, the Lake Michigan Federation, Citizens for a Better Environment, Great Lakes United, Natural Resources Defense Council, the Coast Alliance, the Lake Superior Alliance, and U.S. PIRG to urge you to enact a comprehensive program to clean up contaminated sediments that line our harbors and stop additional toxic pollution from sullyng our waters.

This is of top importance to all Americans and especially the millions who belong to these organizations. The Sierra Club's 100,000 members in the Great Lakes region and 600,000 members in U.S. and Canada have made restoring the country's waters and the Great Lakes -- that is making water safe for mothers to drink, and fish and wildlife that depend on water safe to eat -- a national campaign.

The need for this is clear to those of us living in Wisconsin and witnessing the human tragedy in Milwaukee. In the past few weeks, thousands have been sick from a water-born infection spread in the public drinking water. 800,000 people were not able to safely drink the public water. Several elderly and AIDS patients have died or are critically ill from the contaminated water. Schools and businesses were forced to close. The public in Wisconsin and much of the country have lost faith in the safety of our water delivery system and we are looking to Congress to restore the nation's waters.

We must address water safety issues in the upcoming Clean Water Act reauthorization to insure that America's waters are safe for drinking, swimming, and fishing.

I will use the Great Lakes example to illustrate this need because one in ten Americans drink the water and because these are good examples of problems seen everywhere. But the problem of toxic pollution and sediment contamination are everywhere.

Thanks to the work of this committee, Congress, cities, and the states, we have made progress to clean up the Great Lakes. Efforts to cut phosphate releases have brought Lake Erie back to life and the lake now supports a thriving fishing and tourist economy. Tourism is now the second largest sector of the economy in Ohio and many Great Lakes states.

Yet this economy is threatened by continued contamination. Nitrate pollution and persistent toxics levels for PCBs and dioxin are increasing in several lakes. Table I-2 shows the persistent toxic levels of PCBs in coho salmon in all the Great Lakes. These levels are over 70 times EPA's 1/100,000 cancer risk level and may cause

thousands of cancer cases each year.

According to the EPA National Water Quality Inventory, 1990 Report to Congress, 67.7% or 3,288 miles of Great Lakes shoreline do not support Clean Water Act designated uses. Only 1.8% or 85 miles fully support Clean Water Act designated uses for fishing and swimming. None of the shoreline in Wisconsin, Illinois, Indiana, Michigan, and Ohio supports full Clean Water Act designations.

#### Designated Use Support in Great Lakes

State	Great Lake Shore Miles	Shore Miles Assessed		Miles Fully Supporting	Miles Threatened	Miles Partially Supporting	Miles Not Supporting

*EPA National Water Quality Inventory, 1990 Report to Congress, March 1992, Page 38.*

Current water, air, and waste laws allow toxic chemical discharge into the nation's waters and the Great Lakes ecosystem which cause these impairments. These laws - especially the Clean Water Act -- allow polluters to dilute and mix toxics in the air and water. The only way to make the Great Lakes safe for drinking, fishing, and swimming is to phase out the release of these toxic substances into the U.S. water and the Great Lakes to achieve Zero Discharge.

**According to the U.S. General Accounting Office, U.S. Great Lakes polluters were LEGALLY permitted to dump 7.3 million gallons of oil, 89,000 pounds of lead, 1,935 pounds of PCBs, and 933 pounds of mercury into the Lakes in 1990.**

*Water Pollution, Observation on EPA's Efforts to Clean Up the Great Lakes, U.S. General Accounting Office, Testimony of Richard L. Hembra, October 1991, page 6.*

To put this in perspective, the Exxon Valdez illegally dumped 11 million gallons of oil into Alaska waters and was fined about \$1 billion. Each year, U.S. industries dump two-thirds that amount into the Great Lakes water supply for 25 million Americans.

This is a national problem also. Conservative estimates taken from the 1990 Toxic Release Inventory (TRI) data (which do not cover all industrial sources) showed that industry dumped nearly 200 million pounds of toxic and hazardous material into U.S. waterways. In addition, manufacturing industries dumped 448 million pounds of toxic materials, and hazardous waste facilities washed another 254 million pounds into public sewers in 1990.

Scientific evidence shows that widespread, low-level exposure to some persistent toxic chemicals like PCBs and mercury:

- threatens newborn children with premature birth, low birth weights, and impaired learning loss of up to 5 IQ points;
- will cause 38,255 cancers to fishers and non-fishers in the Great Lakes basin, according to EPA Risk Analysis of 26 Environmental Problems, Draft Working Documents, page 4;
- causes birth defects, sterility, and population decline in fish and wildlife like bald eagles, lake trout, cormorants, and mink;
- makes lake trout, salmon, and other species unsafe to eat in all the Great Lakes because they can cause health problems and increase cancer risks; and
- remain in the lake ecosystem, concentrating in and damaging humans and wildlife for decades.

Current U.S. and state environmental laws allow polluters to dump toxic chemicals into aquatic ecosystems which poison the food web. According to a recent International Joint Commission study, Great Lakes states now use a hodgepodge of regulations that allow dumping of persistent poisons. For example, a plant that could only dump 4 pounds of mercury into Wisconsin waters, would be allowed to dump 55 pounds in Ohio, 99 pounds of mercury in Illinois, and 323 pounds in New York.

	<u>WISCONSIN</u>	<u>OHIO</u>	<u>ILLINOIS</u>	<u>NEW YORK</u>
MERCURY PLANT CAN DUMP (IN POUNDS)	4	55	99	323

*The Control of Discharge of Toxic Pollutants into the Great Lakes and their Tributaries: Development of Benchmarks, Jeffrey A. Foran, PhD., International Joint Commission, page 39.*

Clearly, this jeopardizes more than the water quality, fish eaters, and wildlife. It puts industries of the clean states at an unfair competitive disadvantage. States compete for industry by jeopardizing their water supply rather than strengthening their

workforce. We are promoting uniform, water quality standards that protect jobs, people, fish, and wildlife.

This is indicated by the ubiquitous fish advisory throughout the country. As you can see from Figure 6-1 in the appendix, the Great Lakes states have the greatest number of fish advisories.

### **PHASE OUT PERSISTENT TOXICS TO MAKE THE WATER SAFE**

To virtually eliminate persistent toxics from the nation's water and Great Lakes, we must phase out persistent toxics releases as called for in the original Clean Water Act and the Great Lakes Water Quality Agreement with Canada.

We urge you to adopt the recommendations of the Clean Water Network, supported by the Sierra Club, and all the groups listed above. Specifically, we urge Congress to reauthorize the Clean Water Act (CWA) to:

- Sunset the most harmful toxics by giving the EPA Administrator a phase out procedure under the NPDES program to ban chemicals that pose significant human, wildlife, or aquatic health hazards because they persist and/or bioaccumulate;
- Make pollution prevention part of the CWA by improving existing programs like TRI and Clean Water Act 402 permit applications and building on successful state programs like the New Jersey or Massachusetts models;
- Strengthen CWA effluent guidelines and pretreatment provisions to control cross-media pollution;
- Require that EPA select the "Best Available Technology" to minimize pollution from all medias, not just water;
- Prohibit the use of mixing zones in Sections 301 and 303 for all but conventional pollutants;
- Require that effluent limits and monitoring be expressed in total mass for each toxic emitted, not just concentration;
- Require consistent state water quality standards for toxic pollutants that protect groups that consume high quantities of fish like Native Americans, urban fishers, Bald Eagles, and mink;
- Require the EPA Administrator set fees to cover effluent guidelines development costs, and all permit costs of the EPA or delegated states;

- Designate Lake Superior an Outstanding Natural Resource Water to move toward the Zero Discharge Demonstration area called for in the Great Lakes Water Quality Agreement and recommended by the International Joint Commission;
- Increase right-to-know provisions to allow the public more information on toxic discharges for more chemicals, facilities, and types of uses; and
- Create a program to aid worker transitions for the provisions that affect the workforce.

We urge the committee to study the approach taken in EPA's new Great Lakes Water Quality Guidance to create a level playing field. This Guidance is called for in Section 118 of the 1987 amendments to the Water Pollution Control Act and the 1990 Great Lakes Critical Programs Act.

The document recently released by EPA would require states, in their next triennial review, to:

- Establish minimum water quality standards to protect human, wildlife, and fish health;
- Target the worst pollutants -- those that bioaccumulate the most like PCBs and Dioxin -- in people, fish, and wildlife;
- Prohibit the use of mixing zones for these chemicals of concern;
- Include provisions to keep clean waters, like Lake Superior, clean; and
- Protect inland rivers and lakes, in addition to the Great Lakes.

#### **CLEAN UP CONTAMINATED SEDIMENTS THAT MAKE UP TO 75% OF THE TOXICS**

Contaminated sediments -- the toxic muck that settles to the bottom of our rivers, lakes, and harbors -- is a huge national problem. EPA has concluded that it is likely that every major water body in the U.S. has moderate to severe sediments contamination. This issue is also an economic one, since the contamination often makes it difficult to dredge harbors and maintain shipping as we are seeing in ports like New York/ New Jersey.

The 60 million tons of dredge material that are ocean dumped from these harbors and rivers each year pose a significant challenge to environmentalists and port operators. For an idea of the extent of sediment contamination on the marine coasts, please see the attached list. Table 6-5 shows a list of these sites. Note that Ohio leads the

nation with 193 sites clogged with toxics like arsenic, cadmium, and lead.

Contaminated sediments account for 75% of the PCBs going into Lake Michigan, according to a recent National Wildlife Federation study. They are also the main source of fish contamination. According to the EPA National Water Quality Inventory, 1988 Report to Congress:

**"The main reason for these fishing restrictions is contamination of sediments by toxic chemicals such as priority organics that are, in turn, passed along to macroinvertebrates and fish." (page 35)**

**In the 1990 Report to Congress, EPA said: "...landfills and contaminated sediments are the leading sources impairing the Great Lakes." (page 39)**

There is no clearer example of the national need for this program than in the Great Lakes. Toxic muck clogs all but one of our areas of concern and stifles economic development in many. The Port of Toledo may be forced to close if the U.S. Army Corps of Engineers does not cooperate with the Ohio and U.S. EPA to end the dumping of contaminated dredge spoil in Lake Erie near Toledo and Oregon, Ohio water intakes. The Corps insists that this sediment is not polluted, but the Port of Toledo and all the environmental agencies feel that it is.

To help solve this problem, EPA plans to release draft criteria for five sediment contaminants this summer, but clearly the progress is too slow. With current staff and funding, the EPA will not have sediment criteria for all the IJC Critical Pollutants List until the middle of the next century. The public will not accept this slow response to our worst contamination problem.

We have several successful programs to address Great Lakes sediment pollution, like the Assessment and Remediation of Contaminated Sediments (ARCS) Program, set up under Section 118 of the 1987 Clean Water Act Amendments and the Great Lakes Critical Programs Act. These provide key demonstration programs and deadlines to test technologies and complete the Remedial Action Plans (RAP).

As a member of the ARCS Citizen Work Group, I can report some progress on this program -- five pilot treatments were tested last summer with some promising results. In the laboratory, over 10 technologies were tested. ARCS also did five in-depth contaminant assessments from Buffalo, Ashtabula, Saginaw, Indiana Harbor, and Sheboygan harbors. But these plans and tests are only that. We need a concrete program to clean up these 27 toxic Great Lakes hotspots and many others in ports around the country.

The Clean Water Act reauthorization presents a perfect opportunity to make additional progress in the Lakes and make the fish safe to eat. Over the past three years, Great

Lakes and coastal advocates have worked with the ports, EPA, and Army Corps of Engineers to draw up a national program to deal with these underwater toxic sites.

The National Contaminated Sediments Working Group, made up of the Sierra Club, Coast Alliance, Great Lakes United, NRDC, National Wildlife Federation, and 200 other labor and sports groups, has a six-point plan to deal with contaminated sediments:

We urge Congress to instruct the EPA and Army Corps of Engineers to:

1. Develop a national program with deadlines and funding to measure and clean up toxic sediments with strong and practical sediment quality criteria in a timely fashion so that communities can identify and control toxic sediments in their area;
2. Use technologies developed by EPA's ARCS and SITES programs to clean up sites in the Great Lakes toxic harbors and add at least three additional marine sites for assessment and testing new technologies in critical areas like New York/New Jersey harbors and others;
3. Make pollution prevention measures a condition to receive a permit to dispose of contaminated sediments and include pollution prevention measures in other Clean Water Act programs to reduce further sediment contamination;
4. Develop a phase-out period for open water dumping of contaminated sediments in sensitive areas like Lake Superior as called for by the International Joint Commission;
5. Strengthen and enact the Metzenbaum Great Lakes Sediment Control Act, S. 75, to improve sediment management in the Great Lakes; and
6. Create a funding mechanism to pay for sediment management and clean-up.

## CONCLUSION

In conclusion, this year's Clean Water Act reauthorization gives us the opportunity to stop additional persistent toxics from entering the waters of the United States and to clean up the current toxic hotspots. We urge this committee to be bold and meet the challenge to make this happen.

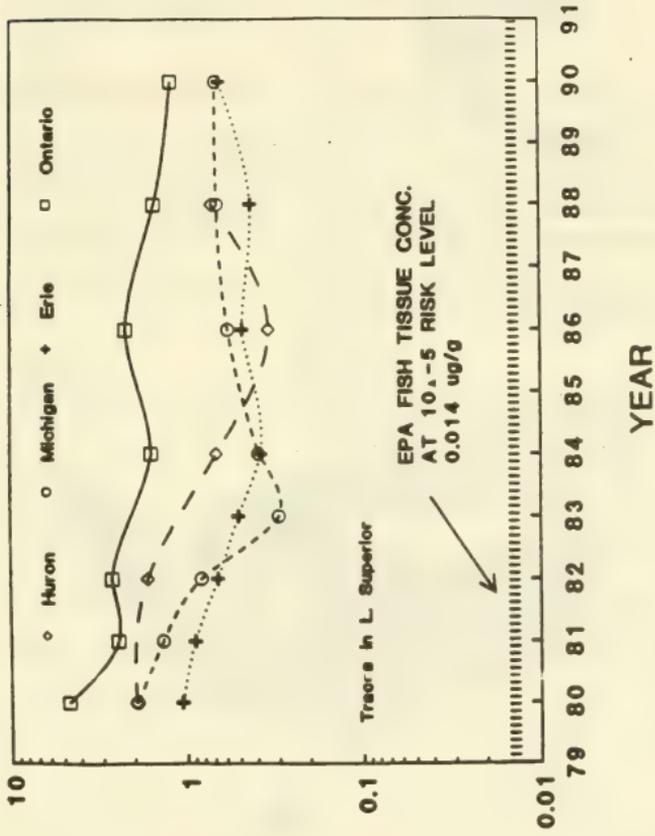

We are especially concerned that you:

- Protect women and children from toxic chemicals that accumulate in fish and cause birth defects;

- Restore the toxic harbors of the nation;
- Protect people who eat the most Great Lakes fish, like sport anglers, Native Americans, and others who fish for their food;
- Protect fish and wildlife from all chemicals that cause birth defects and deformities; and
- Keep high-quality waters like Lake Superior clean.

If we use these principles to guide our Clean Water Act reauthorization, we can restore faith in the nation's water. Thank you.

Table 6-5. Sediment Contamination Reported by States

State	Number of Sites	Contaminants Identified
Alaska	1	Aromatic hydrocarbons
Arizona	6	Pesticides, metals (boron, chromium, selenium), radiochemicals
California	1	Mercury
Connecticut	6	Lead, polychlorinated biphenyls (PCBs), organic chemicals, and other metals
Delaware	2	Metals
DC	—	Lead, cadmium, zinc, chlordane, DDT
Florida	—	—
Hawaii	1	Arsenic
Illinois	—	Heavy metals, DDT, PCBs, heptachlor epoxide
Indiana	8	Metals, polynuclear aromatic hydrocarbons (PAHs), cyanide, other organics
Iowa	1	PCBs
Kentucky	1	PCBs
Louisiana	7	Priority organics, creosote, metals, oil and grease, PCBs
Maine	7	Dimethyl formamide, toluene, trichloroethane, chlorinated solvents, tris (2,3-dibromopropyl) phosphate, PCBs, copper, cadmium
Maryland	—	Nickel, zinc, PAHs, non-DDT chlorinated pesticides, pesticides, DDT, PCBs and other metals
Massachusetts	13	Metals, priority organics, oil and grease
Michigan	13	Mercury, alkylated lead, PCBs, dioxin, benzo(a)pyrene, hexachlorobenzene (HCB), DDT, dieldrin, toxaphene, mirex
Minnesota	1	Mercury, PCBs, coal tars
Nevada	7	Mercury and other metals
New York	21	Priority organics, metals, pesticides
Ohio	193	Arsenic, cadmium, chromium, copper, lead, zinc
Oklahoma	10	Mercury, lead, zinc, chlordane, hydrocarbons, PCBs
Oregon	14	Arsenic, cadmium, chromium, copper, lead, nickel, zinc, DDT, PAHs, PCBs, phthalates, cyanide, volatile organic compounds, phenanthrene, pentachlorophenol
Rhode Island	—	—
South Carolina	2	PCBs, chromium, mercury
South Dakota	4	Mercury
Virginia	31	Selenium, chromium, arsenic, iron, manganese, nickel, cadmium, zinc, copper, mercury, lead
Virgin Islands	10	Mercury, copper, selenium, cadmium, nickel, zinc
Wisconsin	24	PCBs, dioxin, mercury, pentachlorophenol, arsenic, cadmium, chromium, zinc, oil and grease, pesticides, PAHs

## SIERRA CLUB GREAT LAKES FACT SHEET

### Contaminated Sediment Clean-up A Top Priority for Restoration of the Great Lakes

#### I. Summary

Congressional appropriations well spent in the Great Lakes over the past four years have: 1) identified priority contaminated sediment 'hot spots' in Great Lakes bays and tributaries; 2) developed a cost-effective means of sampling and determining the conditions under which contaminants from sediment become available to fish, birds, wildlife and people; 3) tested and modified a series of technologies for isolating or treating the contaminants; and 4) developed formulas for determining which of those technologies will work best under different conditions. To make use of this research, we must act now to implement the recommendations of the U.S. EPA's ARCS Program (Assessment and Remediation of Contaminated Sediments), developed under Section 118 of the Clean Water Act, 1987, and now near completion.

#### II. The Problem

In itself, rapid sedimentation of navigable streams and harbors within the Great Lakes system limits, delays, or increases the cost of waterborne commerce, deprives farms of needed topsoil, destroys fish spawning grounds, and lessens the aesthetic appeal of Great Lakes coastal recreation areas.

When persistent, bioaccumulative toxic chemicals are included in the land runoff or deposited from industry effluent pipes or smokestacks and settle into bottom sediment, the problem is complicated a thousandfold.

When sediments and the poison chemicals they hold are resuspended—a constant process of wind and currents, ship and boat traffic, and movements of bottom-dwelling organisms—they provide fish and other aquatic plants and animals with a steady diet of toxic chemicals. This poison meal may be stale—some of the contaminants were deposited 20 to more than 100 years ago—but it is nonetheless lethal.

As other sources of pollutants are brought under better control, many Great Lakes scientists now believe that contaminants from sediment are the biggest source of toxic chemicals to lake fish and the other animals and people who eat them. This argument is particularly persuasive on Lake Michigan.

The health effects from these contaminants—predominantly from the ubiquitous PCBs—include serious chronic neurological and behavioral problems as well as reproductive impairments, birth defects and severe physical deformities. Other chlorinated organic compounds and a handful of metals such as mercury are also implicated in the chronic effects to aquatic and terrestrial creatures, including our national symbol, the bald eagle, and, of course, those particular omnivores at the top of the food chain—people.

#### III. Needed Action and Budgets

A. Authorization and funding for one full-scale demonstration of ARCS assessment and

technology at a Great Lakes site. Problems in a system that may be suspected but don't show up clearly in small, controlled pilot scale projects involving a few dozen yards of sediment can be corrected in a larger project involving the logistics of earth- and equipment-moving to remove several hundred yards of material. Cost: \$1.5 million.

B. Thorough sampling, assessment, and recommendation of appropriate technologies, based on cost-effective formulas developed in the ARCS program--at the 24 remaining Great Lakes Areas of Concern not sampled already in the ARCS program. This effort would provide data critically needed for federal enforcement actions against active or former polluters and/or for action by state in-place pollution programs. Cost: \$250,000 per site for a maximum of \$1.3 million a year for five years if all 24 sites are assessed.

C. Continuation of an inter-agency team of experts developed through ARCS with USEPA Great Lakes National Program Office oversight to provide ongoing technology transfer to states which will be carrying out sediment clean-up. Allocation of a fixed percentage of GLNPO's annual budget will guarantee continuity for this effort. Cost: \$1.5 to \$2 million minimum per year.

D. Pass through money to states to provide coordination of a sediment clean-up program and to fund public participation through Remedial Action Plan Public Advisory Committees in Great Lakes Areas of Concern. Cost: \$600,000.

Additional Congressional action is recommended, at no cost, to require active coordination - efforts with Canada by the EPA's Great Lakes National Program Office in this binational water body bound by an international Great Lakes Water Quality Agreement.

The International Joint Commission's specific recommendations regarding agreements for actions on lake Superior should be implemented. A specific binational agreement to protect Lake Superior from the disposal of contaminated dredged materials and other pollution sources has been developed by three U.S. states and one Canadian province. This agreement should be implemented to begin to provide Lake Superior with the protection it needs.

And, finally...Unfinished business from the 102nd Congress includes two excellent bills that should immediately be re-examined and passed. Senator Howard Metzenbaum (D-OH) introduced legislation to provide badly-needed monitoring of confined disposal facilities and better control of the manner in which materials are disposed of in current and proposed CDFs.

And Senator John Glenn (D-OH) introduce legislation to require an audit of sediment sources into the Great Lakes and propose methods of reducing sediment inputs into the streams that flow into the Great Lakes.

## An Act

To amend the Federal Water Pollution Control Act to provide for the removal of the quality of the Nation's waters, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,*

SECTION 1. SHORT TITLE: TABLE OF CONTENTS: AMENDMENTS TO FEDERAL WATER POLLUTION CONTROL ACT: DEFINITION OF ADMINISTRATOR.

(a) SHORT TITLE.—This Act may be cited as the "Water Quality Act of 1987".

### SEC. 104. GREAT LAKES.

Title I is amended by adding at the end the following new section:

#### Sec. 118. Great Lakes

##### (c) Great Lakes Management

(3) 5-Year Study and Demonstration Projects.— The Program Office shall carry out a five-year study and demonstration projects relating to the control and removal of toxic pollutants in the Great Lakes, with emphasis on the removal of toxic pollutants from bottom sediments. In selecting locations for conducting demonstration projects under this paragraph, priority consideration shall be given to projects at the following locations: Saginaw Bay, Michigan; Sheboygan Harbor, Wisconsin; Grand Calumet River, Indiana; Ashtabula River, Ohio; and Buffalo River, New York.

##### (h) AUTHORIZATION OF GREAT LAKES APPROPRIATIONS. -

There are authorized to be appropriated to the administrator to carry out this section not to exceed \$11,000,000 per fiscal year for the fiscal years 1987, 1988, 1989, 1990, and 1991. Of the amounts appropriated each fiscal year-

(1) 40 percent shall be used by the Great Lakes National Program Office on demonstration projects on the feasibility of controlling and removing toxic pollutants;

EXAMPLE OF MARINE CONTAMINATED SEDIMENT SITES

\* New Bedford Harbor, MA. According to an EPA Region 1 case study, this Superfund site in southeast Massachusetts consists of 18,000 acres of sediments that include the Acushnet River estuary and the harbor of the city of New Bedford. The sediment is contaminated with PCBs and heavy metals. Concentrations of more than 100,000 parts per million of total PCBs in sediments have been found in the Acushnet River. EPA notes that "numerous studies in the early 1970s raised concerns about the site. The original concern over the site was related to human health effects. However, the loss of the harbor as a resource may be an equally important factor driving future remedial action." The area has been closed to all fishing and shellfishing since 1979.<sup>1</sup>

\* Sullivan's Ledge, New Bedford, MA. Another underwater Superfund site, Sullivan's Ledge encompasses 270 acres, with the most severe contamination concentrated in a 112 acre site. EPA has found chemical contamination of soil, sediments and groundwater at the site. An example of the mobility of contaminated sediments is found at Sullivan's Ledge, where PCB-laced soils have migrated offsite via runoff. The mobile sediments have, in turn, polluted stream bottomlands and wetlands north of the site.<sup>2</sup>

\* Quincy Bay, MA. EPA's Region 1 has conducted a five-part study to investigate the types and concentrations of pollutants in sediments of Quincy Bay, the incidence of abnormalities in Bay marine life, and the potential public health implications of consumption of seafood exposed to contaminated Bay sediments. The study, released in 1988, identified sediment contamination by organic and metal pollutants. Quincy Bay flounder and soft-shelled clams were found to exhibit "an extremely high incidence of several conditions believed by the investigators to be associated with environmental stress and poor health"; these conditions were found to be "unusually high" in comparison to other New England areas. Cancerous lesions were found in more than 25 percent of the tested flounder, while nearly 85 percent had liver problems. Approximately 80 percent of the soft-shelled clams had "significant pathological conditions." The study recommended that a human health advisory regarding consumption of lobster tomalley from Quincy Bay be immediately issued. It also recommended that EPA develop sediment quality criteria for chemicals such as those detected in contaminated urban embayments.<sup>3</sup>

\* New York/New Jersey Harbor, NY. According to EPA, sediments in the New York/New Jersey Harbor are contaminated with a variety of chemicals, including mercury, cadmium, DDT, PCBs, and petroleum hydrocarbons. EPA has pinpointed major sources of contamination in the area, including permitted discharges, municipal wastewater that includes a significant volume of

<sup>3</sup> Environmental Protection Agency, "Assessment of Quincy Bay Contamination: Summary Report." Environmental Protection Agency: Boston, MA. June 1988. pp. 1-3.

untreated sewage, agricultural runoff, PCBs from extensive contamination of the Upper Hudson River, urban runoff and atmospheric deposition.<sup>4</sup>

\* Chesapeake Bay, MD. NOAA has discovered that toxic organic chemicals and metals enter the Chesapeake Bay from industrial and municipal pipelines and agricultural and urban runoff. Contamination of sediments and organisms by these pollutants is severe near Baltimore Harbor. Other areas of the Bay, such as the Elizabeth River in Virginia, are contaminated by toxic materials. Polyaromatic hydrocarbons (PAHs) are the most prominent organic contaminant found in both the Maryland and Virginia portions of the Bay, while PCBs and metals are found in Baltimore Harbor sediments. The PAHs in the sediments of the Bay have caused lesions in Bay fish.<sup>5</sup>

\* Mississippi Sound, Gulf of Mexico. According to NOAA, Biloxi Bay has ranked consistently high for PCBs and chlordane, and it has some of the highest concentrations of Polycyclic Aromatic Hydrocarbons (PAH) found in the Gulf of Mexico. Pascagoula Bay has very high arsenic levels in the sediments, while Pass Christian has high concentrations of cadmium. These pollutants, and other chemicals, are borne into the Gulf by the Mississippi and other rivers, and from discharges associated primarily with refineries and the petrochemical industry. Dredging and dumping sediments is an additional source of pollution into the Gulf.<sup>6</sup>

\* San Diego Bay, CA. PCBs, tributyltin (TBT), DDT, PAH, heavy metals and organic chemicals have all been found in San Diego Bay sediments. There is a 13,000-fold increase in copper levels on the Bay bottom. In addition to these pollutants, aromatic hydrocarbons and pesticides are carried into the Bay from the 114 storm drains that empty into it.<sup>7</sup>

\* Santa Monica Bay, CA. Discharges of DDT from the Los Angeles county outfall pipe have contributed to massive concentrations of DDT in Santa Monica Bay sediments. A DDT plume in Bay sediments stretches almost 18 miles north. Along with DDT, Bay sediments also have heavy metal contamination. Levels of lead, cadmium and chromium in sediments have been found at 37 to 324 times the action levels of ambient water concentrations.<sup>8</sup>

\* San Francisco Bay, CA. According to a 1988 ocean pollution report, there is not an area in

<sup>4</sup> Ibid, pp. B-13 - B-17.

<sup>5</sup> Chesapeake Executive Council, "The Second Progress Report under the 1967 Chesapeake Bay Agreement." Chesapeake Executive Council: Richmond, VA. pp. 28-33. December 1969.

<sup>6</sup> Memo from Dorothy Leonard to Charles Ehler, National Oceanic and Atmospheric Administration. October 16, 1990.

<sup>7</sup> Heal the Bay, "San Diego Bay Toxic Hot Spots." Heal the Bay: Santa Monica, CA.

<sup>8</sup> Hayden, Tom, "Ocean Pollution in California: Regional Problems - Statewide Concern." California Assembly Task Force on Toxic Pollution in Santa Monica Bay: Sacramento, CA. p. 7. August 1988.

San Francisco Bay that is not contaminated to some degree. This is not surprising, given the fact that the Bay hosts 65 major dischargers, large amounts of urban runoff, agricultural drainage and reduced fresh water inflows. According to the 1988 report, estimates by the General Accounting Office indicate that non river-borne sources annually discharge 21.5 million tons of suspended solids, 26,000 tons of petroleum hydrocarbons, 225 tons of arsenic, 2,370 tons of chromium, 2,600 tons of lead, 4 tons of mercury and about 1 ton of PCBs into the Bay.<sup>9</sup>

\* Oakland Harbor, CA. A case study of Oakland Harbor conducted by EPA Region 9 revealed heavy metals, PAH, and TBT in elevated concentrations. This contamination is attributed to shipyards and heavy industry situated near the Harbor. Sediments in Oakland's Inner Harbor also have cadmium concentrations exceeding international or USFDA standards.<sup>10</sup>

\* Everett Harbor, Olympia, WA. Much of the sediment contamination in Everett Harbor is attributable, believes EPA Region 10, to historical and present discharges from pulp and paper mills. Ongoing surface runoff from storm drains also contributes significant loadings of contaminants. Found in Harbor sediments are a variety of chemicals, including resin acids, chlorinated phenols and PCBs.<sup>11</sup>

\* Commencement Bay, WA. Located in southern Puget Sound, chemical contamination of the marine environment is the major problem at this Superfund site. Commencement Bay supports important fisheries resources. Yet the site includes contaminated sediments in industrialized waterways and along the shoreline adjacent to a former copper smelter. Twenty-five major identified sources supply metals, PCBs, hydrocarbons and PAH compounds to the Bay, but more than 400 potential sources of contaminants have been identified.<sup>12</sup>

\* Puget Sound, WA. Studies conducted on English sole from Washington's Puget Sound revealed a high occurrence of liver lesions and "unique degenerative conditions." The authors of the study, scientists with the National Marine Fisheries Service (NMFS), concluded that exposure to "polluted embayments of Puget Sound" were directly responsible for the increased fish diseases. Concerns raised by the NMFS study are further corroborated by a case study of Puget Sound conducted by EPA's Region 10. Heavy metals, PCBs, and a variety of chemical contaminants were released into the Sound from point and nonpoint sources, combined sewer overflows and storm drains, and agricultural runoff, according to EPA. The Agency's case study notes that, "surveys of Puget Sound by NOAA, EPA and other agencies in the early 1980s documented the presence of abnormal benthic communities and high abundances of tumors in flatfish harvested in areas of high sediment contamination. Subsequent work has shown that

<sup>9</sup> *Ibid.*, p. 9.

<sup>10</sup> PTI Environmental Services, *op cit.*, pp. B-37 - B-46.

<sup>11</sup> *Ibid.*, pp. B-18 - B-23.

<sup>12</sup> *Ibid.*

sediment contamination in potentially toxic concentrations is widespread in many urban and industrial areas of the Sound.<sup>13</sup>

\* Milwaukee Estuary, WI. Many pollutants have affected the estuary, including significant combined sewer overflow discharges; upstream nonpoint sources ranging from polluted runoff from agricultural land and industrial sites, and seepage from waste disposal sites. The few fish found in the area are contaminated. Beach closings due to bacterial contamination have occurred, as well.<sup>14</sup>

\* Saginaw River/Saginaw Bay, MI. Organic pollutants and heavy metals have contaminated River and Bay sediments. Several health advisories have been issued for consumption of salmon, trout, muskellunge, carp and catfish. Polluted runoff, including heavy phosphorous inputs, is a major culprit.<sup>15</sup>

\* Waukegan Harbor, IL. Contamination at this Superfund site was first observed in the early 1970s. Exceedingly high levels of PCBs have been measured in harbor sediments, triggering concern over human health impacts as the city of Waukegan has an emergency drinking water intake in the harbor. Fish consumption advisories are also in effect from PCB contamination, and dredging and navigation are restricted due to heavily contaminated sediments.<sup>16</sup>

\* Maumee River, OH. Eutrophic conditions in Lake Erie are increased by phosphorous carried by the Maumee River from agricultural runoff. Along with farming impacts, river and Lake sediments have been contaminated with oxygen-consuming materials and heavy metals from municipal and industrial point sources, and combined sewer outfalls. Violations of effluent limits have been recorded for some sewage treatment plants along the river, resulting in water quality violations for dissolved oxygen and human wastes.<sup>17</sup>

\* Black River, OH. Discharges from the steel industry and other heavy industries have led to significant sediment contamination from heavy metals. Ammonia and fecal coliform levels are also high. Various forms of cancer have been found in fish in the lower Black River. A 1980 study identified lip cancers in fish; the cancers were found to correspond to high contaminant concentrations.<sup>18</sup>

<sup>15</sup> Ibid, p. 41.

<sup>16</sup> Ibid, pp. B-9 - B-12.

<sup>17</sup> Ibid, p. 43.

<sup>18</sup> Ibid, p. 44.

\* Ashtabula River and Harbor, OH. Fish from this area have been found to contain hydrocarbons, PCBs and heavy metals, resulting in a fish advisory for the lower two miles of the river. Sediments in Fields Brook, which feeds into the river, have been classified as hazardous and qualify for cleanup under Superfund. A large number of industries discharge into the brook and river. Since the Ashtabula has periods of zero water flow, wastewater generated in the area around the river can comprise the total flow of the river.<sup>19</sup>

## INTRODUCTION

Thank you for the opportunity to present to the Water Resources and Environment Subcommittee this statement on reauthorization of the Federal Water Pollution Control Act ["Clean Water Act," hereinafter "CWA"] and to offer recommendations for legislation to clean up and protect our Nation's aquatic resources. The National Wildlife Federation (NWF) and its 5.3 million members and supporters have been working for clean water since we were first established in 1936.

This testimony is divided into four major sections, each addressing a CWA issue of major concern to the NWF. Part I addresses reducing and eliminating toxic contamination in the food chain. Part II discusses keeping clean waters clean, or the prevention of further pollution of the nation's waters. In Part III, the integral role of water conservation in meeting CWA goals is discussed. And finally, Part IV addresses the issue of wetlands protection.

**PART I: REDUCING AND ELIMINATING  
TOXIC CONTAMINATION IN THE FOOD CHAIN**

Despite the progress that has been made in the past 20 years since the Clean Water Act was originally enacted, toxic chemical contamination of the nation's waters remains a serious threat to the health of people and wildlife. The reasons include the fact that EPA's implementation of the Clean Water Act allows the continued discharge of even the most dangerous toxic chemicals. EPA's regulatory efforts have been inappropriately directed at attempting to control and manage toxic pollution after it has been created, rather than attempting to prevent toxic pollution in the first place. EPA and the nation have spent years of effort debating "acceptable" concentrations of even the most dangerous toxic pollutants, rather than setting timetables to force technology that would eliminate the use and discharge of these chemicals. In addition, EPA's implementation of the NPDES permit system has allowed the use of dilution and mixing zones for toxic discharges. This practice has never been sanctioned by Congress and it results in increased discharges of dangerous chemicals into the nation's waterways.

The National Wildlife Federation recommends that Congress return to the original wisdom of the Clean Water Act by restoring the zero discharge philosophy. This philosophy can be implemented by Congress amending the Act to emphasize prevention and reduction of all toxic pollution and the elimination of the most dangerous toxic chemicals. In this section of our testimony, NWF recommends a program to "sunset" or phase out the discharge of the most harmful toxic chemicals -- those that have contaminated the food chain and pose substantial threats to wildlife and humans. Congress should also amend the Act to put an end to the use of dilution as a solution to toxic pollution.

**The Problem: Toxic Pollution Continues to Threaten the Health  
of People and Wildlife.**

Despite the notable progress that has been made in some parts of the country, many waterways throughout the country fail to meet the basic "swimmable and fishable" goals of the Clean Water Act. EPA's 1990 Water Quality Inventory found elevated levels of toxic pollutants in 39 percent

of all monitored lake acres, 15 percent of monitored river miles and 19 percent of estuarine square miles. In the Great Lakes, 98 percent of the shoreline miles monitored show elevated levels of toxic pollutants.

Certain chemicals, including PCBs, dioxin, mercury and many pesticides are of special concern because of their ability to bioaccumulate. This phenomenon can result in concentrations that are too small to even detect in water being magnified millions of times in the flesh of fish that inhabit the waters. This pernicious characteristic of a relatively few chemicals results in dangerous contamination of not only fish, but the entire food chain in sensitive ecosystems like the Great Lakes. Scientists have documented a long list of problems from chemicals that bioaccumulate. For example:

- An U.S. EPA data base indicates that health warnings, advisories or bans on eating fish are in place on over 4,000 bodies of water in 46 of the 50 states.
- Populations of bald eagles, mink, otter, turtles, cormorants, herring gulls, ring-billed gulls, common terns, Forster's terns and other species that live near polluted waters in North America suffer from one or more of the following health problems: mortality, population decline, egg-shell thinning, twisted beaks and other deformities, or behavioral problems.
- Certain chemicals are known to interrupt the endocrine system in people and wildlife by blocking estrogen and testosterone from performing their normal functions. For example, some male herring gulls from Lake Ontario colonies behave like females, and some female herring gulls attempt to pair with females. In other parts of the Great Lakes mink are born with both male and female sex organs.
- Children born to women who ate moderate to high amounts of PCB-contaminated Lake Michigan fish performed significantly worse on tests of their visual and verbal memory skills.

Today, concern is mounting over insidious effects of toxic pollution on sensitive biological systems like the role of hormones and reproduction and development. Indeed, the most troubling signs of damage to our health from these chemicals is being seen in the offspring of people and wildlife that frequently eat contaminated fish.

### **A New Approach Is Needed.**

These and other problems persist today because EPA has failed to take seriously the zero discharge intent of the original Clean Water Act. Arguments about how much pollution might trigger endocrine disruption or reproductive problems are more arcane, more time-consuming and more subject to manipulation by polluters. As pollution prevention becomes widely recognized as an effective and efficient technological solution to pollution -- in striking contrast to the dilution solution promoted by EPA and many states -- the technology forcing effect of zero discharge is more relevant and makes more sense today than in 1972.

EPA has failed not only to take seriously the zero discharge intent of the Act, but the Agency has implemented the Act in a way that allows polluters to exploit dilution loopholes. Dilution techniques such as mixing zones and differing stream flow calculations were developed for control of conventional pollutants, such as phosphorus, that degrade after being discharged. This approach does not work for toxic chemicals that persist in the environment or build up in the food chain. The use of dilution does not protect against the long term effects of toxics in waters downstream from the discharge pipe, in sediments or in the food chain.

In our report, "A Prescription For Healthy Great Lakes," the National Wildlife Federation recommended a program of "sunsetting" to prevent pollution from the most dangerous toxic chemicals. The International Joint Commission, has recommended sunsetting as an essential strategy to implement the requirements of the U.S. Canada Great Lakes Water Quality Agreement. The IJC has defined sunsetting as a comprehensive process to restrict, phase out and eventually ban the manufacture, generation, use, transport, storage, discharge and disposal of persistent toxic substances.

The success of bans and phase-outs in protecting the environment is illustrated by the few cases where this approach has actually been implemented. For example, emissions of lead dropped by 86 percent from 1975 to 1985 after the sunseting of lead in gasoline. Levels of DDT and PCBs in body fat have each dropped by more than 70 percent since their use or production was banned in the early 1970's. And mercury levels in sediments declined by 80 percent between 1970 and 1979 after the use of mercury was replaced in the production of chlorine. In fact, in a study of the success of Great Lakes protection efforts, the President's Council of Environmental Quality concluded that:

"It appears that the only chemicals to have declined significantly in the Great Lakes ecosystem are those whose production and use have been prohibited outright or severely restricted."

The sunseting concept has been endorsed by and is being implemented by Canada and several European countries. The Ontario Ministry of the Environment recently published a report recommending the sunseting of 21 substances. Several European countries are in the process of ratifying the sunseting concept as part of the "Convention for the Protection of the Marine Environment of the North-East Atlantic." This convention provides that a Commission will be established to "draw up plans for the reduction and phasing out of

substances that are toxic, persistent and liable to bioaccumulate arising from land-based sources."

### **Recommendations**

Congress should amend the Clean Water Act to implement the sunseting of the most dangerous chemicals. Priority should be given to those chemicals that bioaccumulate. Sunseting amendments must accomplish two objectives: a prohibition, (either immediately, or according to a specified timetable) against discharges of sunset chemicals to water; and a phase out of all uses of sunset chemicals to prevent releases from being transferred from one-medium to another. We recommend the following amendments to Section 307 of the Act

- **Immediate Action on a "Short-List" of Chemicals:** EPA should issue regulations that would immediately prohibit the discharge of those chemicals for which there is clear evidence of harm. In their Great Lakes Water Quality Initiative, EPA has identified 28 chemicals that are highly bioaccumulative. Ontario has identified 21 candidates for bans and phase-outs. A group of scientists have listed 26 chemicals or chemical families that are capable of disrupting the endocrine system. From these lists, the National Wildlife Federation has distilled a short-list of chemicals, which are the minimum recommended for sunseting: benzo[a]pyrene; hexachlorobenzene; lead; mercury; polychlorinated biphenyls (PCB's); 2, 3, 7, 8-TCDD and other dioxins; and 2, 3, 7, 8-TCDF and other furons.
- **A Procedure For Listing Other Chemicals For Eventual Sunseting:** EPA should be required to prepare a comprehensive list of additional chemicals whose discharge will be prohibited at a later date. Potential to bioaccumulate should be a primary criteria for listing additional chemicals. Researchers at George Washington University have proposed comprehensive scoring criteria for screening potential candidate chemicals for sunseting. Ontario has developed similar criteria. These could be readily adopted for use. Citizens should have the right to petition EPA to add other chemicals to this list.
- **A Multi-Media Link:** Once a chemical is targeted for discharge prohibition on either list, EPA must ensure that all sources of pollution are controlled. This could be accomplished by triggering a finding of "unreasonable risk" under the Toxic Substances Control Act. EPA would thus be empowered to issue regulations that would phase out all uses of sunset chemicals.

Congress should also amend the Act to close the dilution loopholes. Dischargers of all toxic and non-conventional pollutants, especially those chemicals that are persistent and bioaccumulative, should be required to meet water quality standards at the end of the pipe.

In their last report on Great Lakes water quality, the IJC stated:

"Surely it is time to ask whether we really want to continue attempts to manage persistent toxic substances after they have been produced or used, or whether we want to begin to eliminate and prevent their existence in the ecosystem in the first place." (Emphasis in original.)

After 20 years of attempting to manage all toxic chemicals, it is time for Congress to instruct EPA to return to the zero discharge concept of the original Act. For some chemicals, any pollution is simply too much. Those toxic chemicals that build up in the food chain should be sunset.

## PART II: KEEPING CLEAN WATERS CLEAN

There is mounting recognition of the critical need to maintain biological diversity and to provide for protection of the whole ecosystem. Nowhere is that need more strongly evident than in our Nation's waters.

Over the past 20 years, the focus of attention has been on pollution cleanup of waters that are habitat for these declining species. As a result, protection of existing clean water from **new or increased sources of pollution** has fallen through the cracks. The National Wildlife Federation believes that a simple, effective and proactive approach to ecosystem protection is to amend the Clean Water Act with an explicit regime protecting the Nation's remaining clean water and threatened aquatic resources from new sources of pollution.

At present, Section 101 of the Clean Water Act does contain an overall objective to "maintain" the integrity of the Nation's waters, and EPA has interpreted the word "maintain" to require adoption by States of so-called "antidegradation" policies. However, these policies are vague, contradictory and are ignored more often than followed. In addition, EPA has taken the position that it lacks authority to compel states to adopt implementation plans for their antidegradation policies.

The National Wildlife Federation believes that a multi-tier antidegradation provision should be explicitly stated in the reauthorized Clean Water Act, expanding upon and improving EPA's existing regulatory scheme.

### Recommendations for High Quality Waters

One tier should address High Quality Waters which **exceed** state water quality standards. States should be required to conduct an antidegradation review and public hearing when a **new or increased source** of pollution is proposed for discharge into high quality waters. A waiver for "di minimis" discharges of conventional, nontoxic pollutants could be allowable. However, the review should be required in all cases involving proposed discharges of toxic or bioaccumulative chemicals which are inherently dangerous to humans, aquatic organisms and wildlife. If, after the review, the decision is made to allow degradation from the new

pollutant, the State should be required to put a cap on future new source discharges to the same waterbody.

For the antidegradation review, the person seeking the discharge should carry the burden of proving: (a) that the new or increased pollution is necessary to accommodate important economic or social development in the area where the waters are located; (b) that there are no pollution prevention techniques available to prevent the discharge; and (c) that there will be no damage to the ecological integrity of the waterbody resulting from the new or increased pollution. In no event should high quality waters be degraded below state standards for any reason.

In the past, one or more states have refused to conduct antidegradation reviews when a new chemical constituent is proposed for discharge into waters that are generally described as impaired. The Clean Water Act should be amended to prevent this result. Where a waterbody is impaired overall due to the presence of multiple constituents, a review should be required when a discharger proposes to introduce a new chemical pollutant into waters that are "high quality" (that is, better than the state standard) for that particular pollutant or to increase an existing discharge.

In addition, antidegradation requirements should be expressly extended to new or increased nonpoint sources of pollution, assuming a new nonpoint bill is enacted into law containing some mechanism for new sources to be identified and regulated.

### **Recommendations for Outstanding National Resource Waters**

A further tier of protection should provide for designation of the Nation's pristine waters as Outstanding National Resource Waters, which would then receive absolute protection against new or increased sources of pollution.

A recent National Wildlife Federation report reveals that, under the present lax regulatory schemes, fewer than 3.6% of the Nation's river miles have, to date, received this designation and most of these river miles are protected under state programs that fail to provide the appropriate level of protection. At least 8 States have no state law

authorizing designations, and some 13 States that do have the legal authority to make designations nevertheless say they have no systematic procedure to inventory eligible waters.

A new Clean Water Act antidegradation section should:

- Define Outstanding National Resource Waters as all waters situated in, or affecting, national or state parks, wildlife refuges, wilderness areas, wild and scenic rivers, estuarine and marine sanctuaries, and critical habitat for endangered species (unless such designation would be deemed inappropriate by federal land management).
- Mandate that EPA, in consultation with appropriate state and federal agencies, publish criteria to identify additional eligible waters based on special ecological, recreational, cultural or historical significance.
- Require states, at the time of their 3 year water quality standards review and with the assistance of public participation, to name and formally designate the particular outstanding resource waters that fall within the description above. If a State fails to give the formal designation to an eligible waterbody, then the State should be required to give reasons why it did not do so, and EPA should be given authority to override this decision for good cause and make a federal designation.
- Enable citizens to petition for designation of waterbodies they believe are particularly deserving of outstanding waters status and provide for federal land managers to seek designation of waters in or affecting their areas.

The National Wildlife Federation believes that these crucial steps must be taken in order to protect our last, best unique aquatic environments and halt the steep descent of our remaining aquatic resources toward extinction. In addition, protection of existing clean water makes eminent good sense. It is wiser and cheaper to protect waterbodies from

degradation now than it is to pay for cleanup and endangered species recovery plans later down the road. Nor is it too much to ask that persons wanting to discharge new pollution be required, as a cost of doing business, to absorb the expense up front of minimizing or eliminating the pollution. In the end, if the polluter does not pay, the expense will fall unfairly on the taxpayer as cleanup or, tragically, on the fish and wildlife that are within our trust to protect.

### **Part III: Water Conservation**

As this committee knows, EPA recently reported that **over \$110 billion** in capital investment would be necessary for publicly owned wastewater treatment plants to comply with the existing requirements of the Clean Water Act between 1990 and 2010. Financial resources of this magnitude will be very difficult to come by. However, by reducing unnecessary discharges to overburdened treatment plants, water conservation can reduce the size and the cost of expensive plant expansion and new facilities. Conservation can also lower the cost of existing water and sewer service.

Unfortunately, the existing provisions of the Clean Water Act designed to promote water efficiency have not been adequate to prevent water waste. In fact, some utilities and municipalities have promoted water use rather than water conservation. Water efficiency must be an integral part of the Nation's efforts to improve wastewater treatment and maintain healthy aquatic ecosystems.

#### **Water Conservation Standards for New or Enlarged Facilities**

We recommend that basic water efficiency standards be set for water and sewer utilities seeking to expand water supply or wastewater treatment facilities requiring permits under the Clean Water Act. Sewage treatment plants receive permits under section 402 of the Act to discharge treated wastewater into navigable waters. When water supply systems discharge fill associated with construction of water intakes or storage reservoirs into waters of the United States, including wetlands, they receive permits under section 404. Water suppliers may also need 402 permits for the discharge of filter backwash from potable water treatment.

In each of these situations, the receipt of a federal permit for new or expanded capacity should be conditioned on the implementation of basic water efficiency measures. For example, applicants for permits for new or expanded water supply facilities should institute several well known water efficiency measures -- such as metering all customers and eliminating promotional rate structures -- and should be able to show that their proposed facilities have been sized to account for the

conservation savings. Similarly, operators of wastewater treatment plants seeking permits to discharge treated water from new or expanded facilities should demonstrate that they have met basic requirements to reduce wastewater volume. The permits issued should take into account reductions in water demand and wastewater volumes that can be achieved with cost-effective conservation efforts.

### **Integrated Resource Planning (IRP)**

In order to ensure that the limited funds available for wastewater treatment are used most efficiently, applicants for State Revolving Fund (SRF) loans for new or expanded treatment capacity should prepare an integrated resource plan. Such plans will be used to identify and evaluate the least costly alternatives, or mix of alternatives, for managing growing volumes of wastewater. EPA should provide guidelines and technical advice on the preparation of integrated resource plans, while state agencies administering the SRF's should review their adequacy and consider their content when awarding SRF loans.

The successful experience of electric utilities with integrated resource planning indicates that such analysis holds great promise to increase the efficiency of water and wastewater utilities. San Jose and Santa Monica, California, have been early leaders in this field. New York City's ongoing water conservation program is providing less costly alternatives to an anticipated multi-billion dollar outlay for water supply and wastewater treatment expansion.

Wastewater treatment and water supply entities should be encouraged to work together in analyzing savings from water efficiency improvements. Water conservation investments can reduce the costs of both water supply and wastewater treatment. Conservation has often been undervalued because water supply and wastewater treatment entities working independently have seldom assessed the full range of benefits. Once these entities have collaborated on an integrated resource plan, they will be able to make more informed decisions about cost-effective investment in water supply and wastewater treatment.

## Use of Revolving Funds for Water Conservation Measures

Where conservation measures are found to have the potential to reduce the capital or operating costs of wastewater treatment, we recommend that such measures be eligible for funding from SRF's. Last year, NWF surveyed the 50 state agencies administering SRF programs, and found no more than five where water conservation measures were routinely eligible for funding. Particularly disturbing were the states' limitations against the use of funds for the installation of water saving equipment on private property. Broadening SRF eligibility to include conservation is essential for "leveling the playing field" for system planners looking for least-cost solutions to meet wastewater treatment needs.

## Revenue Sufficiency and Rate Design

Recent surveys have found that a large number of municipalities -- 38% in one survey -- do not have user charge systems in place that fully recover the cost of operation and maintenance of their treatment plants, as required by the Clean Water Act and EPA's current regulations. As the EPA Inspector General has pointed out, in such communities it is not a matter of if, but when, such facilities will begin to deteriorate and fail to meet their permit requirements. In addition, such communities are directly undercutting water conservation efforts by underpricing wastewater treatment service to their customers.

In order to deal with this dual threat to both water quality goals and sound resource management, we recommend that states be required, as a condition of future financial assistance from the federal government, to periodically review the adequacy of the user charge systems of the publicly owned treatment works under their jurisdiction. At least once every five years, concurrently with NPDES permit review if they so desire, states should make sure that revenues are adequate to recover the cost of operation, maintenance, and minor replacements, and that rate designs are not promoting unnecessary wastewater discharges. Additionally, EPA should be directed to spot check user charge systems on a more systematic basis, and should have the authority to impose civil penalties equal to the amount of revenue deficiency that they uncover in such audits.

**Recommendations**

NWF urges Congress to:

- Enact minimum standards for water conservation for growing water and wastewater systems that seek permits to expand under the Clean Water Act.
- Encourage communities to integrate water conservation into their planning for any new or expanded wastewater facilities proposed for funding out of the State Revolving Loan Funds established by the Clean Water Act.
- Make water conservation eligible for funding by State Revolving Loan Funds.
- Ensure that local wastewater treatment charges are sufficient to recover all the costs of operation and maintenance of treatment works.

## **PART IV: SECTION 404 OF THE CWA: THE NATION'S WETLANDS REGULATORY PROGRAM**

Because of the critical ecological function wetlands play in the hydrological cycle, their protection is critical for meeting the Clean Water Act goal "to protect and maintain the chemical, physical, and biological integrity of our nation's waters." It is for precisely this reason that the Subcommittee should adopt policies to strengthen and expand protection of the nation's wetlands resources.

### **Status and Trends of Our Nation's Wetlands**

Wetland losses since the late 1700's have been enormous. Of the original 215 million acres of wetlands believed to exist in what is now the coterminous United States in the late 1700's, only an estimated 103 million acres remained by the mid-1980's. Some areas of the country have been particularly hard hit by the loss of wetlands (Table 1.) For example, the state of Ohio has already lost 90% of its historic wetlands resource. Unfortunately, latest U.S. Fish and Wildlife Service statistics testify to the inadequacy of the current Section 404 (§404) Wetlands Regulatory Program. These data show that wetland losses continued at an estimated 290,000 acres annually during the 1970's to 1980's, the most recent time period for which trend statistics are available.

### **Wetlands Functions and Values**

With the loss of wetlands has come a tremendous loss in the functions and values that they provide for people. It is well established in the scientific literature that wetlands provide a number of critical ecological functions from which the American public derives enormous benefits -- economic and otherwise. Wetlands functions and values has been the subject of dozens of texts and hundreds of publications and anything other than a cursory overview of the topic is beyond the scope of this testimony. Nonetheless, because many of the arguments made against a strong wetlands regulatory protection program frequently turn on the issue of economics, it is important that the Subcommittee fully understand the ecological, economic and social ramifications of reducing federal protection for wetlands. Table 2, for example, reveals the proverbial "tip of the iceberg," by showing the importance of sport

fisheries --just one function of wetlands-- to anglers, workers, and the economy in selected states. In fact, in California alone, the sport fishing industry, which is dependent upon clean water and wetland habitats, provides more than 70,000 jobs. Scientists generally agree that wetlands provide the following values and functions:

- Flood Conveyance
- Storm Surge Abatement
- Water Quality -- Nonpoint Pollution and Sediment Control
- Groundwater Recharge and Discharge
- Habitats for Rare and Endangered Species,  
    Waterfowl and Other Wildlife
- Habitats for Fish and Shellfish
- Recreation
- Water Supply
- Food Production
- Timber Production
- Historic and Archeological Sites
- Education and Research
- Open Space and Aesthetics

## Recommendations

In the past, implementation of the §404 program has been plagued with institutional and administrative problems which have frustrated the regulated community and the environmental community, while allowing our wetlands base to continue to erode. These problems must be remedied. However, rather than "solve" them with wholesale changes to the program, as some suggest, we instead must work within the existing framework and fine tune the process.

Most of the criticisms of §404 do not involve major programmatic deficiencies but instead focus on delayed delineations and ambiguous permitting expectations. For example, some landowners have reported long delays in receiving delineations from the Corps District offices. Other applicants report having received inaccurate delineations that were conducted by poorly-trained consultants. And, partly as a result of misinformation generated and circulated by the regulated community and other opponents of §404, still others are confused by the program's content and scope.

A number of environmental groups, including NWF, have shared many of the same frustrations in obtaining timely answers and dependable information from Corps and EPA personnel. Therefore, we urge this Subcommittee to explore our recommendations to provide timely resolution to these problems. Many of the recommendations are included in H.R. 350, The Wetlands Reform Act, introduced by Representative Don Edwards (D-Ca). The NWF strongly supports H.R. 350, and urges its inclusion in the Clean Water Act reauthorization.

- Expand CWA §404 to cover drainage, dredging, flooding, clearing, channelizing, placement of piling-supported structures, and other significant physical wetlands alterations, regardless of whether any of these activities entail a discharge of dredge or fill material. The NWF, and more recently the National Wetlands Policy Forum, recognized that the nation cannot seriously address the problem of wetlands loss without the ability to control all major forms of physical wetlands alteration--not just discharges of dredged or fill material as provided under the existing §404 program.

The current rate of wetlands loss is a stark reminder that many activities that destroy wetlands often go completely unregulated by §404 and other state and federal programs, and continue unabated. We strongly recommend that the Subcommittee amend §404 to cover these other forms of alterations.

Expanding the scope of regulated activities would offer greater protection to wetlands, and it would actually help decrease much of the uncertainty associated with the program. Partly due to lack of clear direction, the Corps has historically made overly narrow and often inconsistent interpretations of what constitutes a discharge of dredged or fill material requiring a §404 permit. As a result, activities such as ditching, stream channelization, and clearing and bulldozing of wetlands vegetation have been inconsistently regulated, and a lot of time and resources have been expended by the regulatory agencies, the regulated public, and environmentalists debating this problem. Expansion of §404 to explicitly cover all major physical alterations of wetlands is necessary to fully protect wetlands and to eliminate this source of uncertainty and needless resource drain.

- The Corps should continue to administer the §404 program with EPA oversight. In the past, the Corps' weak implementation and enforcement of the §404 has been a liability to achieving the goals of the CWA and the overall effectiveness of protecting wetlands under §404. Recently, however, the Corps and EPA have begun working together to better solve longstanding problems with the §404 program. These initiatives include the establishment of the Wetlands Mitigation Memorandum of Agreement and the proposed rule to close the loophole for "de minimis" discharges. Both of these initiatives demonstrate to us that the program can run smoothly while maintaining dual agency oversight. But if the status quo is to be changed by vesting the §404 program in one agency, administration of the program should go to EPA, not the Corps because EPA is the author of the §404 (b)(1)

guidelines and EPA is charged with administration of the Clean Water Act.

- Explicitly include wetlands in the Clean Water Act goal statement. Although an explicit wetlands protection goal does not currently exist in the Clean Water Act, wetlands are an essential component of the waters of the United States, of §404, and of other CWA provisions. We, therefore, recommend amending the CWA goal section to include explicit reference to wetlands to ensure that all relevant provisions of the CWA contribute to wetlands protection.

- Strengthen the general permit program. The Corps' general permit program, particularly Nationwide Permit 26, sanctions the unreviewed and unmitigated loss of thousands of wetland acres annually. Furthermore, inadequate public involvement in overseeing this program seriously weakens its implementation and does nothing but expedite wetlands losses. Therefore, we recommend amending §404 to (1) require general permits to include adequate measures to track activities conducted pursuant to general permits; (2) forbid authorizing activities under general permits for which states have denied §401 water quality certification; and (3) provide the public and state and federal resource agencies with pre-discharge notifications and an opportunity to comment before activities are undertaken pursuant to general permits. Section 404(e) should be amended to require that each Corps district prepare reports documenting each activity and the amount of acreage affected that is authorized by each general permit and to require that the Corps submit a biennial report to Congress of cumulative impacts to wetlands and other aquatic areas under each general permit.

- Strengthen the role of Fish and Wildlife Service and the National Marine Fisheries Service in §404 permit decisions. Currently, the Clean Water Act and the Fish and Wildlife Coordination Act require the Corps to consult with the FWS and National Marine Fisheries Service (NMFS) on all §404 permits. Although these resource agencies can recommend

modifications be made to the permits, the Corps can, and frequently does, ignore these comments. Therefore, we recommend amending §404 to require the Corps to provide written explanation of its reasons for rejecting FWS or NMFS comments and to explain how the Corps' permit determination is consistent with the purposes of the Clean Water Act and the §404 (b)(1) guidelines.

- Earmark §404 enforcement penalties for §404 implementation. Historically, the Corps' and EPA's §404 implementation programs have been severely underfunded. To make available additional resources over and above appropriated monies from general revenues, we recommend amending §404 to establish an account into which §404 enforcement penalties would be deposited for use by the EPA and Corps for §404 program implementation.
- Modify §404 state water quality certification requirements to better protect aquatic ecosystems. While §401 certification requirements are generally required from states before a §404 permit is issued by the Corps, questions have arisen over whether the requirement applies to Federal Energy Regulatory Commission licensing and whether states can--or must--include narrative standards to protect wetlands and other aquatic habitats from degradation. Therefore, we recommend amending §404 to expressly broaden the protections provided by §401 and direct states to address physical and biological alterations of aquatic areas, as well as chemical pollution of those waters.
- Legislate EPA's definition of "fill material." For years the Corps and EPA have been at odds over the regulatory definition of "fill material." The result has been massive confusion and both agencies shirking the regulation of discharges of a number of materials that destroy wetlands [e.g., waste tires and mine tailings]. For this reason, we recommend amending §404 to legislate EPA's definition of fill as any material which has the effect of replacing an aquatic

area with dry land or of changing the bottom elevation of a waterbody.

- Strengthen the CWA citizens suit provision (§505) to provide for stronger wetlands protection by private citizens. Given the paucity of agency enforcement resources, vigilant private enforcement of §404 is critical to protecting the nation's wetlands. One reform which should be made is to clearly provide that §505 applies to §404 violations. Section 505 should also be amended to encourage courts to overcome their reluctance to impose restoration requirements in cases in which restoration of degraded wetlands is both practical and desirable.
- Make the §404 program more efficient by adopting a fast track provision for minor permits. Special priority should be given to minor permit applications (e.g., permits for activities that would disturb no more than 1 acre of wetlands) to ensure that they are processed within 60 days. Section 404(q) should be amended to require the Corps to allocate sufficient personnel to expedite minor permit applications in this fashion.

We urge the Subcommittee -- and Congress -- to step back from the controversies and to reaffirm the critical role the §404 program plays in attaining the central goal of the Clean Water Act -- to restore and maintain the integrity of the Nation's waters. We also urge the Subcommittee to assist our efforts in securing and applying more resources to §404 wetlands delineations, mapping, outreach and education, and to the program in general, and thereby make its value and importance more understandable to everyone. Finally, we urge Congress to support the nation's burgeoning interest in protecting wetlands by expanding the reach of regulated activities under §404 and by incorporating the additional strengthening amendments highlighted above. These are progressive and necessary changes if we are ever to achieve the goals of the CWA and end the long history of wetlands loss in this nation.

## SUMMARY

Reauthorization of the CWA, with strengthening amendments, is critical for protecting and cleaning up our Nation's aquatic resources. The NWF has presented here a prescription for achieving this objective.

**Toxic Contamination.** The original CWA goal of eliminating the discharge of toxic pollutants has not been met. Continued discharge of persistent, bioaccumulative chemicals is having serious health impacts on humans as well as fish, birds and other wildlife. The CWA should identify a "short list" of known pernicious chemicals causing these impacts and mandate their phase-out. EPA should be required to identify additional chemicals to sunset in the future. Also, the CWA should explicitly prohibit the use of mixing zones and other dilution factors and thus require end-of-pipe compliance with water quality standards.

**Keeping Clean Waters Clean.** Conservation of clean waters has received little attention under the CWA over the past 20 years due to the focus on pollution clean-up. As a step in achieving ecosystem protection, the CWA should be amended to protect clean water from new or increased sources of pollution. The Act should place strict conditions on degradation of high quality waters as Outstanding National Resources Waters, with absolute protection from new or increased pollution.

**Water Conservation.** Amendments to the CWA which require and encourage water conservation can significantly reduce the cost of wastewater treatment while effectively helping to protect our nation's waters and aquatic resources. Congress should enact minimum water conservation standards for new or expanded water and wastewater systems and ensure that water conservation measures are fully considered in the construction of new facilities.

**Wetlands.** Wetlands protection is integral to achieving the CWA purpose of "protecting and maintaining the chemical, physical, and biological integrity of the nation's waters." Because wetlands and wetlands functions continue to disappear at an alarming rate, the CWA must be amended to strengthen the existing wetlands regulatory program. In addition to improving the permitting process, the Congress must expand the scope of regulated activities to include all activities impacting wetlands.

Table 1. Wetland Losses in Selected States

<u>State</u>	<u>Wetland Acres</u>		<u>% Loss</u>
	<u>1780's</u>	<u>1980's</u>	
Arizona	931,000	600,000	36%
California	5,000,000	454,000	91%
Florida	20,325,013	11,038,300	46%
Georgia	6,843,200	5,298,200	23%

Food Industry Environmental Council ● 1764 Old Meadow Lane, Ste. 350 ● McLean, VA 22102

TEL: 703/821-0770 ● FAX: 703/821-1350

May 12, 1993

The Honorable Douglas Applegate  
Chairman, Subcommittee on Water  
Resources and Environment  
Committee on Public Works and Transportation  
United States House of Representatives  
B370-A Rayburn House Office Building  
Washington, D.C. 20515

Dear Mr. Chairman:

On behalf of the members of the Food Industry Environmental Council (FIEC), we appreciate the opportunity to provide input for your consideration as the Subcommittee on Water Resources and Environment addresses reauthorization of the Clean Water Act (CWA). We respectfully request that this submission be included in the record pertaining to the recently concluded Subcommittee hearings on this issue.

Overview

FIEC is comprised of national food manufacturing and processing trade associations and individual companies. Together, the Council represents approximately 15,000 companies which employ more than 1.4 million people and are responsible for approximately \$121 billion of sales annually. FIEC has been formed to support sound, effective environmental policies and to coordinate the activities of its members, particularly as these activities relate to reauthorization of the CWA.

FIEC's objective is to serve as a resource to Congress to provide any necessary data regarding the processes used in the manufacture and delivery of food as related to CWA considerations. In addition, FIEC will evaluate any proposed legislative amendments to determine their potential impact on the continued safety and availability of the nation's food supply. Therefore, we hope that our comments will serve as the first step in a continuing dialogue during your deliberations of CWA reauthorization.

FIEC supports Congressional efforts to ensure that this nation's waters are clean and protected. It is essential to the companies represented by this Council that a continuous supply of clean water be available for use in food processing. It also should be recognized that the food processing industry has invested millions of dollars in pollution control technology to protect our waters, and along with other industries, has improved water quality significantly. For example, the loadings of conventional and toxic

The Honorable Douglas Applegate  
May 12, 1993  
Page 2.

pollutants to surface waters have been reduced by over 90 percent since the implementation of the National Pollutant Discharge Elimination System (NPDES) permitting program and the National Pretreatment Program. Progress will continue to be made under existing law.

FIEC's primary message as you begin considering reauthorization of the CWA is that, overall, the Act is working quite well. Perhaps some fine-tuning may be appropriate, but a wholesale rewrite of the legislation is neither warranted nor desirable.

#### Legislative Goals

It is a goal of the Council to ensure that there is an adequate supply of clean water for use in providing consumers with safe and nutritious processed food at reasonable prices. As you evaluate various proposed amendments to the Act, we urge you to consider the following guiding principles:

- o Based on sound scientific data, any proposed amendment should improve water quality significantly, fairly, flexibly, and cost effectively.
- o Any proposed amendment should not affect food safety adversely or contradict current food safety regulations.
- o Any proposed amendment should not contribute to the need for an increase in the price of the food supply.
- o Any proposed amendment should not cause a loss of jobs.

FIEC believes all amendments should be evaluated against these principles.

The Council believes that any proposed changes to current regulations should be based on a risk-based approach that is grounded on sound and appropriate scientific analysis. Only those amendments which ensure cost-effective and efficient solutions to any problems presented, or not addressed, by the current regulations should be adopted. This fine-tuned approach must recognize and evaluate industry specific needs. For example, any wholesale prohibition of certain chemicals for all industries would not be desirable. This is certainly the case with some disinfectants, which may be dispensable in some industries, but which are essential to food processors for ensuring the safety of the food supply by maintaining a contaminant-free workplace. In fact, regulations promulgated by the Food and Drug Administration (FDA) and the U.S. Department of Agriculture (USDA) stipulate that certain chemicals can and should be used in food plants for sanitation and other purposes.

The Honorable Douglas Applegate  
 May 12, 1993  
 Page 3.

In addition, any revisions to the CWA should be consistent with other environmental programs and should not create cross-media environmental problems. The solution to water pollution problems for example, should not create new solid waste or air emission problems.

#### Legislative Suggestions

FIEC recognizes that, while this country has made substantial progress toward improvement of water quality, more can and should be done to accomplish the goals of the CWA. Specifically, legislative proposals should embody provisions to ensure adequate funding of ongoing programs, particularly the National Pretreatment Program, the Non-point Source Pollution Program, and Control of Combined Sewer Overflows. Adequate funding of these programs would provide continued cost-effective improvements in water quality.

Moreover, a major revamping and revision of the CWA presently is not needed and would be counterproductive to the continued progress being made under the existing program. Dramatic changes to the Act are not needed particularly since most of the proposed changes, if adopted, would result in significantly increased regulation, spending, administrative burdens, and costs without achieving significant public health benefits and enhanced environmental quality.

Based on FIEC's review of several proposals put forth during the last session of Congress, we offer the following specific comments on provisions that might be under consideration by the Subcommittee:

- o Conventional Pollutants. The current technology controls on conventional pollutants are adequate and should be retained. Additional restrictions on conventional pollutants would not be cost-effective and would not result in any significant improvement in water quality. Accordingly, the current effluent guidelines for conventional pollutants should not be modified. The Council also recommends that ammonia and chlorine be retained as non-conventional pollutants contrary to some suggestions that these two chemicals should be added to the list of toxic pollutants. The weight of scientific evidence does not support the inclusion of these chemicals on the toxic pollutant list. Inclusion of ammonia and chlorine on the toxic pollutant list would add substantial cost to industries and municipalities, without associated environmental benefits.
- o Water Quality Standards. Water quality standards should reflect efficient resource allocations on a site-specific basis and should result from a consideration of the costs and benefits of associated controls. It is necessary to recognize that the goal of fishable and swimmable waters, as contained in the original Act, may be unrealistic for all waters and would result in an inefficient allocation of resources.

The Honorable Douglas Applegate

May 12, 1993

Page 4.

- o Water Quality Monitoring. Water quality monitoring requirements, while important, should focus on generating useful and not excessive data and should be industry-specific.
- o Pretreatment. There have been some suggestions that indirect dischargers should be required to meet the same effluent levels imposed on direct dischargers, and that indirect dischargers should receive NPDES permits. The Council suggests that this requirement would increase the financial, technical, and administrative burdens on both industry and the regulators, with no significant improvement in POTW performance. The Council encourages Congress to fund adequately the National Pretreatment Program and allow adequate time for it to be effective before enacting any additional, and perhaps unnecessary requirements.
- o Permit Fees. Permit fees should be reasonable and fair. The Council urges Congress to consider an equitable funding mechanism. Since water quality permit programs benefit the public as a whole, funding these programs should not burden unduly any one segment. Therefore, the Council urges that public funds generally be used to finance federal and state water quality programs.
- o Toxics Use. During the last session of Congress, mandatory toxics use reduction was contemplated, including required changes in production processes, products, or raw materials that would eliminate the use of toxic substances. FIEC believes Congress should reject any such proposal. Toxics use reduction should be voluntary and should not be micro-managed by EPA. Individual companies, not EPA, should determine what production processes will be used in their facilities taking into account many factors, such as product quality, safety and other resource conservation and environmental pollution concerns. EPA is not in a position to make those decisions for the thousands of facilities subject to effluent guidelines, nor should any government agency be given such responsibility. Companies are keenly aware of the multimedia impacts in the cost of environmental planning decisions and already consider these issues in their plans. Legislation including these mandates simply is not needed.

The Honorable Douglas Applegate

May 12, 1993

Page 5

- o Audit Programs. The Council urges Congress to encourage the use of audit programs which would avoid the threat of public disclosure and prosecution for efforts to correct identified problems.

#### Conclusion

FIEC suggests that Congress should be guided by the fact that substantial progress has and continues to be made in improving water quality. Any proposed changes to the current CWA programs should be evaluated thoroughly using cost-benefit analyses to assess their efficacy and to determine if they are necessary. Changes that have the potential to affect adversely food safety and supply of this nation's processed foods should be rejected.

The Council appreciates the opportunity to provide these comments and looks forward to with you and other Subcommittee members during the reauthorization process.

Sincerely,

**Testimony of John (J.I.) Lewis  
Belmont Mills  
Belmont, Ohio  
on behalf of the  
Agricultural Retailers Association**

**April 22, 1993**

**Introduction**

Mr. Chairman and members of the Subcommittee, my name is John Lewis and I am President of Belmont Mills, a retail outlet of fertilizers, pesticides, seed, and feed in the 18th Congressional District of Ohio. Mr. Chairman, Belmont Mills has been serving farmers in Belmont, Harris, Jefferson, Monroe, Noble, and Gurnsey counties in your district since 1900.

I am also very pleased to be representing the Agricultural Retailers Association or ARA today. ARA was formed just last year to represent the unique interest of retail dealers of farm supplies across the United States. Today, ARA represents over 5,000 farm supply outlets that market well over 80 percent of the fertilizers and crop protection chemicals sold annually in the U.S. The topic of this hearing is of significant interest to my business, my customers, and American agriculture.

Today I would like to discuss the issue of non-point source agricultural pollution from the standpoint of my business in addition to voluntary industry initiatives and actions to reduce fertilizer and pesticide runoff from farms. Further, I would like to discuss current regulatory requirements and programs aimed at agricultural nonpoint sources and then conclude with an overview of pending legislation and suggestions for future action. Since my primary business is not keeping up with all the new regulations and legislation, I am accompanied here today by Chris Myrick, Director of Government and Environmental Affairs for ARA, to help answer specific regulatory and legislative questions that this subcommittee might have.

### **Industry Efforts to Reduce Nonpoint Source Runoff**

The agricultural industry has made tremendous strides, especially in the last few years, to voluntarily adopt new management practices and application technology that reduce the potential for nonpoint source pollution. I believe that the increased adoption of these new measures has significantly impacted this issue.

Following, I have listed some of the agronomic practices that are currently being undertaken by the agricultural industry that impact the nonpoint source issue. I hope that this subcommittee will take note of what our industry is doing without government regulation.

#### **Precision Application of Fertilizers and Pesticides**

##### Variable Rate Technology

The last five years has seen a tremendous increase in the use of variable rate technology for the application of both fertilizers and pesticides. Variable rate technology targets specific plant needs with regard to nutrients and pesticides to insure proper application. From a financial standpoint, no agricultural producer wants to over-apply products because of the increased per acre production cost, so retail dealers, as an environmental and economic service to their farm customers, are increasingly recommending and using this technology.

In practice, variable rate technology requires retail dealers to work closely with producers to establish a realistic yield goal based on historic Agricultural Conservation and Stabilization Service (ASCS) yield records, nutrient needs as established through soil sampling and soil type, and plant/pest populations. Only the fertilizer and pesticides needed are applied to reach these yield goals. In many cases, less fertilizer is applied to fields than has been removed by the crop in question.

Even higher technology approaches are now coming onto the market which result in the use of variable rate technology during application. For example, a patented site-specific liquid or dry application system called "Soilection" recognizes nutrient needs of varying soil types and varies blend and rate of application while the application equipment is actually going over the field. Using systematic soil sampling and digitized mapping along with Soilection, only the necessary amount of fertilizers are applied to the field, eliminating over application of fertilizers which may result in excess fertilizers turning into a nonpoint source problem.

#### Other New Methods of Application

New methods of application are being rapidly adopted by farmers as a way of addressing environmental concerns and increasing profitability. For example, the use of starter fertilizers has had a renewed interest, particularly with the increase in no-till, which results in decreased sediment, nutrient, and pesticide run-off.

Herbicide applications are gradually shifting from broadcast preplant to postemergence applications after the crop and weeds have emerged. This production practice is good because you know what weeds you have to control and specifically apply for those weeds. In addition, many growers are spot treating acres where certain weeds are a problem instead of blanket applying pesticides to a entire field. These practices result in decreased use of pesticide products therefore reducing the chances of nonpoint source run-off.

#### Increased Field Scouting and Soil Sampling

Because of increased environmental concern about the use of fertilizers and pesticides, many dealers are increasing the agronomic services they provide along with the sale. Services specifically include soil sampling, crop scouting, and product recommendations based on research which insures that the right products are being used at the absolute minimum rate.

As a result of increased agronomic services, dealers have actually seen a decrease in the use of fertilizers and pesticides by farmers participating in dealer provided agronomic programs. Some may doubt this claim based on the fact that dealers are selling fertilizers and pesticides for a profit, but what the nay-sayers forget is that dealers operate in a competitive environment. Dealers compete for the business -- so dealers who can provide inputs leading to the best crop at the cheapest cost win the farmer's business.

#### Custom Application

Of all the new technologies and management methods which enhance environmental protection, custom application is the most widely adopted. Custom application basically amounts to a farmer contracting with a professional custom applicator to apply pesticides, fertilizers, or both to their fields. The end result of using custom application is that a farmer gets more accurate application conducted by a professional. In the majority of cases and at my dealership, applicators are licensed under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and as of yesterday, all applicators must be trained and in compliance with the Environmental Protection Agency's Worker Protection Standard.

In my business, I custom apply for many of my farm customers. Because custom applicators are more highly trained and experienced than farm applicators in most situations, custom application reduces the chance of nonpoint source pollution due to more accurate application, use of better equipment, and reduced over application.

#### Additional New Technologies

New products, technologies and management practices abound for protecting the environment from agricultural runoff. For example, many new pesticide products have been introduced during the last few years which result in reduced application, faster degradation, and decreased likelihood of being a contributor to nonpoint source pollution. In addition, Integrated Pest Management Strategies (IPM) and Best

Management Practices (BMP) include a host of management practices which reduce the use of pesticides and fertilizers, including those I have already mentioned.

Herbicide resistant crops and biotechnology, which use pheromones to disrupt insect reproductive cycles for example, are all advances which are addressing the environmental concerns brought before this subcommittee. Finally, the use of Global Positioning Systems (GPS) provide specific field position which allows for precise application. You can't get much more high-tech than using satellites, computers, grid-soil sampling, and precise application equipment in unison to address nonpoint source problems on the farm.

In short, the agricultural industry is addressing, and I might add successfully, environmental concerns, which include nonpoint source pollution, through the adoption of new technology.

#### **Residue Management**

There has been a literal revolution in the use of residue management on U.S. farms. Residue management is important to point out because of its effectiveness in eliminating sediment, nutrient, and pesticide run-off which may result in non-point source pollution to our nation's waters.

In 1989, of the total 279,654,989 acres planted, 71,733,086 or approximately 26% used no-till. In 1992, approximately 32% used no-till. An increase in no-till use of approximately 6% of total planted acreage in 4 years is phenomenal and sends the message that agriculture is not only serious about addressing environmental concerns, it's doing something about it. Research has shown that conservation tillage on average reduces soil loss by 81%, surface run-off by 31% and soil sediment concentration by 66%. Currently, more than 98% of highly erodible soils are covered by a Department of Agriculture Conservation compliance plan.

It is important to note the studies that have shown that reductions of the direct transport of nitrogen and other elements to surface water is attained by control of soil erosion. Run-off water containing no soil has very little nitrogen. Further, no-till greatly reduces the chance that pesticides will end up in our surface and groundwater as a result of erosion or water run-off.

### **Certified Crop Advisor Program**

Research has indicated that nonpoint source contamination may result from poor handling and application practices by farmers or custom applicators. In order to reduce potential problems, the Certified Crop Advisor (CCA) program has been developed by the American Society of Agronomy (ASA) to improve the quality and consistency of information farmers receive from crop input advisors. The goal of the program is to give agriculture a tool for addressing environmental issues such as water quality, soil loss and integrated pest management.

Each applicant for certification must have at least 2 years of crop advising experience and a BS degree in agriculture or 4 years of crop advising experience. The national exam includes some 200 questions regarding soil fertility, soil and water management, pest management, and plants and plant growth. Further, the applicant must pass a State specific examination.

Currently, a Certified Crop Advisor (CCA) program is in place in the States of New York, Pennsylvania, Ohio, North Carolina, Indiana, Illinois, Minnesota, Iowa, Missouri, Arkansas, Mississippi, Alabama, Kansas, Nebraska, Montana, Idaho, Washington, Oregon, and California. By August of this year, CCA Boards will be in place in the states of Vermont, Michigan, Wisconsin, Kentucky, Tennessee, Georgia, Oklahoma and Texas.

The CCA program is a prime example of how the agricultural industry is addressing the nonpoint source pollution issue and other environmental concerns voluntarily.

### Pollution Prevention Initiative

On April 14, 1992, the EPA and Department of Agriculture announced a Memorandum of Agreement (MOA) to implement increased pollution prevention in the agricultural sector. The MOA puts into place a plan to address agriculturally related environmental problems.

The agreement outlined four basic strategies to achieve environmental results which include:

1. implementation of a nationwide pollution prevention program;
2. establishment of a coordinated research and technology development and transfer system;
3. implementation of a comprehensive marketing strategy to promote voluntary pollution prevention; and,
4. a strengthened working relationship between EPA and USDA, using existing programs, voluntary initiatives, and regulatory programs.

The following five areas, with appropriate measurable goals, have been targeted for emphasis:

1. Nutrient Management -- developing recommendations for the establishment of a voluntary nutrient management program
2. Total Resource Management Planning -- establishing guidelines for site-specific farm and ranch plans designed to address environmental concerns while maintaining efficient agricultural production.
3. Voluntary Livestock or Poultry Management Agreements.
4. Safer Pesticide Registration -- instituting a policy framework and set of procedures to speed registration of environmentally safer pesticides.
5. Voluntary Action Projects in Selected Watersheds -- assisting local leadership in setting criteria and establishing agreements to achieve measurable environmental improvements

Even though ARA is supportive of increased public/private partnerships through the pollution prevention initiative, we have been disappointed by some of the public/private meetings that have taken place to date on this issue. Since the MOA was signed, ARA has participated in three meetings covering adoption of Integrated Pest Management (IPM), reduced risk pesticides, and watershed protection.

For example, during the National Integrated Pest Management Forum held in Washington D.C. on June 17-19, 1992, ARA and farmer participants offered several suggestions that would speed adoption of IPM through the Pollution Prevention Initiative. Since the forum's main purpose was to establish proposals to further the adoption of IPM, a vote was taken among forum participants to determine the primary focus of future efforts to increase IPM adoption. Unfortunately, input from ARA was ignored and farmer representation at the meeting was so small that their input was minimal (Note: Of the 346 listed attendees of the IPM forum, only 8 were farmers).

How can the government expect agriculture's adoption of IPM programs if its input is not considered? One farmer at the IPM forum stated, "You cannot decide National IPM policy from the top down... it must come from the bottom up". Increased participation of the agriculture sector residing outside the beltway is needed in these types of positive programs to insure success and reduced nonpoint sources of pollution emanating from agriculture

ARA recommends that from this point on, the USDA and EPA include private industry from start to finish in the process of writing implementation plans for meeting the goals of the Pollution Prevention Initiative. This entire issue is too complicated and important not to include those actually impacted

#### **Government Regulations and Programs aimed at Nonpoint Source Pollution**

Numerous federal programs are aimed at addressing nonpoint source pollution emanating from agricultural production. However, under funding, lack of coordination,

and bureaucratic roadblocks have resulted in delayed implementation and non-attainment of objectives. Following is a brief summary of federal programs aimed at nonpoint source agricultural pollution.

#### Clean Water Act and Section 319

In 1987, Section 319 was added to the Clean Water Act. This section requires states to submit an assessment report to the EPA that:

1. Identifies state water not meeting water quality standards because of nonpoint source pollution.
2. Identifies the general and specific nonpoint sources causing problems.
3. Describes processes for identifying best management practices that can address the identified problems.
4. Identifies programs for controlling nonpoint source pollution.

To date, all states have approved section 319 assessments and management programs. However, under funding has delayed implementation of this program. Programs instituted under Section 319 of the Clean Water Act need full funding and time to work.

#### Coastal Zone Management Act

The Coastal Zone Management Act (CZMA) of 1990 gives authority to Coastal states for the development and implementation of management plans aimed at reducing nonpoint source pollution. In early January of this year, two guidance documents were issued by the EPA and NOAA which create a Nonpoint Pollution Control Program specifically aimed at fertilizer and pesticide use in agriculture.

Through CZMA, States have increased authority to implement nonpoint control measures beyond existing provisions of Section 319 of the Clean Water Act. State management measures under CZMA target specific problem areas, allowing for a more reasonable approach to the nonpoint source issue.

### Department of Agriculture Programs, Plans, and Research

Currently, there are many USDA programs which impact the agriculture sector with regard to nonpoint source pollution. Without going into specific detail on each programs, I would like to list 15 plans implemented under the USDA which relate to soil and water conservation and other environmental programs. These plans are as follows:

1. Voluntary Conservation plan
2. Conservation Compliance plan
3. Conservation Reserve plan
4. Agricultural Conservation Program Long Term Agreement
5. Water Quality Incentive Program plan
6. Long Term Contract under Land Treatment Watersheds (PL566)
7. Great Plains Conservation Program plan
8. Wetland Reserve Program plan
9. Water Bank Program plan
10. Integrated Farm Management plan
11. Stewardship Incentive Program plan
12. Wetland Mitigation & Restoration plans
13. Water Quality Plans in Hydrological Unit Areas
14. Colorado River Salinity Program plans
15. Rural Clean Water Program plans

### State-Implemented EPA Programs

There are also several state-implemented EPA programs which address water protection. These programs include the recently finalized Comprehensive State Groundwater Protection Program, Wellhead Protection Program (25 states approved), Safe Drinking Water Program, and finally, State Management Plans issued under the EPA's Pesticides in Groundwater Strategy which was released in 1991. All of these programs address nonpoint source pollution.

### President's Water Quality Initiative (WQI)

The President's Water Quality Initiative (WQI) called for a vigorous effort to protect ground and surface water from contamination by agricultural chemicals, commercial fertilizers, and waste, especially pesticides and nutrients. The WQI program is being implemented over 5 years, starting in 1990, through three types of programs. These

programs include demonstration projects, hydrologic unit area initiatives and the Agricultural Conservation Program Water Quality Special projects.

#### Other Federal, State, and Local Water Quality Programs

In addition to the numerous federal programs and initiatives I have already mentioned, there are numerous other programs that address the agricultural nonpoint source pollution issue. Clearly, this issue is not being ignored.

#### **Other Nonpoint Source Related Government Programs and Regulations**

##### FIFRA 88

As a result of amendments to the Federal Insecticide, Fungicide, and Rodenticide Act in 1988 (FIFRA 88), retail dealers across the United States will be investing well over \$1 billion dollars to build secondary containment for bulk pesticide storage and more environmentally sound pesticide warehouses by 1997. ARA thinks that this investment is significant in the fight to address both point and nonpoint source water quality concerns because research has indicated that there is a direct correlation between ground and surface water detects of pesticide and fertilizers and retail dealer facility mixing and loading sites. Many states are also adopting bulk fertilizer containment regulations. Secondary containment, mix and load pads, and improved warehouses will eliminate this potential source of contamination.

##### Stormwater Permitting Requirements

Stormwater permitting impacts many retail dealers who mix and blend substantial amounts of fertilizers. Upon implementation of the full stormwater permitting requirements and controls run-off into streams and rivers will be further limited.

##### Effluent Guidelines for Pesticides

The EPA is currently in the process of writing effluent guidelines for bulk repackagers of pesticide products at retail facilities. Even though retail dealers reuse, instead of release,

pesticide contaminated rinsate, we fully expect that the EPA will issue a zero release threshold for retail facilities in 1995.

#### SARA Title III

The Superfund Amendments and Reauthorization Act (SARA) Title III Community Right-to-Know reporting requirements allow for the institution of even greater control of point source releases at retail establishment that may result in what is considered a nonpoint source. In addition, proposed expansion of the program may allow for even greater regulatory control in the future.

#### FIFRA Registration & Re-registration

The development and use of pesticides in America are highly regulated through FIFRA's registration, reregistration and special review process. In fact, the most expensive and complex studies undertaken to register a pesticide are with respect to water quality and aquatic life. Pesticide registration takes between 8 to 10 years and \$35 to \$50 million dollars before a product can reach the market.

With proper handling, the use of pesticide products does not pose an environmental concern. ARA and our industry are working extremely hard through voluntary programs and the adoption of new regulations such as the Worker Protection Standard to insure proper handling of pesticides.

#### Clean Air Act

The 1990 Clean Air Act will also impact nonpoint source pollution through controls of pesticide and fertilizer application and storage. Management practices currently being considered by the EPA include changing pesticide formulations and application practices which will directly impact the probability of nonpoint source contamination and fertilizer manufacturer controls.

### Remediation Efforts

ARA is working closely with the EPA's Cincinnati Research Laboratory to develop pesticide and fertilizer remediation technologies that will allow for the timely cleanup of pesticide spills and long term contamination. Instead of waiting years while the court system battles over Superfund liability, for example, new biotechnologies are being developed and used that allow for the cleanup of contaminated soil and water, eliminating the chance of point and nonpoint source pollution emanating from dealer and farm sites. In fact, just last week a major breakthrough in biotechnology as it relates to pesticide cleanup was made by Dupont.

### **Evaluation of Legislative Proposals**

#### "Draft" Nonpoint Source Water Pollution Prevention Act of 1993

Even though ARA has had only a limited amount of time to evaluate Representative James Oberstar's (D-MN) draft legislation entitled the Nonpoint Source Water Pollution Prevention Act of 1993, I would like to provide some very general comments on the draft. Representative Oberstar's bill represents an important effort to address the nonpoint source issue, however, the current vagueness of its language could place tremendous burdens on agricultural producers in effected watersheds that are already on the economic brink of disaster.

The overall construction of the legislation is, in ARA's view, a positive step forward, but duplicative of current CWA Section 319 program authority and CZMA initiatives. Targeting specific impaired watersheds and giving credit to farmers participating in Farm Bill, Coastal Zone Management Act, and Chesapeake Bay programs is the first step forward in balancing this very complex issue. However, a lack in legislative details leaves the door wide-open for future watershed management programs that place an unreasonable burden on the agricultural sector. Because of the importance of

agriculture, any nonpoint legislation should clearly establish regulatory limits and take into account the economic impact that such regulations will have on agriculture.

The draft legislation would require that States revise Section 319 management programs, prioritizing 5 target watersheds. Of concern to ARA is the fact that the bill gives very broad authority to States, with limited public input, for defining the prioritization criteria while imposing no limit on the strictness of enforceable standards. Further, designation of five separate watersheds seems to incriminate watersheds that are not in the first priority group requiring site-level management plans.

It is clear that more time and "impacted" public input be given before development of the proposed management programs. Since the draft legislation calls for full restoration and protection within 4 years, this proposal could severely impact the agricultural sector unless some flexibility is built in.

The penalties proposed in the draft are also severe. For watersheds not meeting the goals of full restoration and protection within 4 years, additional management measures and site-level programs would be instituted. In other words, the watersheds covered by the site-level programs could include not only those in the first priority group, but all five targeted watersheds. Every agricultural producer in the state could be required to institute a very stringent site-level plan within four years of this Act's implementation.

The draft legislation also sets out policy for water quality criteria, anti-degradation, and new sources which gives regulators unlimited authority to establish water quality criteria that may be unattainable for agriculture. In addition, the draft explicitly directs the EPA Administrator to target fertilizer and pesticide products when establishing parameters associated with degradation without justification. In reality, the draft legislation is like a trap, it baits you inside the trap with seemingly reasonable programs, then slams the trap door shut behind you when it steadily ratchets down requirements and expands the scope of the program to the point that farmers could not meet the requirements without negative economic impacts to their businesses.

Finally, the Citizens Watershed Monitoring Program is a nightmare in the making. ARA is opposed to the establishment of a citizen monitoring group because of the potential problems it will create. How will these programs screen out citizens with an "ax to grind" or special interest to promote? Who is to be held accountable when a citizen reports a problem that's not a problem, ruining a reputation and business? Most government regulators don't know the requirements of the programs they implement full-time, how can we expect citizens to properly monitor watersheds with all of the accompanying complex requirements? In short, this program is a very bad idea.

#### **ARA Suggestions for Nonpoint Source Pollution Legislation**

As I have pointed out in my testimony up to this point, agriculture is not ignoring or failing to address the nonpoint source pollution issue as it pertains to production agriculture. Whether it be voluntary adoption of new technologies and management practices or participation in an existing government program aimed at this issue, agriculture, especially in the last five years, has made tremendous strides at adopting management practices that reduce nonpoint source pollution.

If you look at what agriculture is doing voluntarily and the poor funding and administration of nonpoint source government programs in the past, it is hard for me, as a taxpaying citizen, to sit here and suggest that our government spend more money establishing new programs. When you take into consideration the cumulative "negative" impacts that the Clinton Administration budget will have on agriculture and also take into account the 200% regulatory compliance cost increase that the retail agribusiness industry already faced before President Clinton took office, it is clear that the government is trying to cut off the hand that feeds it. Instead of stopping here however, I would like to take a moment to make some recommendations for future action.

#### **RECOMMENDATIONS**

##### Coordination of Existing Federal, State, and Local Programs

In preparing to provide testimony today, I was astounded by the sheer number of

existing and overlapping government programs that are aimed at addressing the nonpoint source issue. The very first step that this subcommittee should take is to develop a plan for coordination of existing programs that best address this issue. Mr. Chairman, I think it is a mistake to propose and pass legislation mandating another layer of federal programs that will go under funded or impose a negative economic burden on our rural communities without first understanding what we are currently doing and the ramifications of what we want to do.

#### Accounting for Private Industry Initiatives

One of government's most critical failures in all areas is not taking into account what private industry is doing to voluntarily address environmental issues as they arise. Many environmental advocacy groups assert that private industry will do nothing for the environment unless forced to do so by some government regulation. This assertion is untrue.

Instead of making the worst case assumptions and writing them into law, I hope that this subcommittee will take into consideration my statements today concerning adoption of new management practices, application technology, and voluntary industry efforts to do a better job of providing sound fertilizer and crop protection chemical recommendations. I think that if this subcommittee will look at this issue, not strictly from a government program perspective, you will discover more has been done to address the nonpoint source issue through private industry efforts than through government mandated programs

#### Fully Fund Programs After Peer Review

After an evaluation of existing programs, ARA suggest that Congress fully fund programs that are deemed beneficial. For too long, Congress has tried to fix programs that are not working by establishing new programs. It's time to stop wasting taxpayer money developing new ones. Fully fund Section 319 and Coastal Zone Management Programs.

### Voluntary and Flexible Approach

Because soils, climates, crops and a host of other important factors impacting nonpoint source pollution differ from farm to farm, watershed to watershed, and State to State, it is extremely important that any new approaches to this issue are flexible. Any new legislation should allow for strategies to be developed on a hydrologic unit, watershed-wide basis and allow for individual farm flexibility.

Finally, forcing farmers to adopt specific nonpoint source management measures will only result in increased hardship on our endangered rural american communities. ARA recommends that future programs rely heavily on education, technical assistance, adoption of voluntary management measures and incentives for producers to participate.

### **Conclusion**

Mr. Chairman and members of the subcommittee, I would like to thank you for the opportunity to appear before you today to address the nonpoint source issue. I would be happy to answer any of your questions at this time.

Good morning. I wish to express my thanks to Chairman Applegate (D-OH) and the other members of the Committee for inviting us to testify on this very important issue. My name is Dawn Martin and I am the Issues Director for American Oceans Campaign and the Coordinator of the National Coastal Caucus. American Oceans Campaign (AOC) is a national organization dedicated to conserving and enhancing our nation's oceans and coastal resources<sup>1</sup>. The National Coastal Caucus (NCC) is a coalition of regional environmental organizations working collectively to fight pollution and habitat destruction in our oceans, bays, beaches, and wetlands.<sup>2</sup> My comments today are on their behalf and on behalf of the American Planning Association and Coast Alliance.

## INTRODUCTION

Since the original Federal Water Pollution Control Act (Clean Water Act) was signed into law its provisions have been revised on numerous occasions. With each reauthorization, Congress has strengthened protections for our coasts from pollution. As the 103rd Congress is faced with this same daunting task, we believe that the critical state of our nation's aquatic ecosystems and our global environment demand passage of even greater protections.

Citizens of this nation are becoming increasingly aware of the value of our earth and its abundant, yet limited, resources. According to a 1991 Gallup poll, approximately two-thirds of the U.S. public is "greatly concerned" (the highest rating) about the contamination of drinking water and pollution of our lakes, rivers, and beaches.<sup>3</sup> Even in light of the extreme financial restrictions currently facing our state and federal treasuries, the public has consistently called for increased environmental protections, while acknowledging the high cost of some of these programs. Similarly, the Wirthlin Group conducted a poll in July of last year which found that 80 percent of the U.S. public think "protecting the environment is so important that requirements and standards cannot be too high, and continuing environmental improvements must be made, regardless of cost."<sup>4</sup>

---

<sup>1</sup> AOC is a non-partisan, non-profit organization founded in 1987 and dedicated to the restoration and preservation of the world's oceans. Our efforts are rooted in the premise that the earth's environment is dependent upon healthy oceans. Our mission is to work to protect the vitality of coastal waters, estuaries, bays, wetlands, and deep oceans. We accomplish this goal by educating the public and decision-makers on the need to protect our marine resources. We focus on strengthening public policy to protect our marine resources, and we believe that strong grassroots input and sound scientific information are the key ingredients to making effective public policy.

<sup>2</sup> In February, 1991 AOC convened a gathering of geographically diverse, regional environmental organizations with national reputations. The result of that meeting was the formation of the National Coastal Caucus. The purpose of the NCC is to build a powerful and united voice of coastal experts, committed to the enactment of strong national coastal pollution legislation, and specifically to strengthen the Clean Water Act. The positions taken by the NCC are based on the experience and expertise of those who have implemented and enforced the Clean Water Act at the local level.

<sup>3</sup> Americans Report High Levels of Environmental Concern, Activity, Graham Hueber, The Gallup Poll News Service (April 1990).

<sup>4</sup> Environmental Concern Still High after Rio Summit, Christine Keilpinski, The Wirthlin Group and Susan Wysoki, Hill and Knowlton; the Wirthlin Report (July 1992).

Clearly, the public sees the potentially disastrous short and long-term environmental, social and economic costs associated with delaying the implementation of environmental protections. They realize that it is more costly to deal with environmental problems with a band-aid approach than it is to address them through a comprehensive and strategic planning process aimed at cleaning up and preventing pollution. Therefore, as you reauthorize the Clean Water Act (CWA), we encourage you to move ahead with confidence that the public solidly supports strong and enforceable legislation.

## PROTECTING AQUATIC ECOSYSTEMS

*"Aquatic ecosystems worldwide are being severely altered or destroyed at a rate greater than that at any other time in human history..."*<sup>5</sup> Protection on a "systems basis" of the functions of aquatic ecosystems such as pollution control, fisheries and wildlife support, floodwater storage and groundwater recharge have been largely ignored. Historically, resource management has been fragmentary in its approach and has focused on artificial boundaries (such as local, state or country borders) when dealing with protection of lakes, rivers and streams, or wetlands. Generally this has been done in isolation from their regional watershed contexts and despite clear hydrological and ecological linkages calling for broader aquatic ecosystems management.

A fundamental goal of the CWA is to maintain and restore, the physical, chemical and biological integrity of the nation's waters. During the past twenty years, however, the EPA has dedicated much of its resources to development of criteria that addresses the chemical integrity of the nation's waters, primarily because wastewater management was treated as a public health concern. As a result, little attention has been paid to the physical and biological impairment of these waters. EPA's focus on reduction of chemical inputs and concentrations in the nation's waters has resulted in considerable progress towards controlling and reducing certain kinds of chemical pollution. However, it is time for the CWA to explicitly address the restoration and protection of aquatic ecosystems, recognizing that biological integrity of the nation's waters stands on equal footing with human health risk assessments. Water quality standards should use biological criteria to protect water-dependent wildlife and ecosystem health. In addition, the CWA should be amended to clarify that the Endangered Species Act and other federal environmental laws apply to state action taken under federally delegated clean water programs.

The focus of my remarks will deal with two specific pieces of legislation that we would like to see incorporated into the reauthorization of a broader Clean Water Act. The first provides a good example of aquatic ecosystem management: **H.R. 1720 -- DeLauro-Lowey Water Pollution Control and Estuary Restoration Financing Act**. The second bill acknowledges that coastal water systems are connected despite artificial boundaries and sets forth minimum national standards are necessary for providing basic protections: **H.R. 31 -- Beaches Environmental Assessment, Closure and Health Act**.

## BACKGROUND -- COASTAL POLLUTION

Two months after the last reauthorization of the CWA in 1987, the Office of Technology Assessment ("OTA") published an oft cited report that documents the severe threats to our coasts posed by pollution.<sup>6</sup> The report highlights the ecological and economical significance of our aquatic ecosystems. From an economic perspective, it explains that these waters harbor food species for human consumption (ie., fisheries, coastal waterfowl, and marine plants) and it points out the impact of pollution on the tourism and recreational industries. Other commercial interests such as shipbuilding, fish processing and retailing, pharmaceutical research and development, and production of other common consumer goods are also affected.<sup>7</sup>

In addition, each of these economic activities are adversely affected by waste disposal. The report estimates that industry discharges 4.9 trillion gallons of wastewater annually and that 3.6 trillion gallons of wastewater from sewage treatment plants are dumped into our coastal waters each year.<sup>8</sup> One of the report's conclusions is that *"estuaries and coastal waters around the country receive the vast majority of pollutants introduced into marine environments. As a result, many of these waters have exhibited a variety of adverse impacts, and their overall health is declining or threatened."*<sup>9</sup>

Uncontrolled urban, suburban and industrial growth are responsible for much of the pollution fouling our nation's coastal waters. According to EPA's most recent (1990) National Water Quality Inventory, at least a third of our rivers, half of our estuaries and more than half of our lakes are not meeting designated uses, meaning that they are not safe for swimming, fishing and other uses. That same inventory found elevated levels of toxic pollutants in many of our rivers, lakes and estuaries. The National Environmental Law Center estimates that at least 350 billion pounds of toxic chemicals were produced or used in the U.S. in 1988.<sup>10</sup> While the National Research Council (1984), reports that 65,000 chemicals are used by industry worldwide.<sup>11</sup> Heavy metals are also of particular concern because of their persistence and acute toxicity. These and other forms of pollution enter the marine environment through industrial and municipal discharges, urban and agricultural runoff, and atmospheric deposition, posing severe threats to aquatic habitat, including our vital fisheries and recreational resources.

<sup>9</sup> Id. at 3.

<sup>10</sup> G. Lomas et al., "Toxic Truth and Consequences: the Magnitude of and the Problems Resulting From America's Use of Toxic Chemicals," National Environmental Law Center and U.S. Public Interest Research Group (April 1991).

<sup>11</sup> The Impacts of Ocean Dumping and Debris on the Sport Fishing Industry, Stephen H. Phillips, Sport Fishing Institute (March 1, 1990) (hereafter SFI Report) at 4.

The increasing loss of fish habitat to pollution, unplanned development and other human activities is the single largest long-term threat to the future viability of the marine fisheries of the United States.<sup>12</sup> Additionally, the loss of wetlands and other aquatic ecosystems has contributed to dramatic declines in waterfowl and amphibians. Pollutants continue to be released into our aquatic environments at levels that are toxic to aquatic species, birds, mammals and other predators that consume contaminated fish. However, many more aquatic species are threatened and endangered than their terrestrial cousins: 73 percent of mussels, 65 percent of crayfishes, 34 percent of fishes, and 28 percent of amphibians are jeopardized compared to 13 percent of mammals, 11 percent of birds, and 14 percent of reptiles. Likewise, an American Fisheries Society study found that nearly one-third of the native North American freshwater fish species are at risk.

In Puget Sound recent studies by scientists at the National Marine Fisheries Service have shown that toxicants (polyaromatic hydrocarbons and PCB's primarily) are impairing juvenile salmon's DNA, immune systems, and growth rates, all of which reduce their chances for ocean survival.<sup>13</sup> These kinds of effects suggest major impacts on populations and ecosystem communities, whereas previous studies on cancer in Puget Sound bottomfish indicated a more simple effect at the individual level. This new research is also alarming because the salmon are exposed for a very short time, only 14 days during their migration, and yet something as serious as DNA damage is occurring. And Puget Sound is not alone.

Millions of fish die annually from pollution and lack of oxygen - millions more are rendered inedible by dangerous toxics. Swimmers are exposed to bacteria and viruses from sewage and sludge discharges. Estuaries are filled with toxics that threaten the biological life cycles of both marine organisms and wildlife. The oceans are facing increased pressure from coastal development and industrialization. Coastal currents transport pollutants along the shoreline where they accumulate in organisms and are sometimes transferred to others in the food chain. Yet, we are here today to express our hope that with the strengthening of the CWA, the situation can be changed for the better.

## BEACH CLOSURES AND ADVISORIES

During 1988, the effect of coastal pollution on beachgoers was brought to national attention when medical waste began to wash up on our coastlines. The resulting beach closures cost New York and New Jersey an estimated \$2 billion in lost tourism. The media focused on the threat that toxic chemicals and marine floatable debris pose to the nation, and reported on toxic red tides, sewage spills, dead dolphins, and fishing bans. Alarming accounts explained that unseen contamination from sewage spills and polluted runoff can contain high levels of pathogens posing such health threats as hepatitis and gastroenteritis. Despite the severity of the problem,

<sup>13</sup> The Effects of Contaminated Estuaries on Juvenile Chinook Salmon, J. Varanasi and S. Geballe, NWAFC Quarterly Report (Oct-Nov-Dec, 1991, pp.1-2).

individual beachgoers are often uninformed of the potential risks incurred by coming into contact with polluted coastal recreational waters.

The Natural Resources Defense Council released a report in 1992 that inventoried beach protection programs for 22 coastal states.<sup>14</sup> NRDC found that more than 5,000 pollution advisories and beach closures were issued between 1988 and 1991, and over 2,000 in 1991. The report also found that beach water standards, monitoring, and closure practices vary widely from state to state, and within states. Many states do little or no monitoring of beach water quality.

Regional studies have also been conducted. The 1991 Beach Pollution Report released by Heal the Bay (HTB) in Santa Monica, CA, compared nearly 18,000 bacterial samples taken from southern California beaches between January, 1989 and March, 1991 to the recreational water contact standards of the California Ocean Plan. Since the beginning of 1991, more than 78 percent of the daily samples from one location exceeded the Ocean Plan limits for enterococcus (indicating the presence of fecal matter). Although southern California beaches violate standards almost every day, the Los Angeles County Department of Health Services posted beach warnings and closures only 13 times over the period of the study.

As noted previously, the harm caused by coastal pollution extends beyond illnesses contracted from body contact or ingestion of contaminated seafood; it also poses risks to marine species and to the economy. Though it is difficult to calculate total economic losses, there are indications of wide impact. For example, the sport fishing industry which generated just under \$5 billion in retail sales during 1985, suffers significant losses from coastal pollution. One-third of the nation's remaining productive shellfish waters are closed on any given day because of pollution. Those same pollution sources cause swimmer illness, further impacting the economy through lost work days.

Because coastal tourism generates billions of dollars annually, it makes good economic and environmental sense for states to provide public health protection for coastal recreational waters. Federal guidance is needed to discourage health officials from turning a blind eye from this pollution for fear that closed beaches will deter tourists. Instead, beachgoers should be aware that beach closings indicate responsible combined efforts to protect public health. In the long term, larger coastal pollution problems -- of which beach closings are only a symptom -- must be addressed and a comprehensive remedy must be found.

#### **H.R. 31 - Beaches Environmental Assessment, Closure Health Act**

Not all states conduct water quality testing, monitoring and posting of coastal recreational waters and those that do use different standards to judge the safety of such waters. Often neighboring states have conflicting standards that would deem water safe on one side of the border and unsafe on the other, and standards sometimes differ even within states. In general, protective action taken by states is often nonexistent or sporadic.

---

<sup>14</sup> Chasis, Sarah, et al., *Testing the Waters: A National Perspective On Beach Closings*, Natural Resources Defense Council (July 1992) (for copies, contact NRDC's New York office: 40 West 20th Street, New York, NY 10011, 212-727-2700).

There are essentially three main problems that stand in the way of states issuing credible and consistent beach closures and advisories. We believe that these problems could be corrected fairly easily. We, therefore, recommend the inclusion of H.R. 31, introduced by Representative Hughes (D-NJ), in the CWA reauthorization to help address these concerns.

**Problems and Potential Solutions:**

(1) The federal government has not set any guidance for developing minimum water quality standards for testing coastal recreational waters.

Solution: Set mandatory national bacterial indicator organism standards. Adequately protective minimum standards are needed for all coastal recreational waters. Public health will not be protected until there is consistency regarding the threshold beyond which exposure to bacteria is unacceptable. Where there is an impact on water quality due to heavy rainfall and the resulting polluted runoff, rainfall standards should trigger preemptive beach advisories in anticipation of high bacteria levels. In addition, local health and environmental agencies should also be advised to combine their information on water quality and pollution sources to increase the available data for implementing these programs.

(2) The federal government has not set any minimum monitoring practices to guide states in testing coastal recreational waters.

Solution: Set minimum monitoring practices. The federal government should provide guidance for states on the minimum frequency with which beaches should be tested to ensure that recreational waters are safe for swimming whenever swimming is expected to occur. Monitoring and testing protocols should reflect the degree of pollution and must be adequate enough to detect even periodic violations of the standards.

(3) The federal government has not established a national protocol for public notification of unacceptable coastal pollution levels. Local health departments and/or appropriate environmental agencies often fail to notify the public of the potential health risks from coming into contact with contaminated waters.

Solution: Establish mandatory public notification procedures in the form of beach closures and advisories when standards are exceeded. The public has the right-to-know about the safety of coastal recreational waters. When minimum pollution levels are exceeded, regardless of the source, beach closures or advisories should be issued explaining the health and environmental effects of the violation. Whenever possible, sanitary surveys should be conducted to identify the source of contamination, and to abate it (ie., combined sewer overflows, sewage spills, polluted runoff). Posting of closure and violation notices should occur at all beach access points and at the source of the pollution. Signs should explain, in all prevalent languages of the area, the type of pollution, initial level of pathogen contamination and/or the indicator densities, and its known or suspected source. A toll-free phone number to contact for more information should be included. The beach should remain posted until further sampling indicates that the health risk has subsided. In the case of a violation by a discharger, the facility should be required to post notices at the building entrances.

## NATIONAL ESTUARY PROGRAM

Estuaries form transition zones between freshwater and marine ecosystems and, as a result are among the most productive natural systems. Maintaining the health of estuaries is critical to the biological life cycles of both marine organisms and wildlife. Society also places a high value on estuarine areas as places for living, working, and recreating. Although estuaries are important to both economic development and ecological processes, they are among the most densely populated areas and are one of the nation's most highly stressed natural systems.

In spite of their high value, intense use and frequent overuse, estuaries only recently have been recognized as a unique and severely depleted resource. In addition, the problems facing our nation's estuaries have not fit into the traditional pollution control regulation and enforcement procedures. Recognizing this fact, Congress authorized the National Estuary Program (NEP) under Section 320 of the Water Quality Act of 1987. The NEP, which was modeled after the Chesapeake Bay and Great Lakes Programs, provide a successful example of watershed planning for addressing many of the complex issues that have contributed to the deterioration of our nation's estuaries. These issues include habitat protection, polluted runoff control, resource management and land-use planning.

The NEP authorizes the Environmental Protection Agency (EPA) to designate estuaries of "national significance" for participation in the program.<sup>15</sup> The EPA is then responsible for convening management conferences to address all uses that affect the restoration and maintenance of the chemical, physical and biological integrity of each estuary. Participants in each management conference include representatives of the relevant international, interstate or regional agencies, federal agencies, the Governor(s) and appropriate state agencies, local government agencies, affected industries, educational institutions, and citizens. The purpose of these five-year conferences is to develop a Comprehensive Conservation and Management Plan (CCMP) to protect and restore the water quality and living resources of estuaries. To date, actual implementation of these plans has been stymied by an inadequate federal financial commitment to the program.

The program has four tiers. Tier I was convened in 1985 through 1987 and includes the following six estuaries: Puget Sound, Buzzards Bay, Narragansett Bay, Long Island Sound, Albemarle-Pamlico Sounds, and the San Francisco Estuary. Tier II was convened in 1988 and includes New York-New Jersey Harbor Estuary, Delaware Inland Bays, Santa Monica Bay, Sarasota Bay, Galveston Bay and Delaware Estuary. Tier III was convened in 1990 and includes: Casco Bay, Massachusetts Bays, Indian River Lagoon, Tampa Bay, and Barataria-Terrebonne Estuarine Complex. In 1992, four additional estuaries were designated under the program, but were not to be convened until 1993. Tier IV estuaries include Corpus Christi Bay, Peconic Bay, San Juan Bay and Tillamook Bay.

Of these twenty-one estuaries, the Puget Sound Estuary Program, which was convened in 1985 was the first program to receive approval of its CCMP by EPA. The Buzzards Bay CCMP was

---

<sup>15</sup> Federal Water Pollution Control Act §320 (a)(1), as amended.

approved by EPA last April and Narragansett Bay was approved in December. Long Island Sound has submitted its proposed CCMP for review and approval is expected in January, 1994.

During the past several years, AOC through the National Coastal Caucus, has been gathering comments on the NEP from citizens organizations that are integrally involved in their local estuary program. While working with these organizations, we developed a list of priority problems and potential solutions necessary to strengthen the program. Representatives involved in developing and implementing CCMP's from the following estuaries participated in this process: Albemarle/Pamlico Sound, **North Carolina**; Barataria-Terrebonne Bay Estuarine Complex, **Louisiana**; Buzzards Bay, **Massachusetts**; Casco Bay, **Maine**; Chesapeake Bay, **Maryland, Pennsylvania and Virginia**; Columbia River, **Oregon**; Delaware Estuary, **Delaware, New Jersey and Pennsylvania**; Delaware Inland Bays, **Delaware**; Galveston Bay, **Texas**; Gulf of Mexico Program, **Texas, Louisiana, Mississippi, Alabama and Florida**; Indian River Lagoon, **Florida**; Long Island Sound, **Connecticut and New York**; Massachusetts Bays, **Massachusetts**; Narragansett Bay, **Rhode Island**; New York-New Jersey Harbor Estuary, **New York and New Jersey**; Puget Sound, **Washington**; San Francisco Estuary, **California**; Sarasota Bay, **Florida**; Santa Monica Bay, **California**; Tampa Bay, **Florida**.

Thanks to a close working relationship with the offices of both Congresswomen DeLauro and Lowey, our concerns and suggestions moved from being simply a Congressional wish list into a very viable piece of legislation. The compilation of our comments became the basis of the NEP reforms in H.R. 1720, the DeLauro-Lowey Water Pollution Control and Estuary Restoration Financing Act (introduced as H.R. 5070 in the 102nd Congress). The bill, which was reintroduced on Monday, April 19, 1993 has secured the support of several broad-based coalitions. One such coalition, which includes labor unions, construction trades councils and environmentalists, have focused on the ability of the bill to create "Clean Water Jobs."

**H.R. 1720 -- DeLauro-Lowey Water Pollution Control and Estuary Restoration Financing Act:** The protection of estuaries and other aquatic resources is a top legislative priority for citizens around the country, as well as for the local economies that depend upon them for long-term economic growth. However, many states and municipalities possess neither the infrastructure nor the financial resources to stop the ongoing destruction of these watersheds. This legislation attempts to address that issue by recognizing that investing in healthy estuaries is tantamount to investing in jobs and a healthy economy.

The DeLauro-Lowey bill is designed to implement estuary protection and cleanup in such a way as to create jobs and foster economic growth through commitment to a strong federal-state-local partnership. According to a March 1992 study by Apogee Research, Inc. this legislation would create 800,000 to 1.4 million new jobs over the seven year life of the bill in the construction industries and industries that support these workers.

Assuring the development of the most economically and environmentally efficient plan for managing our nation's estuaries is the main goal of H.R. 1720. It is our belief that the present statutory and regulatory structure of the NEP has great merit but does not adequately deal with the complexities of the problems faced by these valuable watersheds. As a result, we have worked to ensure that this bill significantly strengthens the program and provides adequate financial resources for implementation of comprehensive management plans.

This legislation strengthens the CWA in several important ways. In particular, it will help clean up our nation's water resources by significantly increasing federal aid to states for upgrading sewage treatment plants, controlling polluted runoff, and fixing combined sewer-overflows. In addition, it reauthorizes Section 320 - the National Estuary Program, mandates implementation of CCMPs and targets State Revolving Loan Funds (SRF) for economically and environmentally efficient implementation of estuary management plans. The bill also ensures full coordination of efforts taken to carry out other requirements of the CWA and Coastal Zone Management Act.

Specifically, the legislation strengthens the planning process in such a way as to assure that management plans achieve their goals and are economically feasible, before unnecessary resources are expended. It also would create a set-aside of additional funds in the SRF program to assist states in implementing approved CCMP's. This SRF set-aside will provide funds to local economies while achieving the dual purpose of protecting the integrity of their estuaries, and creating the necessary economic base essential for continued economic resiliency.

**Problems and Potential Solutions:**

The DeLauro-Lowey Water Pollution Control and Estuary Restoration Financing Act addresses the major weaknesses in the current estuary program. It is our belief that the following solutions to these problems as outlined in the DeLauro-Lowey bill will significantly strengthen the program:

(1) After the CCMPs are developed there is no firm requirement that the plan be implemented. In addition, the planning process itself is often unnecessarily stalled and is extended beyond its five year limit. The NEP has been generally successful at identifying water quality problems, however, it is essential that the program move from the identification phase to implementing the solutions to these problems.

Solution: Mandate implementation and fixed time-frames. Section 320 of the CWA should be amended to extend the program for purposes of implementation and federal financial assistance should be provided to assist in the effort. Efficient use of the resources expended in developing the CCMPs necessitates federal support for implementing, monitoring and enforcing the plan. Deadlines are necessary to ensure that individual members of the management conference are not able to stall the entire process.

(2) The role of the EPA, as an active participant and as a coordinator of the appropriate environmental agencies, has not been consistent in each of the projects nor has its level of commitment to the NEP.

Solution: Section 320 of the CWA should require the EPA to take on a more aggressive leadership role in assisting the program to fulfill its goals. The EPA needs to take a stronger position in coordinating activities with the Governor's office and state coastal zone management offices. States should also be required to adopt the stronger (or more protective) of their own state coastal protection plans or the final CCMP. EPA's role must be consistent in all estuaries, therefore, staff and resources for some programs may need to be increased.

(3) Citizen participation during the development of the CCMPs is often inadequate, as is the funding necessary to accomplish this goal.

Solution: Increase citizen participation. Section 320 should be strengthened by requiring citizen participation in all aspects of the CCMP process. Public hearings should be held on a regular basis throughout the life of the program. Funding is needed to ensure full citizen participation and for public education efforts. Environmental organizations should be members of the estuary management conference.

(4) Due to state budget shortfalls and a lack of federal support, many states have been unable to follow through on their CCMPs; therefore, there is no guarantee that these plans will ever be implemented, monitored, and enforced.

Solution: The CWA should include a funding mechanism to ensure that the states are given federal assistance so that the CCMPs can be implemented, enforced and closely monitored. Section 320 should be amended to provide grants for innovative projects and interim actions that are not ordinarily funded under the SRF program. Title VI should also be amended to increase funding for the CWA's State Revolving Loan Funds with a set aside for implementation of CCMPs.

EPA's involvement in implementation, enforcement and monitoring is just as critical as it is in the formulation of the plans. It is imperative that access to additional resources be provided for implementation of the plans to be successful, otherwise the federal funds expended for crafting the plans will have been wasted. Federal funds also provide an incentive for states to undertake the more politically difficult task of putting the elements of the plan into practice. Under current law, states are eligible to receive CCMP implementation funds under the SRF program, however, appropriation levels are severely inadequate to meet the growing demand for funding. The SRF program should be increased to a minimum of \$5 billion per year with a specific set-aside for implementation of comprehensive management plans.

We fully support and encourage any actions that may be taken by this Committee to strengthen the program and to help the estuaries develop and implement their CCMP's. In particular, we support the passage of H.R. 1720 and its Senate companion, as a means to not only provide for implementation of the CCMP's, but to also strengthen the process by which these plans are developed.

In summary, we feel that the National Estuary program has done an excellent job identifying waters of "national significance" and documenting their problems. However, we believe that the program will be significantly strengthened by passage of H.R. 1720, which incorporates: (1) a mandate for implementation and development of fixed time-frames; (2) a requirement that EPA take on a more aggressive leadership role; (3) increased citizen participation; and (4) a federal commitment to provide the funds necessary to implement CCMPs. Proper implementation of the NEP would help address a full range of other coastal issues that impact the economic and environmental health of our communities.

**CONCLUSION**

This concludes our testimony. I hope we have highlighted the inevitable economic and environmental costs associated with ignoring protection of our aquatic ecosystems. In order to avoid the furtherance of these costs, we encourage you to do all that is within your power to assure that the current provisions of the National Estuary Program are strengthened and that a federal minimum beach closure and advisory protocols are developed. We applaud Representatives DeLauro (D-CT) and Lowey (D-NY) for sponsoring H.R. 1720 and Representative Hughes (D-NJ), the author of H.R. 31, for their focus on the economic and environmental benefits of cleaning up these estuaries and coastal recreational waters. Thank you once again for soliciting our views on these important issues. We appreciate the Committee's attention to estuary and aquatic ecosystem protection.

**BEFORE THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
REPRESENTATIVE APPLIGATE, CHAIRMAN**

**REGARDING REAUTHORIZATION OF THE  
FEDERAL WATER POLLUTION CONTROL ACT**

**TESTIMONY OF NATIONAL WATER RESOURCES ASSOCIATION  
PRESENTED BY BENNETT W. RALEY  
CO-CHAIRMAN, NWRA CLEAN WATER ACT TASK FORCE  
HOBBS, TROUT & RALEY, P.C.  
DENVER, COLORADO**

**April 22, 1993**

Mr. Chairman and Members of the Committee:

I am BENNETT W. RALEY, Co-Chairman of the National Water Resources Association's Clean Water Act Task Force. I appear before this Committee today to express the Association's concerns and interests in issues related to the reauthorization of the Federal Water Pollution Control Act. The National Water Resources Association (NWRA) is a non-profit federation of associations and individuals dedicated to the conservation, enhancement, and efficient management of our Nation's most precious natural resource, WATER. NWRA is the oldest and most active national association concerned with water resources policy and development. Its strength is a reflection of the tremendous "grass roots" participation it has generated on virtually every national issue affecting western water conservation, management, and development.

The Federal Water Pollution Control Act Amendments have been in place for over 20 years. With the exception of the 404 Dredge and Fill program, the Act should be viewed as one of the more successful environmental programs enacted by Congress. In contrast to the Endangered Species Act and CERCLA, which are viewed by many as expensive failures which require major legislative overhauls, the Clean Water Act does not require significant changes in order to achieve the goals of the Act.

As Congress considers reauthorization of the Act, it should squarely face several critical issues:

1. **What is the goal of the Act? Is it to attain water quality sufficient to allow the use of water for municipal, agricultural, recreational and aquatic life purposes, or is it to achieve "ecological", "biological" or "physical" integrity, as measured against a pristine environment? Is it feasible to restore and enhance all waterbodies to "fishable, swimmable" levels?**
2. **Should states retain the authority to determine the level of protection to be provided to specific waterbodies?**
3. **Does Congress want to abrogate existing state authority over water allocation and administration decisions, and replace it with a federal water allocation system?**
4. **Does Congress want to assert regulatory or oversight authority over local land use decisions which have always been the prerogative of States and local governments?**

NWRA believes that any amendment of the Clean Water Act should 1) include a consideration of economic and technical factors in determining the goals of the Act, and attempts to attain "ecological", "biological" or "physical" integrity must recognize and allow human-induced changes to water quality so long as existing State classified uses are protected; 2) allow States to continue to establish water quality standards and use classifications for specific waterbodies, and to decide whether the protection of additional uses is attainable; 3) preserve

state authority over the allocation and administration of quantities of water; and 4) not establish federal oversight or regulation over local and regional land use decisions.

In particular, Congress should give States adequate time and resources to allow the full implementation of Section 319 of the 1987 Clean Water Act Amendments, which created a comprehensive program to address nonpoint sources of pollution. If changes to Section 319 are needed, they should be consistent with the attached "Principles Statement of the Clean Water Act Working Group", and "NWRA Statement of Principles Regarding Clean Water Act Reauthorization", dated July 29, 1991.

**THE GOAL OF THE CLEAN WATER ACT SHOULD BE TO PROTECT AND ALLOW  
THE USE OF WATER FOR DRINKING WATER, AGRICULTURE, RECREATION,  
AND AQUATIC LIFE**

NWRA represents municipal, industrial, and agricultural water users in the 17 western states. These states vary widely in climate, geography, and patterns of economic development, but share the common problem of water scarcity. Over 125 years ago Congress recognized that this diversity required that the individual states be able to develop a water allocation and administration system that fit their particular needs. Interstate water allocation issues have been addressed through interstate compacts and equitable apportionment decrees of the United States Supreme Court. In response, the states have developed sophisticated systems for establishing rights to the use of water within their boundaries, and millions of people and billions of dollars of public and private investment rely on these systems. In almost all states, these systems have been modified to recognize and allow non-traditional allocations of water for instream environmental and recreational purposes. The critical element of these water allocation and administration systems is that they provide a rational mechanism for allocating water in times of scarcity, which in turn allows more efficient decision-making by those who would invest public and private resources.

The relationship of the Clean Water Act to these systems is inextricable. On the one hand, water must be of adequate quality before it can be used for municipal, agricultural, and recreational purposes. On the other hand, water users typically must withdraw water from its natural source for the intended use, and return a portion of the withdrawn supply to the stream for successive use by others. Consequently, the Clean Water Act must function in a manner which protects water quality without destroying the water allocation and administration systems upon which water users rely, or prohibiting the uses altogether.

The greatest threat to the integrity of these systems from the Clean Water Act are attempts to use the Act as a surrogate or replacement mechanism for allocating the use of quantities of water in order to establish instream flows<sup>1</sup>. For example, it is impossible to

---

<sup>1</sup> See EPA's Paper on "Arid Area and Water Efficiency Issues" dated February 11, 1991, pp 7-8, which states that "Stream flows may be depleted beyond the point where they can

simultaneously divert water from a stream for use elsewhere and preserve the "physical integrity" of the stream - the stream no longer has the naturally occurring quantity of water. If the Act is changed from a program to address the discharge of pollutants from point and non-point sources to a program to protect and preserve aquatic habitat, or biological, physical, or ecological integrity, it will then be asserted to restrict the diversion of water under state created water rights. This leads to chaos, because the water will then be used in a manner inconsistent with the state allocation system, and the purpose of the Clean Water Act will have been defeated, because the uses it was intended to protect and allow (municipal, agricultural, and recreational) will be prohibited.

An actual example of the type of chaos that will result has already occurred in Colorado. In one instance, the United States Forest Service illegally required the owner of a reservoir to release water to protect the downstream aquatic environment. However, the water was immediately diverted by a downstream junior water right. The result was that the water was taken from the entity which had a right to it under the state system, and instead given to an entity which was not supposed to receive the water, and the purpose of the Forest Service was not achieved. The answer to these types of problems is that water allocations for all purposes must be integrated into the existing state systems, as is required by the McCarran Amendment. 43 U.S.C. § 666. The Clean Water Act cannot and should not be used as a partial and illogical replacement for existing state allocation systems. Where additional water is required for instream flow purposes, it should either be appropriated in accordance with state law, or purchased from its existing owners.

A second example of the problems that the Clean Water Act can create for water uses is found in the many streams and artificially created wetlands which would not have any significant flows at dry times of the year if it were not for treated municipal effluent or agricultural return flows. If water quality standards impose additional requirements to achieve "biological integrity", these flows may be eliminated by alternate treatment methodologies, which will in turn eliminate the modified aquatic environment these flows support.

Consequently, the focus of the Clean Water Act should be on reasonable control of point and non-point discharges of pollutants which impair classified uses of water for drinking water, agriculture, recreation, and aquatic life, as defined by the States through the setting of water quality standards and effluent limitations applicable to point sources, and economically feasible voluntary best management practices identified by the States for nonpoint sources. However, it is equally important that the goal of the Clean Water Act not be defined as the restoration of

---

support the goals of the CWA and maintain the physical, chemical, and biological integrity of water bodies. ... In many areas, particularly in the West, instream flows are a critical factor affecting water quality and the health of aquatic ecosystems. In such cases, CWA programs that emphasize water quality and ecological protection, critical aquatic habitats, and risk-based and geographic targeting will not be successful unless instream flows are maintained."

the natural or pristine environment, or by concepts of biological, physical, or ecological integrity.

#### THE GOAL OF THE CLEAN WATER ACT

EPA and environmental groups have indicated a desire to shift to a new focus on the "restoration" and "enhancement" of the "biological" and "physical" integrity of waters within the regulatory scope of the Act. This intent is demonstrated by EPA's adoption of "Guidance on Biological Criteria"<sup>2</sup>, by EPA's requirement that the States adopt an "Antidegradation Policy", and by provisions in both S. 1081 (102nd Congress) and Representative Oberstar's March 18, 1993 draft "Nonpoint Source Water Pollution Prevention Act of 1993" (see Sections 301, 303, and 321).

In 1972 Congress did refer to biological and physical integrity in Section 101(a) of the Act, and to the laudable goals of elimination of all discharges of pollutants by 1985 and attainment where possible of fishable, swimmable status by 1983. However, it is equally clear that these theoretical goals have not and cannot be achieved for point sources, let alone the vastly more complex nonpoint sources. Congress must consider both the technical feasibility and economic consequences of pursuing these theoretical and unattainable goals.

There is an important distinction between the protection of existing and reasonably foreseeable uses of waters and the attainment of physical and biological integrity, particularly if integrity is measured by reference to a natural or pristine condition (as is proposed in EPA's Guidance on Biological Criteria). Many waterbodies which have been affected by discharges of pollutants from point and non-point sources nonetheless support aquatic habitats which differ from the natural or pristine condition that would exist in the absence of human impacts. The Clean Water Act should recognize and allow human-induced modifications to water quality so

---

<sup>2</sup> See EPA's "Biological Criteria, National Program Guidance, April, 1990, pp VIII-IX. "Biological criteria are narrative or numerical values that describe the biological integrity of aquatic communities inhabiting waters of a given aquatic life use. They are developed under the assumptions that surface waters impacted by anthropogenic activities may contain impaired aquatic communities (the greater the impact, the greater the expected impairment), and that surface waters not impacted by anthropogenic activities are generally not impaired. Measures of aquatic community structure and function in unimpaired surface waters functionally define biological integrity and form the basis for establishing the biological criteria." ... "To develop values for biological criteria, states should (1) identify unimpaired reference water bodies to establish the reference condition, and (2) characterize the aquatic communities inhabiting reference surface waters used to establish reference sites.... The basis for choosing reference sites depends on classifying the habitat type and locating unimpaired (minimally impacted) waters." (emphasis added).

long as existing uses are protected.

It is therefore essential that any implementation of the concepts of biological or physical integrity recognize and allow human induced changes in the aquatic environment associated with the withdrawal and use of water. Congress must recognize that there are technical and economic limitations on our ability to achieve the goals of the Act, which must be considered in the course of the establishment of standards and criteria that will be imposed on discharges of point and non-point sources of pollutants.

#### **STATES SHOULD HAVE THE AUTHORITY TO DETERMINE THE LEVEL OF PROTECTION FOR SPECIFIC WATERBODIES**

As a practical matter, the implementation of the Act over the past 20 years by States with delegated programs has resulted in site-specific decisions regarding the appropriate level of protection for each waterbody. Waterbodies have been classified and protected for drinking water, agricultural, aquatic life, and recreational uses. These decisions have considered and balanced the theoretical goals of the Act with the physical and economic realities applicable to specific areas. The issue of enhancement and restoration of uses which are not supported by existing standards is addressed through the use attainability analysis already in place as a part of the Clean Water Act regulations. The use attainability analysis allows the States to assess the economic and technical feasibility of protecting additional uses.

It is critical that States retain the ability to make these site-specific judgements, and that this authority not be eroded by second-guessing of these decisions by Congress, EPA, or the courts. Accordingly, so long as existing classified uses of water are being protected, as measured by the standards currently in place, state determinations of use attainability should be final. Moreover, states should not be forced to adopt water quality standards which implement biological or other criteria in a manner which unreasonably affects point and non-point source dischargers to those waters, or to implement non-point source programs in a manner which is contrary to state laws regarding land and water uses. Finally, any implementation of a "watershed" approach to water quality regulation must carefully consider and respect state sovereignty, as well as interstate compacts and equitable apportionment decrees which allocate water between states.

**THE CLEAN WATER ACT SHOULD NOT INTERFERE WITH STATE AUTHORITY OVER WATER ALLOCATION AND ADMINISTRATION DECISIONS.**

For over a century, Congress has chosen to delegate to states the responsibility and authority for allocation and administration of quantities of water<sup>3</sup>. When the 1972 Federal Water Pollution Control Amendments were adopted, Congress reaffirmed pre-existing law which had established state primacy in water allocation matters. Section 102(b) of the Act states that it is

"the policy of the Congress to recognize, preserve, and protect the primary responsibilities and rights of States . . . to plan the development and use (including restoration, preservation, and enhancement) of land and water resources." 33 U.S.C. § 1251(b).

Congress also provided that:

"Except as expressly provided in this Act, nothing in this Act shall . . . (2) be construed as impairing or in any manner affecting any right or jurisdiction of the States with respect to the waters (including boundary waters) of such states." 33 U.S.C. § 1370.

After EPA indicated that it wanted to regulate the diversion of water as a part of the Clean Water Act<sup>4</sup>, Congress again explicitly addressed the relationship between the Clean Water Act and state water allocation and administration systems in 1977, and in the "Wallop Amendment" again made it clear that the Act was not intended to usurp these state prerogatives:

"(g) It is the policy of Congress that the authority of each State to allocate quantities of water within its jurisdiction shall not be superseded, abrogated or otherwise impaired by this Act. It is the further policy of Congress that nothing in this Act shall be construed to supersede or abrogate rights to quantities of water which have been established by any State. Federal agencies shall cooperate with State and local agencies to develop comprehensive solutions to prevent, reduce and eliminate pollution in concert with programs for managing water resources."

33 U.S.C. § 1251(g).

However, numerous proposals have been made to extend the scope of the Clean Water

---

<sup>3</sup> NWRA's statement on S. 1081 (102nd Congress), as included in the Hearing Record of the Senate Committee on Environment and Public Works, Subcommittee on Environmental Protection, May 21, June 13, and July 9, 17, and 18, 1992, at page 928, discusses this history in greater detail.

<sup>4</sup> See "Water Quality versus Water Quantity: A Delicate Balance," 34 Rocky Mtn. Min. L. Inst. § 24 at p. 24-15 (1988).

Act to the impacts resulting from the diversion of water pursuant to state water allocation and administration systems. These proposals are typically indirect. Rather than address the issue explicitly, they instead attempt to extend the scope of the Act from the "discharge of pollutants" to the prevention of "adverse impacts" to water quality, and the "restoration and enhancement" of "biological and physical integrity", or similar goals. In addition, and notwithstanding the fact that Congress stated in 1972, and again in 1977, that the Clean Water Act was not intended to replace the authority of the States over water quantities, EPA has continued to ignore the existing mandate of Section 101(g)<sup>5</sup>.

Of particular concern to NWRA is the inclusion by EPA of dams and diversions within the nonpoint source category of "hydromodifications" in its Guidance on Section 319, without any recognition of the distinction between the withdrawal or diversion of water and a discharge of pollutants. This distinction is critical, as the Clean Water Act is intended to control the discharge of point and non-point sources of pollutants in order to prevent injury to classified uses of water for agricultural, municipal, recreational and aquatic life. The reference to "physical" and "biological" integrity of water in Section 101(a) clearly refers to implementation of the Act by means of pollutant discharge control, not instream flow maintenance. This is consistent with the 1972 Congressional testimony of EPA Administrator Ruckelshaus that "we don't believe that the solution to pollution is dilution." Perhaps in an attempt to avoid this history, proposals have been made to define the operation of a dam or a diversion as a "pollutant", even though the diversion or storage of water does not discharge pollutants to the stream<sup>6</sup>.

Simply put, it is the position of NWRA that Congress should not take from the States their authority to allocate and administer quantities of water. If Congress intends that the Clean Water Act abrogate state authority over water rights, it should do so explicitly by repealing both Section 101(g) of the Clean Water Act and the McCarran Amendment, 43 U.S.C. § 666, and should set forth the manner in which quantities of water will be allocated in the future, as well as define the extent to which Congress intends that existing property rights in water be affected by the Clean Water Act.

While NWRA would oppose any such decision as an abandonment of the principled federalism which has characterized federal involvement in land and water issues for over 200 years, at least the decision would be based on a full and public discussion of the issue, and an understanding of the mechanism that would replace the existing system.

---

<sup>5</sup> See January 8, 1987 Memorandum Re: State Authority to Allocate Water Quantities -- Section 101(g) of the Clean Water Act from Edmund M Notzon, Director, Criteria and Standards Division to Water Management Division Directors Regions I - X.

<sup>6</sup> See § 8(a)(3), S. 1081 (102nd Congress).

## CONGRESS SHOULD NOT USE THE CLEAN WATER ACT TO ESTABLISH A NATIONAL ZONING LAW

Nonpoint sources of pollution are essentially associated with any use of land and water resources. Under Section 319 of the Clean Water Act Amendments of 1987, Congress intended that nonpoint sources of pollution be addressed by states through the development and implementation of nonpoint source management plans. These management plans have been developed by the States, and consist of the identification by the states of voluntary best management practices for activities associated with nonpoint sources of pollution.

This approach recognizes that nonpoint sources of pollution are very diverse and complex, and that management measures for these sources are best developed and implemented at the state and local level. Section 319 has only recently been implemented by the States because of delays the development of program guidance by EPA, as well as shortfalls in Congressional funding for the program.

Some have concluded that Section 319 is a failure, and that a more aggressive federal program is required. This assertion ignores the fact that 20 years and billions of dollars have been spent on point source control. Nonpoint sources are more even complex, and much more difficult to identify and address than were point sources. It is not reasonable to conclude that Section 319 is a failure before it has had a chance to succeed. The most common model suggested for a replacement for the 319 program is the Coastal Zone Management Act, as implemented in the recently issued Program Guidance and Management Measures. CZMA is essentially federally supervised zoning and land use planning. NWRA opposes the extension of the concepts of the CZMA program to nonpoint source control under the Clean Water Act. Section 319 can and will work if sufficient time and resources are available.

### CONCLUSION

The Clean Water Act should be reauthorized with no changes in its basic structure. States should continue to have the authority to determine the existing and future uses to be protected for individual waterbodies, and to set the standards for protection of these uses. This authority should not be eroded by the requirement that States implement "Biological" or other criteria which seek to define water quality in a manner which precludes water withdrawal and use. The Clean Water Act should not supersede, abrogate, or impair state water allocation and administration systems and water rights. Finally, the Clean Water Act should not be the vehicle for imposition of federally supervised land use planning. Principled federalism requires that States retain the authority to plan for and allow the use of land and water resources. If changes are made in the Section 319 Nonpoint Source Control Program, they should provide for more efficient targeting of areas where nonpoint sources impair classified uses, improved monitoring and data collection, and increased flexibility for States to implement Section 319 in a manner which recognizes the site-specific nature of nonpoint source pollution.

## CLEAN WATER ACT REAUTHORIZATION: NONPOINT SOURCE PROVISIONS

In the reauthorization of the Clean Water Act, Congress should adhere to the following principles:

1. The Clean Water Act (CWA) does not stand alone in protecting America's waters from nonpoint source (NPS) pollution. Other ongoing programs at the federal, state and local level must be funded fully, coordinated with and not superceded by the CWA. This includes, in particular, the soil conservation and water quality provisions of the 1985 and 1990 farm acts and the state groundwater and surface water protection programs of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).
2. Recognizing the 20 year commitment our country has had to eliminating point-source pollution, success in reducing the more complex and diverse NPS pollution will require similar time and resource commitments. However, management of this problem will require a different approach than that of point source pollution elimination because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities.
  - \*NPS pollution management programs should (a) emphasize the protection of water resources and state-designated water uses, including state-designated agricultural uses, and (b) recognize the importance and needs of individual agricultural producers and other landowners affected by the CWA.
  - \*This approach emphasizes the use of locally designed and applied, economically feasible, site-specific best management practices which do not infringe on private property rights. Implementation of these farm management options over a realistic time frame will further the goal of reaching or maintaining designated uses of water bodies.
  - \*It is inappropriate to link USDA commodity, conservation or disaster program payments to the success or failure of management programs for NPS pollution authorized under the CWA.
4. Current CWA language contains valuable provisions for NPS management embodied in Section 319. Although this NPS section has been historically underfunded and has been hampered by bureaucratic roadblocks, all states now have approved Section 319 assessments and approved management programs. Within the CWA, it is the preferable vehicle for management of NPS pollution, and changes which occur during CWA reauthorization should reinforce these existing NPS provisions.
  - \*The proper management of NPS pollution lies in state and local efforts. As such, states should continue to identify and resolve their priority NPS water problems through administration of Section 319 funds. With state oversight and approval, local organizations should continue to carry out these NPS programs. Agencies at the federal and state levels should harmonize objectives and coordinate funding for national and regional NPS management programs.

- \*State and local programs should provide for a mix of research, development, education and technical and financial assistance for both planning and implementing actions aimed at achieving state designated uses.
5. Management efforts funded by Section 319 of the CWA should be directed to priority areas based on scientific assessments that identify water bodies with impaired or threatened uses.
    - \*Priority, as determined by states, should be based on the magnitude of risk to human health, the protection of designated uses, and likelihood of further significant and unreasonable water quality degradation if no action is taken.
    - \*Strategies should be developed on a hydrologic unit, watershed-wide basis using an approach that includes the consideration of both surface and ground water quality.
    - \*Programs should focus on cost-effective, site-specific practices for individual operations with flexibility for implementation.
    - \*In order for Section 319 to work effectively for agriculture, USDA must play a lead role in the delivery of education and technical assistance at the state and local level.
  6. An effective and cost-efficient response to water quality problems requires accurate and reliable information on (a) the source, extent, and impact of NPS pollution, as well as (b) the effectiveness, utility and economic feasibility of conservation measures and best management practices.
    - \*Any Clean Water Act reauthorization should include a strong financial commitment to further research, monitoring and assessment projects.
    - \*Monitoring should include before and after sampling as well as frequent sampling during storm events and assessment of natural and historic loadings.
    - \*Scientific research and monitoring projects should follow protocols developed by the U.S. Geological Service and should be conducted on a watershed basis with local and state input.
    - \*Representative pilot projects aimed at achieving market based incentives on a watershed or regional level should be encouraged.
  7. The Clean Water Act Reauthorization should not directly or indirectly create a federal water quality law or program which supercedes, abrogates or impairs state water allocation systems and water rights.
  8. Section 319 management programs on federal lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.
  9. It is inappropriate for a reauthorization of the Clean Water Act to provide the authority for citizens suits against individuals participating in NPS management programs.

**STATEMENT OF PRINCIPLES REGARDING  
CLEAN WATER ACT REAUTHORIZATION\***

- I. Section 101(g) should be reaffirmed as applying to all sections of the Clean Water Act and all programs thereunder, including programs under Sections 208, 303, 304, 319, 401, 402, 404, and 510(2), and any new or altered programs resulting from the Clean Water Act Reauthorization. In this regard, Section 101(g) should be recognized as establishing the following principles:
- A. The Clean Water Act and any amendments thereto shall not directly or indirectly create a federal water quality law or program which supersedes, abrogates, or impairs state water allocation systems and rights to water created and managed thereunder.
1. Water allocation is to be accomplished by established principles of law. This means that the states have the primary responsibility and prerogative of allocating, determining, and administering rights to quantities of water. Under the provisions of the McCarran Amendment, water rights asserted by federal agencies and Indian tribes must be claimed in the appropriate state water forum when the United States is properly joined. No water rights arise in the United States or any other person by virtue of the Clean Water Act.
  2. Neither the Corps of Engineers, nor EPA, nor any other federal agency or officer shall utilize any provision or program under the Clean Water Act to allocate or reallocate quantities of water, or to require that specified levels of assimilative capacity, dilution water or instream flows remain in the water body. Nor shall these agencies or officers redefine, limit, or prohibit those uses of water which are authorized by state law as beneficial uses.
  3. No provision or program of the Clean Water Act shall be applied so as to prohibit or limit the development of water allotted to a state under equitable apportionment cases or interstate compacts.
  4. No provision or program of the Clean Water Act shall be construed or applied to authorize a taking of any state-created interests in water quantities.

5. No provision or program of the Clean Water Act shall be construed or applied to require or restrict any state in the choice of its water law, or the judicial or administrative principles for making water allocations (whether riparian, reasonable use, prior appropriation, public trust, a combination of the foregoing, or any other system of allocation chosen by a state).
  
- B. The Clean Water Act's purpose should remain the regulation of the water quality impacts of point and non-point discharges of pollutants upon classified uses of water through the setting of water quality standards and effluent limitations to protect classified uses. Though the regulation of pollutants benefits classified uses of water by protecting water quality needed for such uses, the Clean Water Act should not be expanded, construed or applied to create a national recreational, cultural, historical, ecological, habitat, aesthetic, instream flow, or land use law or program, or otherwise be utilized to regulate anything other than discharges by point and non-point sources of pollutants to waters of the United States.
  
- C. Section 404 protections and allowances for water-dependent activities should be expanded, particularly with regard to permitting for facilities which are related to the exercise of state-created water rights. In this regard, Section 404 and regulations thereunder, including Section 404(c), should facilitate the construction and operation of water facilities in waters of the United States, unless they obstruct navigability or injure an overriding federal interest of preemptive national importance. Deference should be accorded to local determination of water project purpose and need.
  
- D. Reasonable best management practices should be the means by which Clean Water Act programs are to be pursued for non-point sources, such as agriculture. The states should have primary responsibility for identifying and administering best management practices. Federal funds should be made available for implementing BMP's, as funding was provided for POTWs under the 1977 Clean Water Act and its predecessor, the 1972 FWPCA Amendments.
  
- E. All additions, deletions or modifications to the Clean Water Act during the process of the Act's reauthorization should be analyzed in light of the principles enunciated above.

## NWRA POSITION STATEMENT CLEAN WATER ACT REAUTHORIZATION

The Clean Water Act's purpose should remain the regulation of the water quality impacts of point and nonpoint discharges of pollutants upon classified uses of water through the setting of water quality standards and effluent limitations to protect classified uses. Though the regulation of pollutants benefits classified uses of water by protecting water quality needed for such uses, the Clean Water Act should not be expanded, construed or applied to create a national recreational, cultural, historical, ecological, habitat, aesthetic, instream flow, or land use law or program, or otherwise be utilized to regulate anything other than discharges by point and nonpoint sources of pollutants to waters of the United States.

In any reauthorization of the Clean Water Act, the following principles should be embraced:

The Clean Water Act and any amendments thereto shall not directly or indirectly create a federal water quality law or program which supersedes, abrogates, or impairs state water allocation systems and rights to water created and managed thereunder.

Water allocation is to be accomplished by established principles of law. This means that the States have the primary responsibility the prerogative of allocating, determining, and administering rights to quantities of water. Under the provisions of the McCarran Amendment, water rights asserted by federal agencies and Indian tribes must be claimed in the appropriate state water forum when the United States is properly joined. No water rights arise in the United States or any other person by virtue of the Clean Water Act.

No provision or program of the Clean Water Act shall be construed or applied to require or restrict any state in the choice of its water law, or the judicial or administrative principles for making water allocations (whether riparian, reasonable use, prior appropriation, public trust, a combination of the foregoing or any other system of allocation chosen by a state).

With growing frequency, the Clean Water Act is being used as a vehicle to thwart the siting and construction of storage reservoirs, hydroelectric facilities, and other water based activities associated with irrigation and drainage. As cited below, the Clean Water Act needs amendment to clean-up its intent to permit these water dependent activities.

1. **Local Responsibilities** - It is particularly important that Congress and the Administration recognize that section 404 of the Clean Water Act frequently affects local matters that are best determined by state and local governments; and that decisions by such governments on those matters should be controlling unless significant issues of overriding national interest are involved. The Corps of Engineers should accept local responsibility and respect state water rights.

2. **Decision Authority** - The decisionmaking authority for issuing section 404 permits should logically reside within the permitting agency, the Corps of Engineers. The decision process should carefully limit delay of important water resource projects by consulting agencies through the interagency review process. When the permitting agency has sufficient information on which to base a decision, it must be free to make its decision; free of any administrative veto by other federal agencies whose proper role is consultative. In this regard, the Executive Branch should make clear to the Administrator of EPA that the section 404(b)(1) guidelines that he is required to develop shall not have the force of regulatory criteria, but shall be advisory guidance to the Secretary of the Army is carrying out his statutory duty to administer the section 404 permit program.

3. **General Permits** - The section 404 permit program has resulted in needless delay and expense to state, regional and local agencies in the development of vital water resource projects at a time when the federal government is urging the states and their political subdivisions to undertake greater responsibility for meeting the needs of their citizens. Both legislative and regulatory actions are needed to remedy this situation.

In the legislative area, action is needed to provide for meaningful transfer to the individual states through the issuance of state general permits, rather than "puppet" transfers which merely add to the burden on state regulatory agencies, resulting in unnecessary duplication and delay in the permit process.

The Corps should adopt simplified procedures for issuing general and nationwide permits and for transferring 404 permit authority to states; exclude categories of water such as headwaters, isolated waters and intrastate waters; substitute a five year review period for nationwide permits; and reduce review processes with other Federal and state programs.

4. State Water Law - In accordance with the expressed intent of Congress, under no circumstance should the section 404 permit process be used by any federal agency to override the primacy of states in matters regarding the allocation of water quantities within their respective jurisdiction. An amendment to section 404 is needed to clearly provide that neither the Corps nor EPA have authority to prevent or restrict consumptive use of water or water depletions authorized under state law.

5. Guidelines - The EPA and Fish and Wildlife Service must establish guidelines which provide objective mitigation criteria; allow premitigation; and defer to the Corps in matters of engineering, economics, and other technical areas within their expertise.

The federal agencies should produce, at the conclusion of the initial scoping process, a single, project-specific list of the criteria that will be applied to the project's permit evaluation. The criteria should be clearly related to relevant federal statutory authorization and sufficiently specific for state or local governments to make responsive decisions regarding alternatives, mitigation and modifications. State and local governments should be able to rely on the fact that these criteria, once established at the scoping phase, will not change except as required by law or modification of the project application.

6. Memorandum of Agreement - The February 7, 1990 Memorandum of Agreement on mitigation between the Corps and EPA is not official policy and should be rescinded until proper public lawmaking processes are followed. The same is true of the Corps Wetlands Delineation Manual. Analysis of practicable alternatives should allow credit for mitigation in determination of the "least environmentally damaging alternative."

7. Artificial Water Areas - Limit section 404 jurisdiction so that it does not apply to water surfaces created artificially incidental to irrigation, hydropower, and water supply projects. Experience with this issue has resulted in some ridiculous examples where the effort to conserve water by lining canals has been impaired by wetlands created by the seepage. Strict and inflexible interpretation of artificial water areas is also an impairment to relicensing hydroelectric projects to conserve additional renewable energy resources.

8. Documentation - Require EPA to document its concern and recommendations to the Corps as part of the permanent process after thorough analysis of project impacts. The Corps would then have to consider EPA's formal statement in a manner similar to a biological opinion rendered by the Fish and Wildlife Service under Section 7 of the Endangered Species Act.

Milestone federal decisions, either by a permitting agency or cooperating agency, should be accompanied by specific written findings with regard to each of the criteria which it must apply by law, stating specifically the decision and the basis for that decision.

9. Continuing Cooperation - The federal government must speak with one voice. Internal inconsistencies as to federal agency policies, definitions, standards and positions should be resolved and eliminated. In any case where the project, as proposed, does not or is unlikely to receive a federal permit, the federal agencies should identify alternatives which are more likely to be permissible. Such alternatives should be reasonably cost effective and should accomplish the purpose identified by the states of local governments.

10. Reuse of Reclaimed Water - The CWA should be amended to modify water quality requirements for the discharge of reclaimed water to ephemeral and/or affluent dominated streams in order to encourage water reuse. The CWA should be amended to exempt from application manmade waterways that discharge de minimis flows of reclaimed water and remediated groundwater to waters of the United States.

Section 304 of the CWA requires EPA to develop and publish water quality criteria that will provide for the protection of various designated uses. These criteria are contained in a document entitled "Quality Criteria for Water" (U.S., EPA, Office of Water Regulations and Standards, May 1, 1986) also known as the "Gold Book." Incorporation of Gold Book criteria in state standards for all water bodies is inappropriate for many situations. In particular, in arid areas where it is critical to maximize the reuse of water, strict water quality criteria are inappropriate for the discharge of reclaimed water to ephemeral streams and creation of reclaimed water dominated streams to recharge aquifers. The Eastern Municipal Water District of Riverside County California produces tertiary treated water. The most beneficial use of this water is to discharge it into the Santa Margarita River where it will ultimately become part of the water supply of Camp Pendleton and the Fallbrook Public Utility District in San Diego County. This procedure has been approved by the health agencies and the state water resources control board. EPA Region IX has overruled the local agencies.

11. Water Conservation and Water Use Efficiency - Section 218 requires consideration of water conservation and water use efficiency measures. These should be addressed separately from the Clean Water Act so that they are not tied to permitted or grand and loan programs with the purpose of eliminating pollution discharges.

## **NWRA POSITION STATEMENT IMPLEMENTATION OF CLEAN WATER ACT**

State Water Rights - State and local allocation of the use of the waters of the streams of the several western states has provided a critical element in the development of the health and welfare of those areas. Accordingly, Congress has consistently deferred to state water rights jurisdiction wherever possible. However, some federal courts have interpreted the provision of the Clean Water Act, section 101(g), very narrowly. Accordingly, Congress should reaffirm that section 101(g) should not be construed or used to supersede or abrogate rights to quantities of water established by any state; and in particular that section 101(g) applies to section 404 and 510(2). Further, the water quality provisions of section 303 were established to protect water rights allocated by the states for beneficial consumptive use, and that section should not be construed to impair those rights in any way.

POTW Compliance - EPA and participating states are imposing increasingly restrictive effluent limitations for municipal wastewater discharges based upon more restrictive water quality standards. The adoption of new and more stringent water quality standards will result in existing permits being revised to require immediate compliance with the more stringent effluent limitations. While a compliance schedule provides some relief to the discharger, the effluent limit must be met regardless of public costs of actual benefits to the downstream uses. Accordingly, EPA needs authority to allow municipalities operating POTWs a reasonable period to achieve compliance with those new permit conditions, including time for development of new cost-effective technology.

Instream Uses - Water quality standards necessary to protect instream uses can require stringent effluent limitations for wastewater dischargers who discharge greater flows than are normally in the stream itself or who discharge to streams having naturally high metals concentrations. Such effluent limitations are to be achieved regardless of cost to publicly owned wastewater treatment works and regardless how small the benefit. Section 302 of the Act provides an opportunity to evaluate the benefits and costs of effluent limitations necessary to protect instream uses. However, EPA has interpreted section 302 as not applying to state-issued permits that implement water quality standards pursuant to section 301(b)(1)(C). Section 302 was amended in 1987 to apply only to NPDES permits issued to industrial dischargers. Section 302 should be amended to apply to publicly owned wastewater treatment permits and to be usable by delegate states. Such an amendment should be consistent with the congressional policy that no federal funds be used for advanced waste treatment facility construction where no substantial benefit to stream quality will occur.

Indian Tribes - As part of its implementation of the Clean Water Act's 1987 addition of section 518, EPA has created four work groups for the purpose of developing regulations on how Indian tribes will be treated as states under sections 104, 106, 201 to 219, 303, 305, 314, 319, 401 and 404 of the Act. Section 518 allows qualified Indian tribes to, among other things, establish water quality standards, issue NPDES permits, dredge and fill permits, and pursue enforcement activities. The issues related to these responsibilities, and their relationships to state water quality programs and Indian jurisdiction in general, are extremely complex.

Clean Water Act section 518(3) directs the Administrator, in promulgating regulations which specify how Indian tribes shall be treated as states, to "consult affected states sharing common water bodies and provide a mechanism for the resolution of any unreasonable consequences that may arise as a result of differing water quality standards that may be set by states and Indian tribes located on common bodies of water."

All issues related to Indian jurisdiction are of vital interest and concern to western states, where many tribes share common water bodies with those states. When that jurisdiction impacts the management and protection of critical water resources, the concern is even greater. Because of this concern, NWRA requests that in accordance with section 518(e) of the Clean Water Act, EPA take the steps necessary to consult all states affected by the inclusion of Indian tribes as states within the Act.

Nonpoint Source Program - Section 319 outlines a program for control of nonpoint sources of pollution. Water users may be greatly affected by the promulgation of nonpoint source control regulations. Certain federal agencies such as the Bureau of Reclamation and Soil Conservation Service have extensive knowledge and expertise with agricultural practices and state water laws and should be involved with this process. Local governmental agencies such as water conservation districts, conservancy districts, and municipalities can also greatly assist in

the careful consideration of the many issues that are involved with nonpoint source control measures if applied to agriculture. EPA and the states should approach the section 319 program with an orientation designed to fully involve and respect the role of agriculture and other water users in meeting the need for food and fiber and public drinking water supplies in the nation's and the world's economy. Nonpoint source controls, if adopted, should stress reasonable, cost effective measures which don't interfere with the exercise of water rights and are demonstrably necessary to protect against injury to the beneficial uses of water supplies.

Adequate funding of the nonpoint source program is particularly important. Federal mandates to the states without financial support impair the effectiveness of a uniform national program. In particular, the Clean Water Act Amendments of 1987 require a new focus on nonpoint sources but without financial support. States are to create and implement individual control strategies for categories of nonpoint sources. Yet, abandoned mine drainage is a major nonpoint source category where control is not feasible because no person or entity remains financially responsible for the pollution. Federal aid combined with state programs should be encouraged. Not only federal funding support for nonpoint source control implementation, but also federal funding for all other federally required actions being implemented by the states should be maintained and improved.

National Estuarine Program - The National Estuarine Program, added as section 320 of the Clean Water Act by the 1987 Amendments, establishes a management conference process for developing and implementing conservation and management plans to protect estuarine resources. In structuring and administering that process, EPA and other participating federal agencies have, at times, tended to overlook resulting impacts of that Program on public water supplies diverted from streams upstream of the estuary. However, section 102(a) of the Act specifically recognizes that one of the Act's key purposes is to protect public water supplies. **The above concepts should apply in the implementation of any watershed planning program.**

In light of increasing pressure on public water supplies, it is essential that EPA and other federal agencies developing National Estuarine Program implementation plans fully recognize the need to protect public water supplies developed from streams flowing into the estuary as well as other resources; and allow state, local and regional agencies that rely on those public water supplies to participate fully in developing those plans.

Nationwide Permits - The Secretary should renew each of the existing nationwide permits and should promulgate others which cover general categories of construction activities which are performed nationwide and which either cumulatively or individually will not have significant impact on the environment. This would allow the Corps to monitor even more standard projects with its existing staff and trained individuals. If the United States is to remain competitive in world markets, we must all do what we can to improve the efficiency of the system and this is one step towards that end.

Wastewater Contracts - In implementing the federal Clean Water Act provisions for funding wastewater treatment projects constructed by local water agencies, EPA has imposed serious hardships on those agencies by changing federal design criteria and funding allocations, and thus, federal contractual obligations, after completion of those facilities. This resolution urges EPA to discontinue that practice in order to protect the financial stability of local agencies that have constructed wastewater treatment projects under EPA Clean Water Act contracts.

Under EPA regulations, audits are performed to ensure the project constructed is in accordance with the plans and specifications, and are necessary to discover (1) discrepancies in the project elements that are constructed, (2) whether the project is being used as intended, and (3) whether the project has been constructed under conditions of fraud or corrupt practices. If any of these items is discovered, the grant may and should be annulled in accordance with regulations of the Act (CWA Construction Grants Manual Section 30.920-5, Annulment of Grant).

EPA's audit practice, however, has been to reevaluate the design criteria many years after the project was conceived and to apply hindsight to determine whether the design criteria are consistent with present day practices. The result is to reduce the eligibility of project capacity based on this new information not available at the time of project conception and to disallow, retroactively, the use of EPA grant funds, sometimes in the range of millions of dollars.

Section 203(a) of the amended Clean Water Act clearly expresses the congressional intent that eligibility determinations, once made, are not to be later modified unless found to have been made in violation of applicable federal statutes and regulations.

This resolution is in furtherance of paragraph B(8) of NWRA Statement of Objectives, supporting action which would result in uniform project development standards applicable to all federal water development agencies.

Protection of Wetlands and Municipal Supply - Currently, section 404 of the CWA outlines procedures for issuing permits for the discharge of dredged or fill material into navigable water of the Nation. The Secretary of the Army is charged with administering a regulatory program pursuant to section 404. The Administrator of EPA has oversight of the Secretary's regulatory program and has authority to prohibit the discharge of such material to a defined area when it is determined that the discharge will adversely impact municipal water supplies, shellfish beds and fishery areas, wildlife or recreational areas. Steps for regulations are measures to direct positive steps for water resources managers and measures to integrate protection of wetlands with safe drinking water.

a. Section 404(a) should be amended to encourage early and full evaluation of water supply reservoir alternatives in a joint process between a permit applicant and the Army Corps of Engineers. Currently, the Corps requires submittal of a very detailed application outlining the proposed project in order to initiate the federal regulatory process. Because the federal process for water supply reservoirs commonly requires preparation of an Environmental Impact Statement pursuant to the National Environmental Policy Act, the alternatives issue is then reopened after the applicant may have already undergone a state review of alternatives.

b. Currently, EPA and the Corps publish Memoranda of Agreement (MOA) to set out significant policies dealing with definition and delineation of jurisdictional wetlands and with wetlands mitigation. This MOA process has been a closed one that has not included Federal Register publication of draft policy statements subject to public review and comment. Section 404 should be amended to provide for development of policies in a public forum for prioritizing of wetland resources, for development of mitigation banks, and for integration with drinking water requirements which will help to direct water supply managers in their planning for new supplies.

c. The CWA exempts a variety of activities including emergency repair of existing water supply facilities, but does not allow for construction of water supply projects under extreme emergency situations. Section 404(f) should be amended to allow construction of emergency municipal water supply projects to meet minimum water supply needs for the protection of public health in response to drought, natural disaster or other emergency situations.

Statement of the  
NATIONAL BROILER COUNCIL  
NATIONAL MILK PRODUCERS FEDERATION  
NATIONAL PORK PRODUCERS COUNCIL  
NATIONAL TURKEY FEDERATION  
UNITED EGG PRODUCERS  
Before the  
Subcommittee on Water Resources and Environment  
of the  
Committee on Public Works and Transportation  
U.S. House of Representatives  
on  
Reauthorization of the Federal Water Pollution Control Act

April 22, 1993

Presented by: Danita Rodibaugh  
Executive Committee  
National Pork Producers Council  
Route 4, Box 195  
Rensselaer, Indiana 47978

Mr. Chairman and Members of the Committee:

My name is Danita Rodibaugh and I am a pork producer from Rensselaer, Indiana. Our 400-sow, farrow-to-finish operation, consists of 1600 acres of farmland that includes 900 acres of corn and 500 acres of soybeans. We also practice no-till on all of our farmland. In addition to my involvement in the family farm, I serve on the Executive Committee and the Environmental Committee of the National Pork Producers Council.

Today I am speaking on behalf of the National Pork Producers Council, the National Turkey Federation, the National Broiler Council, the National Milk Producers Federation, and the United Egg Producers. Together these associations represent the majority of farmers who produce pork, chicken, turkey, eggs, and dairy products for this nation's consumers.

We appreciate this opportunity to testify on the reauthorization of the Federal Water Pollution Control Act, and look forward to working with the Committee as new legislation is developed. The "Clean Water Act" plays a key role in our future.

Meeting a growing demand for food, while maintaining a quality environment has been a persistent challenge throughout man's development. As the world's demand for food has increased, so has the complexity of problems associated with more intensive agricultural production.

Our members are working to protect the environment. We in agriculture continue to respond to new concerns everyday as scientific advances are made on the environmental front. At the same time, if we are to remain competitive in the international marketplace, it is imperative that our producers be allowed the flexibility to deal with environmental concerns through the use of current programs, new technologies, and innovative approaches that minimize the regulatory burden and capital investment.

#### Dairy, Meat and Poultry Sectors

The United States has experienced a steady decline in the number of dairy, meat, and poultry producers that has corresponded to an increase in

concentration in these sectors. As individual producers have expanded their production, confinement units have become the most efficient and productive way to raise chickens, turkeys, swine, and dairy cows.

Confinement systems offer a number of advantages. This type of production system allows a producer to more closely control temperature, feeding, and the spread of disease. These units also concentrate the nutrients produced by the animals. As these operations have intensified, we have developed new creative methods for managing and utilizing these organic resources.

#### Animal Nutrient Storage and Application

The discussions of water quality as they relate to animal agriculture center primarily on the transport of nutrients into our water supply through run-off or leaching. Changes in modern livestock and poultry production, however, are affecting the way we store and apply animal nutrients. The continued development and use of these systems will have long-term implications for water quality.

Some operations utilize a lagoon storage system for holding animal nutrients until they can be incorporated into the soil. Proper lagoons today are constructed with the assistance of U.S. Department of Agriculture Soil Conservation Service personnel, Cooperative Extension Service agents and other technical experts who are familiar with soil types, hydrology, nutrient levels, and flow rates of individual farm operations. Lagoons can be lined with impermeable clay that acts as a sealant to prevent nitrates and other components of livestock and poultry nutrients from leaching into the groundwater. Other lagoons rely on a natural seal that is created by the nutrients themselves. The application of each of these methods is dependent upon the soil type where the lagoon will be located.

The slurry system is another means of storing animal nutrients. This system is designed for easy introduction and removal of nutrients. Slurry systems are traditionally concrete or steel tanks designed to store nutrients for a prescribed number of days. The system's capacity is determined by the number of head, the size of the animals in the unit, and

the frequency of nutrient application. Additional capacity is also provided to account for rainfall.

Another method of waste management is the manual scraping of open pens. This option requires an adequate land area that is available year around for the application of nutrients. Frequent cleaning of pens reduces the amount of nutrients exposed to rainfall. This method of manure management can be effective for smaller animal agriculture operations with crop acreage. In addition, there are other effective nutrient management techniques that can be used by producers that fit the individual needs of their operations.

#### Nonpoint Source Pollution Control Programs

The Food Security Act of 1985 ("1985 Farm Bill") and the Food, Agriculture, Conservation, and Trade Act of 1990 ("1990 Farm Bill") both included provisions to help agricultural producers in addressing nonpoint source pollution concerns. The programs implemented under the 1985 Farm Bill are beginning to show dividends in protecting water quality. These efforts and the new programs included in the 1990 Farm Bill need to be given a chance to work if we are to make substantial gains toward improved water quality.

The Agricultural Water Quality Protection Program found in Section 1238B of the 1990 Farm Bill is a potentially significant and far-reaching program for improving water quality. This program was designed to provide producers with the financial and technical resources necessary to develop and implement comprehensive water quality protection plans. Producers must implement a water quality protection plan approved by the Secretary of Agriculture to receive incentive payments under this program. According to the Act, the plan must include:

"(1) a description of prevailing farm enterprises, cropping patterns, and cultural practices, and other information that may be relevant to protecting water quality on the farm; (2) a description of farm resources, including soil characteristics, proximity to water bodies, and other relevant characteristics of the farm related to water quality; (3) to the extent practicable, specific, quantitative water

quality protection goals and objectives that will minimize contamination or degradation of surface or groundwater; (4) water quality protection practices that will, if implemented by a producer, assist such a producer in complying with State and Federal environmental laws, and where appropriate, will complement conservation plans prepared for highly erodible lands under Section 1212 of the Food Security Act of 1985; (5) the specific agricultural production practices that will be implemented, improved and maintained, including practices that ensure the continued farm productivity by promoting efficient use of fertilizers, other crop nutrients, and pesticides, as well as management practices that are to be avoided, in order to carry out and achieve the water quality goals and objectives of the producer; (6) to the extent practicable, water and loading of pesticides and fertilizers and storage and handling of animal wastes; (7) their timing and sequence for implementing such practices that will assist the producer in complying with State and Federal environmental laws, taking into consideration schedules that may be established in such laws; (8) information that will enable the evaluation of the effectiveness of the plan in protecting water quality; and (9) recommendations of application rates and disposal methods of nutrients, pesticides, and animal waste materials as recommended by the Secretary."

This plan represents one of the most comprehensive, multidisciplinary approaches to improving water quality implemented by the federal government. It requires an investment of time and money by the producer, yet through the use of incentives, makes the adoption of these practices economically feasible. If proven successful, this approach could serve as a model for future water quality programs.

The technical assistance provided under this program by USDA's Soil Conservation Service is a necessary component of any water quality improvement plan. Nonpoint source pollution is, by definition, difficult to identify and prevent. Faced with this challenge, it is unlikely that most producers would have the knowledge necessary to develop a plan to meet water quality standards. In addition, any water quality improvement plans producers develop must concentrate on addressing the actual threats to water quality that can be identified through objective, scientific methods.

This can only be accomplished with technical assistance supplied by a field force that has an established working relationship with producers.

The other essential component of the Agriculture Water Quality Protection Program is the financial assistance it provides. Producers have demonstrated they will adopt new practices and build new structures to protect our environment. It is difficult for them to do so, however, if those changes and structures threaten the financial viability of their operation. Incentives for the adoption of new water quality improvement measures will help producers implement practices that go beyond what would be required to meet national water quality standards.

Another program included in the 1990 Farm Bill that uses a multidisciplinary approach is the Integrated Management Systems. This research and education program is designed to encourage producers to adopt integrated crop and livestock management practices that minimize environmental degradation. The program provides producers an opportunity to implement and evaluate environmentally sound farming practices that can help them meet environmental standards with minimal cost.

The livestock component of the Integrated Management Systems is the Integrated Resource Management (IRM) Program. It is our hope that IRM will serve as an education and technical assistance program for teaching producers economical ways to protect the environment. The research and education components of this program are a perfect complement to the Agriculture Water Quality Protection Program.

There are a number of other programs included in the 1985 and 1990 Farm Bills that will have a positive impact on water quality. The Conservation Reserve Program (CRP) and the Wetlands Reserve Program will help reduce run-off. Furthermore, the preservation of wetlands will help mitigate the affects of nonpoint source pollution by absorbing pollutants before they enter surface waters. The CRP, the Agriculture Conservation Program (ACP), and the conservation plans required by the 1985 Farm Bill were all designed primarily to reduce soil erosion. The reduction of sediment entering our streams and lakes, however, will have a much greater impact upon water quality.

By reducing the amount of sediment that enters our surface waters, we are also reducing the level of nitrates, animal nutrients, chemicals, and fertilizers that enter surface water via attachment to the soil particles. The overall result of these soil conservation programs is likely to be a dramatic improvement in water quality.

#### Point Source Provisions of the Clean Water Act

Current Clean Water Act authority allows states to regulate feedlots and confinement units larger than 1000 animal units. State pollution control directors have additional authority to enforce the statute where they have determined a serious environmental threat exists. In these situations, livestock and poultry producers are effectively treated as point source contributors.

The federal government has invested in excess of \$60 billion over 20 years in dealing with the issue of point source pollution. We believe that we also need sufficient time and economic resources to adequately address the more complex issue of nonpoint source pollution.

#### Section 319

Congress began to take a comprehensive approach to the problem of pollution from all nonpoint sources in 1987, when it last amended the Clean Water Act. Some of you on this Committee provided the leadership in adding Section 319 to the Act, authorizing a state-federal program aimed at controlling the diverse sources of pollution. The program was designed to be funded jointly by the federal government and the various states, with funds being distributed to those states that created and implemented nonpoint source pollution programs.

Six years later, nonpoint source pollution remains a problem, and many people claim it is because the Section 319 approach has not proved effective. These critics now ask Congress to replace Section 319 with a new nonpoint source pollution control program. The Coastal Zone Management Act is offered up as one such model for addressing nonpoint source pollution, even though the management guidance has only recently been released, and the program is yet to be implemented. It would be

extremely premature to assume this program should serve as "the model" in light of the fact that it not been put in place and tested for effectiveness.

The livestock and poultry producers represented here today disagree with the criticism directed at Section 319, and urge Congress to retain and enhance this watershed approach. Section 319 has not suffered because of structural flaws in the program; it has suffered because Congress has failed to provide adequate funding. Congress authorized \$400 million for Section 319, yet to date has funded little more than one-quarter of that total. Even with woefully limited resources, Section 319 has yielded positive results in the effort to control nonpoint source pollution. New York, Florida, Oregon, Idaho, Illinois, Colorado, Iowa, and Vermont already have documented water quality improvements that are the result of using Section 319 nonpoint source management strategies.

Section 319 works when funded because it is implemented and managed at the local level, where the site-specific nature of controlling nonpoint source pollution can be addressed. A common policy objective of the groups represented is to maintain local primacy over efforts to control nonpoint source pollution. This pollution comes from a variety of diverse sources, so potential pollutants--and the methods to control and eliminate those pollutants--vary not only from state to state, but from watershed to watershed, and farm to farm. A nonpoint source pollution problem in the Shenandoah Valley does not simply differ from a nonpoint source problem in Colorado. The Shenandoah Valley problem may well differ from a nonpoint source challenge along Virginia's tidal marshlands. Therefore, we must pursue a site-specific approach when tackling nonpoint source pollution.

Animal agricultural producers recognize the potential threat of nonpoint source pollution, and we are working to be a major part of the solution to this problem. Our own self-initiated efforts together with the use of existing programs, such as the Water Quality Protection Program mentioned earlier, and an enhanced Section 319, could make the difference in effectively reducing nonpoint source pollution in virtually all regions of the country. The marriage of a site-specific effort with a strong watershed-by-watershed program administered through Section 319 is clearly the

preferred approach.

#### Goals within the Clean Water Act Reauthorization

Our most fundamental goal is to develop and implement a coordinated plan and programs to help livestock and poultry producers be better stewards of our natural resources. We believe that problem identification, environmental research, producer education, and technical and financial assistance are the essential building blocks for ensuring that livestock and poultry systems are effective in addressing environmental concerns.

Once problems have been clearly identified on the farm, producers can begin to implement a number of new and traditional practices to protect surface waters. Incorporation of nutrients into the soil is one option to help preserve nutrients for plant use and reduce run-off. For example, broad band incorporation, which blends nutrients and soil together better than traditional "knifing" systems, offers even greater potential environmental benefits. This type of system requires either specialized equipment or additional trips across a field to incorporate the nutrients.

Producers may also use constructed wetlands to manage nutrients in some situations. This option uses natural plants to filter nitrates and biological pollutants from lagoon waste water. Constructed wetlands provide environmental benefits in addition to waste management. Additional research on this technology is needed to make it practical and cost-effective.

Our experience in other areas, such as food safety, shows us that effective producer education with technical advice, plays a major role in the on-going success of any plan and program.

#### Incentive-Based Approach

We strongly believe that an incentive-based approach that includes cost-share assistance, no-interest or low-interest environmental loans, and environmental tax credits would help provide agricultural producers with the financial tools to effectively deal with nonpoint source concerns. Most agricultural producers have limited financial resources, and would be

hard-pressed to take on new regulations that require expensive outlays. Because economic incentives have a proven track record in the environmental arena, we should provide a menu of options to producers in order to improve water quality.

#### Bio-Criteria and Bio-Diversity

In addressing potential water pollution problems, we must remember that our primary focus is to improve the overall quality of water in threatened watersheds. Any revisions to the Clean Water Act must keep that basic principle in mind if it is to be successful.

Some have proposed using bio-diversity criteria to determine the cleanliness of a particular body of water. The proponents of bio-diversity say a stream, river, or lake is not truly clean unless there is sufficient evidence that the water body is sustaining a wide variety of life forms.

A farmer managing a confinement operation has a basic responsibility to the watershed--he or she must make sure any potential pollution from the operation is controlled and that the water remains clean. If the water in question meets the water quality standard, the farmer has fulfilled their responsibility. The farmer cannot and should not be expected to guarantee a certain level of bio-diversity in a watershed.

Congress should adopt water quality standards that recognize different uses in different watersheds and provide for clean water capable of sustaining aquatic life where appropriate. Moreover, Congress and EPA should refrain from dictating the specific forms of aquatic life all watersheds should sustain.

#### Citizen Monitoring/Lawsuits

Every American has an interest in the environment, including all of us represented here today. At the same time, we believe it would be a mistake if Congress further encouraged citizen monitoring and citizen lawsuit authority in its reauthorization of the Clean Water Act.

American agriculture already spends an extraordinary amount of time and incurs significant expense in complying with regulations promulgated by governmental agencies. They do not need the additional burden and expense that comes from worrying about and defending themselves from third-party monitoring efforts and third-party lawsuits. While some citizen's groups genuinely believe their monitoring and litigation efforts are filling a void left by inadequate government regulations, there are many other groups that will engage in such activities solely to disrupt farm operations.

Rather than enhancing the opportunity for citizen monitoring and citizen lawsuits under the Clean Water Act, Congress instead should make sure the government agencies assigned with enforcing environmental laws have the resources necessary to perform their task thoroughly. In addition, agricultural producers should be encouraged to focus their efforts on avoiding water quality degradation as opposed to avoiding water quality litigation.

#### Environmental Taxes

Some have suggested levying environmental taxes to defray the cost of programs like the those implemented under the Clean Water Act. Administering these programs is expensive, and government resources are limited. Why not make those that are discharging into the water supply pay for the program? It may be a tempting proposition, but one Congress must resist.

The cost to American agriculture of complying with even modest changes in the Clean Water Act will be significant. Agricultural producers could be required to pay for a variety of new equipment and to make extensive structural changes in their farm operations. American agriculture stands ready to bear its reasonable share of the burden to ensure safe, clean waters for generations to come. But it would be wrong to expect agriculture--or any other nonpoint source contributor--to pay the cost of complying with new environmental laws and the cost of administering those laws.

The goal of any environmental law should be to maximize ecological protection while minimizing the disruption of commerce. Every expense added by the Clean Water Act reauthorization will effect the cost of producing the farmer's end product. Not only will this lead to increased food prices, but higher production costs could also effect our international competitiveness in agricultural commodities. Agricultural exports remain one of this country's unqualified successes in international trade.

We urge Congress to minimize the financial impact of any Clean Water Act reauthorization. Restrict the costs to those expenses that are absolutely necessary to protect our water supply. Do not add an additional tax burden that will most certainly adversely effect our competitiveness and that could well drive many of our farmers out of business.

### Wetlands

We believe that the reauthorization of the Clean Water Act must address the regulation of wetlands under Section 404. Agricultural producers are concerned about the confusing and ever-changing regulations governing wetland areas. As landowners whose livelihood is earned from working the land, producers need consistency and certainty in federal regulations.

Those of us in agriculture want the federal government to speak with one voice when making wetland determinations on farmland. A large share of producer problems with wetland cases in rural areas are the result of contradictory advice given by the various federal agencies that have a legislated interest in the issue. The confusing weave of agency jurisdiction unfairly traps innocent and well-intentioned landowners who simply want answers to their questions.

We support the efforts of Congressman Jimmy Hayes in H.R. 1330, which classifies wetlands based on value and functional importance, while providing for just compensation to landowners if there is a regulatory "taking" of wetlands. H.R. 1330 also requires the presence of all three factors--water, soil and vegetation--as necessary indicators before a wetlands determination can be made.

It is imperative that the Clean Water Act contain new wetlands language that provides fair and reasonable regulation. Congress should provide necessary protections to true wetland areas, while respecting individual property rights and providing for minimum restriction of available agricultural land.

### Conclusion

Livestock and poultry production will continue to be a vital part of environmentally sound farming operations. Methods exist to reduce run-off from these operations and thus improve water quality, but producers need financial and technical assistance to achieve these objectives. Significant progress toward water quality is being made through programs currently administered by the USDA. We hope these programs will be allowed to work before additional regulatory requirements are placed upon the agricultural community.

The livestock and poultry sectors recognize the role that we, as members of the nonpoint source community, must play in protecting our environment. We recognize the need to further educate producers about the importance of protecting the environment. Our organizations are willing to work with the Committee to find creative solutions that protect our nation's waters, while maintaining the financial viability of our members.

TESTIMONY OF  
PETE WENSTRAND  
ON BEHALF OF  
AMERICAN SOYBEAN ASSOCIATION  
NATIONAL BARLEY GROWERS ASSOCIATION  
NATIONAL CORN GROWERS ASSOCIATION  
NATIONAL COTTON COUNCIL OF AMERICA  
NATIONAL ASSOCIATION OF WHEAT GROWERS  
U.S. RICE PRODUCERS GROUP  
TO THE SUBCOMMITTEE ON WATER RESOURCES AND THE ENVIRONMENT  
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
APRIL 22, 1993

Thank you, Chairman Applegate, for the opportunity to address your subcommittee today. I am testifying on behalf of the National Corn Growers Association, of which I am Vice President, and the American Soybean Association, the National Barley Growers Association, the National Cotton Council of America, the National Association of Wheat Growers and the U.S. Rice Producers Group. Our organizations work closely on environmental issues and are especially interested in the reauthorization of the Clean Water Act.

At the outset, I want to stress that we enthusiastically support the positions on legislation addressing nonpoint source pollution that were developed last year by a broad-based coalition of agriculture industry groups. One of our allies in this effort, the National Cattlemen's Association, is also represented here today, and our joint position paper is attached to their testimony. We look forward to working with NCA and the other groups as the reauthorization effort continues.

I'd like to take a few minutes to outline some points of particular interest to crop farmers, whose operations stand to be significantly affected by some of the proposals that have been put forth so far in the debate over the Clean Water Act rewrite. In short, we favor adequate protection for our nation's water resources while ensuring that agriculture is provided an opportunity to contribute to water quality enhancement by means that are technically and economically viable. We feel the current authority in Section 319 of the Act provides a valuable framework for managing nonpoint source pollution and should not simply be cast aside in favor of a new regulatory approach.

First among our core principles is that the federal government should allocate additional resources to states to assist them in better identifying water quality problems and activating effective management strategies to address the problems. Second, greater financial commitment should also be directed to research, monitoring and assessment programs to enable effective and cost-efficient responses to water quality problems. Finally, where problems are identified, landowners should be encouraged to adopt voluntary, site-specific water quality best management practices through cooperative programs which provide education, technical assistance and incentives to accelerate BMP installation.

We also recognize that, in some cases, the Environmental Protection Agency may need to give additional direction to state agencies as they develop plans to achieve water quality goals. Any such new oversight activity should, however, preserve the flexibility of state and local authorities to tailor programs to fit their local situations.

As for our interest in continuing a voluntary approach to protecting water resources, there are several federal programs with the potential for improving water quality which have been warmly received by farmers. Perhaps best known is the Conservation Reserve Program, which will reduce erosion and runoff on more than 36 million acres nationwide. The Rural Clean Water Program, run between 1980 and 1990, established several pilot projects for testing the effectiveness of management practices for managing nonpoint source pollution. Ongoing efforts include the Great Plains Conservation Program, the Agricultural Conservation Program and the Water Quality Incentives Program, which encourages producers to enter into three- to five-year agreements to put into place resource conservation practices.

It should also be recognized that the conservation compliance requirements for highly-erodible land established in the 1985 farm act have contributed significantly to water quality improvement.

While I realize this subcommittee does not hold the purse strings for water quality programs, permit me to address the issue of funding for a moment.

Appropriations for Section 319 programs, first approved in fiscal 1990, have averaged only \$47.8 million per year. It should come as little surprise that some states have been less than enthusiastic about enacting vigorous nonpoint source programs when, on average, they can expect to receive less than \$1 million per year to carry them out.

There are some encouraging signs on this front, however. In its fiscal 1994 budget proposal, the Clinton Administration has proposed increasing 319 funding to \$80 million. We also applaud the Administration for proposing an additional \$47 million for Section 319 projects in fiscal 1993, atop the \$50 million already appropriated. Our organizations feel these developments are a strong signal of support from the Administration for the nonpoint source pollution management approaches envisioned in Section 319. Accordingly, we encourage this subcommittee to authorize significant new resources to ensure that quality nonpoint source programs can be put into effect.

At the same time, we were disappointed to note that no funds were specified for the Water Quality Incentives Program as part of the fiscal 1994 budget for the U.S. Department of Agriculture. We hope that the Appropriations Committees will see fit to at least continue this year's funding level of \$15 million.

Getting back to our preference for voluntary programs, there is ample evidence that when farmers are provided with information on management practices which minimize erosion and runoff and enhance their economic viability, they are quick to adapt. In my personal situation, I farm about 1,500 acres of corn, soybeans and wheat in a "no-till" system. I realize no-till farming is not a viable alternative in all areas. I am simply pointing out that information on reduced tillage was available to me, I evaluated it from an economic and environmental standpoint and decided to try it out -- without facing any government mandate to do so.

In a study released earlier this month in my home state of Iowa, researchers found that a policy similar to that which our groups support -- based on increased research and education efforts -- would result in significant improvements in water quality while maintaining the profitability of agricultural production. One of the researchers, Michael Duffy of Iowa State University, said that a state investment of \$1.5 million to \$2 million would help farmers reduce nonpoint source pollution. That is only slightly more than the \$1.4 million in Section 319 funding that EPA allocated to Iowa in fiscal 1992. Obviously, the figures will vary from state to state.

Our message today is that we can improve water quality -- without burdensome regulation or taxation of inputs -- through reasonably-funded programs that encourage farmers to carry on a legacy of stewardship while maintaining their economic ability to produce food and fiber for a world market.

Mr. Chairman, thank you again for the opportunity to testify today. Our nation's farmers look forward to working with your subcommittee to protect our water resources and maintain the profitability of agriculture.

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

---

WEDNESDAY, MAY 5, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to call, at 9:30 a.m., in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. If everybody would please take their seats, we will proceed with today's hearing. I think there are a few still trying to squeeze in the door.

This morning the Subcommittee on Water Resources and Environment meets to continue its hearings on the reauthorization of the Clean Water Act. We will be receiving testimony from two agencies which will have a large role to play in this process.

First, I welcome Ms. Carol Browner, the Administrator of the Environmental Protection Agency, to the subcommittee. This is Ms. Browner's first appearance before the subcommittee, or any other subcommittee of the Committee on Public Works and Transportation.

I expect that as we continue our efforts on Clean Water Act reauthorization; that as we begin our efforts on Superfund reauthorization; and as we explore other issues such as the establishment of the revolving loan funds for the construction of water supply facilities, we on the committee will have ample opportunity to exchange ideas with the Administrator, and develop effective responses to our Nation's environmental and infrastructure needs.

Ms. Browner comes to the Administration from her post as Secretary of the Department of Environmental Regulation for the great State of Florida, and in that role she worked to deal with the greatest challenge in environmental regulation: Balancing a mandate for environmental protection with the need for economic growth. Her tenure in Florida was marked by a decrease in regulatory burden, an increase in community involvement, and the substitution of dialogue and incentives for confrontation and legislation.

We look forward to Ms. Browner's exercising these admirable skills in administering EPA's programs.

We will also be receiving testimony on behalf of the Department of the Army from Dr. G. Edward Dickey, the Acting Assistant Secretary of the Army of Civil Works. Dr. Dickey has twice filled the role of the acting assistant secretary and has testified before the

subcommittee on several occasions over his 20 years with the Army, and we welcome him back to the subcommittee.

Dr. Dickey is here primarily to discuss clean water reauthorization issues related to section 404, the regulation of the deposition or dredged or filled material into the waters of the U.S., including wetlands, and I certainly look forward to his comments.

I will now yield to my very distinguished colleague, Mr. Sherwood Boehlert, the Ranking Republican Member of the subcommittee.

Mr. BOEHLERT. Thank you very much, Mr. Chairman.

I would like to begin today's hearings on the reauthorization of the Clean Water Act by welcoming Administrator Browner and Dr. Dickey, and it is propitious timing because the Senate had the good judgment yesterday to pass legislation elevating EPA to cabinet level status.

I want you to know, in the spirit of bipartisanship, the originators of that legislation in 1988 were now Governor Jim Florio of New Jersey and me. So you belong at the cabinet level and we want to make certain you get your seat there and the House will follow through rapidly.

I think your thoughts and the thoughts of Dr. Dickey on America's water policies will play a major role in the reauthorization legislation this committee is preparing. During the 102d Congress, the reauthorization of the Clean Water Act never really got off the ground and that is unfortunate. However, this year's consideration of the act brings to the table a new and highly enthusiastic cast.

Under the new leadership of Norm Mineta and Bud Shuster at the full committee level and Doug Applegate at subcommittee level, I am confident that this committee will set a meaningful new direction for our Nation's clean water policies.

This committee, with the guidance of EPA and the Corps must develop clean water policies that address the challenges and realities of the 1990s. Since 1972, this committee has passed legislation to reauthorize the Clean Water Act on three separate occasions, and in each of these instances the act was successfully tuned to meet new challenges in both regulation and funding.

Today, nonpoint sources of pollution constitute over half of our water quality problems, the majority of new wastewater construction needs are in small rural communities, and our Nation's wetlands are continuing to disappear at an alarming rate. Our policies must address these and a host of other realities.

While I welcome Administrator Browner here and I want very much to make certain that this House follows the Senate action and elevates you to cabinet level status, I would insert one little comment. I am somewhat disappointed that we didn't get your testimony until eight o'clock this morning. And I can appreciate the problem that you are having getting the new team assembled and everything else, but we should have had the testimony beforehand.

We will work with you. You are going to find you have some partners here that want to make your job easier for you.

Thank you very much, Mr. Chairman.

Mr. APPLEGATE. Thank you, Mr. Boehlert. And Chairman Mineta was to be here at the outset, however, he has not been able to make it as yet. However, we look up and down the line, and does

anybody have any questions or any statements that they would like to make at this time?

We will start with Mr. Menendez, who was here first, I believe.

Mr. MENENDEZ. Thank you, Mr. Chairman. In the interest of time I have a statement that I would like included in the record without objection.

Mr. APPLGATE. Without objection.

Mr. MENENDEZ. I will then ask Ms. Browner questions when the time comes. Thank you.

Administrator Browner, Secretary Dickey, thank you for appearing in front of this subcommittee to discuss issues which may be important to us as Legislators, but are vital to the livelihood of many people back home.

As you are aware, the Port Authority of New York and New Jersey submitted an application for routine maintenance dredging of the berths at Port Newark/Elizabeth more than three years ago. Because traces of dioxin were found in the sediment, this application was turned into a national test case, subjected to intense scrutiny by dueling Government agencies and unending tests. This process was delayed over and over. Each time a decision was expected, the standard by which the tests were measured changed, and a new battery of tests were required. When one Government agency approved of issuing the permit, another Agency decided to enter the process and raise new objections.

In order for the port to remain commercially viable, maintenance dredging must be performed annually. As a result of the three year delay, the port has become a hazard and can not accommodate fully loaded vessels. Recently, the port's second largest customer moved it's East Coast deepwater port to Canada and several other users have pulled out of lease negotiations because of hazardous conditions. The ships which continue to use the port have been forced to reduce their loads. During the last quarter of 1992, the port suffered a 2 to 3 percent loss of cargo tonnage and it is estimated that longshoremen lost at least 100,000 hours of work because vessels are not coming in fully loaded. Each year, the port generates over \$20 billion and supplies more than 180,000 jobs. Each day the dredging permit is unnecessarily and unreasonably delayed, we are putting the livelihood and security of these people and their families at stake.

By preventing maintenance of the berths, we are also unnecessarily harming our environment. Each day that the dioxin-

contaminated silt is left in the bay, this poison is spread throughout the area and dragged out to sea by ships. In fact, 1993 test results have shown that dioxin concentrations in the areas to be dredged are "significantly less" than when originally sampled in 1990. Dredging the berths, removing the contaminated soil, and placing it in an ocean disposal site where it can be capped and monitored is the most environmentally sound action at this time. How can allowing this harmful chemical to float freely be the best course of action for the environment? Each day ships containing chemicals and toxic materials are in danger of rupturing their hulls, causing a major environmental disaster.

In the Water Resources Development Act, the E.P.A. and the Army Corps of Engineers were required to submit to Congress a plan for the long-term management of dredged material in the Port of New York and New Jersey. As you work on this plan, I strongly urge you to find alternatives to the ocean disposal of contaminated sediment by developing the means and methods for locating and constructing permanent, cost-effective long-term disposal sites for the disposal of dredged materials.

Administrator Browner, when you met with me personally in an attempt to resolve this problem, you expressed frustration that the laws governing the permit process were somewhat convoluted. Next week, I intend to introduce legislation which will clearly define the process by imposing concrete time constraints and requiring a uniform, consistent standard by which an application is judged. Applicants deserve fair and timely consideration.

First, the bill establishes a definitive time limit on the entire process. The Secretary and the Administrator must make a determination regarding whether to issue a permit within 255 days after the Secretary receives an application. Applicants will not be strung along anymore.

Second, this bill requires that the standard in effect on the date an application is filed with the Secretary will be the standard applied to that application. No longer will the rules be able to change in the middle of the game.

Lastly, this legislation improves the criteria by which a determination is made. The Secretary must consider the effect that the failure to dredge the material will have on human health and welfare, including economic, esthetic, and recreational values.

Administrator Browner and Secretary Dickey, I look forward to working with you during this Congress on the implementation of this legislation, thereby establishing a clear, fair, and timely process for evaluating dredging permit applications. Thank you.

Ms. NORTON. Mr. Chairman.

Mr. APPLGATE. Let me go to the subcommittee chairman, Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman.

I ask unanimous consent also to submit an opening statement in the record and also questions in writing, if need be.

Mr. APPLGATE. Without objection.

Mr. RAHALL. Thank you.

[Mr. Rahall's prepared statement follows:]

STATEMENT OF

REPRESENTATIVE NICK J. RAHALL, II

CLEAN WATER REAUTHORIZATION HEARING

SUBCOMMITTEE ON WATER RESOURCES AND THE ENVIRONMENT

MAY 5, 1993

MR. CHAIRMAN: I would like to take this opportunity to thank you for holding these hearings and to thank you Director Browner for coming before the subcommittee.

Clean water is one of the most basic requirements for life. This requirement does not discriminate by the size of the community in which one lives nor by the economic base of the community. We all need clean water. Unfortunately, we all do not have the same access to clean water.

Since the State Revolving Fund was instituted and increasingly over the past few months, there has been a lot of

discussion about the ability of small, rural communities to afford proper sewage treatment facilities. These are the people whom I was elected to serve and I can attest that they are having great difficulty building these facilities.

The SRF was designed to be a self-sustaining loan fund. Unfortunately, as many people have testified before this subcommittee, the communities which most need the help in building wastewater treatment systems cannot afford the loans which the SRF's provide. The communities in my district do not have the population bases of cities like New York or Chicago over which to spread the cost of building a treatment system.

While I believe that small, low income, rural communities must be encouraged to take responsibility for their wastewater and drinking water needs, we have to find a way to make the monies provided through the SRF program more accessible to

them. To this end, I have introduced HR 1544, the Rural Community Environmental Assistance Act.

HR 1544 addresses many aspects of the SRF program which create difficulties for small, poor, rural communities. It dedicates a portion of the fund to such communities and provides for grants and low or zero interest loans for them. It also extends the loan repayment period to thirty years.

Another reason that small communities have difficulty complying with federal mandates is that they just do not have the technical know how to run sophisticated systems. In my bill, I provide funding for regional, State and local agencies and not-for-profit organizations that provide municipalities with training and technical assistance.

The importance of this provision cannot be overlooked. Small community officials are often volunteers. They do not have the skills to design and operate systems on their own nor

do they have the funds to hire engineers. These officials rely on the expertise of training and technical assistance programs through state agencies or non-profit organizations.

It is my hope, and all indications are, that the needs of small communities will be considered as the Public Works committee reauthorizes the Clean Water Act. Ms. Browner, I look forward to what you have to say about this urgent matter in your testimony.

Mr. APPLEGATE. Ms. Norton.

Ms. NORTON. Mr. Chairman, I ask permission to insert a statement in the record and I would like to say on the record that we welcome Administrator Browner, and to say to her that I know she is working at an environmentally unsafe habitat as well, and that in another of our subcommittees we are hard at work in trying to correct that situation.

Thank you, Mr. Chairman.

Mr. APPLEGATE. Thank you.

**WATER RESOURCES AND ENVIRONMENT**  
**May 5, 1993**

I want to welcome Administrator Browner and Assistant Secretary Dickey. Their testimony is critical to the legislation this subcommittee must shape this session.

Had the President's supplemental stimulus package passed an additional 47 million dollars would have immediately gone into vital Clean Water Act programs and would have created desperately needed jobs.

The larger reauthorization of the Clean Water Act must proceed with its vital array of programs. The health of the environment and of individual Americans is contingent upon our work. The concern of Americans with the quality of their water has never been greater.

In addition, I have identified a departure designed to make us all face up to the devastation of America's urban waterways. The urban waterways are household names. The Detroit River, the Los Angeles River, the Chicago River, the Platte River in Denver, the Hudson River in New York, the Lackawanna in Pennsylvania, and here in the Nation's Capitol, the Anacostia. The Anacostia River has just been named the "Most Endangered Urban River In America". These are the rivers that built America they have been central to industry and commerce, and have provided drinking water, food, and recreation. Although these rivers are in plain view every day, they have been plainly ignored. Their survival is a miracle of nature when we consider the enemies that plunder their shores everyday.

As a member of this Subcommittee, I am working with its staff as well as my own to introduce an Urban Watershed Restoration program as part of the Clean Water Act. We envision major roles for the federal government, state and local governments and especially citizen action.

Administrator Browner is to be commended for the way she is seizing the initiative to revive the EPA and its programs on an issue of major importance to her. I want to assure the Administrator that I am hard at work on a plan to find an environmentally safe and comfortable habitat for her own employees.

Again I welcome Administrator Browner and Assistant Secretary Dickey to this hearing and look forward to their testimony.

Mr. APPLGATE. Mr. Zelif.

Mr. ZELIFF. Thank you, Mr. Chairman. I too welcome the new administrator that comes before us as well as Dr. Dickey.

The reauthorization of the Federal Clean Water Act will represent the most significant environmental initiative to be considered during the 103d Congress. Decisions that we are going to be making regarding such issues as wetlands regulation, funding for sewage treatment works, combined sewer overflows, nonpoint source pollution and others will definitely have a profound impact on this country both in terms of environmental protection as well as the financial well-being of the many communities faced with pressing and costly water treatment needs.

When I talked to our mayors up in New Hampshire and town managers in my district, I continue to hear the hardships these communities face in meeting the cost of compliance with Federal clean water regulations; costs that are inevitably shouldered by ratepayers. Clearly one of the major priorities that we will be facing will be making the State Revolving Loan Program work more effectively.

I would like to say that in New Hampshire we have had a task force on Superfund, working with the highest levels of EPA, and probably one of the most, I think, refreshing days of my life was about two months ago when we met over at your headquarters working out how we can make the existing law work better administratively; what we need to do to change future laws. And I am very positively looking forward to some excellent work and enjoyed working with Bill Riley as well, so we wish you the best.

Mr. APPLGATE. Thank you. Mr. Poshard.

Mr. POSHARD. Thank you, Mr. Chairman. I would like unanimous consent to submit a statement for the record.

Mr. APPLGATE. Without objection.

[Mr. Poshard's prepared statement follows:]

OPENING REMARKS OF THE HON. GLENN POSHARD  
SUBCOMMITTEE ON WATER RESOURCES and ENVIRONMENT  
MAY 5, 1993  
9:30 a.m.

MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE, I AM PLEASED TO BE HERE THIS MORNING TO HEAR TESTIMONY FROM THE ENVIRONMENTAL PROTECTION AGENCY AND ARMY CORPS OF ENGINEERS, TWO AGENCIES THAT PLAY A LARGE ROLE IN IMPLEMENTING THE PROVISIONS OF THE CLEAN WATER ACT.

I REPRESENT A LARGE RURAL AREA IN CENTRAL AND SOUTHERN ILLINOIS THAT IS LARGELY A COAL MINING AND FARMING COMMUNITY. THE FARMING COMMUNITY, IN PARTICULAR, HAS MANY CONCERNS REGARDING THE DELINEATION AND CLASSIFICATION OF WETLANDS. BOTH THE ENVIRONMENTAL PROTECTION AGENCY AND THE ARMY CORPS OF ENGINEERS HAVE JURISDICTION OVER THE NATION'S WETLANDS. SO I HAVE A PARTICULAR INTEREST IN HEARING FROM THESE TWO AGENCIES ABOUT THEIR EFFORTS TO WORK TOGETHER IN EVALUATING WETLANDS ISSUES AND REVIEWING APPLICATIONS UNDER THE SECTION 404 PROGRAM.

THANK YOU, MR. CHAIRMAN, FOR HOLDING THIS HEARING, AND I LOOK FORWARD TO HEARING FROM THESE TWO PANELISTS.

Mr. APPLGATE. Anybody else on this side? Anyone else?

Ms. Browner, if you would like to come to the table. I would also say we did only receive your testimony this morning, I believe at eight o'clock, and Dr. Dickey's last evening at four o'clock, and we do like to have that testimony before the committee so we have ample time to be able to review it properly, and we like to have it 48 hours before we enter into the hearings.

**TESTIMONY OF HON. CAROL M. BROWNER, ADMINISTRATOR,  
U.S. ENVIRONMENTAL PROTECTION AGENCY, ACCOMPANIED BY MARTHA PROTHRO, ACTING ASSISTANT ADMINISTRATOR FOR WATER**

Ms. BROWNER. Mr. Chairman and members of the Committee, you have my deepest apologies for the delay in the testimony being delivered. The interagency comment process on all testimony to be provided to the Congress has not been fine tuned yet. We, obviously, accept full responsibility for the delay, but we did not receive the comments from all of our sister agencies until yesterday evening. We have to, obviously, as an Administration, do a better job. We will certainly do our part to see that those changes occur.

I am very, very sorry for the delay in the testimony reaching you. You are absolutely right, for you to be able to review it, we have to get it up here. To be able to have a meaningful dialogue, we need to get it to you in advance.

I appreciate the opportunity to be here to testify before the Chairman and the members of the Subcommittee. I am Carol Browner, Administrator of the Environmental Protection Agency. Accompanying me this morning is Martha Prothro, Acting Assistant Administrator for Water.

The issues we are going to discuss today are extremely important to all the people in this country. There are many important challenges that face our Nation as we undertake to achieve the goals of the Clean Water Act.

Mr. Chairman, I appreciate your role in fostering this process of reauthorization. I look forward to working with you and your colleagues on the many issues involved. During this process we need to tap the energy and ideas generated by people in the public and private sectors and to involve those with the State not only in achieving the goals but in implementing the solution by which those goals are to be obtained.

Investment in our natural resources not only reflects our obligation to act as stewards of our environment, to hold the environment in trust for our children, but also represents sound economic policy.

As we begin the Clean Water Act reauthorization process, we must consider the ecological and human health dimensions of protecting our aquatic resources. Today's problems are very different than those of the past. Our efforts to protect the water quality of our rivers, lakes and streams today must go well beyond the individual physical and biological integrity of these water bodies. Our efforts must also encompass the integrity of the surrounding watersheds that are an integral part of the total ecosystem. We should set clear expectations that water quality will focus on aquatic ecosystem protection, not just on cleaning the chemical water column.

Although we face many challenges, I would like to focus my testimony today on five particularly critical issues: protection of watersheds, control of polluted runoff and related nonpoint source issues, toxics and pollution prevention, funding, and strengthened enforcement mechanisms as well as other improvements to EPA's programs.

#### WATERSHED PROTECTION

EPA strongly supports what we call the watershed protection approach. By this we mean an approach to water resource protection that looks first to the water resource itself, including ground water, which evaluates its needs and then tailors solutions to those needs to the participation of stakeholders in every phase of the process.

As the Act itself envisions, the focus of watershed protection is on the biological and physical as well as chemical integrity of our Nation's waters. This framework provides us with the methods and the solutions needed to tackle the problems still facing our waters, especially those problems that are too diffuse and difficult to tackle in any other way. Focusing on the watershed as a whole system rather than focusing on specific sources of pollution within the watershed is essential to ensure that we succeed in restoring and protecting our aquatic resources.

The Chesapeake Bay initiative is one good example of watershed protection that focuses on specific sources of pollution. This effort has involved many Federal agencies, three State governments, local governments and citizen advisory groups in a comprehensive effort to restore and protect this region's critical natural resource, the Chesapeake Bay. Its protection and restoration also represent an active and collective movement by citizens, industries and fishermen who depend upon its waters.

I believe the Clean Water Act generally provides EPA and the States with the authority we need to look at the entire aquatic ecosystem; however, I would encourage Congress in its reauthorization process to refine statutory requirements to ensure effective implementation of this comprehensive approach. For example, we can encourage more comprehensive and cost-effective solutions to the many stresses on a watershed by consolidating planning and priority setting requirements under the Act and modifying the timing of various reporting requirements.

Wetlands are an important component of healthy watersheds. The EPA and the Corps of Engineers share responsibility for implementation of the 404 program and EPA is responsible for approval and oversight of State 404 programs. EPA is also working with Federal agencies, States, local governments and private landowners to encourage a better understanding of wetlands restoration and protection beyond the 404 program.

While historically we have focused our efforts on degraded water bodies, we must also not forget the importance of preserving pristine areas. As the saying goes, an ounce of prevention is worth a pound of cure. We must move above and beyond treatment as a cure and recognize that acquisition and preservation of unspoiled habitat represent a long-term investment for us and our future generations.

## POLLUTED RUNOFF

Polluted runoff, sometimes referred to as nonpoint source pollution, is one of our most vexing water quality problems. Nutrients, siltation and pathogens from agricultural activities, septic systems, urban areas and forestry are responsible for the most common pollutants causing the degradation. These sources have also been linked to nitrate contamination of ground water. In this context, I believe we must confront the consequences of poorly managed land use activities on our Nation's ecosystems and address the habitat degradation and destruction that frequently results.

At this stage, I believe there are several basic principles that should guide our discussions of polluted runoff. First, State nonpoint source management programs based on effective local participation should be strengthened. EPA should help to set clearer technical base lines for nonpoint source controls and management practices. Also, we must improve our scientific understanding of the means to control problems such as nutrient and siltation pollution and improve the tools to address them. In this effort, we will need to work closely with other Federal agencies such as NOAA, the U.S. Department of Agriculture, and the Departments of Interior and Transportation.

Second, voluntary approaches should remain the primary focus but backup enforcement requirements are needed when voluntary approaches fail to produce necessary environmental improvements. Where feasible, pollution prevention should be the approach of first choice for addressing nonpoint source pollution.

Finally, we should encourage innovation, including public-private partnerships and greater use of market based incentives. Federal funding should support State and local actions but should not be a prerequisite to accelerating progress.

## TOXICS AND POLLUTION PREVENTION

Although I have tended to focus attention on problems that have been overlooked in the past, I think we also need to be reminded that toxic pollutants remain a critical threat to our Nation's waters, despite our substantial progress over the past two decades.

In the water program, as in all our environmental programs, traditional end-of-the-pipe approaches have often served us well and have been the driving force behind the significant water quality gains of the past. However, we have learned that treatment and disposal are simply not enough if we wish to continue to make progress. A more comprehensive prevention-oriented approach, coupled with a strong base program, will allow us to move even more effectively towards meeting the overall goals of the Clean Water Act.

I believe this is particularly important if we are to achieve additional reductions in the discharge of toxics. In promoting pollution prevention, we would like to explore with you how to amend the Clean Water Act to help larger dischargers develop pollution prevention plans tailored to suit their respective industries.

We also believe that the statute should be amended to allow EPA to prohibit controls that simply transfer residual pollutants from one medium to the next. Pollution prevention approaches, such as

switching to different process solvents, may produce permanent solutions to environmental problems, solutions that do not need to be maintained or replaced periodically as do add-on control technologies.

In addition, prevention oriented approaches can help us meet statutory goals and requirements through market forces and economic incentives, thereby producing an economic as well as an environmental benefit.

#### FUNDING

As we work toward reauthorizing the Clean Water Act, we must also remember the value and the cost of clean water. The Nation's waters, whether polluted or pristine, are our children's inheritance. Measures we take now must not only return what is lost but also guard against what is yet unblemished. Needless to say, these responsibilities carry a substantial price tag.

We expect water safe enough to swim in, to fish from and to drink, and we expect healthy and diverse populations of plants and animals in our lakes, streams, wetlands, estuaries and oceans. Consequently, we must also expect to assume the cost of treating our wastewater and our drinking water.

By funding States and municipalities adequately, we can help ensure reliable infrastructure of wastewater, sewers, sewage treatment plants and drinking water supply and treatment facilities upon which public health, our quality of life, and many of our important economic sectors depend.

Accordingly, we support the creation of a new State Revolving Fund to facilitate funding for storm water, combined sewer overflows and nonpoint source management and other high priority problems. We also support the creation of a new drinking water State Revolving Fund. Clean, safe water was once viewed as free, but in our modern society this may no longer be true. Just as we believe the polluter should assume, at a minimum, the cost associated with permitting, all of us as users of our water resources must appreciate and help bear the cost of water quality protection.

As you know, financing necessary treatment projects has become in many parts of the country both difficult and expensive. We must be sensitive to the importance of using water efficiently to help keep costs down and to prevent further degradation of our aquatic ecosystem. By acknowledging public and private responsibility for the cost of clean, safe water, we also foster greater invention and innovation. It is in all of our interests to improve water quality in the most cost-effective manner possible.

A vigorous enforcement program remains an integral component of successful Clean Water Act implementation. We believe the Clean Water Act can be strengthened to improve EPA's enforcement authority, thereby allowing us to respond more effectively to facilities that are not in compliance with the Act's requirements.

The Clean Water Act is one of the best statutes we have. It provides us with a valuable opportunity to consider new and innovative solutions to complement the existing array of successful tools and programs we already have to protect human health and the environment. We believe adopting a watershed protection approach is very important.

Similarly, we recognize that we must increase our emphasis on pollution prevention as the most practical and cost-effective means of approaching the Act's zero discharge goal. In concert with a strong point source program, we must focus considerably more attention on the sources of polluted runoff and wet weather flows. We cannot forget these pollution sources contribute heavily to our persisting water quality problems.

Finally, we must ensure adequate funding is available to States and municipalities to enable them to execute the responsibilities and obligations that the Clean Water Act entrusts to them.

I recognize that I have described a large task, but our Nation's waters issue us a stark challenge we cannot ignore except at our own cost. I believe this committee shares with me a respect for the purity of our streams, the diversity of life in our estuaries, the dynamic interplay of forces in our watersheds and the safety of our drinking water.

I look forward to working with the Congress, our State and local governments, our sister Federal agencies, citizens, industry and environmental groups to meet this challenge.

Mr. APPLIGATE. Thank you very much, Ms. Browner.

We are privileged of course, always on our subcommittee, to have the Chair of the full committee, Mr. Mineta, here with us at this time I would like to refer to him.

The CHAIR. Thank you very much, Mr. Applegate, and to you and Mr. Boehlert for your leadership in these issues coming before the Water Resources and Environment Subcommittee. I appreciate very much the hard work that both of you are putting into this effort.

I would like to extend a warm welcome to Carol Browner, the very distinguished Administrator of the Environmental Protection Agency. As Secretary of the Florida Department of Environmental Regulation, all of you know that she established a very commendable record in environmental protection and I expect that she will equally distinguish herself in her new and present position.

These subcommittee hearings are very important because reauthorization of the Clean Water Act is probably the most important environmental issue before this Congress. The program itself has accomplished much since 1972 when it was established in its present form, but much remains to be done.

We still face serious pollution problems. These are not easily solved. A huge backlog of needs exist in sewage treatment and pollution from nonpoint sources is a serious problem as are combined sewer and storm water discharges. More emphasis must be placed on pollution prevention and we must examine carefully the issue over discharge of toxics.

Now, the most controversial issue we face in reauthorizing the clean water program is that of wetlands protection. Wetlands serve vital functions of providing essential habitat for waterfowl and shore birds and nursery and spawning grounds for fish. They also lessen flood damages, reduce erosion, recharge groundwater, filter sediments and abate pollution.

Over one-half of the wetlands existing in the lower 48 States at the time of the European settlement have now been lost. So, from my perspective, we must take measures to ensure that remaining

wetlands will be protected and that wetlands restoration and creation take place in order to increase this valuable resource.

At the same time, it is understandable that we must seek to make the wetlands protection program fair and efficient. And we must increase public awareness of the importance of our wetlands resources. Resolution of the complex and controversial issues surrounding wetlands will not be easy, but I am committed to finding a solution.

So I look forward to working with Administrator Browner on this and other issues associated with Clean Water Act reauthorization. I intend to work very closely with members of this committee as well as other committees that have jurisdiction over some phase of the Clean Water Act.

So my door is open, phone lines are open, and I know that with the help of my very distinguished Ranking Republican on the full committee, Bud Shuster, we are going to make sure that we complete our work of the reauthorization of the Clean Water Act so that we can carry this measure forward in the protection of our own future.

Again, I would like to thank Mr. Applegate and Mr. Boehlert for their leadership on this subcommittee and look forward to working with everyone to resolve these issues.

Mr. APPLGATE. Thank you, very much, Mr. Chairman.

We are also very honored to have our distinguished Ranking Member of the full committee, Mr. Bud Shuster, who would like to make an opening statement. Mr. Shuster.

Mr. SHUSTER. Thank you very much, Mr. Chairman. I certainly want to welcome you to the committee. You testified back in the fall of 1991 before the subcommittee and I thought at that time it was very well thought out and balanced testimony.

I agree with you that the Clean Water Act has been a great success and an enormously important piece of legislation. My concern is that we make sure that we spend our money wisely and fairly.

One of the areas of greatest concern to me is wetlands. I hope that we can create some one-stop shopping so that we can streamline that. I think it is enormously important. We have heard some horror stories about overextension and overregulation there, and I am committed particularly in this area to do everything we can to streamline it, and thank you very much for being here.

I have a prepared statement to submit for the record.

Mr. APPLGATE. Without objection, so ordered.

[Mr. Shuster's prepared statement follows:]

Statement of  
Honorable Bud Shuster  
Clean Water Act Hearing  
Water Resources and Environment Subcommittee  
May 5, 1993

Thank you Mr. Chairman. Today the Subcommittee continues its hearings on reauthorization of the Clean Water Act.

We have already heard from state and local governments, environmental groups and the agricultural community on proposed changes to the Act. Today we will hear from the EPA and the Corps.

I want to extend a cordial welcome to Administrator Carol Browner who will testify for the first time in her new capacity as Administrator. She has testified previously before the Subcommittee on behalf of the State of Florida on the issue of wetlands protection. Dr. Dickey has testified numerous times before the Subcommittee and we welcome his testimony.

Mr. Chairman, environmental protection in general and clean water in particular are indispensable to a healthy society. Properly conceived and executed environmental regulation can improve our quality of life and improve economic productivity. On the other hand, poorly directed environmental regulation can waste time and money, stifle economic development, and breed disrespect for the law.

On balance, the Clean Water Act has been a success story. There is, however, a growing need for us to make some revisions and refinements to respond to various funding and regulatory issues. There is an even stronger case for revising the nation's wetlands laws--particularly the Clean Water Act's section 404 permitting program.

I understand that both Administrator Browner and Dr. Dickey, the Acting Assistant Secretary of the Army for Civil Works, will testify on the controversial wetlands permitting program. I look forward to receiving their testimony and exploring ways to make the section 404 program more effective. In my mind, this would certainly include more reasonable regulation, greater flexibility, and greater deference to private property rights.

These same themes also apply to the Clean Water Act. I look forward to Ms. Browner's testimony and hope she will work with us to make Clean Water Act programs more reasonable and effective. Better science, more risk-based approaches to regulation, and more market-based approaches as alternatives to heavy-handed regulation would certainly go a long way.

-2-

Mr. Chairman, thank you for your leadership in conducting these hearings. Through them, we can help to provide for a clean environment and a sound economy that includes more jobs and a stronger national infrastructure.

Mr. APPLGATE. Thank you very much, Mr. Shuster, and thanks again to you, Ms. Browner, for your testimony, and I would say that your entire statement will be made a part of the record, and that if we don't have enough time today to get to ask all of the questions we would like to ask, we will certainly be submitting questions to you and ask for responses as soon as possible.

Because time, I think, really is of the essence, although it seems like we have a great deal of it, we don't, and I think we need to get the job done. And I am hopeful that working in concert that we can, with your input, put together legislation this year that we will be able to see successfully passed. It will not be easy.

Let me ask you this question, about the fact whether or not the Administration intends to submit a comprehensive Clean Water Act reauthorizing proposal to the Congress and, if so, what is the schedule? And I ask that question, and, too, I would like to find out about money.

In your statement, you stated that without additional funding State and local water wastewater programs will not be able to fulfill the mandates of the Clean Water Act or the Safe Drinking Water Act or meet the expectations of the public. What I would like to find out is what do you think, how much additional monies do you think we will need and is the President going to take those recommendations and submit those with a comprehensive plan?

Ms. BROWNER. Thank you, Mr. Chairman. The President's budget, as I am sure you all are aware, does call for the creation of a new Clean Water State Revolving Fund. The jobs package would have completed the \$18 billion commitment that had been made by the Congress to the States to fund a State Revolving Fund, and we believe that it is essential that we expand the focus of such a fund and continue to provide monies to the States.

I think all of us are keenly aware when you visit in your districts and I go out across the country, that while the Clean Water SRF has done a tremendous job, it has not dealt with all of the problems. The funds have not been eligible for use in a way that has in some instances been supportive of local communities. They don't have the rate base, so a 20-year payback is very difficult. Wet weather issues cannot be addressed adequately. And so we would look forward to working with the committee and the Subcommittee to develop legislation immediately focusing on the issues relating to an expanded SRF.

In terms of the comprehensive reauthorization legislation, we would also want to work together with the Committee with the Members and the staff to develop a package. We will make available shortly what we see to be the primary areas of concern and then suggestions in terms of how to proceed.

But it occurs to us, and if this is the will of the Chair and the Committee, that if we can work together on drafting specific legislation, that may be in everyone's best interest.

Mr. APPLGATE. Well, when you are talking about money, are you saying—I believe they are talking about continuing the \$2 billion a year to the State Revolving Fund. I assume when you say additional funding, you are talking about monies beyond that?

Ms. BROWNER. No, the fiscal year 1994 budget calls for \$1.2 billion for a clean, a new expanded Clean Water SRF. That, in the

President's Vision for America document, goes up to \$2 billion in the following years.

Mr. APPLGATE. Wasn't that because the \$1.2 was because they wanted to advance the 800 some into the 1993?

Ms. BROWNER. Right.

Mr. APPLGATE. So since that does not seem to be happening right now, that would be, then, I assume, \$2 billion next year and \$2 on after that?

Ms. BROWNER. We are working with the White House and the Office of Management and Budget to address the very issue you raise.

With respect to forward funding in the jobs package (taking money from 1994 to 1993), we were one of maybe two agencies that found themselves in that particular position and there is a great recognition in the White House that we need to address that \$845 million.

Mr. APPLGATE. Okay, we will talk about that at a later time.

It was noted, I think in the paper, I am not sure what paper, that Bob Perciaseppe, who is currently serving as Secretary of the Maryland Department of Environmental Protection, was being considered for the position of Assistant Administrator of Water. Is that correct?

Do we have somebody that may be coming on board that we might be able to work with?

Ms. BROWNER. Well, we certainly look forward to having all of our AA-ships filled. The White House has moved forward several nominees at the agency, but as you recognize, not the water position. We hope that will happen sooner rather than later, and the White House, in conjunction with us, is looking at a number of very qualified individuals, including Mr. Perciaseppe, who is extremely qualified.

Mr. APPLGATE. I guess we on the committee are somewhat concerned about the lack of administration from the standpoint of making the appointments. Why is it so slow? I mean I don't think this is historical. And let's say even particularly the Assistant Administrator for Solid Waste Emergence Response. We will be getting into and we need some input even now that we won't be able to get to Superfund until maybe a little later time, but we need that kind of input.

What is the reason for—certainly there are people out there that would be able to fulfill many of these roles.

Ms. BROWNER. It is not a question of finding talented people, you are exactly right, there are lots of very committed talented people. The process, quite frankly, in terms of the investigations and the number of investigations, the number of individuals in the process, is quite large. This is a transition that I think is appropriate to compare to maybe a transition of 12 years ago, not to the transition that took place when you stayed within the same party, and it has taken perhaps a little bit longer than everyone would have preferred, but it is not appropriate for nominees to be sent over to the Senate until they have completed the FBI process.

Mr. APPLGATE. Let me just ask you this because I have had an opportunity to talk to people from Boston and different other places and they have monumental problems. It is hard to believe after

seeing some of the outlines of what it is they have to do to meet the Clean Water Act requirements and all. But in light of that, what do you think should be done to assist communities in meeting Clean Water Act requirements, and focusing in on the small and rural communities?

I am very interested in that. I think it is terribly important. I think sometimes they sort of get the short shrift and where the big bucks always go to the larger areas. I don't want to pit one against the other. We don't want to do that. But the small communities have difficulties even far beyond, even if you are working with a much smaller amount of money, but for them trying to raise a half million dollars is just a monumental, an almost impossible task.

Ms. BROWNER. I absolutely agree with you, Mr. Chairman, that the task facing small and rural communities is quite challenging. I think the Clean Water SRF, as historically structured, reflects information that was available when the fund was originally created and some best judgments at that time. I don't think this was an intentional consequence, but the effect has been that for some areas the money is not as available as I think we would all like to see it.

A 20-year repayment schedule, if your rate base is relatively small, is not do-able. So we would like to explore with the Subcommittee options that would make the funds more flexible, for example, we could establish in terms of meeting the needs of small and rural communities. A different payment schedule; maybe you would go to 30 years. Possibly we should probably discuss whether to forgive part of the loan to allow the smaller communities to participate.

I think the thing we have to all remember is that by helping those communities come into compliance, we all benefit and there is a direct benefit to everyone.

You also mentioned the large cities; and I don't know if you wanted me to speak to the large cities that are also encountering some problems.

Mr. APPLEGATE. I think we will get around to that a little later, but would you be in favor of, say, some kind of maybe at least a limited grant program? We on the Committee, Mr. Boehlert and I, are interested in what they call a principal subsidy approach, and you are familiar with that, and which is not a bad idea, but directed primarily towards, say, small town, rural communities of 10,000 or less or something like that.

Ms. BROWNER. I am sure you are aware that in the RDA budget, the administration has called for an increase in \$900 million for grants, of wastewater and drinking water to communities under 10,000. And it may be appropriate and we could work with you in terms of the needs assessment that we do on wastewater to understand how far this goes in terms of meeting the needs out there, and it may be appropriate to look at the Clean Water SRF in the way you have suggested.

Mr. APPLEGATE. Okay, well thank you very much, Ms. Browner. I appreciate your willingness to be here and to talk to us and we will be looking forward to working with you in the future.

Mr. Boehlert.

Mr. BOEHLERT. Thank you very much, Mr. Chairman. I want to encourage the Administrator to work with us on a bipartisan basis and, thus far, the Administration, not you but the Administration, is not getting very high marks working on a bipartisan basis. Now I can say that because I am one of three living Republicans in this town who voted for the economic stimulus plan.

Ms. BROWNER. We appreciate that.

Mr. BOEHLERT. But it was quite by accident. It wasn't because of any effective outreach program on the part of the Administration. It is just that I happened to agree with the basic premise of the program, which leads me to this question.

Are you going to request \$845 in a supplemental now that we have a stimulus program for which apparently the obituary has been written?

Ms. BROWNER. The White House is evaluating options in terms of how to proceed, and we have been in constant contact with those individuals as it relates to the \$845 million. There is tremendous recognition in the White House that we were in a very unique position, that this \$845 million was a very unique pot of money, not similar to most of the other money in the stimulus package and that we were front loading, if you will.

There is also a tremendous recognition that this was something that would move almost instantly to local communities and that would create real jobs. There was a leveraging effect. If you expand wastewater treatment capacity, then you can have expanded development. And it was we thought, really a very nice package.

Mr. BOEHLERT. I take it from your response you are strongly advocating a supplemental?

Ms. BROWNER. We are advocating that the \$845 million be available to local communities in as expeditious a manner as possible.

Mr. BOEHLERT. I am in your corner on that one.

Ms. BROWNER. Thank you.

Mr. BOEHLERT. The next question we deal with is the principal subsidy program. I know it is a nuance, but there are definitions and interpretations. I, for one, don't particularly care for the grant program. I much prefer the principal subsidy concept that says to the States we are going to give you flexibility; we are going to recognize that you know better what is good for the State rather than Washington being the source of all wisdom.

So those communities, and Mr. Rahall and I have been particularly concerned about this, in addition to Mr. Applegate, those small hard-pressed communities in rural America who find it difficult to come up with a couple of bucks to solve the problem, the State would have the flexibility not only to have a no-interest loan but to forgive or subsidize the principal payments. I am enamored of that concept and I intend to push it. We already have it in the other bill, H.R. 1865, that came out of the committee last week.

Could you address that portion of it, the principal subsidy portion?

Ms. BROWNER. Having been in a State for the last two years and dealt with a lot of these communities who just could not make use of the fund, I certainly recognize the need to do something, and I think the suggestion you make is one very worthy of consideration.

The only concern I have, and this is something we should all be conscious of, is the goal in creating the original Clean Water SRF was to cede money to the States so that they would have a fund available and that that fund would be sizable. If we allow a portion of the fund, to become what are in essence grants, but to be administered at the State level, that does deplete the corpus.

That may be the right decision, but I think we just need to think, be aware of that, to be conscious of that.

Mr. BOEHLERT. What is the Administration suggesting, an outright grant program?

Mr. BROWNER. Pardon me?

Mr. BOEHLERT. Isn't the administration suggesting an outright grant program in addition to funding the State revolving fund?

Ms. BROWNER. In the RDA program it is a grant program, that is true. That money is made available to local communities in grant form.

Mr. BOEHLERT. What I am suggesting is we put more money in a State revolving fund program and give the States the flexibility to act as they think best fits.

Now, let me ask you another question. I am sure you are familiar, as the whole world probably is by now, of the David and Goliath situation in New York, the New York City watershed. I have the privilege of representing the watershed area, which involves thousands of people and you have the water needs of millions of people in the metropolitan New York area.

It would seem to me we should have some special consideration for the needs in the watershed area of these small rural towns that are hard-pressed. Is the Boston earmark the only earmark you have in the bill?

Ms. BROWNER. The \$100 million for Boston doesn't specifically say Boston, it is a formula, but we believe that Boston is the only city that will qualify under the formula.

Mr. BOEHLERT. Under what, special circumstances?

Ms. BROWNER. It recognizes special circumstances, and we have called for consideration of the problems of needy cities. We would look forward to working with this Committee, to create a needy cities program for cities that are having a rate shock of the sort that Boston and several other cities are encountering.

Mr. BOEHLERT. Madam Administrator, what I am getting at, you recognize special circumstances in the Boston area, and I won't quarrel with that. As a matter of fact, previously the President is one of the people that pointed out special circumstances in the Boston area, but I would suggest to you when we think in terms of special circumstances, we think in terms of all the metropolitan areas and forget about the smaller areas.

I think there are special circumstances prevailing in the New York watershed area. I can understand the city of New York trying to find an alternative to spending \$5 billion to \$6 billion for a new filtration plant, but I also would hope that everyone in New York City would recognize that the people in the upstate area, in the watershed area, Delaware County, for example, should be able to use their land as they best see fit. And I am wondering if these are special circumstances that might prompt your agency to take a look at being a little more aggressive in helping resolve the problem?

The two sides are meeting now, but I think most of us agree that the upstate communities, the watershed communities, are handicapped in dealing with the big guys, the big boys from the city. And I don't suggest any mischievousness on the part of the New York City people, but I would hope EPA would play a prominent role here in bringing the parties together and recognizing special circumstances.

Ms. BROWNER. I am not specifically familiar with the matter that you raise, but I absolutely think we should, if we can, play a role, if the parties want us to play a role.

The whole idea of looking at the integration of the system as a whole is something that is extremely important to me and to the Agency. I think for far too long we have not done that and that is a common occurrence. It pits urban areas against rural areas or large areas against small areas in a way that is not most protective and conducive to the management of the system and to the needs of all those people who rely on that system.

Mr. BOEHLERT. I want to work with you on this. It is just that it seems to me that once again, in a special circumstances category, if you have a need for a wastewater treatment facility in a watershed town, that would get priority over a need for a wastewater treatment facility in some other locale simply because of the much broader implications. You are impacting on millions rather than just the thousands that might reside in that jurisdiction.

I want to thank you for your testimony. I want to pledge to you my support. I want to express the hope that the next time you are before us I will be able to officially say Madam Secretary, and I wish you well.

Ms. BROWNER. Thank you very much.

Mr. APPLGATE. Thank you very much, Mr. Boehlert. Chair Mineta.

The CHAIR. Thank you very much, Mr. Chairman.

Let me deal with two issues; one is on standards. I come from the Silicon Valley area. High technology is not a stranger to us. I think if I were to take a look at my environmental record in the 19 years I have had, I think it has been a good one, but by the same token I want to make sure that in the reauthorization of the Clean Water Act that we have some commodity relating to pragmatism and common sense.

I am wondering to what extent do you detect or think that our technology is able to detect toxics is outstripping our technology to be able to treat in the area of clean water?

The reason I ask this, from my own experience coming from local government, having been on the city council and then having been elected mayor, at one point in the 1960s, one part per hundred million was a standard because of the capability of the machines to detect something on the basis of one part per hundred million. But as technology got better, it became one part per billion, and now one part per trillion. And each time we have a technological advance, it seems to me that becomes the new standard.

I am wondering to what extent is there the relevancy between the standards that are being set and health and safety?

Ms. BROWNER. Well, you are exactly right. The measurement technology has advanced rapidly. In some instances, the ability to

measure at lower and lower levels has then resulted in an increase in the technology to remove the particular toxin, but not in all. I think what we need to do—and I think the Clean Water Act does do this—is to provide the States with the ability on a site-specific basis, to the flexibility to make decisions based on the watershed as a whole, where the treatment technology has not kept pace with the measurement technology.

The CHAIR. One of the problems in our Silicon Valley area, when I was mayor, we went from roughly 67 mgd on a secondary plant to 120 mgd on an advanced secondary. Subsequent mayors have taken that now up to a plant capacity of 150 mgd at a tertiary level. And now the city of San Jose, which also serves surrounding communities, has been told that the copper in the water going into the receiving waters of the San Francisco Bay is too high.

The level of copper, however, that is being discharged into the San Francisco Bay is lower than our source of water, which is either the Central Valley Project or from pumping from aquifers.

And now the San Francisco Bay Region Water Quality Control Board, in effect, has a cease and desist order against the city of San Jose from discharging further into San Francisco Bay, not only because of the copper content but because of the fact that the discharge is cleaner than the receiving waters, and the salt waters of the San Francisco Bay are now turning brackish.

It is a crazy situation. I am just wondering whose head is up and locked on this thing about pursuing this? This is where I think somewhere between what we intend in law, in terms of quality of life, and the pragmatic effect on a local community is crazy.

EPA is now suggesting that we build a super sewer line from San Jose up to Redwood City, about 25 miles away, along the bay front. But that means building probably a 60-inch sewer line in wetlands going all the way up to Redwood City. It is just crazy. I look at the thing and I think Mr. Hayes must have written the regulations on this thing.

But seriously, it is a crazy situation and it follows this pattern about standards, which is fine, and then as we follow through the scenario and we are at the other end of the legislative pipeline, the effect on the community is just crazy. So I was just wondering what process you have that you go through at EPA in terms of setting standards; and, again, that finally get to the San Francisco Bay Region Water Quality Control Board that says to the city of San Jose, all right, cease and desist?

Ms. BROWNER. Let me say something generally and then I will call on Martha Prothro to speak specifically to the process.

Obviously, the situation you describe is one of concern. It is an example of why it is so important to work with the local communities, to look at the watershed and to develop the actions that you will take, and the solutions that will be imposed based on that analysis. You have to weigh the decision.

I am not specifically familiar with the situation in San Jose, but I believe you would want to weigh the cost to the community consider the other areas where you could actually have the outfall, and look at the benefits to be derived from that and what it does to the watershed as a whole.

The CHAIR. But I wonder to what extent is there that delegation. It seems to me what we have is, "Now Hear This," "Now Hear This," and it comes top down and we don't have the local input into it because it is being mandated from top down.

You know, it is like anything else, if you are going to be mandating it, we are going to have to be more responsible in terms of the cost of those issues. And as Mr. Boehlert says, what do you do with rural and small communities? They cannot use an SRF because they don't have—even if it is a no interest loan—they don't have the ability to pay back.

Ms. BROWNER. Right.

The CHAIR. So instead of this top down, we mount this yes, let us work together.

Frankly, one of the things I am looking at in this Clean Water Act reauthorization is taking an approach that we did in the surface transportation bill that was signed by the President in 1991 and was the work of this committee, and I authored the provisions in the Intermodal Surface Transportation Efficiency Act, now known as ISTEA, where we said localities, State governments do know what kinds of solutions best fit their problems, but we won't only just tell them to solve their own problems, we will also give them the money to do so and the decision-making process.

Now, frankly, I would like to see in this program some kind of an ISTEA approach to States and local governments by watershed, to be able to treat or to deal with their own problems. And I am wondering if in your looking at this reauthorization of the Clean Water Act whether or not you envision doing any of that or is it going to be a strict controlled mechanism from the Federal level?

Ms. BROWNER. We have got to do exactly what you say, which is to provide mechanisms that allow for meaningful participation in the decision-making process, and for meaningful debate about the options and the choices that a community has to make.

I appreciate your statement that it should be on a watershed basis. I think that has got to be the future in terms of—

The CHAIR. Ten years ago we could not have said that; right.

Ms. BROWNER. I don't think we understood in some ways the significance of looking at a watershed as a whole. We understand that now.

We have an opportunity in this reauthorization to bring that understanding to bear.

The CHAIR. Absolutely. Absolutely. Well, in any event, I look forward to working with you on this as well as on the construction side of the safe drinking water.

I really very strongly feel that if the Administration pursues the SRF approach on the Safe Drinking Water Act, which I think is a good way to go, then I want you to keep in mind that we on this committee consider that a public works and construction of facilities and should be within the jurisdiction of this committee. And that we are not interested in setting standards, but anything that purports to be public works, and that would be in terms of, I think in my definition, in terms of construction of facilities, would be a public works.

So I look forward to working with you on that as well as the reauthorization of the Clean Water Act, and I am hoping that we will

have some kind of mechanism to not only, as you say, have participation—because participation may just be listening. I remember when we were writing ISTEA, we even made the distinction between coordination and consultation, because there are different meanings to those words. So I hope that we can make sure that local and State governments are involved in a much more participatory way and not just a top-down approach.

Thank you very much, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Chairman, and may I say amen. Mr. Zeliff?

Mr. ZELIFF. I have no questions.

Mr. APPLGATE. Thank you. Mr. Hayes.

Mr. HAYES. Norm Mineta, from Silicon Valley, has shown his technical achievements by turning the "on" button in the correct position. He has now demonstrated even greater prowess.

I am going to probably disappoint the network and most everyone here by telling you that I think you and I agree way more than we disagree, and in that context would urge you, for three reasons that I am going to cover, to support what the Chairman of the Interior, George Miller, has supported, and what I am sure the Public Works Chairman would support and the other affected committees towards the environmental summit on some of these issues.

I notice Senator Boren announced on the Senate Floor a response from the President to his and the concerns of six other Senators leading to an interagency discussion on policy and would urge you to press with others who are interested to expand that. Not in any way contradictory to the content of the President's letter or the theme of it, but the agencies getting together is one important step, but then putting the access of public information so that there is the public support necessary to carry out your regulations and to enforce what we enact into law is placed there.

The questions I have are on three lines only, mainly because of the question of time. I would like to ask a thousand questions, really. The first is technology. We just finished in my Subcommittee on Investigation and Oversight, and I appreciate your participation through those that you sent over, and I appreciate the telephone conversation we had prior to that. We would love to have you at a future date.

What came out of that, and is related to this hearing today, is that we actually deter innovative technology instead of trying to encourage innovative technology. And in the example the Chairman gave, there may well be demonstrations on that in other areas, but in both this program and in Superfund, because of cost that is related, we are deterring that.

One of the areas that was a deterrent was the interagency and within your agency—though, by the way, three or four witnesses very much complimented you on addressing and improving communications between districts and communication with agencies—but, one, what can we do to better reciprocate information on innovative technology that works?

What thoughts—and I know this is preliminary because you have just stepped into office—but what thoughts have you had on how to better have interagency communication of what technology is out there at the levels we have reached?

Ms. BROWNER. First of all, I think, that environmental technology development in this country is an incredible opportunity for the United States. We are on the cutting edge of developing environmental technologies and there is a huge demand for these technologies worldwide. We can be an international leader, and we need to get out there. We need to create mechanisms that encourage innovative technology development, and then we need to assist those companies in marketing it in other countries who are desperate for U.S. technology.

In our budget, we have called for an increase in environmental technology funds. That money would then be available for us to leverage spending in other agencies, like the Department of Energy, to work together in a coordinated way. The dollar amount we get is actually not that big, but it is very significant because of the way it brings us together with the other agencies in a coordinated manner.

The base closures and the DOE cleanups for example are going to provide incredible opportunities for innovative technology development. We look forward to working with DOD and with DOE to facilitate those sorts of activities.

I think this is one of the most exciting issues in the environmental arena right now, the development of new technologies to meet the goals of pollution prevention. I could go on and on but I won't.

Mr. HAYES. And also an admonition, not a criticism, an admonition, but the consequences of doing nothing are great. Because you mentioned earlier, the military installations. There will be no conversion to civilian use if no company can afford to go on that site because of current costs which they would have to absorb of any unexpected consequential problems of what the government did while it was a military installation. These are the kinds of things that realistically we have to face when there is not a fault of a future landowner.

So the technology issue I would press as difficult indeed, but one that you have to lead, I think, and you have an excellent background, and so many people from what was then Congressman Gore's office when he was with the Investigation and Oversight on Science, Space and Technology. It is an excellent entree into it, and without it we will not clean up anywhere.

Because if we are not able to do innovative lower-cost technologies and better technologies, we cannot give enough mandates because there are not enough resources to respond to all our threats and mandates that exist. And I congratulate you on the beginnings of that, and would very much like to work with you on encouraging it and, second, would ask this:

If in the course of the interagency discussions or any other interagency relationships, if you have an opinion as to how legislative barriers have been created and how we can remove legislative obstacles, if they exist to those interagency transfers, I would very much appreciate knowing.

I know the Chairman would, and the Chairman of the full committee which would have appropriate jurisdiction, would love to give you a hand in furthering the interagency agreements.

Second, it is a theme that I want to ask you a couple of questions about. From the Chairman's example and from many others that you have heard, one of the difficulties that I have, in expressing myself regionally, is that my area of the country is such a large wetlands in southwest Louisiana, and Congressman Tauzin next to me, which I think has an endangered species problem with that coastal community which is impacted and quite different.

A young lady who heard you speak a couple weeks ago at a ceremony for people who came from all across the country who were honored, and I think your words were as American heroes for environmental work, she lives in a parish that is coastal, and her comment to me in the office later was, when I talk to folks around here, they don't realize that doing nothing destroys us. They have a mind-set on preservation, meaning do nothing. And we are losing enormous square miles a year in wetlands loss.

We have to be proactive and doing something or there is no preservation; there is no enhancement. That leads me to the difference in localities, and I would like also to know your thoughts on how we might be able to structure the delegation, not just to States, but in some instances perhaps compacts between regions—may or may not cross State lines—to express environmental concerns and balance that may not meet with national policy, with a broad brush, but would complement more localized policy that might have consequential differences that improve environmental conditions and cut down loss.

Have you given any thought to a structure where we might be able to localize or authorities we might grant to localities?

Ms. BROWNER. This is a complicated issue. We at EPA delegate our authorities to a lot of States, and some States have an awful lot of EPA-delegated authority.

The question has come up a better EPA would be willing to delegate past a State to perhaps local governments or to State regional agencies. There is a question of management and of oversight. It becomes increasingly difficult for us with the resources we have to interface with 200 agencies as opposed to 50. But it is not to say that we should not look at mechanisms for allowing the States and encouraging the States to whom we delegate authority to bring in the local and regional governments in a more intelligent and comprehensive manner.

I think that there have been instances where our delegations, perhaps intentionally, perhaps unintentionally, have discouraged those sorts of activities and have failed to recognize the great interest in resources that local governments can bring to this work. Rather than discourage it, we need to actively seek to encourage it.

I think that we all need to recognize that the amount of resources available towards environmental protection at the State and local level, if you take it in its entirety, probably far exceeds what is available at the Federal level. Rather than creating adversarial relationships, we need to create these partnerships and we need to make sure that individual local agencies and State agencies, are using their money in the best way possible with their skills. We also need to make sure that we are using our money in the best way possible with our expertise and skills. We must have

this constant duplication \* \* \* the value of local and regional entities.

Mr. HAYES. The point I would make is, for example, near my district and Congressman Tauzin's district, recently you avoided having to make a difficult call on an elevation. And if you are like me, you always like to avoid making a difficult call. But it wasn't what would be thought of in the ordinary context, if you asked the average person around the country, of industry versus environment or jobs versus environment, it was fish versus ducks. The issue elevated was whether or not in a marsh management plan there would be more clear water or more saline consequences of the competing plans, with Fish and Wildlife taking one position and many groups like Ducks Unlimited and other environmental organizations taking another.

I have no idea what is right or wrong, or even if those words apply. In fact, I don't think those words do apply. But those competing interests, it seems to me, are much better decided with local information than a review coming out of Dallas in Region 6 or an elevation to you, because the issues there are not policy as much as they are how do you make this tough call with local consequences.

I would use that just as an example, saying there are plenty of instances out there where it is balancing of interagency concerns, both of which can make very good environmental cases and many of which can argue—in fact, the argument of using more salt water killed marsh and dropped those national statistics on remaining wetlands. And that is unquestionably true—but the point is, is that unquestionably right or wrong in the larger thinking? And I am not prepared to make the judgment; I just feel it can be made more locally.

Because of time, let me press on to the last thing, and that is the third thing I wanted to talk about, which is we have to create—or the second thing—and I would be very much interested in your thoughts also, both now if you wish to respond or at a later time if you wish to supplement that with a statement—there must be some way we can give thought to differentiating with whom we are dealing as well.

Let me give you an example. In the 404 program you mentioned briefly sequencing. Instead of debating the merits of sequencing, let's look at it, one, as it applies to a major corporation that owns lots of stuff and has a lot of resources; two, as it applies to the average citizen of the 7th District of Louisiana whose median family income is \$26,000 a year and who owns one thing that may well be in a delineated wetland.

Please give some thought to how policy impacts on use denial and how the whole sequencing concept has such a divergent and dramatically different impact on the case of the one person, with one site, seeking one thing, and the case of the conglomerate, with many arms reaching everywhere, with vast resources, legal resources, and with the ability to exert their position both at the agency level or, if necessary, in court.

I don't know if you have given that thought, but I would love to hear a response, and I would also like your subsequent response,

if you would indeed wish to, as you proceed with further policy issues, to address it again.

Ms. BROWNER. Well, if I understand the question, we have begun the process, we have signed some MOUs with the Corps and other agencies to start to streamline the permitting process in a recognition of some of the delay and duplications that can occur. I think there are probably other opportunities from an administrative perspective that we can take to try to recognize the differences that you raise.

On the point you made before, I wanted to call the committee's attention to the National Estuary Program, because I think that it will be useful to keep this program in mind during the reauthorization process. There are 21 designated programs right now in the National Estuary Program. This comes as the result of communities and local governments coming together and deciding what makes sense for that specific watershed. Then we seek to provide funds to help them implement an estuary plan. This plan takes into account how people live their lives, the industries in the area, the municipalities, and how they have to function. I really think it is a model that can serve us well in terms of determining the process by which you achieve effective and efficient local involvement in the decision-making.

The other one I would call attention to is the Great Lakes water quality initiative. That was the result of over 100 public meetings. Now, some will say we took too long, we didn't meet our statutory deadline, but what is absolutely important about that initiative is that it is the result of what people who live there and who will live there and whose children will live there believed it would take to give them the quality of life, the jobs, the recreational opportunities and the clean water that they wanted. As we go through the reauthorization process, I think we really need to focus not only on watersheds but also on this local participation.

The fascinating thing about local participation is they will generally make much tougher decisions than we will make. Because once they come to understand the system and what the system needs and they are invested in this system, they will make those tough decisions.

Mr. HAYES. I think it would probably go both ways. Some would be tougher and some would be different, but all of them would be faster, that I am certain of, because of their own experience with local conditions and aided by the technology and science that I think EPA has the capacity and with other agencies has the capacity to deliver.

I got amused listening to Norm about the watershed as a whole. I got to thinking what I would do, one, if I was the Governor of Maryland, because I would like to include all of Pennsylvania, three-quarters of New York in the Chesapeake watershed and tell them to be sure to get their permits through Baltimore. These are the kind of problems that you are going to face, because I guarantee that is the definition of a watershed.

If I were mayor of New Orleans, I would say, Ms. Browner, we need about four zillion dollars to make up what has come down the Mississippi River since that count began on the Discovery of America. That is going to be a tough position in which you have got

yourself by volunteering for this. They should put you in the cabinet. You will have as many wars as the Department of Defense ever dreamed of on this.

Ironically, it will not fall in a predetermined mode of environment versus business, it will fall on jurisdiction and turf, and who permits what and how and where and its impact, because of the same thing he is talking about in copper. You are elevating the ability to trace source in a way that you are not—by you, I don't mean you personally; we, government—is not yet ready to deal with the political and structural and legislative consequences of that ability.

It will be a very interesting time in which you serve, and I guarantee you have a seat at the table finally.

Last question I want to deal with is on the integrity of policy, and once again this is not a personal statement, but agencies have got to do two things, all of them. And yours is the lead agency in this area. One is the integrity of science that is offered. It has to have public faith in it and be based upon what are perceived as coordinating the local conditions.

The one thing I would also ask you to consider and address is a means of making the science more independent and the inter-relationship of grants and predetermined outcomes, that are quite often mandated by who gets the grant to do the study, because they already know what conclusion you had better reach. If that is only an opinion, I guarantee you it is one shared by many people, from their perspective, of the manner in which we have a virtually in-house and brother-in-law relationship of scientists, grants and agencies.

There has to be a better way if clearly science is going to be viewed as above and below arguments over policy A and policy B.

And second, we need to give you and Interior, and I suppose Interior more than you in this instance, but we need to have a program by which future acquisitions don't go down a political chain but have more environmental input and more national consequences of their acquisition on behalf of the United States. We need to do that in a way that does not involve people who are also registered lobbyists, who hold the property in interim steps and sell it to the government. That is an integrity that I also question. None of which is your fault, but it is an awfully good area to pursue in science and in the chain of acquisition.

Finally, when they are called public properties, and I watched every minute of the summit on television, and I wondered as the ton of questions went by and they showed the whole idea and concept of a Northwestern forest, but there is individually owned lands in between. And the difference between public and private struck me as dramatic.

For one thing, the public is not willing to have the same consequences apply to a private owner, when we tell them what they cannot do, as they are on public lands that they feel they own. They are more than willing to say we are going to have consequences, because the consequences are borne by all of us in our collective ownership as taxpayers. But to target, when you have a small landowner in between and you tell them they just happen to

have owned it in the wrong place, that is something we should address.

And, finally, and this is where I am leading up to the question, I think we should treat public and private lands in the same manner in which we do permitting. I think they should have to deal with every agency, every day, at every level of review, and incur every other consequence instead of a streamlined process that we have for public properties. And in that manner, it will give them more than ample opportunity to see many of the things that are complained about and will not allow them to shortcut a system that is imposed upon every private landowner.

And I want to know, as my final question, your opinion on having public and private lands subject to precisely the same regulatory permitting requirements.

Ms. BROWNER. There are instances that public and private lands are subject to the same process, although I would not say that this is true in all instances. But as we all well know, there are times when EPA suggests that a particular activity go forward based on our environmental review that we do not find there to be adverse consequences, and then another agency feels differently and vice versa.

I think the solution is not to subject everybody to the same system, because we have recognized that the system needs to function better. The solution is to fix the system and to fix it for everybody so that it is an integrated approach and that people don't, whether they be the private or the public sector, feel jerked back and forth within the system.

Mr. HAYES. Well, thank you very much for your testimony and responses, and I very much appreciate your appearance here and look forward to working with you from my subcommittee as well especially on technology transfer. Thank you.

Mr. APPELATE. Thank you, Mr. Hayes.

I will say this; that I did allow Mr. Hayes some leniency in the time because he has pretty much contained himself over the past few subcommittee hearings, and he has had a very specific interest in the subject, but I would like to ask the committee to try to stay within the five-minute limit.

Mr. Horn.

Mr. HORN. Thank you, Mr. Chairman. You perhaps have heard of Miles Law, after Rufus Miles, the great Assistant Secretary of Administration in HEW, who said where you stand depends on where you sit, and in October 1991 you testified before the subcommittee on wetlands protection, in your role as Secretary of Environmental Regulation for Florida.

You raised some very serious questions at that time about wetlands classification and ranking schemes and wetlands creation projects. I am just curious what your current views are and if they have changed at all from your views expressed to the subcommittee less than, well, a little over a year ago?

Ms. BROWNER. I continue to have significant concerns about wetland creation. I think that we are ultimately better served through restoration and improvements in previously impacted wetlands than by creating wetlands. Where we—I think what I said to the Committee a year ago, or a year and a half ago, was, it is very hard

and very expensive to do that which nature does naturally and wouldn't that money be better spent and the rewards more readily available if we were to restore where water had once been, restored the flow.

In my experience in Florida, we have had some tremendous successes. And, quite frankly, we sort of changed the whole argument regarding wetlands protection as we moved away from creation to restoration, mitigation banks, and a number of other things that really just made a lot more sense.

In terms of the ranking issue, as I remember my testimony of a year and a half ago, I think I was speaking to a specific, a particular scheme that had been put forth. The general notion of ranking is not inherently problematic; however, I am concerned with the schemes I have seen thus far. I may not have seen all of them, but it seems that the effect is to not encourage avoidance and minimization, which I think is appropriate as a first step, but rather to sort of say here are the areas that can be impacted and here are the areas that cannot be impacted.

Again, we have to be looking at the systems as a whole, at the quality of the systems and protecting systems.

Mr. HORN. On that very important point of the holistic view, obviously, a lot of the polluters are small farmers, and this has sort of been touched on, and the question is when you have all these various sources of pollution, small farmers, the difficulty of compliance, the reluctance of society to regulate smaller farmers who are sort of the economic production unit of many communities in this country, what sort of carrots and sticks do you conceive of that might be different from what is going on now to secure compliance or encourage compliance in this area?

Ms. BROWNER. Well, I do believe there are tremendous strides that we can make in working cooperatively with farmers in looking at how they farm and in working with the Soil Conservation Service and other services that are available to farmers to develop solutions that work for them and work for water quality protection.

I think farmers absolutely understand that water quantity and water quality are interrelated. They see the consequences of decreases in water quantity perhaps before anybody else, and I think there are many who are eager to work in a cooperative manner. In terms of dealing with the agricultural runoff issues, we are suggesting that we structure a framework that will allow for cooperation.

We also, obviously, need to work very closely with the Department of Agriculture. I think they can bring a tremendous amount of assistance to that effort, and it is important to focus on those areas where the greatest problem exists and then to begin our work solving the greatest problems.

Mr. HORN. Thank you.

Mr. APPLGATE. Thank you very much, Mr. Horn. Chairman Rahall.

Mr. RAHALL. Thank you, Mr. Chairman.

Administrator Browner, I appreciate very much your testimony today. I wanted to follow up on the issue of the State revolving funds and the assistance to small communities so very well brought

out by Chairman Applegate and Ranking Minority Member Boehlert a little while ago.

Training and technical assistance to these small areas are just as important as any amount of money we provide, as you know. In regard to the funding and in regard to SRF mechanisms, I have introduced H.R. 1544, which I certainly want to work with you on, but the technical and the training programs are essential as well if the rural communities are to be able to comply with Federal mandates. I have written to you in this regard.

In providing rural technical assistance services, following up and continuing those services that are provided by the National Rural Community Assistance Network and the National Rural Water Association, and given the critical importance of this type of assistance to rural areas, what steps do you think we should take to ensure these programs continue to be an integral part of the EPA's outreach and mobilization efforts?

Ms. BROWNER. We absolutely agree with you as to the importance of providing this sort of training and technical assistance. Our budget does include about a half million dollars for these sorts of activities to work with groups that work with these communities.

To be honest with you, I think, these groups had hoped for more. There were difficult decisions to be made in the budget. We had funded the groups previously and so I thought it was important to provide some continuing funding. They may wish to look to some sort of fees program to help provide them with additional funds in the future from some of their members.

But it is absolutely essential that we do increase the capacity, if you will, of those in the rural communities in terms of their ability to do the job.

Mr. RAHALL. Many States, such as my own in West Virginia, provide these type of services through other agencies. Do you think that should be the main role or should nonprofit organizations provide the most assistance or a combination of both? What do you think is the proper delivery mechanism?

Ms. BROWNER. Well, I think States and regional State entities, governmental entities, are a good tool. They are not necessarily available in all States in the way that perhaps your State has structured it, and so it is potentially important to look to other sources.

Obviously, if there were enough money and enough full time EPA employees, we would welcome the opportunity to do it. That is not something that is available to us, so we need to look to other groups.

Now, the two groups that would be eligible for the funds or that have historically been eligible for the funds in our budget can also look to the States in terms of some funding, and they may want to do that.

Mr. RAHALL. Thank you very much, Administrator Browner, and thank you for the leadership you are bringing to the EPA.

Ms. BROWNER. Thank you.

Mr. RAHALL. Thank you, Mr. Chairman.

Mr. APPEGATE. Thank you, Chairman. Mr. Quinn.

Mr. QUINN. Thank you, Mr. Chairman and welcome, Ms. Browner, this morning. I appreciate your testimony.

I am one of the freshmen Members in the Congress, one of those 110 renegades that the public sent up here last November and am terribly excited about our activities on this committee and wish that very soon you will join us as a freshman Secretary and work with us to get some projects done. I pledge you that help and support.

Four months ago, though, before I came to the Congress I was a town supervisor in upstate New York, near Buffalo, New York; a town of about 50,000 people. Our discussion on local importance today rings true to form for me. I have been on the receiving end as a town government executive in western New York of Federal grants and projects.

Without repeating all of the testimony you heard from the committee in your direction this morning, I want to underscore my feelings for the important aspect of involving the local community and pledge any modest support to you, Chairman Applegate, and to Mr. Boehlert which I can bring to this subcommittee in that regard.

One of your comments earlier, though, strikes me, and I wanted to mention it to you, and that is the whole business of accountability. Because your concern as an administrator, as the secretary, will be that you cannot have 200 or 300 agencies out there running around making important decisions without some kind of accountability, whether it is the 50 States or the 200 or 300 that you mentioned. We are all accountable up here in the Congress to 600,000 people in a congressional district.

I just wanted to remind you, and we need to remind ourselves, that in most cases when we are talking about these local projects in towns of my size, even smaller villages and small cities around the country, those local elected officials are accountable to their residents and to the people that they represent. As you have already said this morning, in many cases those folks will come up with tougher standards, make tougher decisions, and we need to be reminded that in many cases, these projects, these issues, have been discussed for months and sometimes years at the local level.

Speaking as a former local official, I can tell that you are not removed from your constituents in Albany, New York, home of our State legislature, or in Washington, D.C. Local officials are with their residents every day. I see them at my son's baseball games, at the shopping markets, at church on Sunday, and you know full well those folks are holding you accountable each and every day.

So some of our concern resolving accountability needs, I think, to rest with those local officials. That is important to me. I hope from what you have said that is important to you.

And then just briefly on the wetlands issue, if I may. Have you any sense, as you manage the department, as to how we might streamline this process? I think Chairman Mineta mentioned this morning. Any suggestions how we might help you on that up here in the Congress or on this committee?

Ms. BROWNER. Well, we will be back to the Congress on that specific issue. As you may be aware, there is a study that has been commenced by the National Academy of Sciences; this goes back a little to the point that Mr. Hayes made about the need for the integrity of science. I think the Congress determined that the best

way to deal with the delineation issue in terms of wetlands was to use this body, which is highly esteemed. So we will be looking to that and then to administrative actions.

As I said, we have already entered into some MOUs with our sister Federal agencies. We need to continue to work together through this process to determine what makes sense and to give us the tools that we need to give people a timely answer and an answer that protects the environment and protects water quality.

I appreciate your comments as it relates to local government. One thing occurs to me that we have not really talked about too much today; we also need to educate the public so that they can be full participants in these discussions. I think that we should think about opportunities in the reauthorization process to talk to the public so that they are informed on both the cost and the value of clean water.

I think I made reference to this in my statement. Many in the public think clean water is just sort of there; that you turn on your faucet and it is there. And it is not just there. It is the product of an awful lot of investment and hard work and tough decisions. The public needs to know that so they can be more effective participants in these decisions.

Mr. QUINN. I agree. I think our role in the Federal Government is to assist, whether it is the State or local governments, in some of the technical information.

You mentioned earlier today we need to have meaningful participation in the decision-making process. For many of us in local government, that meaningful participation was affixing stamps to the application that went to Washington and then hope and pray we would hear from them before we were out of office. I am hoping I can help you do that. I think we all want to do that.

Thanks. Those are good comments. I appreciate them.

Ms. BROWNER. Thank you.

Mr. APPLIGATE. Thank you, Mr. Quinn. Mr. Parker.

Mr. PARKER. Thank you, Mr. Chairman.

Welcome to the committee. I have a general question concerning your agency's handling of matters under the Uniform Relocation Assistance and Real Property Acquisition Act.

You were just talking about accountability. Now, I have people that are saying that they accept responsibility for it, but I don't have people having enough courage to do something about it. Let me give you an example.

This case may be one of the most egregious cases we have in the country but there are others out there like it. It started back whenever Gerald Ford was President of the United States, back in 1975. I have a constituent in my district by the name of Gus Saunders. This case deals with the EPA and FEMA. It deals with their expansion and correction of lines on his property.

He was never given his rights under URA as this project continued off and on until the early 1980s. As a matter of fact, he was told by your regional office in Atlanta that it was EPA's policy to ignore citizens' complaints under URA.

What happened was that EPA and FEMA destroyed his personal property—now, this has been admitted by EPA and FEMA—and they built sewage lines off of his easements that he had granted.

For 15 years or more, Gus Saunders has been trying to be made whole but no one has listened. Over \$200,000 of personal property was destroyed in the late 1970s but your agency now wants to settle his claim for just that. No interest and no payment for damage to real property.

Now, I brought this matter to the attention of your predecessor, Mr. Riley, when he appeared before this committee over two years ago. By letter dated April the 5th of 1993, I brought this matter to your attention and I know you just got there. One of the problems with taking over an agency is you inherit all of this. After four years of trying to assist my constituents, it seems we are no closer to a solution.

Now, if the Chairman would permit, I would like for you to detail to this committee within 15 days the reasons why the Saunders case has not been resolved and I would also like to know what you plan on doing about it.

In addition, I would also like to know your thoughts on why any citizens' complaint is ignored and whether a case of this type will be allowed to continue or how it is going to be resolved in the future, because this is one of the problems that we have as Federal officials. Our agencies go out and they think they have total immunity and they destroy private property and the individual rights in this country, of just an individual, small individual, when the power of the government comes upon this person, they get no response.

And it is always because career people and political appointees are trying to protect themselves. They say, yeah, we did you wrong, we hurt you, we destroyed your property, but we are not going to do anything about it because we are going to pass the buck to somebody else.

Would you comment on that?

Ms. BROWNER. Well, I have no problem with making hard decisions and I don't seek to pass the buck. I am somewhat familiar with this case although clearly not at the level you are. It is something that the Agency does take seriously. It is why we have come forward now with an effort to solve the case with an offer. It may not be acceptable to Mr. Saunders, but as I understand from talking to the EPA people involved, we are at least now talking. Mr. Saunders and the EPA for the first time are actually sitting at the table.

Mr. PARKER. Mr. Saunders has been wanting to talk for years.

Ms. BROWNER. Well, I can't speak for what happened in the Agency prior to January 22; I can tell you since January 22 we are talking, and, hopefully, we can resolve this in a way that is acceptable to Mr. Saunders, and if it is the Chairman and the committee's will, we are more than happy to provide an explanation of the case to the committee and to you.

Mr. PARKER. Let me mention one other thing and then I will stop.

I was actually, it was by inference more than anything else, that officials from your agency tried to tell me that my constituent was not Gus Saunders; that I had a larger constituency, which was the city of Jackson. So they tried to put me in a position that politically

it would be much wiser to satisfy the people of Jackson and go against the individual rights of Gus Saunders.

I cannot tell you how mad that made me. My response to them was in the next election, if I get one vote from Gus Saunders and everybody else votes against me, that will make me happy, because that type of attitude will not work and that is what has caused so many problems in this country already with this situation.

I look forward to your response. Thank you.

Mr. APLEGATE. Thank you, Mr. Parker.

Mr. Gilchrest.

Mr. GILCHREST. Thank you, Mr. Chairman.

Ms. Browner, I know there are problems all over the country similar to what we just heard. I would say, however, and I know there are some overzealous and underzealous bureaucrats, which we always run into. I would say at the risk of not being correct that the ultimate responsibility for these regulations lies not with yourself or the bureaucrats but with us and we need to wade in waist deep into whatever it help resolve these problems.

I have a question that I hope was not raised while I was gone. I had another committee hearing. In regards to watershed management, specifically geared toward wetlands. Wetlands is very controversial from salt water intrusion in Louisiana to prairie potholes in Iowa to saving the Chesapeake Bay through its filtration system on the Eastern Shore of Maryland.

This is an enormously complicated effort that we are undertaking here to propose an idea of no net loss of wetlands. The previous President made that statement. I think it has been made again, although I am not absolutely certain. I have a twofold question dealing with no net loss of wetlands.

Number one, first of all, I would like to see no net loss of wetlands, but that is my own personal opinion. I like wetlands and open space and things like that. But practically speaking, is it possible to have a policy where there is no net loss of wetlands, given the enormous diversity and, dare I say, economic needs of certain, of all the areas of the country?

I want to be a little—I want to give an example of watershed management in all its complexity, the idea and philosophy that I think we ought to push of no net loss of wetlands, but just give a simple example of where it might not be totally practical.

In my district, there are a number of communities where there are areas zoned industrial and commercial. In this one particular incident, you have an industrial area of a small town where they have built numerous factories, warehouses, you name it. In one lot, between two buildings—and it is a lot, about 150 feet wide by 200 feet long, that is surrounded by factories—it has been delineated as a wetland. So, therefore, another expansion to a factory cannot go in.

Given the 1987 manual now—I agreed with the 1989 manual—but if we are to look at flexibility and the idea of watershed management, can there be, with the reauthorization of the Clean Water Act, section 404, some flexibility with an area that is specifically considered a wetland under those circumstances?

Ms. BROWNER. Under the existing law, there is the ability to take into account some of the matters that you raise. The issue of no

net loss is a complicated one, because in the implementation of no net loss, I don't think we have achieved what those words meant when they were originally said.

There have been acres of wetlands destroyed and in its place "no net loss" wetlands created. Now, those created wetlands are not functioning as part of a system. They are not providing us with the quality of biodiversity or of water that the area impacted was providing. I consequently am not sure that no net loss is really giving us the quality that is absolutely essential to the future.

Mr. GILCREST. I agree with that, and you are referring to mitigation, I suppose.

Ms. BROWNER. Yes.

Mr. GILCREST. Mitigating an area someplace else, and that is where I guess—and I know it is probably a little more difficult to take wetlands into a watershed concept as we do other things.

Ms. BROWNER. I don't think so. It is something I think we have to strive to do, because the wetlands are part of a larger system. They may not appear so to the naked eye but they inevitably are, for example, the ground water connections, the sheet flows, et cetera, and I would think that it would be important, as we begin down the path of using watersheds as the way of thinking about what we do, that we absolutely incorporate wetlands into that discussion. They are part of the watershed. And for the watersheds to be successful, for them to be healthy and beneficial, the wetlands have to be.

Mr. GILCREST. Is there, then, any plan to develop—there is a great deal of discussion about watershed management for drinking water, for wastewater, for point pollution and nonpoint pollution and things like that. Is there a plan under way to begin to map out the wetlands and their connectiveness as far as the watershed is concerned so that communities in their comprehensive planning can focus on that?

Ms. BROWNER. Yes, there is some work under way. There is some work being done at the State level. We also have our EMAP program that attempts to look in at water chips the way that you suggest. Obviously, we have not covered the entire country. That will be a significant undertaking. Although, I might add, NOAA and EPA are working with the Department of Interior as they put together their biological mapping survey to make sure that all of the various mapping activities that are going on will be integrated so that that kind of information will be available.

We also have the advanced identification program with States and the regions to go out and actually locate and identify the functioning wetlands systems.

Mr. GILCREST. I think a lot of trouble would be diverted if communities had this information to project planning for the future. And there will be, I suppose, and I understand the idea that mitigation does not always work because it is not in the right area, it is pretty tough to develop a wetland, but if communities had the information and they were able to share that with developers, homeowners, and realtors especially and things like that, the planning would go a little smoother, and the thrust of the community to be behind this program would, I think would be greatly increased.

Thank you.

Ms. BROWNER. I just might say planning and land use planning, obviously, can do an awful lot to address the problems that we have been left to address in a regulatory manner. I think we all recognize that just protecting a particular wetland does not really get us the quality of function. You have to protect the buffer, and there is an interaction between a wetland and an upland that is important to protect.

So land use planning, where you take a comprehensive look on the front end rather than on a piecemeal basis, will be very, very helpful in terms of dealing with a lot of these problems, and quite frankly, preventing a lot of these problems from occurring.

Mr. GILCREST. Thank you very much.

Ms. BROWNER. Thank you.

Mr. GILCREST. Thank you, Mr. Chairman.

Mr. APPEGATE. Thank you, Mr. Gilcrest. Ms. Norton.

Ms. NORTON. Thank you, Mr. Chairman.

Ms. Browner, I was delighted with the part of your testimony that focused on watershed management, ecosystem management, and I want to associate myself with Chairman Mineta's remarks, because I think they illustrate what happens when there is not a comprehensive watershed management waste effort, not to mention money, can be quite significant.

I think that my colleague, Mr. Hayes, may have a point about turf when he is talking about an area that is so large that it runs through half the States of the Union. But if I might say so, in this region, there has been enormous cooperation and no turf battles, for example, in the case of the Anacostia River.

And I want to ask a question about a watershed approach to urban rivers. I am working on a piece of legislation that I hope will become a part of the Clean Water Act that effectively would establish an urban watershed provision, and I am modeling it on what you indeed describe in your own testimony as the nationally significant estuaries program section 320.

Part of my own initial interest comes from the fact that I have a very great interest in the Anacostia River, we saw what the Federal Government did with the Potomac River, the river that runs through the neighborhoods the Anacostia didn't get quite the same treatment. It doesn't have as many tourists visiting the neighborhoods, but while my interest originates with the Anacostia, these working rivers, these rivers that built America, are experiencing, across the country, the same neglect.

The Anacostia has the dubious distinction of having been named a couple of weeks ago by American Rivers as the most endangered urban river in the United States. But there is the Detroit River, the Los Angeles River, the Chicago River, the Platte River in Denver, and the Hudson River in New York. I mean these working rivers are household names in our country. They are in plain view and they are very plainly ignored.

I wonder if you believe that the nationally significant estuaries model could be adapted so that we could name nationally significant urban watersheds and proceed with a methodology not unlike that, that you are using with the estuaries?

Ms. BROWNER. I think it is a very intriguing proposal. As I said previously, I believe that the estuary model, in terms of participation in the development of solutions, is one that has worked and one that I am interested in seeing expanded. I think you make a very interesting proposal in terms of taking that process and expanding it to our urban rivers.

You are exactly right; the urban rivers are at some risk and we need to do better by those rivers and for the people who live near those rivers so that they can enjoy those rivers. Many of our urban rivers historically offered tremendous recreational opportunities for the people who lived nearby, and that has ceased to be true in far too many instances. We should definitely give those rivers back to the people in those communities.

Ms. NORTON. I note that in your testimony, Ms. Browner, you indicate—in the examples you give, which are themselves very interesting—that they are not complete, they don't have a complete watershed approach because you don't yet have that approach. And that some have the resources without the authority, some seem to have the authority without the resources.

I would like to ask you, what effect you think an urban watershed approach would have on existing resources? Would it require additional resources and what effect it would have on existing efforts, such as nonpoint source pollution efforts, that are already under way and other efforts in a rather unconnected fashion around these watersheds?

Ms. BROWNER. As to additional resources, I think there is a lot we can do within existing resources and by bringing together a variety of activities and focusing around a particular urban river.

If this is okay with you, we would like to take a look at your proposal and then provide a more detailed writing in answer to the Subcommittee. We should be able to do a lot within existing resources. Whether we can do everything that you would hope for is something we should probably take a closer look at and get back with you.

Ms. NORTON. I would be glad to share the proposal with you as it develops. I am now working with Committee staff and my own staff and appreciate your response. And thank you, Mr. Chairman.

Ms. BROWNER. Thank you.

Mr. APPLEGATE. Thank you, Ms. Norton. Ms. Shepherd.

Ms. SHEPHERD. Thank you very much, Mr. Chairman, and welcome, and I am very pleased to see you here.

I am from the State of Utah. We have sort of constant preoccupation with water in Utah, as you can well imagine, and Salt Lake County, which is the district I represent, is in a high mountain valley below a watershed of mountains that we have garnered with our lives for years.

I am very interested in watersheds. I am very interested in the notion that we are moving from treating water we have already ruined to protecting water that we have yet to use, and I just would like you to expand in some detail on what your plans are for watershed management policies, and what you imagine will be the hurdles in overcoming all these different jurisdictions and permitting areas and all that sort of thing as you go through doing that, be-

cause that will become our problem very quickly, is to try to help you do that.

Ms. BROWNER. The Clean Water Act is somewhat unique among environmental statutes in the great flexibility it already provides. I think that most people who work with the array of environmental statutes would agree that the Clean Water Act gives greater flexibility.

We hope that in the process of reauthorization we incorporate the concept of watershed protection in all that we seek to do, that we make watershed protection sort of the cornerstone of how we do the job that we have to do, and that we make sure that we don't inadvertently put in place barriers where ones have not previously existed. We would just seek to work with the Committee and the Committee staff on this as actual legislation is developed.

Ms. SHEPHERD. How do you visualize coordinating this effort with the biological survey that Secretary Babbitt is doing in Interior; because there we are talking about ecological systems in terms of animal life and here we are talking about ecological systems in terms of water. And obviously they overlap in many, many ways. Are you going to go forward sort of on the same time schedule?

Ms. BROWNER. Well, we have an existing program, a mapping program within the agency called EMAP, which stands for ecological monitoring and assessment program. It has been ongoing for I think four or five years. It is of great importance to us. It is focused on the ecological resources, as you mentioned, but we are now in the process of making sure that the work that we do will be fully integrated with the work of Interior and NOAA and that we will not overlap each other, but rather we will complement each other.

In additional, we have an interagency working group who has the responsibility for assuring that and for coming forward with proposals. It may be something for which that legislative language would be appropriate. We don't know at this point in time.

Ms. SHEPHERD. Is this the first time that has happened in this particular group?

Ms. BROWNER. I think in this Administration there is probably a greater importance placed on interagency coordination. The example is set at the top. I have wondered why. If this is the case; I will tell you what my answer is, though it may not be right: this cabinet is made up of more people from State and local government than any cabinet, I think, in the history of government, but certainly in recent memory.

If you come out of State and local government, and those of you who have been there know this, you have to work with your colleagues. It is how you get things done. Consequently, we are very comfortable working across agency lines. I think they are setting the example at the top and bringing people together, quite frankly, in a way that perhaps they have not come together.

I think EPA and Interior have a history on specific issues of working well together, but there are other issues we have not worked as well together on, and we need to do a better job. But I honestly believe the only way we can meet the public's expectations, in terms of environmental protection and quality of life, is by working with Interior, NOAA and other agencies.

Ms. SHEPHERD. Well, I certainly support you on that and compliment you on that, because as I try to track down all the many, many examples my constituencies give me of where government doesn't work, it almost inevitably comes to the point where one agency told them one thing, another agency told them another thing, and they just feel like they are being tortured to death. So thank you very much.

Ms. BROWNER. Thank you.

Mr. APPLGATE. Thank you, Ms. Shepherd. Mr. Barcia.

Mr. BARCIA. Thank you, Mr. Chairman.

In the interest of the time constraints, I would like to focus my comments on three concerns that I have, Administrator Browner, and I would like to begin also for thanking you for your appearance before the committee today and say I, too, look forward to working with you the next several years as we address the water quality problems.

The 5th congressional district, in which I represent the State of Michigan, encompasses about 600 miles of Lake Huron shoreline as well as many tributaries and including all of the Saginaw Bay. One of the programs that I have recently been involved in is the Saginaw Bay watershed initiative, and I would like to mention that the entire Saginaw Bay lies within my congressional district and EPA has had a water quality demonstration project under way for the past few years on the bay, the watershed initiative.

Can you describe this project for us, your agency's involvement, and whether you plan to continue your support of this rather unique watershed initiative in the country?

Ms. BROWNER. I am not familiar with all the details of the project. If you don't mind, I am going to ask Martha Prothro to speak specifically to the details of the project.

Ms. PROTHRO. Without going into a lot of detail I can say it has been an excellent project. We think it is moving forward. As you know, in Saginaw Bay there are a variety of stresses on the environment, so it has required work from a number of State and local organizations as well as from EPA and other Federal agencies. So we think we are making very good progress there and that environmental results are going to be achieved in the near term.

Even though there is no specific provision for it in the 1994 budget, there are a lot of things in our existing programs that will continue to support the Saginaw Bay effort, and we are committed to seeing that through.

Mr. BARCIA. I appreciate that response.

The second concern goes along with some of the comments echoed by Congressman Hayes, or explained to you by Congressman Hayes, and that would involve my concern about environmental technology and how we might best utilize some of these new emerging technologies in terms of contaminated landfills, specifically the Saginaw River.

We have something called the middle grounds landfill. It is actually a peninsula, almost an island but a peninsula landfill, located in the Saginaw Bay, and has for years been leaking polychlorinated biphenyls into the Saginaw River and the Saginaw Bay.

The community that I come from, my hometown of Bay City is a small town, about 38,000 residents, and the estimated cost on the

cleanup of the landfill and Saginaw River is about \$100 million, exceeding by more than five times our annual municipal budget. And that is with, of course, the standard technology utilized in the past.

Recently EPA sanctioned a demonstration project on the island to neutralize, if you will, polychlorinated biphenyls by a new technology that has been developed in Canada, and it is my understanding that the initial review by EPA staff has been very positive. And I would like to indicate that I have been working with your staff, Administrator Browner, and that I would like to look forward to working with you to expediting the approval process by your agency so that we may begin to look at cleanup efforts of the middle grounds landfill and also at a reasonable cost. Because it is my understanding that the technology is effective at basically neutralizing the polychlorinated biphenyls, molecularly changing them from nine to six degrees or six to nine.

So we think that is effective, but could you comment on whether or not you could work with us to expedite the approval process?

Ms. BROWNER. Absolutely, we would be willing to work with you. I apologize that my understanding is somewhat limited, although I think that your characterization of it as being optimistic and positive is one that we share. We would look forward to working with you so that we can get the site resolved.

Mr. BARCIA. And with the indulgence of the Chair, one final comment.

I want to thank you, Administrator Browner, and your staff for your strong support of our environmental concerns in the State of Michigan, the Great Lakes State. I would like to just share with you, and certainly you are aware that for the past few years EPA has been developing a Great Lakes Research Center in Bay City. Lake Guardian, EPA's research vessel, is stationed in Bay City, and EPA also has a supercomputer, in fact two supercomputers, which I understand are in constant demand.

Various construction projects are in different phases, and I understand that your fiscal 1994 budget request does continue operational funds for the facility. Can you more fully describe funding levels for the project to date, including the various components that I mentioned and explain your budget request for fiscal year 1994?

Ms. BROWNER. I think what happened in the budget is there was a one-time funding for the acquisition of a facility, and that was, obviously, not carried forward because it was not needed. We do continue funding in terms of the operation of that facility, we just don't continue the—here is the problem, I can't remember if it was for acquisition or actual construction, but there was a one-time dollar amount, I think, of maybe—we can get you the specifics on that, but the facility is a very important facility to us.

You are exactly right, the supercomputers are in very, very high demand and we have continued the operational funding.

Mr. BARCIA. There is great anticipation in our community about the location of the facility in Bay City, and I appreciate very much your continued support on that important project.

Thank you, Mr. Chairman.

I also have a prepared statement to submit for the record.

Mr. APPLEGATE. Without objection, so ordered.

[Mr. Barcia's prepared statement follows:]

Opening Statement  
Honorable James A. Barcia  
Hearing of the Water Resources and Environment Subcommittee  
May 5, 1993

MR. CHAIRMAN, I would again like to thank you for your leadership in addressing this problem of critical concern to the nation. I would also like to thank Administrator Browner for joining us today. I have already been discussing some of the programs that affect my fifth district of Michigan with your staff, and they have been very helpful.

The quality of water in the Great Lakes has been a question of much controversy and concern over the past several years. In my area, the Saginaw River and Bay have presented such problems that they have been given special attention. Two programs, in particular, have been very successful in attacking water quality deficiency.

The Saginaw Bay National Watershed Initiative is one of the ways that water quality problems have been addressed in Bay and Saginaw Counties. This program represents the best of government and private sector cooperation. Unfortunately, I am concerned about the status of this program for my state, and I look forward to working with the Administrator and with the

Committee to try and rectify this problem. The other is the Great Lakes Soil Erosion and Sedimentation Control Program which is funded through the Great Lakes Commission. It addresses erosion and sedimentation which are among the most serious problems for water quality, not only in our area, but throughout the Great Lakes region.

These two programs are overwhelmingly successful in providing their funding directly to clean-up activities, with the Saginaw Bay Watershed Initiative providing over 75% of its monies directly for clean-up, and 100% of Great Lakes Soil Erosion and Sedimentation program money going to local interests to deal with soil erosion problems.

Finally, as you are aware, the EPA has developed a Great Lakes Research Center in Bay City, Michigan. The Lake Guardian, which is an EPA research vessel, is stationed there, and the center is equipped with a supercomputer that I have been informed is under constant demand. Although the construction is in various phases of completion, I understand that things are moving along quite smoothly on this important program. I want to offer whatever assistance that I might to you in filling this critical need for Great Lakes Research.

Madame Administrator, I look forward to your testimony, and to working with you on these problems. Once again, Mr. Chairman, I thank you for your leadership, and I look forward to working

closely with you on this critical issues for so many of our  
nation's communities.

Mr. APPLEGATE. Thank you, Mr. Barcia. Mr. Menendez.

Mr. MENENDEZ. Thank you, Mr. Chairman.

Madam Administrator, I want to welcome you also on your appearance here today, and as a prefatory remark, I want to say that I realize that you have just come on this job.

It is my experience with your Agency, of course prior to your being there, from a multitude of different facets, as an attorney, a mayor, a State Senator, and now as a Member of the House, that some of the things the department has done are an example of government out of control and with little sensitivity to the consequences of its actions. I want to give you some examples.

As you may know, we represent one of the most active industrial waterways in the Nation along the New York Harbor and the Port Elizabeth and Newark location. The port generates \$20 billion in economic activity annually and supplies 180,000 jobs. There are issues with the port in terms of dredging, which are complicated by the fact that there are traces of dioxin contamination generated by the Passaic River, as well as the New York Bay.

Now, it is part of this process, that has taken more than three years and still has not been resolved. Recently the port's second largest customer moved its deep water port to Canada, and several other users have pulled out of lease negotiations because of hazardous conditions due to lack of dredging. Cargo ships are hitting against the built-up sediment at the bottom of the berths.

Section 115 of the Clean Water Act of 1972 directed the EPA to identify locations of in-place pollutants, with emphasis on toxic pollutants, in harbors and navigable waterways. It also authorized the EPA to contract through the Corps the removal and disposal of such materials. Now, it seems to me that this section of the law is all that was needed to stop—and I listened with great interest in your presentation—the source of the pollution which created the contamination, there by creating the dredging issue, and in turn stifling the economic activities of this port. Yet your predecessors did not do this.

Is there sufficient authority given to your agency under this provision to clean up, in this case the dioxin in the Passaic River, or, for that matter, any other part in the Nation that has a similar problem? Is there enough statutory authority? And if there is not, then what do you need to get it done?

Ms. BROWNER. I don't think it is necessarily a question of statutory authority. If I understand the section you are referring to, that section has never been funded. We have not had the monies available to do the job that we need to do.

I think there has been concern that if it were to be funded, the amount of money necessary is quite, quite large.

Mr. MENENDEZ. So, then, we just continue with the source of the contamination unabated.

Ms. BROWNER. Well, if I understand the source you are referring to, is it a Superfund site?

Mr. MENENDEZ. It is now a Superfund site.

Ms. BROWNER. That is my understanding and obviously we will be working to address that under the Superfund law.

Mr. MENENDEZ. Does your budget request have any funding for section 115?

Ms. PROTHRO. Not for section 115. However, we are moving more in the direction, to funding efforts to address contaminated sediments, particularly in our technology development and in our criteria and standards program.

We also have recent requirements from the WRDA bill, the Water Resources Development Act, to develop an inventory of contaminated sediments, and we do have a request in our 1994 budget to help fund the development of that inventory.

Ms. BROWNER. We agree, I think, with the basic point that you are making, which is we need to consider better ways to address sediments. We don't disagree with that.

Mr. MENENDEZ. Let me ask you another question. The specific site in question, my understanding is that the cleanup standard is in the parts per billion, yet I also understand, and correct me if I am wrong, that the testing of the sediments to be dredged for ocean disposal and other disposal alternatives in the parts per trillion, a standard that is a thousand times more rigorous.

Ms. BROWNER. I am not familiar with the cleanup standard. It is the Shamrock site?

Mr. MENENDEZ. Yes.

Ms. BROWNER. I apologize for not being familiar with the cleanup site. We can look at that and get back to you.

Mr. MENENDEZ. I raise the question because if that is the case, let's assume for argument sake that it is, then even when we clean up the land, this could continue to be a source of contamination because we have two different standards that would pollute the waterways. Therefore, the issue of dredging, which needs to be done annually, would remain unresolved. Why is there a standard for one contaminant that is different for the land than the water? How do we resolve the differences so that the source ends up being abated once and for all, otherwise, we have not done our job?

Ms. BROWNER. Well, there are certain toxins and pollutants where it is appropriate to have different standards in terms of water versus soil. It is also very hard to know, without having the specific facts before me, whether this is a particular instance where the effect of cleaning soil to a certain level gives you what you need in terms of water protection. I cannot answer that in the abstract. These things have to be looked at on a very site-specific basis.

The particular material in discussion here is dioxin and one that is I think recognized as being particularly toxic to people who eat fish. We would be more than happy to sit down with you on the specific Shamrock matter. You and I have met previously on the harbor issue, and on March 29 the EPA did concur with the harbor going forward in keeping with certain conditions, and it is now in the hands of other Federal agencies in terms of their decision.

Mr. MENENDEZ. I understand that and I say that when you got involved we had some action, which was we had a lot of inaction before, but still we are in a 3-year permitting process and that seems to me that in that whole process that is an example of government out of control.

I want to quickly bring up one other point. I have various other questions I would like to submit to you on this issue about task forces set up under the Water Pollution Control Act. I have not got a sense or inquired of the department where they are at, I am not

quite sure they are working at all, but they deal with this issue of your having two task forces, one that is supposed to be reporting by October 1993, another by October 1994, and I would like to have an idea of where we are at with that.

My final point. When I was a mayor not too long ago, and dealing with the Clean Water Act, we had a situation where our sewerage was taken care of through one community; the community I was the mayor of did not have facilities. Well, the short part of the story is that we ended up, having inherited plans which that community had submitted. These plans later proved to be insufficient to handle and treat the amount of sewerage as set by the standards of your department and the law.

Since we were under a judicial consent order, we were forced to proceed. After years of litigation, it was reversed so we could use plans that are the most environmentally sound. However, because the time frame was missed—not by a lot of time, but it was missed—the EPA imposed multimillion dollar fines.

When you are trying to reach the long-term goal of taking care of pollutants and complying with the Clean Water Act, and you are being told by the EPA this plan won't meet the standards, then ultimately you have won that issue. But, because of having won that issue you still get fined since you didn't meet the deadline—in terms of time—seems ridiculous because we will meet our goal, which ultimately is to have a facility that completely complies with the Clean Water Act.

This is an example of why people say our government has no sensitivity to the consequences of its actions. The people who are paying are in great shock. Their bonds have kicked in and now we are going to add fines to them simply because we met a condition that was long-term in nature. This is a problem you must review under your stewardship.

Thank you, Mr. Chairman.

Ms. BROWNER. Thank you.

Mr. APPLGATE. Thank you, Mr. Menendez. Mr. Filner.

Mr. FILNER. Thank you, Mr. Chairman.

I appreciate your indulgence to be with us all morning. Believe it or not, there is one subject that has not been covered and that is—and I will be submitting questions in more detail for you—the relationship between coastal cities and wastewater treatment.

Just briefly, as you know, EPA has granted more than \$300 million over the last couple of years to a half dozen coastal cities and the fiscal year 1994 budget did not include funding for all of them but it did include funding, as you acknowledged earlier, for one, and that is the city of Boston.

I was just wondering about the rationale and the intentions for the other coastal cities, which have as great a need certainly as our sister city of Boston, but we cannot figure out why one city was and the rest of the cities—I represent, as you may know, San Diego—why we did not get included in that situation.

Ms. BROWNER. We were faced with some very difficult decisions in our budget, as all agencies were, and as ultimately Congress will be. It would be our hope and intention to work with this committee to see if we could create a fund specifically to address cities such as yours who are experiencing significant rate shock.

You are right, as I said earlier, there is 100 million in this year's budget. We don't pretend that it in any way addresses the concerns that exist in a number of cities. But we recognize that the tremendous need and would like to see if there might be a way to create a specific fund to help those cities who are experiencing rate shock.

Mr. FILNER. That would be very helpful and look forward to working with you.

In the interest of time, just one more policy question. In your own testimony, you talked about how two decades later we are ready to take some very different approaches in the Clean Water Act in terms of the comprehensive outlook, in terms of the total ecosystems for aquatic protection in terms of cost effectiveness.

As you may know, a recent study completed by the National Research Council concluded that those principles ought to be applied perhaps in the coastal areas of the country with regard to wastewater treatment to meet the standards of the Clean Water Act, and that study recommended what was called an integrated coastal management, an ICM, approach to be developed.

It seemed to make an awful lot of sense. It seemed to make an awful lot of congruence between your own statements and your past record in looking at a common sense approach to meeting environmental standards; that we ought to be pursuing this in cities such as San Diego. And I am wondering if that has been started or looked at.

I know you are a freshman, like a lot of us are, and whether we can work with you to do that, because we are interested in meeting the standards of the Clean Water Act but with an approach that is both cost effective and takes into account the specific situations at each coastal city or other State may have.

Ms. BROWNER. We are in the process of reviewing the National Academy study that I think you referred to. If I understand correctly, it does argue for or place focus on the idea of sort of site-specific approaches. What that would mean in any particular site is not really addressed per se in the report, although I guess there were some case studies.

I don't believe that San Diego was, in fact, one of the case studies. I think maybe Boston was.

Mr. FILNER. San Diego was included also.

Ms. BROWNER. As one of the case studies.

Mr. FILNER. In fact, we threw in—

Ms. BROWNER. I know you put in some of the money.

Mr. FILNER. We wanted to be a case study. It is referred to in the study there. They referred to it in the study.

Ms. BROWNER. We thought the study was important, as did your city. We also provided money, I think you are right to draw a connection between what the study says and what we have said here today and, obviously, we would look forward to working with you.

Mr. FILNER. Very good. And on this subject, several issues that came up together I just want to reinforce what the Chairman said in his opening remarks, that the appointment of various officials would obviously move things along a lot quicker.

We appreciate your dedication to solving these problems, working with communities in a very common sense way, and we look forward to doing that over time. Thank you very much.

Ms. BROWNER. Thank you.

Mr. APPLGATE. Thank you very much. Mr. Nadler.

Mr. NADLER. Thank you, Mr. Chairman.

Ms. Browner, I come from the State and city of New York and I have a perspective on some of the problems of large urban areas which have not been too much discussed this morning. I very much agree, by the way, with the approaches. I congratulate you on focusing on geographically targeted watershed, on the need for adequate funding to support State and local solutions, and on water quality problems caused by wet water flows, which are precisely the kinds of problems that we have.

Now, New York has a very large unfunded need for secondary wastewater treatment plants, and New York, like some small rural communities which have been mentioned, but our large urban centers also have very great fiscal problems and it is very difficult for New York to continue participating for ever larger amounts of revolving loan funds.

Is any thought going to be granted—we used to have a grant program, to give grants Federal grants for the construction of wastewater treatment. In the late unlamented Reagan years that was eliminated in favor of State revolving loan funds, which only go so far. Will any thought be given to resuming the use of construction grants for wastewater treatment plants?

Ms. BROWNER. Well, as I mentioned earlier, although obviously, this does not speak to your particular district, the RDA does include an increase of \$900 million for grants to communities of less than 10,000.

We have also recognized that there is a tremendous financial burden being placed on some of our large urban and metropolitan areas, Boston being one, I think New York, San Diego and some others, and that we would hope to be able to work with the committee to see how we might address those specifically and whether a grant program is appropriate. I think that is something we need to discuss.

The point, as you well know, of moving to a revolving fund was to hopefully put the Federal Government in a slightly different position. But we have called for a new and expanded revolving fund because of the recognition of the tremendous needs that still exist. The expanded Fund should help urban areas because of the wet weather issues that are becoming increasingly significant in the urban areas.

In looking at a mechanism to help provide relief to the large metropolitan areas, it would probably be important to look at the rate shock and the ability to pay, in order to establish some formula, I would think, as to how the monies could be made available.

Mr. NADLER. But revolving loan funds, no matter how large and fairly administered, still have to be repaid. We are dealing with some of the large urban areas that are rapidly losing their ability to repay revolving loan funds. I would hope we would get into a large grant program again.

In my view, it was a mistake—revolving loan funds are well and good, assuming there is the ability to repay to start with. When you look at the needs of Clean Water Act and Clean Air Act and mass transit and bridge reconstruction, everything, the capital

budget of New York City is becoming insupportable. So a revolving loan fund, unless you are looking for default down the road, does not help beyond a certain point.

Ms. BROWNER. And, again, we recognize that there are these urban areas that are being put in a particularly difficult situation and that is why we would want to work with the Committee to try to develop a program that addresses their needs.

Mr. NADLER. Thank you.

The second thing I wanted to address is the question of watershed management. Now, New York City will face the need for about \$5 billion or \$6 billion worth of filtration plant construction if the trends continue in our watershed, which has given New York, up to now, one of the best and purest water systems in the country. So we in New York are looking toward increasing the management of our watershed. And toward that end, one of the greatest needs for that is the purchase of additional land in the watershed areas to regulate or stop development which impinge on, which would result in destruction of the watershed areas and of good water.

Mr. Boehlert represents some of the upstate areas and reflected on some of the intrastate tensions between the need for managing watershed and acquiring watershed land in some local communities, which is a separate problem. My question is are you looking toward and do you think we ought to be doing anything to helping States and local governments with funds for purchase of additional watershed area; grant or loan program for aiding in the purchase of watershed land?

In New York and in many other places, if we don't purchase that land pretty soon, it will not be available. It will be developed. And then we are talking, nationwide, tens, maybe hundreds of billions of dollars of filtration plant construction.

Ms. BROWNER. As the discussion has evolved around the drinking water SRF, this is an issue that has been raised. The clean water SRF has not historically permitted land acquisition as one of the costs that are reimbursable, but I think we, all recognize that a little bit of money to prevent something from occurring, to protect an existing pristine or undegraded system, will go a long way towards reducing expenditures in the future. Therefore, we appreciate the discussion that is now taking place on that very issue.

Mr. NADLER. So you think you might end up, as a result of that discussion, recommending grants or loans for land acquisition purchases?

Ms. BROWNER. In the drinking water SRF, that is an issue that has been raised, that is correct.

Mr. NADLER. Let me just urge that that should be resolved with a positive decision because it is extremely crucial and time is not on our side on this one. If we spend a few more years debating the issue it is going to be moot, we will be discussing major grant programs for filtration plants.

Next thing I wanted to ask goes back to the dredging question that Mr. Menendez raised. The dioxin contamination comes from New Jersey but it affects the Port of New York which, of course, is in New Jersey, which is another problem.

When I was just elected to Congress, I hired as my Chief of Staff a gentleman who had been the Northeast regional representative for the Sierra Club in the late 1970s, early 1980s, and was one of the Sierra Club lobbyists here on the Hill in 1980, and at that time they were discussing the problem of that dioxin contamination and the same plant that Mr. Menendez was discussing a few minutes ago, and I forget in detail what was done then about allowing the continuation of the harbor, which, of course, is 180,000 jobs and multibillions of dollars, and everybody pointed out in 1980 a fundamental solution had to be reached because you cannot continue to have a conflict where EPA says you may not dredge and if you don't dredge the whole economy collapses.

It is now 13 years later and nobody has addressed the basic issue at all. So my question is what is EPA doing to find environmentally sound methods of disposal of the silt? Never mind just looking at what Mr. Menendez was talking about, of removing the silt, but where are we going to dispose of the silt so that essential dredging can go forward to maintain our harbors, not just in New York but elsewhere?

Ms. BROWNER. If I could clarify one point. The State of New Jersey did have responsibility in terms of the enforcement lead on the river contamination and we have recently taken that responsibility back to see if we can move the matter forward.

Mr. NADLER. Can I comment or ask you a question right on that point? Because that is exactly the point. We find in New York and in New Jersey, and I don't speak for the Governor of New Jersey or the Governor or the mayor of New York City, but the States and cities have been irresponsible in this. That is, obviously, true. And how do we get around the situation where you allow a State or a city to go forward for 10 or 12 years to do nothing?

The State of New Jersey had the responsibility. They apparently ignored that responsibility for a decade or so; New York ignored its responsibility for a decade or so and now EPA says—now you are up against a deadline or we are going to close the harbor and the State says you cannot do that, it will have catastrophic economic implications and EPA backs off and the whole thing starts over again.

We have to have a situation where EPA enforces them doing something in time so you don't have a choice between backing down on the environmental enforcement or having economically catastrophic effects. They did that 12 years ago and it is happening again now in the same exact place.

Ms. BROWNER. You are saying that the State is not acting?

Mr. NADLER. Twelve or 13 years ago, essentially a decision was made to permit the harbor, they would permit dredging to continue or to be done then—it has to be done periodically, of course, in order not to shut down the harbor with its economically catastrophic effects and the State would then have the responsibility for addressing the pollution.

Here it is 13 years later, the State has not addressed the pollution, the dredging permit again has to be issued, lest there be catastrophic impacts—and I am not saying they should not do that—and now EPA is going to look allegedly at the basic environmental

pollution problem, and I want to know what kind of guarantee do we have 10 years hence we won't be talking about the same thing?

Ms. BROWNER. As it relates to disposal of dredge materials, I don't think there is any disagreement but that we have to get out in front of this issue; that we have to develop a treatment technology that will allow for disposal to take place in a more expeditious manner without restrictions that are extremely burdensome. We also need to make sure we involve the public in this process.

We would hope to be able to work with the various ports around the country in a more amicable manner so that we don't constantly find these things coming down the wire and decisions having to be made in the immediate context of jobs being lost. That is a position no one wants to find themselves in. Rather that we should put in place a process that will develop a system whereby these sorts of dredging, which is maintenance dredging, in part, can go forward.

In terms of the situation with New Jersey, as I understand it, New Jersey made a decision to proceed with the land contamination prior to the river contamination based on their assessment of the health effects 12 years ago. And one of the complications of the work that we do is that new information becomes available to us, information that we cannot always predict, and we have to make adjustments in the decision.

I think everyone involved in this situation recognizes the importance of dealing with the source, that that has got to be a priority; that we have to go into that facility, that Superfund site, and deal with the source. That will not do everything but that will alleviate some of the problems and then we have to have a system for dealing with the disposal in a way that is safe and environmentally sound.

Mr. NADLER. Well, I agree with that, obviously. What you said is we have to work with the State so we don't come up against this.

What I am suggesting is EPA should develop some sort of method of dealing with the State that would rather put off the problem until you are right up against the economic thing. This should have been dealt with five or six years ago when there was not an immediate crisis and not now.

Let me turn to one other subject, the last subject, dealing directly with my district in Manhattan. My district is Brooklyn and Manhattan and has the entire waterfront there basically.

The North River Pollution Plant, in Harlem and Representative Rangel's district, is a major problem, as you know, I assume you know, because somebody made some mistake in building a multibillion dollar facility and it puts out a lot of vapors that smell awfully, like sulfur dioxide, and people who know what that smells like can imagine. Harlem has been complaining about this for a long time.

Second, it is already over capacity. That major pollution every time we build something new in Manhattan or at least on the west side of Manhattan it will increase direct sewage outflow untreated into the Hudson River because we are over capacity on the North River Pollution Plant.

Now, the city EPA will not admit it is over capacity, but I think in court it will come out that it is but everybody agrees it is close to capacity. And yet New York City is planning to allow a new de-

velopment with 6,000 apartments in one place and nearby another few thousand and there is breakneck development going on of new residences, tens of thousands of units, all of which feed directly into the North River Pollution Plant. There is no additional plant capacity being built, and the city and the State are pretending that somehow this is not going to lead to direct pollution into the Hudson. Obviously, it is.

My question is what can EPA do or do you think we should be doing or do you think the Clean Water Act should be amended in some fashion to deal with the situation where development is going on in a way that is guaranteed to produce untreated effluents into a sensible, sensitive, I should say, aquatic aquifer system, like the Hudson, way beyond the capacity to deal with it?

Nobody is making plans to deal with increased capacity and nobody is making plans to somehow deal with the development. What can be done there?

Ms. BROWNER. Well, I am not as familiar with this obviously as you are. We are aware of the problem as I understand it in terms of the odors you made reference to. There was a technology that may not have worked as originally anticipated and so there are going to have to be modifications to the system. It was, I think, an effort to develop a new way of doing things and it didn't work. Or didn't work the way everyone hoped.

In terms of the other issue, which is capacity, at least in my experience and from the a State perspective, States generally have the authority to intervene in those particular instances.

Mr. NADLER. My question is really what happens when the State obviously is acting in such a manner as to be unwilling to exercise its authority and leading to, obviously a few years down the road, gross violations of the law? Do you wait for the violations of the law to occur or do you stop it in advance?

Ms. BROWNER. You raise a valid point. I was saying to Martha that the obvious tool is the water quality standard violation, but by the time we exercise that tool the problem has occurred, the development has occurred. And I have to apologize for not being aware of what other tools might be available to us to avoid the situation in the first instance.

Mr. NADLER. Let me just suggest that I am not aware of any tools at this point, and I hope in the future in some discussions we can develop some tools in the reauthorization of the Clean Water Act to deal with that. Because I will say right here on the record it is obvious to a lot of environmentally concerned people in New York that the State and city of New York have no interest in enforcing that law if it retards certain kinds of politically favored development in any way.

They are making no effort to develop further treatment in certain areas and they are making no effort to limit certain development in those areas and this is absolutely predictable, you will have gross violations of the law a few years down the road and at that time then we will face the consequences, whatever that may be, and we should avoid that in advance.

Ms. BROWNER. You make a very valid point.

Mr. NADLER. Thank you.

Mr. APPELEGATE. Thank you, Mr. Nadler. Very pointed.

Last, but not least, we have a couple of wrap-up questions from our Ranking Minority Member, Mr. Boehlert.

Mr. BOEHLERT. With regard to the SRF approach, I hope the administration will come to see that 20 years, most agree that is too short a time frame, and I would assume that you are exploring that, and that when the administration program comes forward, that will be a 30- or 40-year time frame.

Ms. BROWNER. Absolutely.

Mr. BOEHLERT. Secondly, I hope you are looking at innovative approaches in the evolvment of the administration's position regarding marketable trading permits under the Clean Water Act.

Ms. BROWNER. There has been some discussion of that and we are engaging in trying to bring a group together, and also with your staff, to discuss that. There are some interesting ideas that have been put forward. I think we have to look at them carefully. I think some of them can work.

Water is a little different than air and you don't have sort of the same national connection that has been able to be made in terms of air on the acid rain program, but it may well be within certain watersheds that there are mechanisms.

Mr. BOEHLERT. But you are looking at it?

Ms. BROWNER. Yes.

Mr. BOEHLERT. All right. Thank you very much. Look forward to working with you.

Mr. APPELEGATE. Thank you very much, Ms. Browner. You have been here a good while.

Ms. BROWNER. Well, I have enjoyed it.

Mr. APPELEGATE. I'll bet.

Ms. BROWNER. I have.

Mr. APPELEGATE. Well, I can say that you have been very forthright and answered the questions, and there has been a lot of questions. And, as you can see, there is a very large amount of very serious concern.

We will continue to look forward to working with you as time goes on. I hope that you are going to be able to get your staff together and your water people and those that we will deal with with Superfund, that we will be able to move forward with those specific areas, because it is extremely important, and it is just pretty difficult to move forward without them and we hope that the President and the White House does come forth with a very comprehensive plan with a lot of the things that Mr. Boehlert and I and some of the others are concerned with.

But we will work together to make it a good piece of legislation, whatever it is.

Ms. BROWNER. Thank you and thank you for the opportunity to be here today.

Mr. APPELEGATE. Yes. And, Martha, thank you very much for being here before the committee.

Ms. PROTHRO. Thank you.

Mr. APPELEGATE. Next we have Dr. G. Edward Dickey, Acting Assistant Secretary of the Army, Civil Works. If he would take the microphone there, and we welcome you to the committee.

You have been very patient, been sitting there; I hope you learned something too and got pretty much of an idea of the inter-

est that we have and the concerns that we have and particularly in the area that you are responsible for.

Mr. Boehlert, do you have any statement or anything like at that?

Mr. BOEHLERT. Yes, welcome. Let's go to it.

Mr. APPELGATE. Let's go to it.

**TESTIMONY OF G. EDWARD DICKEY, ACTING ASSISTANT SECRETARY OF THE ARMY, OFFICE OF CIVIL WORKS, ACCOMPANIED BY MICHAEL L. DAVIS, ASSISTANT FOR REGULATORY AFFAIRS**

Mr. DICKEY. Thank you very much, Mr. Chairman, I know the hour is late and indeed the morning has been instructive. I would like to summarize very, very briefly my prepared statement.

I would point out I am accompanied today by Mr. Michael Davis, the Assistant for Regulatory Affairs in the Office of the Assistant Secretary of the Army for Civil Works, and we will be happy to answer whatever questions you might have.

Let me just say, first of all, that, the Army Corps of Engineers has been in the regulatory business since 1899 and has administered the 404 program since 1972. We work very closely with EPA which provides the policy framework for the administration of the 404 program.

We all recognize the 404 program has been an evolving program. It is, however, a very high priority of the Department of the Army. We are very much committed to making it work with the goal of providing high quality protection of the environment without an undue burden on the regulatory public. We have strongly supported the program with both financial and people resources.

We have recently completed a number of actions which have facilitated the administration of the program and we have a number of additional actions under way with EPA and with other agencies that will further improve the program.

In addition to administering the 404 program, the Corps of Engineers has a great deal of expertise in a broad range of environmentally related activities and specifically activities related to wetlands preservation and restoration. And these skills complement the expertise we bring in the administration of the regulatory program.

Specifically, I have outlined a number of different activities in my prepared statement-in particular the Corps has several activities under way with regard to habitat restoration. We would note specifically the Kissimmee River project, which was authorized in the Water Resources Development Act of 1992, or actually it was authorized before 1992, but it has been authorized a number of times, and we, indeed, completed a restoration plan that was finally authorized in WRDA 1992 and we are now under way with design of that.

Our most recent and most important initiative, and I think it is symptomatic with where this administration may be going, is the study that we have recently agreed to and have presented in our budget on looking at possible measures for restoration of the Everglades' ecosystem. That study proposal is the result of an initiative that the Secretary of Interior, Mr. Babbitt, proposed. I met with

Secretary Babbit and we agreed to use Corps' resources to fund a reconnaissance study which will look at Everglades' ecosystem restoration.

Let me conclude with these brief remarks and answer whatever questions you have.

Mr. NADLER [presiding]. Since I am sitting in for the Chairman—

Mr. APPLGATE. No, go right ahead.

Mr. NADLER [continuing]. I was going to say since I am sitting in for the Chairman, I would ask Mr. Boehlert if he has any questions, but I think the Chairman will have some questions in a moment.

Mr. BOEHLERT. I will start, Dr. Dickey. I have a couple.

Can you give us a status report on mitigation banking; how well it is working, from your perspective?

Mr. DICKEY. Well, the Corps of Engineers has a study under way that is looking at mitigation banking across the country. There are a number of banks that have been established. Mostly they are by highway departments, State highway administrations or port authorities. There is only one entrepreneurial bank that has been approved so far, and that is in Savannah.

The other thing we are doing, in addition to looking at past experiences, and I must say mitigation banking, of course, has been around, it has been talked about for a long time, and what we are seeing is a bunch of different approaches, different experiments, if you will, as different States—

Mr. BOEHLERT. A little early to tell, then?

Mr. DICKEY. I wouldn't say it is too early to tell, and I would say we will, systematically, tell you about it in about a year from now when we finish our report. But we are developing guidance with EPA on how the mitigation banking relates to the administration of the 404 program.

What we want to do is create some predictability and define expectations as to how we, as the permitting agency, will view proposals for mitigation. In other words, better define the market, if you will, for the services of the mitigation banks and, therefore, encourage more private development of such banks.

Now, since there is no guidance, that there is a lot of uncertainty, and no private individual is going to go out and invest in creation or restoration of wetlands, for example, with the hope of selling those to would be developers without a clear definition of how the regulatory agencies are going to view these proposals. That is what we are trying to do in the short term.

Mr. BOEHLERT. But are you optimistic it offers great promise?

Mr. DICKEY. Oh, yes, I think it is generally recognized that mitigation, to the extent it needs to be resorted to, compensatory mitigation, is probably better done on a large scale, with large tracts rather than isolated efforts which have characterized many mitigation practices in the past.

Mr. BOEHLERT. In your statement you point out about one-third of the individual permits requested are neither approved nor denied. Some are covered by general permits and some are withdrawn. Some are never concluded because the applicants fail to provide complete information.

Can you give us the numbers of how many fall into each of these categories?

Mr. DICKEY. Unfortunately, we don't have that.

Mr. BOEHLERT. You don't have it readily available or you don't have it available at all?

Mr. DICKEY. No, we don't have it available. That statistic has been mentioned a number of times and every time we use it, that question is asked, because it is an obvious one, and I apologize for not having that breakdown, but somehow we have been unable to generate that information.

Mr. BOEHLERT. You point out the question is always asked. Do you always give the same answer; you don't have it?

Mr. DICKEY. Yes.

Mr. BOEHLERT. That is not very good, is it?

Mr. DICKEY. No, it is not and we are going to change that.

Mr. BOEHLERT. Oh, well, that is good. Raise your right hand and say I will change it 100 times.

Let me ask one further one. One criticism of the wetlands program is the absence of any formal appeals process. You know, if you have an agency, one of the resource agencies, they can appeal if they don't like the decision, but what about the applicant? There is no appeal process for the applicant?

Mr. DICKEY. When a permit is denied, the applicant can also always resubmit, and I am aware of some cases where I have had meetings with people in fact who come in and say, gee, what do we have to do since our permit was denied? The applicant does have the right to resubmit if his permit is denied.

Mr. BOEHLERT. But there is no headquarters' review; the regional guys can say no if they want to and the applicant has no appeal process?

Mr. DICKEY. The applicant can appeal by submitting additional information and I said that people—

Mr. BOEHLERT. Why not treat him the same way you treat the resource agencies?

Mr. DICKEY. If for no other reason, we think the program works pretty well the way it works now and, indeed, if you recognize an appeal process, you have really created routinely a two-step process rather than a one-step. There perhaps would be something gained by that. We don't think so, but it certainly imposes an added burden on applicants in the longer term.

Mr. BOEHLERT. I like it for fairness. You may not see this, but I am green. I am a strong enviro, but I am sympathetic to the plight of the applicants, and I think that they should have some additional remedy. If they don't like the decision, I think they should be able to appeal it. The resource agencies can. It seems there is a double standard.

Mr. DICKEY. Well, they can appeal, if you will, by submitting a new application. They have that right and, as I say, people have come into Washington, I have met with them in fact to discuss exactly what is deficient in their proposal, why their permit was denied so forth. So they get the benefit of a Washington level perspective on that.

But I am saying to make that a routine process, we do not think it produces benefits commensurate with the added delays and costs which it would impose on the process.

Mr. BOEHLERT. You are very fortunate. There is good news and bad news here. The bad news is United States to sitting through a whole morning but the good news is that here we are.

Mr. DICKEY. I appreciate that.

Mr. BOEHLERT. Thank you very much.

Mr. DICKEY. Sure.

Mr. APPLGATE. I appreciate very much your coming in and your statement pretty much says what it is that you feel, but there are a lot of other questions. Carol Browner was able to answer a lot of them with regard to your responsibilities, but we will be submitting questions to you, but let me just ask you this.

In your statement you mention that the Corps—in relationship to the National Academy of Sciences, the delineation study, that you are not a member of a so-called task force, I understand, you are a member of the Interagency Liaison Group that will provide background and information and reference materials. Give me some observations on that. What do you think we might be able to expect and do we need to expect anything at all?

Mr. DICKEY. Let me speak from my perspective, which is largely that of ignorance, but let me speak philosophically about this. We had this enormous controversy about the 1989 manual, and I am speaking on the basis of the volume of letters that were received, typically letters to the President, which were referred to my office for a response, there was just an enormous amount of unhappy people.

The culmination of that agitation, if you will, was the abandonment of the 1989 manual and the adoption by the Corps of its 1987 manual, and EPA has joined us in that, okay?

So now we are, pending this study which is being done by the National Academy of Sciences, using the 1987 manual, and I think, from my perspective, and again I judge on what I receive in the mail and what I hear as I talk to people as I travel around the country, or folks come in from around the country, that the 1987 manual is functioning quite well. And one of the reasons it is functioning as well as it is is because it has a considerable amount of flexibility in it that was lacking in the 1989 manual.

Now, the National Academy study will no doubt give us additional information as to what constitute wetlands, and we are very hopeful, of course, that it will affirm the principles under which our current manual operates. But regardless of what comes from that study in a scientific way, and I am speaking here again as a career civil servant, the one thing that I note in the whole experience with the various manuals is that the administration—or that the determination of the jurisdiction of the 404 program is much more than a scientific question. This is a question of determining the jurisdictional scope of a very important law that carries with it very severe penalties for violating it.

And so the standards of evidence that one might require in terms of asserting that this is a jurisdictional wetland may be somewhat different, in fact more strict, than what in some scientific sense could be discerned as a wetland. And I don't know how that is all

going—I don't know what the National Academy's study will show, but I just want to caution the committee that this is not a mechanical process that is going to give you the answer. It is going to give you additional valuable information, but I believe that whoever is establishing the policy as to the jurisdictional coverage of our law is going to have to take that study and use it to make further policy judgments, and in the best sense of the word it is going to require a political review and a determination of what will then be the manual which individual practitioners, individuals in the Corps of Engineers or people in the private sector, who are certified as wetlands delineators, gather the kind of evidence that needs to be put forth before one asserts that a particular piece of ground is subject to 404 jurisdiction.

Mr. APPLEGATE. So what I gather from that is that we really don't need the NAS study? I am not going to say that you said that, but—

Mr. DICKEY. No, no.

Mr. APPLEGATE [continuing]. But that the 1987 manual seems to be working quite well now and with much less controversy than the 1989 manual?

Mr. DICKEY. Yes, that is precisely right, Mr. Chairman, and I think that is not to say we won't perhaps, get valuable information from the study, but I don't think there is the same kind of urgency that there was when we had the 1989 manual.

Mr. APPLEGATE. I guess that is testimony to the fact that the amount of correspondence that was coming in used to be so great but now it has really dwindled to so very little which must say something.

Mr. DICKEY. Yes, I believe it does.

Mr. APPLEGATE. I think you have covered the field and I appreciate very much your coming before the committee. We may call upon you again for some further questions.

Mr. DICKEY. Any time, Mr. Chairman.

Mr. APPLEGATE. Thank you very much, Doctor.

Mr. DICKEY. Thank you.

Mr. APPLEGATE. Before we conclude, I would like to insert into the record at this point a statement received from Congressman Pete Peterson of Florida.

[Whereupon, at 12:40 p.m., the subcommittee adjourned.]

[Mr. Peterson's statement follows:]

**Statement of Congressman Pete Peterson (FL-2)**

Supporting the Save the Florida  
Bay Act of 1993

Public Works and Transportation  
Subcommittee on Water Resources

May 5, 1993

(1617)

Mr. Chairman, I would like to submit testimony in strong support of the Save the Florida Bay Act of 1993 that was introduced by my distinguished Florida Colleague Clay Shaw and of which I am a cosponsor. It is an honor to return to my old subcommittee to talk about water issues. This is a great committee and I want to congratulate you, Mr. Chairman, on your appointment. Knowing you, I see this subcommittee aggressively addressing water issues important to the Nation's infrastructure. I miss participating in these issues with my former colleagues on Public Works, but I continue to watch over water matters as a member of the Appropriations Energy and Water Subcommittee.

Florida Bay serves as a key water management system for southern Florida that supports the economic integrity of both commercial and recreational fisheries. The Bay also accommodates the only living coral reef system in the nation that is now being threatened by algae blooms.

However, because of the decline in fresh water flow to the Bay, large amounts of sea grass beds and sponges have been lost. As you may know, sea grass and sponges provide habitat for juvenile pink shrimp and lobsters. Current reports have indicated that shrimp harvests have fallen by at least 40 percent in the past decade and that a similar drop is expected to occur in lobster catches.

Another point I would like to make, Mr. Chairman, is because fresh water is being diverted from its natural flow into the Bay, the Bay's saline levels have increased. As a result, algae bloom, which thrives in the saline water, is killing organisms and sealife. Unless the fresh water balance is restored quickly to the Bay, I can see an escalating problem with the bloom that

eventually destroys the natural fisheries of the Bay.

I am also concerned that the bloom problem will put a seriously negative impact on tourism in the Florida Bay area. Thousands of people from all over the U.S. come to see the magnificent coral reefs in Florida Bay annually. The negative economic impact is already being felt by local proprietors who directly operate tourist attractions and by other businesses that provide logging, transportation, and entertainment.

I, like many of my Florida colleagues are very concerned about the future of Florida Bay and its surrounding habitat. I believe, Mr. Chairman, we need to concentrate now, more than ever, to restore the natural flow of fresh water to Florida Bay. By focusing on this problem now, the total cost to reverse the ecological damage in Florida Bay will save the taxpayer funds in the future as well as help preserve the tourist industry in South Florida.

Mr. Chairman, I thank you for allowing me to submit this important testimony to the Public Works and Transportation's Subcommittee on Water Resources. Furthermore, I would like to thank my colleague, Congressman Shaw, for helping to elevate the sensitivity of this meaningful cause for the state of Florida.

[Subsequent to the hearing, additional questions were submitted to Mr. Dickey by Representative Menendez. The questions and responses follow:]

DEPARTMENT OF THE ARMY  
OFFICE OF THE ASSISTANT SECRETARY  
WASHINGTON, DC 20310-0103

0 5 AUG 1993

Honorable Douglas Applegate  
Chairman  
Subcommittee on Water Resources  
and Environment  
Committee on Public Works  
and Transportation  
House of Representatives  
Washington, D. C. 20515

Dear Mr. Chairman:

This is in response to your letter of May 18, 1993, in which you forwarded additional questions from Congressman Robert Menendez to my office for reply and inclusion in the record of the May 5, 1993, Hearing on the reauthorization of the Federal Water Pollution Control Act. The answers to the questions are enclosed.

If you have any questions or need additional information, please do not hesitate to contact Mr. James P. Rausch, Chief, Legislative Initiatives Branch, (202) 272-0117.

Sincerely,

A handwritten signature in dark ink, appearing to read "G. Edward Dickey".

G. Edward Dickey  
Acting Assistant Secretary of the Army  
(Civil Works)

Honorable Robert Menendez  
House of Representatives  
Washington, D. C. 20515

CONGRESSIONAL HEARING  
May 5, 1993  
REAUTHORIZATION OF THE FEDERAL WATER  
POLLUTION CONTROL ACT

RESPONSES TO QUESTIONS

Note: Most of the questions pertain to matters solely under the responsibility of the Environmental Protection Agency (EPA). Responses are given for the questions where the Army Corps of Engineers is solely responsible or jointly responsible with EPA.

Question II. Alternative site for disposal of dredged materials:

Question: In 1983, the Army Corps of Engineers designated a "Mud Dump" located six miles off of Sandy Hook, New Jersey as the disposal site for dredged materials from Port Newark/Elizabeth. The site is expected to reach its capacity of 100 million cubic yards of sediment in 1997. Either a new site must be designated or the existing Mud Dump must be redefined by expanding the boundaries.

Answer: First, may we be more specific on the facts regarding the designation of the "Mud Dump" pursuant to Section 103 of the Marine Protection Research and Sanctuaries Act of 1972, more commonly known as the Ocean Dumping Act. As prescribed in the statute, the ocean dredged material disposal site for the Port of New York and New Jersey was designated by EPA effective June 1984, after their preparation and issuance of the required environmental statement published in the Federal Register in May 1984. The site was designated for a capacity of 100 million cubic yards. Since the EPA designated the "Mud Dump" site, they may also respond to this question. In any event, the following contains the Corps understanding of the current situation.

Question: What is the potential for continuing the disposal of dredged materials at the Mud Dump site?

Answer: We expect to reach the total volume restriction included in EPA's site designation as early as the end of 1995 or as late as 1997. The variation is based on two issues: a) whether the volume of sand caps or covers that are used to enclose some dredged material is included in the total volume limitation for the site, and b) whether the site is physically able to accommodate the full 100 million cubic yards it was designated for.

Question: How long would it take to designate an ocean disposal site? [It took seven years to set up the Mud Dump.]

Answer: The EPA process to designate a new site has started. The New York District is cooperating with Region II EPA in this effort. The current approved schedule is to designate a new site in the ocean by the end of 1995, but it is our understanding that because the environmental impact statement process has not been started, that date is currently being revised.

Question: How long would it take to redefine the existing boundaries?

Answer: Redefining the existing disposal site boundaries would be no faster than the site designation process discussed above, because it is still a designation, even if it is physically next to and adjacent to the existing two square mile site.

Question: What steps are being taken to avoid a situation where the Mud Dump reaches capacity, and no other site has been designated as a replacement?

Answer: Steps have not been taken to provide interim disposal sites, because EPA, at this time, expects to designate an ocean site before the existing one closes.

Question III. Follow-up on Water Resources Act Instructions to EPA:

Question: 1) Under the Water Resources Development Act of 1992, the EPA and the Army Corps of Engineers were instructed to jointly select removal, pre-treatment, post-treatment, and decontamination technologies for contaminated sediments for a decontamination project for the New York/New Jersey Harbor by October 1993. Funding of \$2.7 million was provided to the EPA and the Army Corps for this purpose.

What has been done to date to start this project?

What is your expectation as to the time frame and total cost of the decontamination project?

Also, could you provide for the record how additional funds for FY 1994 would be used, if provided by Congress?

Answer: Although this is a joint responsibility of the Army Corps of Engineers and EPA, EPA has the funding and scheduling responsibility for this project, and we defer to EPA to respond to this question.

Question: 2) The Water Resources Development Act also established a National Contaminated Sediment Task Force, the membership of which includes one representative each from the Administrator of the EPA, the Secretary of the Army, and the National Oceanic and Atmospheric Administration. This task force is required to review and assess the means and methods for locating and constructing permanent, cost effective long-term disposal sites for the disposal of dredged material not suitable for ocean dumping (as determined under previous law).

The Task Force is required to submit a report to Congress stating its findings and recommendations by October 31, 1994.

At what stage are we with this requirement? Has the Task Force been assembled and begun its work?

Answer: The EPA has the responsibility to administer this task force and we defer to EPA to respond to this question.

Question VIII.

Question: You are aware that the problems with dredging of terminal facilities in the Port of New York and New Jersey have their root in dioxin contamination upstream in the Passaic River as well as in Newark Bay. Beyond the pollution in the waters, another problem has surfaced and that is in the permitting process. It has taken over three years and there has yet to be a permit issued for the disposal of the sediments which have passed the necessary tests.

Answer: As correctly stated in the question, the problems of dredged material disposal both in the Port of New York and New Jersey, as well as nationally, comes directly from upland pollution that enters and settles into the natural bottom sediments that must be dredged for safe navigation.

Question: What, if anything, in your opinion should be done to improve the Clean Water Act to both prevent future contamination of coastal waters and to facilitate their cleanup?

Answer: EPA is currently preparing a Contaminated Sediments Management Strategy. Army believes that the following items should be addressed in that strategy:

- a. Point source industrial and municipal discharges must be monitored to ensure they meet discharge standards and when necessary, enforcement actions must be taken.

b. Urban and industrial storm drainage (including combined sewer overflows) should be addressed in the reauthorization of the Clean Water Act. It will be expensive, but removal of pollutants from these systems is a necessity to obtaining clean water in the coastal areas.

c. Rural and agricultural runoff contribute to the pollution load in coastal areas. The pollutants from these sources should be addressed in the reauthorization of the Clean Water Act.

d. Studies are underway to obtain methods and costs for the remediation of contaminated sediments. It may be necessary in some case to remove and dispose of these contaminated sediments. This must be addressed in the Clean Water Act to ensure clean water in the coastal areas. It is not realistic or fair to place the costs of removal and disposal of contaminated sediments in the operation and maintenance budgets for the harbors and rivers involved, but these remediation costs are more rightly placed on the parties responsible for deposition of the contaminated materials.

Question: Also the dredging permit I mentioned is to be issued under the Ocean Dumping Act, is there anything to be learned from this experience that would point to the need for amending the Clean Water Act in order to avoid such an unacceptable period of time in the issuance of permits?

Answer: The lesson to be learned from the experience in the Port of New York and New Jersey, which is also applicable to the Clean Water Act regulated discharges of dredged material is that as testing procedures and technology become more detailed and sophisticated, it is even more important that science based regulatory standards are developed simultaneously so that the regulators can make prompt permit decisions.

PREPARED STATEMENTS OF WITNESSES

---

TESTIMONY OF  
CAROL M. BROWNER  
ADMINISTRATOR  
U.S. ENVIRONMENTAL PROTECTION AGENCY  
BEFORE THE  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
OF THE  
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
U.S. HOUSE OF REPRESENTATIVES

May 5, 1993

Good morning, Mr. Chairman and Members of the Subcommittee; I am Carol Browner, Administrator of the Environmental Protection Agency (EPA).

Accompanying me this morning is Martha Prothro, Acting Assistant Administrator for Water. I am very pleased to appear before you today to discuss the important challenges that confront our Nation, her leaders, and all citizens as we undertake to achieve the goals of the Clean Water Act (CWA).

Mr. Chairman, I appreciate your role in fostering this CWA reauthorization process, and I look forward to working with you on the many issues involved, particularly: *funding* issues associated with drinking water and wastewater treatment; ways to promote *watershed protection* and *pollution prevention*; and solutions to water quality problems associated with *polluted runoff* from wet weather flows. These critical environmental issues require effective, innovative solutions that, in practice, must be implemented with the resources we can *reasonably* expect to be available to governments and the private sector. We need to tap the energy and ideas generated by public and private partnerships and to involve those with a stake not only in achieving the goals but in implementing the solutions by which these goals are to be attained. Investment in our natural

resources not only reflects our obligation to act as stewards of our environment--to hold the environment in trust for our children, but also represents sound economic policy.

## **INTRODUCTION**

The CWA has been a cornerstone of EPA's environmental protection efforts for the last two decades. The Act gives us broad and flexible authorities and, because of this, the Act is considered by many experts to be one of the best federal environmental statutes. Under the CWA, we already work with States, other federal agencies, localities, the private sector, and citizens to address serious water resource problems posed by municipal and industrial discharges, and discharges of dredged or fill material, as well as by polluted runoff from what are known as nonpoint sources. More recently, we are reorienting our focus to move beyond simply controlling pollution sources, to addressing the aquatic ecosystems and integrating, or improving, the programs needed to protect and restore them. We know that our Nation's aquatic ecosystems provide habitat to many diverse forms of life. We must consider not only the chemical but also the physical and biological components of these systems to maintain the integrity of our Nation's waters. The challenge facing us today is how to focus on the remaining threats to our Nation's waters, some of which may not be adequately addressed through current national regulatory or cooperative programs EPA now implements.

At the same time, we must also recognize that new initiatives have placed and will continue to place a significant increased burden on State and federal water quality protection programs. Similar demands are placed on local drinking water systems. Without additional funding, State and local water and wastewater programs will not be able to fulfill the mandates of the CWA or the Safe Drinking Water Act, or meet the expectations of the public.

We need to be sure that adequate resources are available--and available for the right purposes--in order to ensure continued progress in protecting water quality. Similarly, we have seen industry come to applaud and even promote pollution prevention as a common sense approach to reducing costly pollution controls while conserving valuable raw materials. We also recognize that in many instances economic incentives and market forces can be used to achieve progress more efficiently than additional controls. Finally, we must not overlook the economic consequences if we choose to abandon our commitment to the environment.

Although we must do better at quantifying these economic costs, many of the benefits of protecting and restoring our Nation's waters are obvious, including: improved health and increased life spans resulting from cleaner drinking water; safe and more abundant sources of food supply, recreation and commerce; natural flood and erosion protection; and abundant fish, shellfish, and wildlife and the irreplaceable natural environment.

Even in difficult economic times, the American people have said they recognize the cost of neglecting the environment and have reaffirmed their conviction that money spent on surface water pollution control and drinking water treatment are sound investments. We are all beginning to appreciate the fact that safe, healthy water resources and healthy aquatic systems are not cost-free, and to appreciate as well that it is worth the cost.

We have a great deal of which to be proud. Thanks to sustained effort by federal and State environmental and resource agencies, timely compliance by many dischargers, and the vigilance of citizen groups and government enforcement authorities, the discharge of toxics and other pollutants to our Nation's waters has decreased significantly. Nearly 75% of the Nation's assessed surface waters are meeting their statutory goals based on current water quality standards. This progress must not be lost and, as our science improves, we must continue to address significant discharges of toxic pollutants by industry and municipal wastewater plants.

At the same time, we must recognize that nonpoint sources and habitat loss, together with unaddressed point sources such as storm water runoff and combined sewer overflows (CSOs), are responsible for the majority of our remaining water quality problems. Through the reauthorization of the CWA, together we offer this Nation a precious opportunity to attain its environmental goals. This requires us to acknowledge not only that pollution comes from many

pathways, but also that it can often be addressed in a common sense, cost-effective manner, using tools that are already within our reach.

## **OUR FOUNDATION: THE STRUCTURE OF THE CLEAN WATER ACT**

### Overview

Before we sketch possibilities for the future, I believe it is important to understand the foundation upon which we build. In 1972, Congress gave EPA, the Army Corps of Engineers, and the States broad authority to address water pollution. The National Marine Fisheries Service and the Fish and Wildlife Service, through the Fish and Wildlife Coordination Act, were also given a broad mandate for habitat protection. The goal of the CWA is to "restore and maintain the chemical, physical, and biological integrity of our Nation's waters." Under this mandate, we have developed sound programs to reduce point source discharges of pollutants entering all surface waters, including lakes, rivers, estuaries, oceans, and wetlands. Through the construction grants program and, more recently, the State revolving fund (SRF) program, the federal government has made available to States and municipalities nearly \$67 billion since 1956 to finance the construction of major wastewater treatment facilities and the implementation of other critical water quality improvement programs. The statute also has promoted better assessment, identification and targeting of impaired waterbodies and has taken

first steps toward addressing the consequences of wet weather flows, polluted runoff, habitat loss and, to some extent, poor watershed management.

Under the CWA, EPA develops national uniform effluent limitation guidelines, new source performance standards, and pretreatment standards for categories of industries, such as electroplating, pharmaceutical manufacturing, and textiles. These effluent guidelines and standards generally reflect application of the best available technology that is economically achievable. They also include best management practices. Early guidelines covered roughly 129 toxic pollutants, while our more recent guidelines have covered over 400 toxic pollutants. Sewage treatment plants, in turn, are subject to secondary treatment requirements. Those regulations set end-of-pipe performance standards, based on the treatment technology available at the time, allowing dischargers flexibility in choosing the method of compliance.

States are given primary responsibility to develop water quality standards for waters within their jurisdiction. State water quality standards provide the basis for many federal and State water quality management decisions. In developing these standards, States designate specific uses for their waters--such as fishing, swimming, or drinking--and prescribe criteria to protect these uses. These criteria were traditionally pollutant-specific and define levels of pollutants that will not interfere with the designated use. States typically use both national criteria guidance issued by EPA and other scientific information to develop their standards. Recently, through State and federal rulemaking, numeric water quality criteria for

"priority" toxic pollutants are now in place for waters impaired or threatened by those pollutants. EPA is also developing criteria guidance for States to use in adopting standards to address physical and biological parameters. In addition, State water quality standards programs include an antidegradation policy to ensure that existing uses and high quality water resources are maintained. States must review their standards every three years to ensure that they remain adequate, especially in light of new scientific and technical information and additional criteria that may need to be adopted to fully protect designated uses.

#### The National Pollutant Discharge Elimination System Program

The water pollution permit program, known as the National Pollutant Discharge Elimination System (NPDES) program, is one tool by which State or federal permitting authorities translate State water quality standards and federal effluent guidelines into actual pollutant limits for point source dischargers. NPDES programs are administered by EPA, or by States with EPA approval. Currently, 38 States and 1 territory are authorized to operate NPDES programs; EPA administers the NPDES program in all other jurisdictions, although three States--South Dakota, Texas, and my home State of Florida--are in the process of seeking necessary NPDES authority. The national NPDES program addresses more than 65,000 traditional "point source dischargers" such as industries, municipal sewage treatment plants, and some classes of animal feeding operations. In addition, there are well over 100,000 point sources addressed under the urban and industrial

storm water portion of the program and more than 1100 combined sewer systems with more than 10,000 CSO outfalls. The NPDES program has been widely credited as the principal reason for the significant water quality improvement in our Nation's waters over the last 20 years.

#### Pretreatment Program

The CWA does not require EPA or State NPDES permits for industries that discharge into municipal sanitary sewer systems rather than directly into surface waters. Instead, these "indirect dischargers" are addressed through the pretreatment program. Prior to discharging into municipal systems, they are required to remove, or pretreat, those pollutants that could interfere with the operation of a sewage treatment plant or that could pass through and pollute surface waters or the sludge produced by the treatment process. The role of EPA and approved States is to set requirements and procedures for approval of local pretreatment programs, oversee implementation, promulgate national technology-based standards for indirect dischargers, and operate programs where State and local governments do not. These local programs also establish and enforce local limits more stringent than national standards when necessary to protect water quality, sludge quality, and worker health and safety. EPA, States, and approximately 1,500 approved cities are responsible for imposing and enforcing national as well as any local pretreatment requirements for over 30,000 significant industrial users and thousands of smaller indirect dischargers.

Wetlands/ Aquatic Habitat Protection

In addition to the NPDES permitting program, the CWA creates a program in §404 to govern the discharge of dredged or fill material into navigable waters. This program, administered jointly with the Army Corps of Engineers, is a significant component of EPA's efforts to protect aquatic ecosystems.

Under §404, EPA develops the environmental regulatory criteria for evaluating permit applications. EPA, along with the National Marine Fisheries Service and the Fish and Wildlife Service, also reviews permit applications. If necessary, EPA can "veto" permits that would result in unacceptable adverse impacts to wildlife, fisheries, recreation, or municipal water supplies. EPA and the Corps share responsibility for enforcement of the §404 program, and EPA is responsible for approval and oversight of State §404 programs. In addition, under our responsibilities for administering the CWA as a whole, EPA also has the ultimate authority to define the geographic scope of CWA jurisdiction, including wetlands, and to determine the scope of activities exempt under §404(f). It is this role that prompted Congress to appropriate funds to EPA for the purpose of having the National Academy of Sciences conduct a study on wetlands delineation.

EPA's efforts to address wetland and other aquatic resource losses and degradation go beyond the §404 program. We are working with our State counterparts to enhance their role in comprehensive protection, including helping them to assume §404 authority. EPA is providing grant assistance to help States develop wetlands programs and providing technical assistance in areas such as

§401 water quality certification, wetland water quality standards, and integrating wetlands into water resource planning through watershed plans and management practices. EPA has provided assistance to 19 States through Fiscal Year 1992 to develop State Wetland Conservation Plans or Strategies as a way to integrate and improve the effectiveness of protection and restoration programs. EPA has established a Wetlands Hotline to help answer questions and meet information needs of the general public.

EPA, in conjunction with other federal, State, and local groups, is developing private/public partnerships to protect wetlands such as co-sponsoring American Wetlands Month each May, encouraging private landowner participation in voluntary wetlands assistance programs, and creating the Audubon's America program. EPA just completed its next five-year Wetlands Research plan focusing on wetland functions and criteria to protect those functions, landscape scale assessment, and improving wetlands restoration and creation.

### Enforcement

Essential to the success of the CWA is the presence of a vigorous enforcement program. Enforcement and the manner in which we exercise the discretion to use enforcement tools remain an integral component of a successful environmental program. One successful example of EPA's enforcement effort is the National Municipal Policy, under which States and EPA assured municipal facilities met the CWA July 1, 1988 statutory deadline for wastewater treatment.

Largely as a consequence of the National Municipal Policy, of the 4,000 major municipal NPDES permittees, the number in significant non-compliance has decreased from an average of 15% in fiscal year 1986 to 9% for the first quarter of 1993. In 1987, 74% of the municipal facilities had installed treatment necessary to meet basic technology-based requirements. In 1993, that number has increased to 97%.

EPA has also implemented an aggressive administrative and judicial enforcement program. In fiscal year 1992, EPA took approximately 1450 formal enforcement actions under the CWA. Of these, 272 involved the assessment of penalties totalling \$23,066,200. Further, over the period of time from 1989 through 1992, the average judicial penalty has increased from about \$143,800 to about \$414,500. The average administrative penalty has also increased over the same time period from \$17,080 to \$22,895. Since 1975, the Agency, along with the assistance of the Department of Justice, has concluded 904 judicial cases and, since 1987, 802 administrative penalty cases, for a total of over \$125 million in penalties.

Water Quality Act of 1987 and  
the Coastal Zone Act Reauthorization Amendments of 1990

In 1987, the Water Quality Act amended the CWA and signaled some important new directions for EPA and the States: new water quality-based controls for toxic pollutants; industrial and municipal storm water controls; new

State responsibilities for polluted runoff to surface waters; and increased attention to special aquatic resources such as estuaries, bays, and lakes, as well as critical aquatic habitat such as wetlands. The Act also ushered in the State Revolving Fund (SRF) program to provide continuing support for wastewater treatment. Although previous statutes had begun to address these problems, the 1987 amendments reflected the Nation's increased awareness that water quality degradation is caused not only by pollutants pouring out of pipes, but also from nutrients, soil, and chemicals that run off our streets, farms, fields, lawns and forests. The amendments also recognized that diverse ecological resources must be protected by means of geographically targeted solutions to locally identified problems. Without yielding the gains which we achieved through the application of traditional, end-of-pipe controls over other causes of water pollution, we need to reaffirm and, indeed, to expand our federal, State and local efforts to address impairments from uncontrolled wet weather point sources and non-point sources.

In addition, pursuant to the Coastal Zone Act Reauthorization Amendments of 1990, 29 coastal States and territories are developing, for joint approval by EPA and the National Oceanic and Atmospheric Administration (NOAA), coastal nonpoint pollution control programs to control or minimize contaminated runoff to waters associated with agriculture, silviculture, urban activities, marinas, and hydromodification through application of best management practices and protection and restoration of wetland and riparian areas. These programs will provide for the implementation of management measures in conformity with

guidance published by EPA and will also provide for the implementation of additional management measures as necessary to achieve and maintain water quality standards and protect designated uses. EPA's management measures guidance was developed in collaboration with our sister federal agencies, States, the potentially affected sources, and the public. We believe that these coastal nonpoint programs represent an important step in the restoration and protection of our Nation's impaired and threatened waters.

## OUR GUIDING PRINCIPLES

### Watershed Protection

Before addressing specific issues, I would like to articulate what I believe should be the guiding principles for CWA reauthorization. Even as our Nation's water quality steadily improves, we face new challenges that demand new solutions. I have already indicated that the *protection of watersheds* must be a priority for us. But what does this mean? The Clinton Administration envisions an approach to water resource protection that looks first to the ecosystem itself, evaluates its needs based on risk, and then tailors workable solutions to those needs through the participation of stakeholders in every phase of the process. As the Act itself envisions, our focus is on the biological and physical, as well as chemical, integrity of our Nation's waters. Although the Act's national technology baseline requirements have provided enormous environmental protection, this framework, which we call the "watershed protection approach," provides us with

the methods and the solutions needed to tackle the problems still facing our Nation's waters, those problems that are too diffuse and difficult to tackle any other way. Focusing on the watershed as a whole rather than merely on specific sources of pollution within the watershed is essential to ensure that we succeed in restoring and protecting the Nation's aquatic resources.

We must also apply a similar approach for the Nation's ground waters. We are increasingly finding that in certain watersheds ground water recharge to surface waters can be a critical factor in determining the ecological health of aquatic systems. We need to ensure incorporation of ground water in our watershed approach where it significantly influences surface water quality, and we need to guard against the possibility of transferring a pollution problem from surface water to underground sources of drinking water.

#### Pollution Prevention

I believe our second guiding principle should be an emphasis on *pollution prevention*. In the water program, as in other environmental programs, traditional end-of-the-pipe approaches have yielded significant gains in environmental quality. However, we now realize that treatment and disposal will not be sufficient to ensure continued progress. A more comprehensive, prevention-oriented approach within our base regulatory program will allow us to move even more effectively toward meeting the overall goals of the CWA.

There are numerous other benefits offered by implementing a pollution prevention philosophy. By reducing reliance on end-of-pipe or permit-by-permit controls, prevention also reduces the likelihood that a "solution" to one pollution problem will simply transfer the residual pollutants to different media. In particular, we have seen the transfer of surface water contamination to ground water contamination. Pollution prevention approaches, such as switching to different process solvents and reducing water use, have the potential to produce permanent solutions to environmental problems--solutions that require less investment in expensive pollution control and greater emphasis on good planning and strategic designs. It includes conservation techniques and changes in management practices to prevent harm to sensitive ecosystems and resources such as wetlands, ground water and estuaries. In addition, prevention may be the most cost-effective way to address many of the remaining sources of water pollution such as agriculture and urban runoff, the cumulative effects of incremental habitat loss, or numerous small sources, which can result in significant impairments of our water resources at the local level. Pollution prevention also complements the watershed approach. It offers additional tools that give us greater capability and greater flexibility to address localized problems requiring heightened attention.

#### Recognition of the Value and Cost of Clean Water and Healthy Waterbodies

Our third guiding principle must be our recognition of the value--and the cost--of clean water and healthy waterbodies. The Nation's waters, whether

degraded or pristine, are our children's inheritance. Measures we take now must not only return what is lost but also guard what is yet unblemished. However, these responsibilities carry a substantial price tag. We expect water safe enough to swim in, to fish from and to drink, and we expect healthy and diverse populations of plants and animals in our lakes, streams, wetlands, estuaries and oceans. Consequently, we must also expect to address the costs of treating our wastewater and our drinking water. By funding States, municipalities, and federal agencies adequately, we can help to ensure a reliable infrastructure of storm sewers, wastewater sewers, sewage treatment plants, and drinking water supply and treatment facilities upon which public health, our quality of life and many of our important economic sectors depend. Similarly, funding is necessary for other water quality programs to strengthen the scientific basis and guidance to support the prevention and control of nonpoint source pollution and the protection and restoration of estuaries and other important components of watersheds.

Clean, safe water was once viewed as free, but in our modern society this is recognized to be a false view. Just as we believe that the polluter should assume, at a minimum, the costs associated with researching, developing, administering and enforcing the permits under which the polluter is allowed to discharge pollutants into the aquatic environment, all of us, as users of our water resources, must appreciate and help bear the costs of water quality protection. As individuals, we pay user fees imposed by utilities to finance necessary treatment projects. We must also be sensitive to the importance of using water efficiently,

to help reduce costs and to prevent further degradation of our aquatic ecosystem. By acknowledging public and private responsibility for the costs of clean, safe water we also foster greater invention and innovation as the public and private sectors work to improve water quality in the most cost-effective manner possible. We anticipate fostering further innovation by examining and lowering barriers to technology innovation and by creating incentives that encourage innovation.

#### Need to Address Remaining Problems

The fourth guiding principle for reauthorization is the need to address the remaining water quality problems. Many of these are associated with wet weather flows: overflows from antiquated combined sewer systems that result in the discharge of raw sewage, commercial and industrial wastes and storm water during wet weather events; discharges from separate storm sewer systems that deliver toxics and other pollutants from urban and industrial sites to our waters; and polluted runoff from nonpoint sources. In addition, I believe we must confront the consequences of poorly managed land and water use activities that impair our Nation's ecological resources and address the habitat degradation and destruction that frequently results. The first twenty years of water pollution control under the CWA has accomplished much through its regulation of traditional industrial and municipal discharges. However, we must focus our attention now on these remaining problems and attempt to address them as effectively as we have addressed the problems of the past.

Finally, we need to enhance State and federal administration of water quality programs by strengthening enforcement authorities. A strengthened enforcement program would allow the Agency to respond more effectively to facilities that are not in compliance with the requirements of the CWA.

## **THE CHALLENGES AHEAD**

As we begin the process to reauthorize the CWA, we need to consider the ecological and human health dimensions of protecting our aquatic resources. Today's problems are very different than those of the past. In addition, our challenges involve recognizing that "water quality" goes well beyond the chemical water column. Rather, protecting and improving water quality must also address physical and biological integrity as well as the integrity of the surrounding watershed that is an integral part of the total ecosystem.

Although we have many challenges facing us, I would like to focus my testimony today on three particularly critical issues: first, the threats posed to our aquatic ecosystem that can be addressed only by focusing public and private efforts on geographically targeted watersheds, where the sources of impairment and the degradation they produce operate in close and dangerous proximity; second, the need for adequate funding to support State and local solutions and to implement federal requirements under both the CWA and the Safe Drinking Water Act; and third, water quality problems caused by wet weather flows, such as CSOs, storm water discharges, and polluted runoff from nonpoint sources.

### Watershed Management

The principal goal of the CWA is to protect and restore waterbody uses by ensuring their biological, chemical and physical integrity. As the water program has matured, we now have the tools and the understanding of ecosystems to expand our focus beyond a simplistic emphasis on chemical pollution. Therefore, EPA strongly supports what we call the "watershed protection approach," which is a way of promoting a more holistic, risk-based approach to the complex and often persistent problems in watersheds around the Nation. By focusing on the watershed as a whole rather than on specific sources within the watershed, we believe that we can address the watershed's problems more comprehensively, efficiently and effectively and at the same time take better advantage of the energy and resources of our public and private partners.

We can no longer assume that "national" solutions will solve all local problems. By adding a stronger geographically based approach to protecting our aquatic resources, we can ensure that solutions--shaped by the local community as well as by State and federal participants--are carefully tailored to address the unique circumstances facing each locality. This local tailoring can help ensure that we achieve the dual goals of adequately protecting our water resources and doing it in the most cost-effective fashion. We plan to continue working with USDA's Soil Conservation Service in delivering the watershed approach where watersheds are predominantly agricultural. As we build partnerships, we concentrate our resources on locally targeted problems, foster new, innovative approaches and

solutions, and promote implementation of these solutions through the empowerment of local stakeholders.

The watershed approach is not new to EPA and has been used effectively in several geographically targeted programs, including: the National Estuary Program (NEP), initiatives focusing on the Great Lakes, the Gulf of Mexico, and the Chesapeake Bay, and the Near Coastal Waters Program. For example, the Great Lakes Program establishes a partnership of the federal government and appropriate State, tribal, and international agencies to work together in remedying the problems facing the lakes, which together comprise 20% of the world's supply of fresh surface water. The Chesapeake Bay Program calls for EPA and other federal agencies, in concert with the Bay States, to implement programs to abate pollution for the protection and restoration of living resources in this wonderfully vigorous estuary--the largest in the U.S. Under the NEP, States nominate and EPA selects nationally significant estuaries threatened by pollution, development, or overuse. EPA, the States, local governments, interest groups, and the public jointly identify problems, and develop and carry out comprehensive management plans to protect these recognized estuaries. Our water quality standards program allows each State to tailor its water uses and criteria to meet its unique, local requirements. Yet these are only a start. We must evaluate the watersheds individually and let the people who depend on them tell us what solutions are appropriate. Here are several examples:

- ▶ In New England, the Blackstone River suffers from toxic contamination. As part of a watershed initiative, the Commonwealth of Massachusetts and the State of Rhode Island are working with local stakeholders to address the toxics problem, identified by the NEP Narragansett Bay Project as the largest single source of toxic pollutants to Narragansett Bay.
- ▶ In Louisiana, hydromodification has contributed to significant loss of wetlands, including bottomland hardwoods. Government officials and the agricultural community are working together to conduct reforestation activities.
- ▶ In Kansas, phosphorous loading threatens the Hillsdale Reservoir with eutrophication. Activities are underway to develop a system for managing the reduction of pollutants at their source.
- ▶ In California, Morro Bay suffers from sedimentation that, if not addressed, will fill the Bay in approximately 100 years. Agricultural and silvicultural best management practices are being implemented to address the problem.

While we are very encouraged by the progress demonstrated by these examples, I would like to point out that these do not yet reflect the "complete" watershed protection approach I envision. Some programs, such as the NEP, already have authority to comprehensively consider the whole suite of problems affecting a watershed, but do not have authority or resources to implement their plans. Other programs have resources but are only authorized to address specific impacts or sources. We need to bring these approaches together to attain integrated, ecosystem management. Nevertheless, each example mentioned above appropriately conceives the watershed as a whole and involves the stakeholders in the solutions, thereby embracing two of the critical concepts of watershed protection.

The Administration is moving forward even without new legislation to better support ecosystem management. To mention just a few such efforts, the Department of Interior intends to make ecosystems the focus of federal conservation policy; the Department of Agriculture's Forest Service has launched a new policy on ecosystem management; and its Soil Conservation Service has a new strategic plan that uses watershed management as a cornerstone for achieving "Total Resource Management." The Army Corps of Engineers, in its testimony today before this Subcommittee, describes how its approach to §404 permitting is consistent with watershed management approaches.

Watershed management practices can also help to preserve high-value uses that may apply to surface waters within the affected watershed. Some cities are using a system of pollution prevention measures to protect watersheds that serve not only as vital sources of drinking water but as productive habitat for fish and wildlife populations. For example, the City of Portland, Oregon, is protecting its public water supplies, along with habitat for the spotted owl through a written agreement with the U.S. Forest Service that includes restrictions on forestry operations and a public access to erodible terrain. These measures have enabled the City to ensure the safety of its drinking water sources without having to install an expensive filtration system. Innovative, cost-effective alternatives such as this exist in many situations, and we believe that our watershed management approach will help to foster them.

I believe the CWA generally provides EPA and the States with the authority we need to look holistically at the entire aquatic ecosystem. By focusing our attention on watershed management in the context of reauthorization, however, I would like to encourage Congress to promote this approach by: harmonizing, and where necessary, improving our ability to address the physical and biological, as well as chemical, integrity of our Nation's waters; emphasizing watershed-level ecological risk management; coordinating water quality standard reviews; consolidating planning and priority setting requirements under the Act; and modifying the timing of biennial water quality assessments and reporting under §305(b).

The watershed approach I have sketched focuses on carefully tailored, cost-effective solutions to all stresses on the watershed, including nonpoint source pollution, habitat degradation, wetlands loss, and threats to ground water. I believe that focusing on watersheds as a whole--in order to identify causes and effects of high-priority problems, and to develop effective, implementable solutions while at the same time maintaining strong national programs to protect the gains of the past--is essential to ensure that we succeed in restoring and protecting the Nation's aquatic resources. I would also like to point out that the application of the watershed approach does not imply a backsliding of current requirements. For example, national secondary treatment requirements would remain, and the focus would be on eliminating threats that are not avoided through its application.

Funding

In 1981, the federal government committed to a ten-year program of \$2.4 billion per year for financing the construction of municipal wastewater treatment facilities under the CWA's Title II Construction Grants Program. This level of funding was considered adequate to meet the estimated remaining highest priority needs for interceptor sewers, wastewater treatment plants, and sewer rehabilitation projects to correct infiltration and inflow problems. Other major infrastructure needs, such as correction of CSO pollution problems, were not fully considered in the 1981 plan. In 1987, Congress established the SRF program to provide long-term financial assistance for municipal wastewater infrastructure needs, and phased out the Title II construction grant program. The SRF program also provides support for nonpoint source and estuary management activities. A total of \$18 billion was authorized for these two programs through fiscal year 1994, principally to assist municipalities with their remaining municipal sewerage needs and to start to address the more recently identified needs such as CSO correction.

The transition from the Title II construction grant program to the Title VI SRF program has gone well. All States now have approved programs and are receiving capitalization grants. Over \$7 billion dollars of federal capitalization funds and \$6 billion of State matching funds and bond proceeds have been made available for needed waste water projects. More than 1300 municipalities have received low interest loans through the SRF. Approximately 70% of the loan assistance

provided to date has been for financing the construction of secondary and advanced wastewater treatment plants. Another 25% has been used for sewer construction, with the remaining 5% available for storm water and nonpoint source management and other projects.

Although EPA has not yet published data from the 1992 survey of the States regarding needs for municipal wastewater treatment, preliminary estimates confirm that needs continue to grow. Total documented needs have increased in constant dollars from \$90 billion in 1988 to \$108 billion in 1992. In general, this increase is caused by one or more of four factors: (1) continued population growth and redistribution; (2) deterioration of older sewers and other facilities; (3) new requirements to protect water quality; and (4) newly eligible activities. For example, advanced treatment needs have grown by \$10 billion in constant dollars because secondary treatment controls have proved insufficient to meet water quality standards. Documented needs for CSOs have increased by \$5 billion largely because the costs of CSO controls are better understood today. The \$3 billion increase for new collectors is attributable to population growth and redistribution since the last survey.

As daunting as these figures are, there is reason to believe that some needs are seriously underestimated. EPA, States, and localities are still determining how to meet CWA requirements for CSOs and storm water management; therefore, the documented needs do not yet fully reflect the costs of correcting these problems. In addition to sewer and wastewater treatment construction needs, States reported

information on two new significant categories of needs prompted by new mandates of the 1987 amendments: storm water pollution management and nonpoint source pollution control. The estimates reported for these two categories in the 1992 survey are in the range of \$10 billion in constant dollars. And, we have no estimates at all regarding the funding needed for aquatic ecosystem protection and restoration.

In general, States and local communities cannot afford these activities without continued federal support. Because of its revolving fund characteristic, over a twenty year period the SRF can fund three times the value of projects that could be funded by outright grants. Consequently, while \$18 billion was authorized in 1987 to end federal wastewater assistance, the President is seeking a new authorization for clean water State revolving funds to help communities address these new storm water needs, as well as traditional wastewater needs. The President's investment proposal would provide \$7.2 billion in capitalization grants between fiscal year 1994 and fiscal year 1997 to capitalize these state revolving funds.

The Administration is sensitive to the special needs of small and rural communities. We estimate that small communities (defined as communities with systems that serve fewer than 10,000 people and that have a flow of less than 1 million gallons of wastewater per day) have an unmet need of over \$13 billion for wastewater treatment facility construction and improvements. This figure

represents 12% of the total documented national wastewater treatment construction need.

Since 1972, small communities have received 24% of federal funding under the construction grants program, and 18.5% of the funding under the SRF program. In general, small communities report the same mix of needs as the Nation as a whole. One exception is that small communities report a greater need for new collector sewers than reported for the Nation as a whole. This comparatively large need reflects in part the communities' need to replace significant numbers of failing septic systems, and greater distances between dwellings that are common in rural communities. Small rural communities with wastewater needs also can turn to the Rural Development Administration (RDA) for financial assistance. In fact, the President has proposed significantly increased funding through the Rural Development Administration (RDA). The President's investment proposals provide increases of \$740 million in grants and \$1.3 billion in loans for the period from fiscal year 1994 through fiscal year 1997.

#### Wet Weather Flow Issues

##### Storm Water

Storm water is a major program area in which EPA and the States together have made some important progress. As you know, the 1987 amendments to the CWA required the Agency to establish a two-phased regulatory program to address the discharge of contaminated storm water to our Nation's waters. States have

reported that storm water discharges from diffuse sources are responsible for approximately one third of remaining assessed surface water impairments in lakes and estuaries.

With the promulgation of the Agency's Phase I storm water regulations in November 1990, implementation of the program is well underway. Over 100,000 industrial activities and more than 250 municipalities and counties are covered under Phase I. To date, tens of thousands of facilities and storm water activities are covered under general NPDES storm water permits. EPA and the States are now beginning the more difficult process of assuring that necessary controls are implemented as required by those permits. We are in the process of developing individual NPDES permits for municipalities and counties covered under Phase I. Both EPA and the States have placed a very heavy emphasis on pollution prevention and implementation of best management practices as the first step in implementing storm water programs.

While Phase I is a major challenge and much more work remains, Phase II of the storm water program represents an even larger undertaking with as many as one million additional commercial, retail, and light industrial activities potentially affected. Also potentially included in this Phase II group are municipalities under 100,000, as well as emerging growth and new development areas around existing urban centers that are not covered under Phase I. A number of issues must be addressed in connection with the implementation of Phase II, notably whether certain dischargers should be targeted for permitting before others, the possible

menu of regulatory and nonregulatory mechanisms that could be used to address high priority sources, and appropriate deadlines.

We are presently developing different options for a Phase II strategy that will provide for the most effective targeting of high risk sources, identify appropriate roles for federal, State and local government, and strike the right balance between pollution control under the nonpoint source program and the issuance of permits under the NPDES program. We think potential Phase II sources outside urbanized areas may best be addressed under an expanded and strengthened nonpoint source program.

#### **Combined Sewer Overflows**

Another remaining point source problem is combined sewer overflows (CSOs). More than 1100 cities (85 percent of which are located in the Northeast and Great Lakes areas) which serve a total population of 43,000,000, have antiquated combined sewer systems. During wet weather events, these uncontrolled combined sewer systems discharge raw sewage, commercial and industrial wastes and storm water. States' water quality assessments have shown CSOs to contribute to water quality impairments, beach closures, fish kills and shellfish bed closures.

In 1989, EPA took steps to address the CSO problem by issuing a CSO Strategy calling for States and municipalities to focus greater attention on controlling CSO discharges such that waters impaired by CSOs would attain water

quality standards. EPA has recently circulated a new draft *Combined Sewer Overflow Control Policy* that provides additional guidance on meeting the 1989 CSO Strategy. Through negotiated dialogue with State, environmental, and municipal representatives, the draft policy developed a framework for future action. Public comment has been supportive of the draft policy. The draft policy contains provisions for developing appropriate, site specific NPDES permit requirements for all combined sewer systems that overflow as a result of wet weather, including requirements to ensure attainment of water quality standards, and it announces an enforcement initiative to require immediate elimination of overflows that occur during dry weather. The existing statute appears to provide sufficient legal authority to implement the draft policy and to bring CSOs into compliance with statutory requirements, including the attainment of State water quality standards.

#### **Polluted Runoff**

Polluted runoff, which is the contaminated runoff from agricultural lands, grazing and forestry operations, and those urban areas and commercial activities not regulated by NPDES permits, is one of our most vexing water quality problems. Siltation, nutrients, and pathogens are the most common pollutants causing the degradation. In addition, polluted runoff stemming from increased population growth in sensitive ecosystems, such as in coastal areas and wetlands, also poses a serious threat to waterbody integrity. Much of the most serious pollution comes from agricultural runoff, including crops, grazing, and animal waste.

Polluted runoff most commonly results in damage to natural ecosystems, including alteration and destruction of habitats. Fertilizer use, and other activities such as faulty septic systems, inadequate waste water treatment facilities, industry, feedlots, and pesticide use have also been linked to contamination of ground water. These problems are particularly acute in rural areas of intense agricultural activity where ground water is used as the primary source of drinking water for 95% of the population.

We already possess some tools to help. Section 319 of the CWA, enacted in 1987, required States to assess their nonpoint source problems and to develop programs for managing nonpoint source pollution, backed by federal grants. The Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) provided a somewhat stronger approach for coastal areas in 29 States and territories, centering on new State programs to implement the best available management measures economically achievable for categories of nonpoint sources. This program is administered jointly by EPA and NOAA and appears to be well on its way. The 1990 Farm Bill also helps, especially through its water quality and conservation compliance incentives program.

In general, pollution prevention is the preferred approach for addressing the problem of polluted runoff. Several prevention-based techniques are available:

- ▶ Use of various land management practices and techniques that keep sediment in place where construction, crop production, grazing or forestry cause land disturbance;

- ▶ Consideration of alternative processes or practices that avoid degradation and destruction of critical habitats;
- ▶ Restriction of erosion-inducing activities in sensitive areas;
- ▶ Changes in pesticide, fertilizer, and water application methods, rates, and timing to maximize effectiveness to target species and minimize waste of the item applied;
- ▶ Use of more environmentally benign pesticides, plant strains with natural resistance to pests, and low water use crops and vegetation; and
- ▶ Improved pesticide storage, handling, mixing, and loading practices to reduce the likelihood and impact of spills.

The CWA recognizes that States and local governments should play major roles in addressing polluted runoff because of its diffuse nature and because of the need for broad-based teamwork to identify and implement the solutions. Over the last four years, we have provided both technical assistance and over \$190 million in financial assistance to help States with approved nonpoint management programs provide technical assistance, education, and implementation of best management practices, both statewide and in priority watersheds.

On top of the \$50 million per year currently being appropriated for nonpoint source grants, the President is proposing to invest an additional \$180 million in nonpoint source grants between fiscal years 1994 and 1997. These investments would help restore watersheds currently being degraded by polluted runoff.

We believe that we and our many partners are making progress with these and other tools. Based on my experience in Florida, however, I believe that State and federal programs alone will not work. Local initiative, commitment and

incentive are crucial to creating the sense of volunteerism and long-lasting change that will be necessary for success.

At this stage, I believe there are several basic principles that should guide our discussions of the problem of polluted runoff. Specifically:

- ▶ While §319 nonpoint management programs provide a good starting point, stronger measures are needed.
- ▶ A stronger watershed focus should be brought to bear so that farmers, foresters, and other stakeholders can better understand the connection between what they do on the land and the benefits they can help to bring to water quality.
- ▶ Where feasible, pollution prevention should be the approach of first choice for addressing polluted runoff.
- ▶ Voluntary approaches should remain the primary focus, but backup enforcement requirements at the State and federal levels are needed when voluntary approaches fail to produce adequate incentives and necessary environmental improvements.
- ▶ EPA should help to set clearer performance expectations and technical baselines for nonpoint source controls and management practices. We must improve our scientific understanding of the transport, impacts, and means to control problems such as nutrient and siltation pollution, and improve the tools to address them. In this effort, we will need to work closely with other federal agencies, such as NOAA, the U.S. Department of Agriculture and the Departments of Interior and Transportation.
- ▶ We should encourage innovation where appropriate, including public-private partnerships and greater use of market-based incentives. Federal funding should support State and local actions but should not be a prerequisite to accelerating progress.

## CONCLUSION

Reauthorization of the CWA provides us with a valuable opportunity to consider new and innovative solutions to complement the existing array of successful tools and programs we already have to protect human health and the environment. We believe that adopting a watershed protection approach to protect the biological and physical, as well as the chemical, integrity of our Nation's waters is very important. Similarly, we recognize that we must increase our emphasis on pollution prevention as the most practical and cost-effective means of meeting the goals of the Act. In addition, in concert with a strong point source program, we must focus considerably more attention on the sources of polluted runoff and wet weather flows; we cannot forget that these pollution sources contribute heavily to the persisting impairments our waters experience. We must undertake to streamline the process of administering and enforcing the CWA. We must consider how to better address ground-water protection. And, finally, we must help ensure that funding is available to States and municipalities to enable them to execute the responsibilities and obligations that the CWA entrusts to them.

I recognize that I have described a large task, but our Nation's waters issue us a stark challenge that we cannot ignore, except at our own cost. I believe you share with me a respect for the purity of our streams, the diversity of life in our estuaries, the high productivity of our wetlands, the dynamic interplay of forces in our watersheds, and the safety of our drinking water. Therefore, I look forward to

working with you, Mr. Chairman, this Subcommittee, the Members of Congress and their staff, our sister federal agencies, State and local governments, and industry and environmental groups to meet this challenge.

**DEPARTMENT OF THE ARMY  
OFFICE OF THE ASSISTANT SECRETARY OF THE ARMY  
(CIVIL WORKS)**

**COMPLETE STATEMENT OF**

**G. EDWARD DICKEY  
ACTING ASSISTANT SECRETARY OF THE ARMY  
(CIVIL WORKS)**

**BEFORE THE  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
U. S. HOUSE OF REPRESENTATIVES**

**MAY 5, 1993**

---

Mr. Chairman, I am G. Edward Dickey, Acting Assistant Secretary of the Army (Civil Works). I am pleased to be here today to discuss the Department of the Army Regulatory Program (Regulatory Program) and other wetland activities of the Army Corps of Engineers, (Corps), as requested in your March 24, 1993, letter. With me today is Mr. Michael L. Davis, my Assistant for Regulatory Affairs. After some background information about the Regulatory Program, I will focus on the topics you identified as being of interest to the subcommittee.

**OPENING COMMENTS**

Let me say at the outset that the Regulatory Program and other wetlands related activities are important missions for the Corps. The Regulatory Program provides a vital service of protecting our Nation's valuable aquatic resources. The Office of the Assistant Secretary of the Army for Civil Works, which oversees the Corps, and the Corps leadership are committed to protecting these resources, including wetlands. This commitment is reflected in the makeup of the over 1000 professionals in the Regulatory Program, approximately 70 percent of which have natural science degrees -- many with advanced degrees in biology or ecology.

The Army's philosophy for administering Section 404 of the Federal Water Pollution Control Act (FWPCA) is based on two fundamental principles. First, we must

acknowledge our environmental protection responsibilities -- the FWPCA and our implementing regulations require the Corps to give great weight to environmental concerns, including wetlands protection. Second, we must administer the program in an efficient manner that avoids unnecessary regulatory burdens on the public. For both principles, the Army, working with other Federal agencies, has taken a leadership role in implementing provisions for improving the Regulatory Program. We believe that the recent initiatives discussed later in this testimony have enhanced program administration and improved environmental protection.

We continue to encourage Corps permit decision-makers to use the flexibility allowed by our regulations to make decisions that reflect good common sense in terms of the environment and the general public interest. We have also increased efforts to articulate to the public information about how the program operates. We hope this effort will allay many of the fears and misconceptions about the Regulatory Program and wetlands protection in general. Above all, we are striving to improve the efficiency of the program at every level. Working with Corps Headquarters and EPA, we are evaluating current policies, priorities and workload to identify appropriate levels of funding and regulatory personnel. Corps District Engineers have followed this lead by making the program a priority within their respective Districts.

## REGULATORY PROGRAM BACKGROUND

The primary Army Corps of Engineers regulatory authorities are:

- Sections 9 and 10 of the Rivers and Harbors Act of 1899, which prohibits the obstruction or alteration of navigable waters of the United States without a permit from the Secretary of the Army (33 U.S.C. 401, 403);
- Section 404 of the FWPCA, which requires a permit from the Secretary of the Army for any activity involving the discharge of dredged or fill material into waters of the United States (33 U.S.C. 1344); and
- Section 103 of the Marine Protection, Research, and Sanctuaries Act, which prohibits the transportation of dredged material for the purpose of dumping such material in the ocean, without a permit from the Secretary of the Army (33 U.S.C. 1413).

About 40 percent of the 15,000 individual permit applications submitted to the Corps each year require evaluation only under Section 10; 30 percent involve both Section 10 and 404; and 30 percent involve Section 404 only. Of the approximately 15,000 standard individual permit applications evaluated by the Corps each year, about 10,000 are issued and 500 denied. The remaining approximately 4,500 applications either qualify for authorization under a general permit, are withdrawn by the applicant, or are canceled by the Corps when the applicant fails to provide information required for a decision. In addition to individual permits, the Corps verifies authorization of approximately 40,000 minor activities each year under the terms and conditions of regional and nationwide general permits. We estimate that over 40,000 additional activities are completed each year under the terms and conditions of general permits that do not require reporting.

Approximately 92 per cent of all permit evaluations (i.e., both individual and general permits) are completed in less than 60 days. Most of those completed in less than 60 days are general permit evaluations and those individual permit applications that are not complex and/or controversial. About 50 percent of the individual permit applications are completed in less than 60 days, with an additional 25 percent decided in less than 120 days, and the remaining 25 percent may take up to one year, or in rare instances more than a year, to complete. Individual applications that involve complex projects or sensitive environmental issues usually require more than 60 days to reach a decision.

Section 404 applications are evaluated to ensure compliance with the Section 404(b)(1) Guidelines, which provide criteria for evaluating the potential unacceptable adverse impacts of the proposed activity on aquatic resources. The Guidelines, which were promulgated in December 1980 (40 CFR, Part 230) by the Environmental Protection Agency (EPA), in conjunction with the Army, contain the substantive environmental criteria by which the Corps reviews all Section 404 permit applications. Corps permits are issued under Section 404 only when the work involved complies with the Guidelines and on balance is not found to be contrary to the public interest.

As the agency responsible for the day-to-day operation of the Regulatory Program, the Corps must act as the project manager and make final permit decisions. This role includes the responsibility for reviewing Section 404 permit applications to determine compliance with the Corps permit regulations, the Section 404(b)(1) Guidelines, Section 7(a)(2) of the Endangered Species Act, and numerous other statutes. While the final decision regarding the permit application, including a determination of compliance with the 404(b)(1) Guidelines, rests solely with the Corps, the Federal and state resource agencies have an important role in the Regulatory Program. The Corps must consider fully comments received from other agencies when determining whether to issue the permit, to issue the permit with conditions and/or mitigation, or to deny the permit.

The Regulatory Program also includes an enforcement arm which investigates some 6,000 reported violations annually and inspects permitted activities for compliance with the terms and conditions of issued permits. In addition to permit evaluations and enforcement, the Corps conducts approximately 25,000 jurisdictional determinations each year, in response to the request of citizens seeking to know if permits are required for their proposed projects.

### RECENTLY COMPLETED ACTIONS

Always of concern to those involved with the Regulatory Program has been the complexity of the process used to evaluate permit applications. The Army has devoted considerable effort to streamlining the regulatory process in order to avoid unnecessary burdens on the regulated public, while still retaining a high degree of environmental protection. The thrust of this effort was to make administrative changes in the Regulatory Program that reduced delays, duplication among Federal and state agencies, and impediments to timely permit decisions while leaving the environmental requirements of the program intact. We believe that recent regulatory actions have improved the program.

Measures recently completed include the following: issuance of guidance describing Federal agency roles and responsibilities; establishment of shorter time limits in the Section 404(q) elevation process and focusing the elevation process on projects that involve aquatic resources of national importance; issuance of guidance on the Intermodal Surface Transportation Efficiency Act of 1991; implementation of the 1987 *Corps of Engineers Wetlands Delineation Manual* (1987 Manual); and increases to the Corps regulatory staffing levels. A more detailed discussion of these actions follows.

**Regulatory Guidance on Agency Roles:** A consistent criticism of the Regulatory Program in the past was that the regulated public did not have a clear understanding of which Federal agency was responsible for making Section 404 regulatory decisions. In May 1992, the Corps issued a Regulatory Guidance Letter (RGL) which emphasizes the role of the Corps in actively managing permit evaluations and making permit decisions. This guidance also recognized the roles and responsibilities of other Federal agencies involved in this program. The Regulatory Program must operate in an efficient manner in order to protect the aquatic environment and provide fair, equitable, and timely decisions to the regulated public. Clear leadership and a predictable decision-making framework enhances the public's acceptance of the program and allows the program to meet the important objective of effectively protecting the Nation's valuable aquatic resources. Implementation of this guidance has helped to streamline the permit process by minimizing delays, while maintaining a meaningful opportunity for substantive

participation by all relevant Federal agencies. While the RGL clearly states that the Corps is the Federal permit decision-maker and project manager for the Regulatory Program, it also reiterates that the Corps must consider all timely, project-related comments from other Federal agencies when making regulatory decisions. Consistent with this guidance we continue to encourage the Corps and other resource agency field offices to maintain and improve their working relationships.

**Section 404(q) MOAs:** In December of 1992 we completed an initiative to revise and improve the Section 404(q) Memoranda of Agreement (MOAs) between Army and the EPA, the Department of Commerce (National Marine Fisheries Service) and the Department of the Interior (Fish and Wildlife Service). The MOAs were entered into under the general authority of Section 404(q) which calls upon the Army to enter into interagency agreements "to minimize, to the maximum extent practicable, duplication, needless paperwork, and delays in the issuance of Section 404 permits." Prior to adoption of the 1992 MOAs, the Corps and the resource agencies operated under MOAs signed in 1985 and 1986. Experience with these MOAs identified certain problems. For example, the previous MOAs placed no time limits on informal consultations which often resulted in avoidable delays in reaching permit decisions.

The purpose of the 1992 MOAs is to establish a formal, more disciplined process that facilitates more timely permit decisions in an efficient manner while giving the resource agencies assurance that their views will be given full consideration. The MOAs provide a mechanism for resolving policy issue disagreements without delaying individual permit decisions, as well as a mechanism which allows the resource agencies to request elevation of a Corps individual permit decision for review by the Assistant Secretary of the Army for Civil Works, where the permit would have "unacceptable adverse effects to aquatic resources of national importance." The revised MOAs established procedures which should minimize the 404(q) process delays applicants have experienced in the past. The revised MOAs have more rigorous time frames for permit elevation and require the concurrence of the resource agency's highest level regional management before the elevation process can be initiated. We believe that the new MOAs provide for an avenue of higher authority review when aquatic resources of national importance are involved, while recognizing the Corps role as Federal permit decision-maker and the need for timely decision-making while protecting aquatic resources.

**Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA):** In December of 1991, ISTEA went into effect to renovate the Nation's transportation infrastructure. Recognizing the important role of the Regulatory Program in the regulation of transportation projects that affect aquatic resources, we worked with the Department of Transportation and the EPA to identify ways to eliminate unnecessary regulatory burdens and delays. In May of 1992, the Corps, EPA and Federal Highway

Administration issued guidance to our field staff, which provided that transportation projects receive expeditious review and timely decisions. The guidance recognized, however, the importance of environmental protection and the necessity to comply with all legal, including regulatory requirements. The guidance also endorsed the continued use, where appropriate, of general permits and mitigation banking for transportation projects as a way to reduce delays while protecting and enhancing environmental resources, in particular wetlands.

**1987 Wetlands Delineation Manual:** Pursuant to the 1992 and 1993 Energy and Water Development Appropriations Acts, since August 17, 1991, the Corps has been using its 1987 Manual rather than the controversial 1989 *Federal Manual for Identifying and Delineating Jurisdictional Wetlands* (1989 Manual). The 1993 Act included language that requires the Corps to continue to use the 1987 Manual until a final wetlands delineation manual is adopted. Prior to 1989, the 1987 Manual was used on an optional basis by most Corps field offices. Both manuals describe the technical criteria, field indicators, and other sources of information necessary to make consistent wetland jurisdictional determinations. As a result of the current mandatory implementation of the 1987 Manual, we estimate that FWPCA wetlands jurisdiction may be slightly more than it was prior to 1989, but less than it was under the 1989 Manual. We believe that the delineations made with the Corps 1987 Manual accurately reflect wetland conditions. On January 4, 1993, EPA agreed to use the 1987 Manual. We expect the 1987 manual to be used until the National Academy of Sciences completes the study discussed later in this testimony.

**Resource Increases:** The Army Regulatory Program has received vital increases in funding during the past few years. As a line item in the Corps overall budget since 1987, the program has had high visibility. These increases in funding have been well spent on increases in our overall staffing to help keep pace with a continually increasing workload. A 1990 Corps study recommended a 25 percent increase in staff to improve service to the public. A plan to increase staffing was initiated in Fiscal Year 1991. By the end of Fiscal Year 1992, regulatory staff had increased 20 percent (to approximately 1100 FTEs) over Fiscal Year 1990 levels. We anticipate that funding for Fiscal Year 1994 will allow the Corps to maintain these levels of staff and services to the public.

## ON-GOING INITIATIVES

Complex ecological, engineering, economic, and legal issues make the Section 404 program challenging and inherently controversial. Despite the program's complexity and the heavy workload, we believe that significant progress has been made and that the regulated public's concerns have diminished over the past year. We firmly believe that

the program is now on a solid course. For example, the permit application backlog has been reduced in the last year from 7700 to 6800. In addition, the increases in our regulatory staff are only now beginning to provide program benefits because regulatory personnel generally need at least a year of training and experience to become effective project managers. We are continuing to work with other Federal agencies to develop and pursue additional administrative changes to improve the Regulatory Program from both an operational and environmental protection standpoint. A discussion of some of our on-going initiatives follows.

**Wetlands Delineator Certification and Training Program:** Section 307(e) of the Water Resources Development Act of 1990 authorized the establishment of a program for the training and certification of individuals as wetland delineators. This Act also required the Corps to carry out demonstration projects in Corps districts prior to establishing the Wetland Delineator Certification Program (WDCP) nationwide. The intent of the WDCP is: 1) to improve the quality and consistency of wetland delineations, and 2) to streamline the regulatory process by developing procedures for expediting consideration and acceptance of delineations performed by certified delineators. WDCP demonstration projects, which are in progress in the states of Washington, Maryland, and Florida, are being administered by the Corps Seattle, Baltimore and Jacksonville districts, respectively. Other Federal and state agencies are working with these districts on this important project. These districts began accepting applications for certification on February 1, 1993. To obtain certification, individuals must meet certain minimum education and experience requirements, as well as pass written and field examinations.

**Flexibility Regulatory Guidance Letter:** Each proposed project requiring a Section 404 permit must be in compliance with the Section 404(b)(1) Guidelines. The Army remains committed to the "sequential" approach to mitigation as articulated in the 1990 Army/EPA Mitigation MOA (i.e., in general, impacts must first be avoided to the extent practicable, then minimized, and finally all remaining impacts must be compensated for to the extent appropriate and practicable). In this regard, an integral part of the Guidelines' requirements involves a determination that the project represents the least environmentally damaging practicable alternative. Compliance with this provision of the Guidelines has engendered considerable controversy. To address this concern the Corps and EPA are developing guidance to clarify the appropriate level of review that should be given to permit applications when making determinations of compliance with the Guidelines' alternative analysis. As appropriate, the Corps will coordinate with the Fish and Wildlife Service and the National Marine Fisheries Service in the development of this RGL. Our basic approach is to ensure that the level and detail of the alternatives analysis is commensurate with the value of the aquatic resource to be affected. The Guidelines do not contemplate that the same intensity of analysis will be required for all types of projects but instead envision a correlation between the scope of

the evaluation and the potential extent of adverse impacts to the aquatic environment. Our objective is to complete the guidance on this issue within the next two months.

**Wetlands Mitigation Banking:** First, with regard to wetlands mitigation banking we believe that it can play an important role in the regulation and protection of wetlands. The 1990 Army/EPA Mitigation MOA states: "Mitigation banking may be an acceptable form of compensatory mitigation under specific criteria designed to ensure an environmentally successful bank." While mitigation banking cannot obviate the requirement to apply the sequential approach to mitigation, it can be a valuable form of compensatory mitigation. Because mitigation banks are generally created in advance of impacts associated with a particular permitted project, the bank can reduce temporal impacts and provide a higher degree of certainty that wetlands functions will be compensated for. The Corps and EPA are developing Section 404 guidance that will provide procedures and guidelines for establishing, evaluating, and withdrawing credits from a wetland mitigation bank. In addition, the Corps Institute for Water Resources, located at Fort Belvoir, Virginia, is preparing a planning study on mitigation banking. The first initiative was to determine how many mitigation banks are in existence and the number of mitigation banks planned. As of July 1992, there were 46 existing mitigation banks and an additional 64 were identified as "proposed." The majority of these existing banks were established by State Departments of Transportation and Port Authorities. The private sector has been slow to establish mitigation banks due to: 1) the large capital investment required and; 2) the uncertainty regarding use of mitigation banking in the Regulatory Program. It is anticipated that once the mitigation banking guidance is issued, some entrepreneurs may begin establishing mitigation banks. Mitigation banks should enable the government to move more effectively toward the goal of "no net loss" of wetlands functions and values. In addition, banking may allow larger more productive wetland areas of higher quality to be established through restoration projects. If implemented with clear expectations and conditions, mitigation banking can produce a win-win situation which we strongly support.

**Programmatic General Permit Guidance:** Pursuant to Section 404(e)(1) of the FWPCA, the Corps has the authority to issue general permits for any category of activities that are similar in nature and result in no more than minimal adverse effects on the environment, either individually or cumulatively. General permits can be issued on a national, regional or programmatic level. We are currently preparing a RGL on the use of programmatic general permits (PGPs). As appropriate, the Corps will coordinate with the Fish and Wildlife Service and the National Marine Fisheries Service in the development of this RGL. PGPs, which operate in conjunction with a State or local regulatory program that protects the aquatic environment in a manner equivalent to the Army Regulatory Program, are designed to reduce unnecessary duplication between Federal and State or local regulatory programs. The RGL will identify the limitations

that Corps districts should place on PGP's to ensure that they protect the environment and other aspects of the public interest. Our encouragement of the use of PGP's should not be viewed as a method to allow the Corps to excise itself from the Regulatory Program or simply to reduce workload. We are recommending increased use of PGP's only in situations where existing State, regional or local authorities provide for strong environmental protection. Such PGP's will reduce unnecessary duplication and allow the Corps and other Federal agencies to focus better their resources on other activities. In particular, the Corps hopes to enhance its efforts in ensuring compliance with permit conditions.

**Regulation of Excavation Rule:** On June 16, 1992, the Corps and EPA issued a proposed rule that would clarify and improve the Regulatory Program. The proposed rule would make three changes to the Section 404 regulations. One would clarify the definition of "discharge of dredged material." Another would clarify when the use of pilings in waters of the United States should be regulated. The third would codify that prior converted croplands are not regulated under the FWPCA. The first two changes were proposed in accordance with a settlement agreement resolving a Section 404 lawsuit (*North Carolina Wildlife Federation v. Tulloch*).

These proposed changes would close a loophole that has allowed some project proponents to undertake activities that destroyed or degraded wetlands without being subject to regulation under Section 404. At the same time, the rule would ensure that some 60-million acres of prior converted cropland remain outside the scope of the Section 404 program.

The first proposed change revises the definition of "discharge of dredged material" to clarify that the phrase includes discharges associated with mechanized land clearing, ditching, channelization and other excavation activities when those activities destroy or degrade wetlands or other waters of the United States. Discharges associated with activities that do not destroy or degrade waters of the United States will not require a Section 404 permit. This rule will not affect the existing exemptions for normal farming, ranching and silviculture practices (Section 404(f)).

The agencies' current definition of "discharge of dredged material" excludes minimal, incidental soil movement occurring during normal dredging operations. Application of this language in the field has sometimes led to inconsistent results. For example, some small excavation discharges resulting from land-clearing and drainage in wetlands have been excluded from regulation, even though the discharge was part of an activity that had significant effects on wetlands or other waters of the United States.

Consistent with the FWPCA, this proposal will regulate only those activities that involve a discharge of dredged material into waters of the United States. We believe that the proposed changes will improve regulatory consistency, equity, and wetlands protection.

The second proposed change incorporates into the Section 404 regulations existing Corps guidance on when the placement of pilings should be regulated. In the past, some development projects have been constructed on pilings in order to avoid Section 404 regulation. Under the proposed rule, the placement of pilings would be regulated under Section 404 when such placement has the effect of a discharge of fill material.

The third proposed change would incorporate into FWPCA regulations Corps guidance issued in September 1990 stating that prior converted croplands are not waters of the United States and, as a result, are not regulated under the FWPCA. Prior converted croplands are areas that, prior to December 23, 1985, have been cropped and otherwise manipulated to the extent that they are inundated with water for no more than 14 days during the growing season. This proposed change would assure consistency with provisions of the Food Security Act, as amended.

**National Academy of Sciences Wetland Study:** As required in the Departments of Veterans Affairs and Housing and Urban Development, and Independent Agencies Appropriations Act of 1993 (PL 102-389), the EPA is funding the National Academy of Sciences (NAS) to conduct a study of the scientific basis for wetlands identification and delineation. The NAS study will include an evaluation of the scientific validity and practicability of existing wetlands delineation manuals. The Corps is a member of an interagency liaison group that will provide background information, reference materials, and logistic support to the NAS study committee. We expect that the NAS will take at least 18 months to complete its study. In the interim, the Corps and EPA expect to continue to use the Corps 1987 Manual for identifying and delineating wetlands subject to regulation under Section 404.

**Watershed Management:** As we look toward the future, management of the Nation's water resources on a watershed-by-watershed basis will likely become the strategy of choice. The Regulatory Program provides several tools that may be used where a holistic watershed management approach is chosen. Special area management plans or advanced identifications, general permits, and mitigation banks, are well-suited for this type of effort. Special Area Management planning is intended to help steer development activities away from environmentally sensitive aquatic resources, including wetlands. The Corps works closely with EPA on EPA's related program, the Advance Program Identification of Wetlands. Both programs are proactive attempts to identify important areas in advance of development activity, so environmental conflicts can be

minimized and responsible economic growth can proceed unimpeded. Where there are state or local interests willing to conduct the advanced planning, tailor local laws and regulations to properly protect aquatic resources, identify potentially developable areas, and identify aquatic ecosystems that should be preserved or restored, the Corps stands ready to help make those plans implementable in the most efficient and effective manner consistent with necessary environmental protection. The Corps, working with EPA and other Federal agencies, is prepared to use these regulatory tools to reduce duplication with state and local agencies and to effect restoration of degraded portions of the watershed through required mitigation for activities permitted within the watershed. This type of watershed management strategy will improve the Regulatory Program by providing a more comprehensive approach to aquatic resource protection. This will directly benefit the public through increased predictability and reduced delays associated with permit evaluations. Such a strategy, however, will only be successful if there is a spirit of cooperation that leads to dedicated participation by all parties: Federal, state, local and private landowners.

### **OTHER ARMY CIVIL WORKS WETLAND ACTIVITIES**

The Corps civil works environmental and wetlands activities have evolved over recent years into a coherent program with a unified philosophy -- the restoration and preservation of significant environmental resources consistent with the dual fiscal principles of efficiency and cost-sharing. These activities are carried out under the Section 1135 Program (project modifications for improvement of the environment), the Beneficial Uses of Dredged Material Program, the Coastal Wetlands Planning, Protection and Restoration Act (PL 101-646) and other wetlands restoration activities. In addition, the Corps is working with eleven Federal agencies, the coastal states and over one-hundred non-governmental organizations in the Coastal America Program, a far-reaching cooperative effort to improve the coastal environment, a subject which I will discuss first. Finally, the Corps is pursuing a comprehensive Wetlands Research Program to support its operations and maintenance mission.

**Coastal America:** The Army has cooperated closely over the last two years with the Departments of Commerce and the Interior, and the Environmental Protection Agency to develop the Coastal America initiative. Because of this initiative's potential, additional departments and agencies of the Federal government, including Department of Transportation, expressed interest and are participating. A senior Corps employee has been detailed to serve as the Deputy Director of Coastal America.

The initiative provides for joint actions to address three major natural resource problems along the coasts of the United States: 1) contaminated sediments; 2) loss and/or

degradation of coastal habitats, including wetlands; and 3) pollution from non-point sources. The cooperation among the agencies and states achieves synergy through the coordinated application of existing authorities and resources. Site-specific problems are addressed on a watershed basis through the cooperative efforts of the participating Federal, state, local agencies and non-governmental organizations.

The Coastal America agencies have examined coastal problems in seven geographic regions: Alaska; Pacific Northwest; Southwest; Gulf of Mexico; Southeast; Northeast; and the Great Lakes. Within each region, site-specific problems were identified through the active involvement of Corps districts working in concert with each of the participating Federal agencies on regional implementation teams. In Fiscal Year 1992, the partnership agencies initiated 24 joint projects that address one or more of the three major natural resource problem areas identified in their regions. These projects are valued at nearly \$10 million, one-half of which is provided by non-Federal project sponsors. These projects were not specifically funded under the Coastal America initiative, but were implemented under existing program authorities of the participating agencies. Upon completion of these 24 projects, nearly 5,000 acres of wetland habitat will have been restored, over 200 miles of spawning streams will have been opened by removing man-made restrictions, 50 farms will have implemented non-point source controls, and critical habitat for over 10 endangered species will have been protected. These projects represent the beginning of a new way of doing business -- one in which the combined talents and assets of the Federal, state, and local governments and private interests can effectively solve both immediate and long-term environmental problems. The Corps has the lead on six of the twenty-four projects, all of which address wetland restoration, and is an active participant on many of the others.

**Section 1135 Program:** This program was authorized by WRDA 86, as amended, and provides for modifications to existing Corps projects to improve the environment. Since receiving initial program appropriations in FY 1991, 44 studies have been initiated, seven of which have resulted in construction approvals. Two additional studies receive individual appropriations. One project approved for construction, closure of the "New Cut" at Savannah Harbor has been completed. This project modification will help restore approximately 4000 acres of coastal fresh water marsh. Several proposed Section 1135 modifications have been incorporated into the Coastal America initiative. Two of these are among the modifications approved for construction. One, Salt Bayou at McFaddin Ranch, Texas, will enable improved water regulation to preserve and restore approximately 60,000 acres of fresh to brackish wetlands along the Gulf Intercoastal Waterway. The second approved modification will use dredged material from the Calcasieu River to create marsh substrate in the Sabine National Wildlife Refuge, La.

Many of the proposed Section 1135 modifications have been formulated to respond to needs identified in the North American Waterfowl Management Plan, including the management of wetlands to restore waterfowl habitat. Although most of these projects are relatively small in scope, their cumulative effect demonstrates that the Corps is using its engineering expertise to devise effective, efficient solutions to environmental problems.

**Beneficial Uses of Dredged Material:** The Corps has informally employed the concept of beneficial uses within its dredging program for many years, and as formal policy since at least 1968. A recent Office of Technology Assessment study has reported that about 95 to 97 percent of the sediments dredged from coastal waters each year (about 150 million cubic yards) are considered suitable under Federal environmental criteria for a wide range of disposal options, including beneficial uses. In the recent past, about 15 to 20 percent of this material has been used annually for beneficial uses.

Corps authority for beneficial uses of dredged materials was originally limited to projects incidental to maintenance or construction and where there was no increase in cost to the Federal government or where the local sponsor would pay the incremental increased cost. The Corps received further authority for beneficial uses of dredged material for placement of material on beaches under Section 145 of the Water Resources Development Act of 1976 as amended. This authority, justified primarily as hurricane and storm damage reduction, requires 50-50 cost-sharing of incremental costs, and that the beach be public. Section 1135 of the Water Resources Development Act of 1986 provides further authority for dredged material beneficial use. Finally, Section 204 of the Water Resources Development Act of 1992 allows the Corps to participate in projects to use beneficially dredged material for aquatic habitat and wetland creation, restoration and protection. The authority is applicable to the construction, operation, or maintenance of an authorized Federal navigation project. There is a \$15 million annual appropriation limit on the authority, and the President's budget includes \$3 million to initiate the program in Fiscal Year 1994. The Corps and EPA have been working with interested states and others to address some of the issues associated with beneficial use of dredged material. One example of this partnership was a recent workshop held in Louisiana to discuss options for using dredged material to restore wetlands.

**Coastal Wetlands Planning, Protection and Restoration Act (PL 101-646):** The Corps is the chair of the interagency task force established by the Coastal Wetlands Planning, Protection and Restoration Act. The task force consists of the Secretary of the Army, the Administrator of the Environmental Protection Agency, the Governor of the State of Louisiana, the Secretaries of the Interior, Agriculture and Commerce. The purpose of this Act is to plan, design, construct, maintain, and monitor coastal wetlands restoration projects that provide for the long-term conservation of coastal wetlands and dependent fish and wildlife populations in coastal Louisiana. The first priority project

list was submitted by the task force in November 1991. The Corps will be the lead agency on four of the fourteen projects named on the list. The second priority project list was submitted in November 1992 by the task force. The Corps will be the lead agency on two of the fourteen projects named on this list. In addition to the individual projects being implemented, the task force is also preparing a restoration plan which is to be submitted in November 1993. The plan is to be a comprehensive plan for restoring Louisiana's coastal wetlands.

The development and implementation of these projects is cost-shared 25 percent non-Federal (State of Louisiana) and 75 percent Federal. Federal funds to support the development and implementation of these projects come from the Sport Fish Restoration Account, administered by the Department of the Interior. The Corps signed cost-sharing agreements on its first two projects with the State of Louisiana on April 17, 1993. The projects include the La Branche marsh creation project in St. Charles Parish and the Vermilion River cutoff in Vermilion Parish.

**Other Wetland Restoration Activities:** The restoration of wetlands is a significant part of the Corps water resources development program. There are two specific projects that I would like to highlight that demonstrate our commitment to wetland restoration. The Water Resources Development Act of 1990 authorized a feasibility study of the Kissimmee River in central and southern Florida to provide a comprehensive plan for the environmental restoration of the Kissimmee River. The Kissimmee River Flood Control Project was constructed by the Corps in the 1960s and consists of canals and water control structures. The project's construction, however, also reduced wetland acreage and degraded water quality resulting in a decline in fish and wildlife species diversity and populations. The environmental restoration plan that has been developed for the Kissimmee has two major components: a Headwaters Revitalization Project and a River Restoration Project. The Headwaters Revitalization Project, authorized by Section 46 of the Water Resources Development Act of 1988, will modify the existing Federal project in the upper basin to restore more natural flows into the lower basin. The second component of the Kissimmee project is river restoration which was authorized by the Water Resources Development Act of 1992. The river restoration will modify the Federal project by restoring the former wetland ecosystem in the lower basin, with its associated wildlife, fishery, water quality and aesthetic values. Both components are currently in the design stage with construction of the Headwater Revitalization Project scheduled for Fiscal Year 1996 and the River Restoration Project scheduled for Fiscal Year 1997.

A second major effort is the restoration of the Everglades ecosystem. The Corps is an active partner in a cooperative Federal/State effort that will lead to the restoration of the Everglades ecosystem. These high priority activities represent a significant

commitment by the Departments of the Army, Commerce, the Interior, and EPA, and the South Florida Water Management District to reverse the negative environmental effects of past actions. The recovery and restoration of environmental resources of national significance are at stake in these highly visible efforts.

There are several different activities that are ongoing in the Everglades restoration. First, in cooperation with the National Park Service as authorized by the Everglades National Park Protection and Expansion Act of 1989, major ecosystem recovery activities are underway that will lead to the modification of certain water control structures in the Central and Southern Florida water management system to improve the flow regime through the Shark River Slough into the Everglades National Park. All funding for this work is being provided through the Department of the Interior.

A second activity involves another segment of the Central and Southern Florida project. Canal C-111, located at the extreme downstream limits of the project, separates the Everglades National Park from extensive agricultural areas in south Dade County. Study efforts are underway to examine modifications to C-111 to maintain or enhance flood protection while restoring sheet flows to the lower portion of the Everglades National Park through Taylor Slough.

Finally, a reconnaissance study will be initiated this fiscal year for a comprehensive review of the Central and Southern Florida project to determine what modifications are needed to restore the Everglades ecosystem while accommodating other interests. This study was authorized by the Water Resources Development Act of 1992. The Central and Southern Florida Flood Control Project is the Corps largest project in Florida, and elements of the project have been under construction for four decades. A comprehensive review of the project is needed to address the requirements of the Everglades restoration in the context of the other project purposes such as flood control and water supply.

Wetlands restoration has high priority in the Corps water resources program and the two efforts I discussed are just two examples from a number of ongoing studies and projects.

**Wetlands Research Program:** In 1991, the Corps initiated a four-year, \$22 million Wetlands Research Program (WRP) to support its operation and maintenance activities. The chief purpose of the WRP is to develop and field verify more rapid, cost-effective techniques and criteria for the (1) identification of wetlands areas, (2) delineation of wetlands boundaries, (3) evaluation of wetlands functions and values, (4) restoration, establishment and protection of wetlands, and (5) stewardship and management of Corps-owned wetlands. Products from the WRP will enhance the Corps construction and

operations activities, other Federal agencies and states wetland programs and the Section 404 regulatory program. This will translate into better protection of our Nation's valuable wetlands resources and better service to the public.

### CONCLUSION

In summary, I would like to emphasize the Army's commitment to protecting and restoring the Nation's aquatic resources. While we must continue to improve the Regulatory Program in the interest of meeting our environmental objectives and avoiding unnecessary burdens on the public, we believe that significant improvements have been made and will continue with proposed administrative initiatives. With an effective Section 404 Regulatory Program and the other wetland activities mentioned in this testimony, we see real potential for improving the protection and restoration of the nations wetlands -- and perhaps reversing the trend of losing these valuable resources.

Mr. Chairman, that concludes my statement. Mr. Davis and I would be pleased to address any questions that you or other members of the subcommittee may have.

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

TUESDAY, MAY 11, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER  
RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC  
WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to recess, at 10:04 a.m., in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. Good morning. We will reconvene this Subcommittee on Water Resources and Environment and continue with our hearings on the Clean Water Act. This will begin our final two days of hearings on this subject matter.

We've gone through a large number of witnesses who have provided us with some very valuable testimony over the past several weeks. We have accumulated a great deal of material over the past few years under the chairmanship of Henry Nowak, and I think we're pretty much at the point that we know where we want to go.

Today's witnesses will include some Members of Congress, a drinking water panel, the Wetlands Coalition, and home builders and contractors representatives. Tomorrow we're going to receive testimony from industry and business, State and city representatives, and an academic panel.

Mr. APPLGATE. Before we start, I will yield to my very good friend and substitute, I guess, for Sherry Boehlert, who is not here this morning, Mr. Tom Petri.

Mr. PETRI. Thank you very much, Mr. Chairman. It's a pleasure to have the opportunity just for a day, at any rate, to be ranking Member on this subcommittee again. Sherry asked me to express his apologies for not being able to be present, but he has to be in Boston to testify at an important hearing to gather information about a potential base closing in his district in New York State.

I've always believed that we can effectively protect our Nation's waters without crippling American industry. In fact, a quality water infrastructure will increase American productivity, and clean water will ensure that American agriculture continues to thrive.

Today's witnesses should shed important light on the steps we need to take to balance our Nation's water quality interests. I look forward to the testimony we're going to receive, particularly that from our colleague on the committee, Representative James Oberstar, and our other colleagues who will be testifying at the beginning of the hearing today. Welcome.

Mr. APPLGATE. I was looking at this magnificent little item that has been set up here by somebody, which apparently is a water pipe that is pretty much closed in with some kind of gook that has been traveling through this line for a great number of years, and these are the things that we hope to try to be able to correct and try to keep that down. But that's what happens to our arteries, the same thing that happens to the water lines. [Laughter.]

Mr. APPLGATE. We're very fortunate to have some Members of Congress, and I'd like to have the three of those who are going to come and testify today: our very distinguished chairman of the Aviation Subcommittee on Public Works, Jim Oberstar; and we have the very distinguished gentleman, Dan Schaefer; and Representative Tom Barlow.

Is Tom Barlow not here?

[No response.]

Mr. APPLGATE. Well, there isn't anything really I need to say about either one of these two fellows that hasn't already been said a number of times, but we always yield to the chairman of our very distinguished committee, and we will do that today.

Mr. Oberstar?

**TESTIMONY OF HON. JAMES L. OBERSTAR, A  
REPRESENTATIVE IN CONGRESS FROM MINNESOTA**

Mr. OBERSTAR. Thank you, Mr. Chairman, and Mr. Petri. It's a pleasure to be with you this morning. I apologize for having missed the earlier assignment. I had an irreconcilable conflict that day, as often all of us do.

There could be no more dramatic framework for the hearings you're conducting, Mr. Chairman, and for the issue that I wish to address this morning, than the tragic event that occurred in Milwaukee earlier this year when thousands of residents of that city were stricken with a flu-like illness caused by a protozoan called *Cryptosporidium* that, in subsequent inquiry, appears to have been borne to the Milwaukee drinking water from agricultural run-off to a tributary that drains into a river that drains into Lake Michigan, from which the City of Milwaukee gets its drinking water.

That protozoan managed to make its way through the city drinking water treatment system despite the chlorination and all the other precautions—sand filtration and all the rest—that the city takes to keep its water system safe. It made its way into the drinking water system and caused the illness of thousands of residents of Milwaukee.

The fact that a disease that begins in the stomach and the intestine of cattle could make its way into the intestines of human beings from land run-off to tributary to river to lake to drinking water system, through chemical treatment, and back into people's drinking water system, ought to be another red-flag warning signal to us, if we needed any others, like the foam drifting across Lake Erie in the 1950s and early 1960s, like the Cuyahoga River catching on fire, like raw phenols bubbling up in the Mississippi River by the time it got to New Orleans, which galvanized this country into action on clean water.

We've gone through the first phase, the point source treatment of polluted water, and now we face the second line. We have spent

nearly as much on water pollution clean-up as we have on savings and loan clean-up—about \$207 billion—in industry, \$130 billion; and municipalities, about \$65 billion. All of us have paid for it in the final analysis. Citizens and consumers have all paid for it.

We've done a superb job, I think, of getting industry—about 95 percent of point source from industry are complying with the Clean Water Act. About 90 percent of municipalities are complying. But the new frontier, if you will, of pollution abatement is open space—agricultural lands, forestry lands, construction sites—where the land is stripped bare and the soil runs off into the streams, into the tributaries, into the rivers, into the estuaries, and worst of all, of course, are the freshwater and saltwater estuaries, where so much aquatic life begins and changes and transforms.

We have 42 toxic hot spots throughout the Great Lakes. A lot of those toxics are found in sediments from run-off that collected in these 42 critical areas in the Great Lakes. These sinks of pollution continue to contaminate the food chain, ultimately winding up in human beings.

I think I'm the only Member of our Public Works Committee who was here when the Clean Water Act of 1972 was written. I was administrator of the committee staff at the time and worked through what we affectionately called "the long march," the nine-month conference with the Senate, and that was not an occasional meeting. Those were daily sessions of furious, vigorous debate. Most of that act focused on point sources, but one provision, Section 208, focused on run-off from fields, forests, construction sites, and city streets—non-point sources, that section—I happen to have been very closely associated with.

I am also the author of Section 319, Non-point Source Management Programs, added in 1987. In anticipation of this reauthorization, I have developed a draft bill—and I emphasize draft—to build on that earlier legislation. The implementation would rest on shared responsibilities. The States and local jurisdictions and organizations would be the main implementers of the legislation, working with the individual land owners and operators and proprietors. The Federal Government role would be to provide direction, guidance, and financial support.

The bill focuses on watersheds. I spent over 10 years working on this issue with agricultural organizations, everyone from the Farm Bureau to the Farmers Union and the National Grange and all the rest who have had an interest. I have taken this issue out and met with farm groups in my district, and others have done so elsewhere around the country, to try to get a consensus of what works, what's the best way to deal with this problem, and if we don't have voluntary and willing participation by agricultural groups, no matter how strong the enforcement, it just isn't going to work. So we've got to have their input, and we've done that, I think, to a very large and successful degree.

The bill would focus on watersheds that are impaired or watersheds that are threatened. It tracks the recommendations of Water Quality 2000. It would build on the section 319 program and draw in the non-point program in NOAA's Coastal Zone Management Program, as well as the USDA Conservation and Water Quality Programs. It builds on what farm groups wanted—good actors, bad

actors—incentives for good actors, incentives for those who are willing to participate, but an enforcement fall-back for those who are unwilling participants or who outright resist, refusing to clean up.

The bill sets as a goal the full restoration and protection of the Nation's waters, defined as attainment and maintenance of water quality standards. I don't propose in any way to abandon water quality standards that have been developed at high cost and a lot of work.

The program would operate in this way: Four years after approval by EPA and implementation, the State would come back and assess the status of this watershed and the clean-up efforts, and it would go back to the owner/operators who have implemented plans, other sources who are involved in the watershed, and determine whether additional measures are necessary. If so, then the State would be able, backed up by the Federal EPA, to implement even further measures. Every two years there would be a review of the water quality standards and the status of implementation of plans for that watershed until full restoration and protection has been achieved.

The EPA would develop standards, but States would be responsible for managing the non-point source program. If, however, a State fails to carry out its program, EPA could take it over, establish a program, but could not implement that program. Only the State would be able to implement, actually enforce a program, no matter how lax a State has been. We don't want to come in and have a Federal substitutional role for States. We want to prod them, push them, force them, make them do their job, but this is going to work best if we have cooperation at the State level and if we have cooperation and participation by the other Federal Government agencies with similar responsibilities.

We propose also to establish a citizen watershed monitoring program to involve the public in this process.

Finally, I propose \$100 million a year in funding for the non-point source program. I think given all the other dimensions of the Clean Water Program, \$100 million is relatively modest, and it is not too little to do the job. Some have said that's not very much. But it would operate through the State revolving funds. I would suggest that if we could get the \$100 million, this program will stretch those dollars and make them effective, because it doesn't take a great deal of money. We're not talking about huge structures. We're not talking about building multibillion-dollar sewage treatment facilities, with all the complexity that has gone into the treatment of point sources. This is much less costly, but far more effective if we can get the funding.

We did finally, after our former colleague, Mr. Traxler, became chairman of the HUD-Independent Agencies Appropriation Subcommittee, win funding for non-point source for three years. For the current fiscal year, however, the Administration did not request funding, and the Appropriations Committee, in the cutbacks last year, dropped the funding. But we did get up to \$47 million, which is about half of what I propose in an authorization for the future.

As I said at the outset, this is a draft bill. I do not offer it at this point as a final, definitive statement. We're still getting input

and welcome comment from Members and hope that when the bill is introduced and the committee moves to mark-up that we can have this bill fully considered and, I hope, adopted in most of its points.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you very much, Jim.

I'll say this for those who do not know, which I'm sure that you do, that there isn't anybody that I know that has been associated with this committee longer than Jim Oberstar, either as a staff person or as a Member, and he has written much of the law that's on the books that came through this committee, including economic development and Appalachian Regional Commission, which has been tremendously beneficial, and many of the things that we're talking about here now. So when he speaks, he speaks with some great authority.

Jim, could you stay around until we hear the rest of them, and then we'll just zip right through the other two? Or if you want, we can run through the questions now. However you want to handle it.

Mr. OBERSTAR. My colleagues are saying to go ahead and take the questions, and I see that I do have some Close-Up students coming into my office.

Mr. APPLGATE. I know how that is. I had 500 of them last Thursday.

Mr. OBERSTAR. Ohio is closer than Minnesota.

Mr. APPLGATE. Yes, you're right about that. Well, I don't have a whole lot, because I think you and I have talked a great deal, and I think I know pretty much where you are, but let me just say this. Of course, we know that you've done a great deal of work on both your draft and circulating your draft. Could you give us any idea of which interest groups, Federal and State, are reviewing and commenting on the draft?

Mr. OBERSTAR. I've given the bill to a very broad range of people and groups interested in the nonpoint source issue, including federal agencies such as EPA, the Soil Conservation Service, the National Oceanographic and Atmospheric Administration, the Tennessee Valley Authority, and U.S. Geological Survey. I've given it to various House and Senate Committee staffs and Members' offices. Also, I've distributed it to the states, through the Association of State and Interstate Water Pollution Control Agencies (ASIWPCA). I've also given it to many agricultural interests, including the Farm Bureau, the National Cattlemen's Association, the National Park Producers, the National Association of Conservation Districts. Also to the pulp, paper and timber groups and industries. And to the Chamber of Commerce, and some other industry groups. And, of course, to the environmental groups. I've met with a number of these, and received comments from more. So the bill has received wide distribution, and I've gotten back a broad range of comments which I plan to address in the next iteration of the bill.

Mr. APPLGATE. Okay. There are a number of groups who opposed your recommendations back in 1987 that ultimately became section 319, who now have sort of come on board, but oppose your

recommendations in the current draft. What non-point problems do you think need the most serious and immediate attention?

Mr. OBERSTAR. The most important thing we can do is to set up a watershed-by-watershed management program that operates, first, on incentives and, as a fall-back, upon an enforcement mechanism, and has a modest amount of funding to help farmers.

For example, on a dairy farm where a farmer is operating right up to a tributary, to a little creek, as we call it in Minnesota—out here and out East they call it a tributary, but Minnesota calls it a creek—and the cows get up too close to that creek, and all of their droppings eventually get washed off into the creek. Now, if the farmer would back up maybe 50 yards he would have some sort of a barrier so that the farm doesn't get that close, and there is some way to prevent that run-off. That takes away some grazing land maybe, it takes away some crop land, so he may need some kind of incentive. If he gets an incentive to back up, he's going to cooperate.

Those are the kinds of things that I'm talking about, protecting running water or still water from encroachment by agricultural or logging activities. For example, my district is a big logging area where you have a clear-cut and the land isn't properly protected, and you get a heavy rain and you get a lot of run-off. Well, what's running off could be some herbicides, and maybe some fertilizer and certainly a lot of debris in forestry activities that decays in the stream and causes pollution. Foresters, of course, don't want to have to spend the additional amount of money to establish those protections, but I think that it's necessary.

But I think the most important thing we can do is operate watershed by watershed, on a holistic basis, so you're bringing together—not singling out one activity, one practice, but looking at the totality of activities within that watershed.

Looking through the testimony that was given, farm groups testifying last week and in your previous hearings asked for a watershed-by-watershed approach. We have that. They wanted cost-effective site-specific plans. We've proposed that in this legislation.

Mr. APPLGATE. I think you're correct in stating that most of the groups that have come in seem to look toward that watershed management approach, and that may be the best direction in which we can go, and we're certainly looking at that. I thank you very much, Jim, and we'll be talking more, you and I, as we proceed down the line.

Mr. Petri?

Mr. PETRI. Thank you.

I have a number of questions. I don't want to burden you or someone in your office, but perhaps if I could submit them—

Mr. OBERSTAR. I'd be glad to respond here or in writing, whichever would be appropriate.

Mr. PETRI. I'll just ask one question, and then submit the rest, with the Chairman's permission, to you. Your bill calls for the development and enforcement of watershed implementation plans, and I understand it's for both non-point and point source pollution as part of the same plan, or would it be just non-point?

Mr. OBERSTAR. Non-point.

Mr. PETRI. Only non-point.

Mr. OBERSTAR. Yes, that's correct.

Mr. PETRI. So I guess the first question really is, why not have it be comprehensive and look at the tradeoffs between different types of pollution going into the watershed rather than just non-point pollution?

Mr. OBERSTAR. We already have a rather extensive regime for dealing with point sources, with a very strong enforcement program for industry, plus financial assistance for municipalities. Municipalities lag, frankly, behind industry in dealing with point sources. I didn't want to cross over into that area. What I wanted to do was to focus on what I see as the next frontier of the Clean Water Program, which is run-off from open land areas that does not come from a discrete point, for instance, a pipe. While we call run-off non-point, you may be able to identify a farm that is not using good agricultural practices, or you may be able to identify a logging sale, for example, that has not adopted or implemented good management practices, or a construction zone where the builder has stripped the land and hasn't put up the protective barriers to retain siltation after a rain.

But you have to look at this in the totality of its effect. There may be all three of those activities going on in a particular watershed.

Mr. PETRI. Well, now, at what point would the plan for a watershed turn into a permit for a particular activity by a farmer or other person within the planning area? I guess to some people who have looked at it, it sounds a lot like general or regional permits under EPA's current program for storm water and wetland regulation by the Corps.

Mr. OBERSTAR. As under current section 319, the States have the primary role in identifying and prioritizing their own watersheds and in administering the enforcement of programs. I envision that role continuing under the non-point source program. EPA ultimately will sign off on a State's program, but it's the State that's going to develop that program and implement the program, and if the State sees tradeoffs or sees need for flexibility or adjustment in it, they're going to have that ability. But EPA will approve the overall program. The State will actually operate it.

Mr. APPLEGATE. Thank you very much, Mr. Petri.

We're very fortunate to have our very distinguished chair of the full committee, Mr. Mineta.

The CHAIR. Thank you very much, Mr. Chairman.

Jim, I want to thank you for your thought and the work that you've put into this over the years. I'm wondering, to the extent that you delegate it to the States to establish standards, would that in any way weaken the process as it relates to the other portions of the Clean Water Act where the cry seems to be for national standards rather than State-delegated standards?

Mr. OBERSTAR. The EPA will establish water quality criteria. States will incorporate those criteria into their water quality standards. I retain in the non-point source program the existing water quality standards approach of the basic Clean Water Act. It's going to be principally in the implementation and the focus of each State on its plan where there would be some variation from State to

State. Not every State has the same agricultural practices or terrain as every other State, so we need to allow some flexibility.

The CHAIR. And to that extent, then, it would not come under the NPDES process in terms of the permitting?

Mr. OBERSTAR. It would not run counter to NPDES, no. It would complement the National Pollution Discharge Elimination System.

The CHAIR. As I recall, somewhere you also made reference to the Soil Conservation Service.

Mr. OBERSTAR. Yes.

The CHAIR. Someone might remind me. Is the Administration attempting to do away with the Soil Conservation Service or starve it of funds?

Mr. OBERSTAR. I hadn't heard that. If they try, there will be a great outcry in the countryside.

The CHAIR. I would think so, and I was trying to recall whether there was some attempt on their part to cut down on the funding—

Mr. OBERSTAR. Well, I think there was some talk about merging similar activities, combining a number of activities within the U.S. Department of Agriculture into one super subcabinet agency, but already the hue and cry has gone out across the countryside, as I've been hearing it from my district, about doing so. It's less elimination than consolidation into one super agency, and I think that's probably very ill-fated.

The CHAIR. Jim, I just want to thank you for the thought you've given to this. I guess what I want to make sure is that we don't bog down things from happening. I get the feeling today sometimes, is anyone interested in getting anything done anymore? And as much as we have to protect the future in terms of the environment, I'm just wondering to what extent, as we try to establish or make sure we adhere to standards, that it doesn't become a process that really just sort of bogs things down.

When it comes to non-point source, I think that's an area that we're going to have to treat very carefully, knowing how important it is, but to make sure that we don't, I guess, make ourselves less competitive in a global marketplace, whether it be industry or agriculture. As much as I want to make sure that our environment is protected, I just want to make sure at the same time that we just don't bog down the ability of the farming community or the industrial community from doing what they do best, and that's to produce and market our goods.

Mr. OBERSTAR. I appreciate your concern, because we both have in mind the near-disastrous experience with section 404 when the Corps of Engineers took a provision of the 1972 act and put to shame the miracle of the loaves and fishes and expanded it into 40 pages in the Federal Register. I'm very careful not to create a circumstance where we have another huge, costly, intricate, complicated regulatory program messed up as the Corps did with 404. I tried very, very carefully to avoid that situation, and yet at the same time, we have to address this problem of open space run-off.

The CHAIR. Thank you very much, Jim.

Thank you very much, Mr. Applegate.

Mr. APPLEGATE. Thank you, Mr. Chairman.

Mr. Hutchinson?

Mr. HUTCHINSON. Thank you, Mr. Chairman.

Following up on that, would your legislation envision the Federal Government having any role at all in the enforcement of the watershed implementation plans?

Mr. OBERSTAR. The implementation would be to the States. If a State fails to develop a plan, EPA can step in and develop a plan, but it will not have implementation authority. The implementation authority would be in the hands of the State.

Mr. HUTCHINSON. Okay. Thank you. What role will citizen suits play in enforcement of the plans and other requirements throughout the bill? We've had a rather bad experience in my State with the litigation problem.

Mr. OBERSTAR. The bill is silent on citizens suits. In fact, to get around that, I created in this legislation a citizen watershed monitoring unit that would be composed of people on all sides of the issue, watershed by watershed, who would have input into the administration of or implementation of and development of management plans.

Mr. HUTCHINSON. So it's your feeling that while that might not preclude lawsuits, it would minimize it?

Mr. OBERSTAR. That's my feeling. If you get folks in on the take-off, they're more likely to be with you on the landing as well.

Mr. HUTCHINSON. There are many, I think, sincere and environmentally committed people who would like to see more support given to these programs and to allow more time for them to also, in work, that we have not fully funded section 319, before we would move to a more restrictive, more regulatory kind of approach, that we should wait 4 or 5 years and fund properly and give proper support and proper study to that kind of voluntary program before dismissing it as inadequate or ineffective. What might be your response to that?

Mr. OBERSTAR. Well, what's in place now is a voluntary program, and I worked on that basis and took that advice and spent eight years developing this approach and seeing it work, and then when we got to the first crack of getting funding, of course, both the Administration and the House Appropriations Committee said, "Oh, we have to spend money on the manned orbiting laboratory instead of on non-point source pollution," and so I suggested "I hope you find water out there in space, because you're sure not going to have much clean water on Earth if you don't spend money to clean it up." Then we had a change of committee chairmanship and found a way to fund both space and Earth, and that program has been moving ahead, but very slowly.

There are folks who just aren't going to do something unless they know there's an enforcement mechanism, and I operate, as I said earlier, in this legislation, first, on the principle that incentives will get most folks, the good actors, those who express a willingness to comply, they're going to be participating, and there's going to be some incentive. But for those who are bad actors, those who will resist until the last minute, there has to be some enforcement mechanism, and the State level will be the best place to do that.

Mr. HUTCHINSON. Well, I also want to thank you for the hard work you've put in on this and for your presentation today. Thank you.

Thank you, Mr. Chairman.

Mr. OBERSTAR. Thank you, Mr. Hutchinson.

Mr. APPLGATE. Thank you, Mr. Hutchinson.

Mr. Hayes?

Mr. HAYES. Jim, there's no question that the non-point source issue is a valid one that you brought long before I served on this or other committees in the House and, as Mr. Mineta says, before I was born. Nevertheless, it's certainly an issue that should be raised. What I noticed in looking at the draft—and I realize in your own words it's a draft, not a finished bill to fruition, but there are a couple of things I'd ask about. One is, I'm not sure I understood, on the dividing of watershed into fifths, whether that meant a fifth of an estimated cost, a fifth of a plan, or geographically a fifth in size. What do you envision that as meaning?

Mr. OBERSTAR. Under the draft bill, the state would identify, and then prioritize, its impaired and threatened watersheds, and then divide the watersheds into five groups. The state would then develop and begin implementing a Watershed Implementatin Plan for each watershed in one of those fifths each year for five years.

Mr. HAYES. My reaction is not in opposition to it, but, once again, one of those differences of geography that you understand when you're talking about trying to localize some of the priorities, because I was thinking of the Mississippi River, and the watershed as you go down Louisiana is not really divisible easily into fifths geographically, and I'm not sure you can divide it by cost, it's so interlinked. I suspect in other places in Minnesota that's true. I suspect in other places, in different States, fifths would be a very reasonable and accommodating measure.

I would just urge you to try to put some of the same latitude that you want to give the States on others to perhaps come up with reasonable plans that may or may not have to be mathematically as precise, but make environmental sense and make good economic sense.

Mr. OBERSTAR. That's why we have this in a draft form and have received input from people and let others comment on it. It's an evolution.

Mr. HAYES. The second observation would be, and I would certainly support it, that when you do your legislation, you have it cut across other Federal programs, or it almost by definition becomes unworkable. I know that you mentioned another act that we can't leave out, but if we don't have a process—and I'll give you a specific example. Take your guy in Minnesota who is near the bayou that he calls a creek— [Laughter.]

Mr. HAYES [continuing]. And here you're talking about moving a fence or barrier. I promise you, from your State to mine, that's going to be on jurisdictional wetlands through a delineation manual and require 404 permitting as dredge and fill. If it comes under presently a general permit, then we have the Edwards bill that is saying each one of those has to be reviewed individually, even though we have no EPA employees in your State or mine to review them. They'd all come out of Dallas in my State, and I'm not sure what region you're in.

If we don't cut across some of those things to do the other, we'll just end up with endless additional layers of tape instead of addi-

tional environmental goals or additional water improvement through discharge, and I would just urge you to streamline your process, make it fair. In other words, balance it. You can't do something without authority, you have to catch the bad actors, and you've got to encourage the good, but you'll make them all actors who feel like they're in a miniseries that went on for an extended duration, week after week after week, if we don't give them a conduit that they can follow that isn't interposed with dozens of Federal layers.

That's not a disagreement with your approach, it's just a suggestion, because I would support any method that worked start to finish and didn't just become endless and entangled.

I thank you very much for your contribution and observations.

Mr. OBERSTAR. Well, on that particular point, the agriculture groups wanted a lead role for the USDA and for Soil Conservation Service, for example, and I've met with the SCS people. We brought them in, and I tried to understand their programs and give them that lead role, helping.

Mr. HAYES. Thank you very much, Mr. Chairman.

Mr. APPLGATE. Thank you very much, Mr. Hayes.

Mr. Hoekstra?

Mr. HOEKSTRA. No questions.

Mr. APPLGATE. Mr. Filner?

Mr. FILNER. [No audible response.]

Mr. APPLGATE. Mr. Menendez?

Mr. MENENDEZ. [No audible response.]

Mr. APPLGATE. Boy, Jim, you got off easy.

Mr. OBERSTAR. I want to thank my colleagues at the table here for their forbearance and my colleagues for their questions, very helpful and thoughtful. I appreciate that. And thank you, Mr. Chairman.

Mr. APPLGATE. Thank you very much for being here, Jim. We appreciate your input.

Next we will hear from another very distinguished Member of the Congress from the great State of Colorado, who serves in a number of minority legislative positions, and also is a very active Member of the Energy and Commerce Committee, Dan Schaefer.

It's good to have you before the committee, Dan.

#### TESTIMONY OF HON. DAN SCHAEFER, A REPRESENTATIVE IN CONGRESS FROM COLORADO

Mr. SCHAEFER. Thank you, Mr. Chairman, and Members of the committee, for allowing me to testify today on legislation that I've sponsored, which would be in cooperation, of course, with the Clean Air Act, and that's the Federal Facilities Clean Water Compliance Act. I will try to keep this very brief, because I know the Members' time is valuable to them, as we sit in a number of different committees. I would ask the Chairman to allow me to submit my statement as part of the record.

Mr. APPLGATE. Without objection, your prepared statement will appear in the record.

Mr. SCHAEFER. For the Members of this committee, the title of this bill, H.R. 340, may have a familiar ring. Those who were here last year, during that Congress, remember that Congressman Eck-

art and I had worked for five years to get legislation through that would say to Federal facilities, who had sovereign immunity prior to that time, that they have to now comply with RCRA, the Resource Conservation and Recovery Act. This, I think, was very, very important. It's starting to send a lot of waves out amongst the Federal facilities throughout this country. In talking with people from the EPA, this is definitely what they are telling us.

So this year what we have done is to introduce legislation, H.R. 340, that would now say to the Federal facilities that they have to comply as well with the Clean Water Act. If the Chair and the Members would look at the chart we have over here of figures from EPA, the out-of-compliance of Federal facilities is about 15 percent. It ranges up and down a bit. It's getting better. But if you look at the private industry, outside of one particular month where—these were taken in June of each year—it shot up, but, generally speaking, private industry is complying all the way along with the CWA. So why not have to have the Federal facilities comply as well?

The biggest opposition that Dennis and I had over this five-year period was from the Department of Defense and the Department of Energy, mainly because of the Defense facilities and, of course, the various Department of Energy plants that do make weapons.

As a matter of fact, as recently as September of 1991, an alarming 20 percent—one in five—of major Federal facilities were cited by EPA as being in significant non-compliance with the Clean Water Act. Even more disturbing, a General Accounting Office study showed that of those Government facilities in violation of CWA, more than 40 percent remained so for a year or longer. In its report, GAO's recommendation to Congress could not be more clear: EPA and the States need to improve enforcement at the national Federal facilities.

Unfortunately, efforts by State and Federal regulators to improve compliance rates have been repeatedly frustrated because Congress, as the Supreme Court recently confirmed—that was just approximately a year ago—has failed to waive sovereign immunity under the Clean Water Act. Federal agencies have largely been protected from State-levied civil penalties and administrative enforcement actions. This has set up the curious situation in which EPA and the States are prohibited from assessing against Federal facilities enforcement methods that they routinely do against private industry.

I believe this double standard must stop, and I would think that the committee would certainly agree with this. There's simply no reason why the Federal Government should not be forced to abide by the same rules it imposes on others. H.R. 340 would correct this inequity by waiving sovereign immunity for violations of the Clean Water Act, thereby subjecting Federal agencies to State and EPA enforcement actions. It is closely modeled after last year's successful RCRA effort, which Mr. Eckart and I got actually five times through the House, and the last one passed with only three dissenting votes.

Recently I spoke with individuals in the Federal facility office at EPA regarding the effect waiving sovereign immunity had on their ability to enforce provisions of the RCRA statute. The answers I received were very encouraging. I was told that while just months

ago Federal environmental regulators were dealing with lieutenants and captains, they're now dealing with generals. They're now finding generals across from them at the table trying to comply with the legislation that Mr. Eckart and I were able to pass.

It is with no pride of authorship that I bring this legislation to the committee. In fact, having just finished a five-year struggle, as I said, on the RCRA side, I would certainly have no objections to its inclusion in the upcoming Clean Water Act reauthorization bill. In fact, I urge the committee to do just that and would welcome an opportunity to work with you in that regard.

In closing, Mr. Chairman, and Members of the committee, I would ask that a resolution adopted unanimously by the National Association of Attorneys General in support of H.R. 340 be made a part of the record.

Again, Mr. Chairman, I thank you very much and the committee for allowing me to testify today.

Mr. APPLEGATE. Thank you very much, Dan. Let me ask you this. Taking a look at that chart, what's the significance of June of 1990? Why did that shoot up like that?

Mr. SCHAEFER. Well, this was just an abnormality. We asked the EPA what the particular reasons were, and they really couldn't give it to us. They just said that over a period of time from 1986 to actually 1990, it was rather constant, and then a number of things came into play. We can try and get some more information. We received all these figures from EPA and developed our own chart, but they couldn't give us a real specific why in that one-month period, of which they do it in that month of June every year, it shop up. But we can certainly look more into it.

Mr. APPLEGATE. In fact, it doubled.

Mr. SCHAEFER. Yes. Well, an important factor is that all along most of it had been in compliance of less than about 8 percent or so. I mean, they were really complying, and the Federal facilities were much higher than that out of compliance. But we can certainly check further into that and see if we can get some specifics on it.

Mr. APPLEGATE. Yes, it would be of interest to find out just why in that particular month—

Mr. SCHAEFER. I asked my staff the same thing this morning when we looked at it, and we couldn't get a specific answer.

Mr. APPLEGATE. It would seem to me if it could do it any one particular month like that, it could do it in any particular month of any year. Let me ask you this. The Congress, now that they've approved the enhanced enforcement action against Federal RCRA violators, have you seen any change in the compliance behavior of the various Federal agencies?

Mr. SCHAEFER. We just had the EPA in about a month ago and talked to them about what effect the Federal Facilities Compliance Act was having. As I mentioned in my testimony, in the past, whenever they were trying to work out deals with the various agencies, particularly, in this case, DOD, they were having to deal with subordinates—the lieutenants, the captains, et cetera. They did not have to really get into it and do anything. It took them a long period of time, and now they're dealing with the hierarchy, the generals, that are saying, "We want to comply now." Prior to that,

there wasn't any enforcement by anybody. The EPA could say, "Well, you should be doing this or that," but they didn't have to do it. So now what it's done is it's forced the Federal facilities to work deals out with the States, whereas before the States had no authority at all, and now they have to do it.

I know in my own case in Colorado, the Rocky Mountain Arsenal out there, a tremendous problem we've had for years, terribly polluted, that we've finally been able to work a deal out. Rocky Flats, a DOE facility producing plutonium triggers, now the States will be able to get into it.

So they are very encouraging. As a matter of fact, they say it probably could be one of the most significant pieces of legislation environmentally that we have on the books at the time.

Mr. APPLEGATE. Well, I can agree with you on that. It seems to me that that's just a continuance of how people look at the Federal Government, though. We aren't exempt, but they perceive us to be just exempt from all the other laws that govern the rest of the people.

Mr. SCHAEFER. That's exactly right.

Mr. APPLEGATE. That we live in two different worlds and we don't abide by the same laws that we force them to abide by. So I think the legislation sounds very reasonable, and we'll look forward to working with you on this.

Mr. SCHAEFER. I appreciate that, Mr. Chairman.

Mr. APPLEGATE. Mr. Petri?

Mr. PETRI. Thank you, Mr. Chairman.

I really just wanted to focus for a minute on one part of your bill, because it is a problem area in legislation of this sort that we're wrestling with on some other committees that I'm on. This may be too broad a statement, but I have the impression that in areas like worker safety or others, we're setting standards for the private sector and enforcing it. Yet as a government, we should be setting an example, but we're not often managing to perform to the same standards that the private sector is.

Part of that seems to be enforcement sections. When you get right down to it, no one owns Government agencies or whatever in the same sense that they do private businesses, and, therefore, fines and various other penalties don't work in the same way with a Government agency that they do with the private sector. And then we tend not to provide capital investments as much as in the public sector. I think we tend to be driven more toward salaries and that sort of thing over time and less to capital expenditures in operating than does the private sector.

So an agency is fined. So what? I mean, how is that going to really change the percentages here? What can we do? I'd really be eager to see if we can think of some way of having effective enforcement or increasing the ability of the managers of agencies to comply with these Federal laws or mandates. Often they may want to, but they just don't have the means to do it because they're driven by various budget constraints, and you can't get compliance out of thin air, even with the best of intentions in some cases. Sometimes it takes money. So do you have any comments on that?

Mr. SCHAEFER. Well, yes, Mr. Petri. Let me just put it this way. Again, talking with EPA after this legislation now that was signed

by President Bush at the time, last October, what they're saying to us, and which we had said all along, is that all of a sudden we're seeing a turnaround in their willingness to work out deals with the individual States of whatever that facility is in to comply with environmental law.

Let me put it this way. Take a general who's in charge of a particular base. The last thing in the world that he wants to have on his record is the fact that he all of a sudden was out of compliance with a statute in legislation from here in the Congress. That's the last thing he wants. So, therefore, now what they are doing, what is propelling a lot of this, outside of the fact that even if you only had a \$5,000 fine or a \$10,000 issued by a State, the last thing they want is the fine issued. It's not the monetary dollars as much as it is the fact that they were out of compliance with Federal law, being a part of the Federal Government themselves. So that is driving it as much as anything else.

And you could do the same thing with DOE. A particular manager at a plant, say, at Rocky Flats, where it's not so much the fact that they would get a fine from the State for being out of compliance, but it's the fact they got the fine that really concerns them as much as anything else. I mean, it just doesn't really look good. It doesn't set good in the press, in the media, or anything else.

So, therefore, that's why the attorneys general across the country unanimously not only endorsed the Federal Facilities Compliance Act of last year, but have also endorsed H.R. 340 for the same particular reason. They have more clout now. They have more authority now. Before they had none. And every one of these is different than the other.

Mr. APPLGATE. Thank you, Mr. Petri.

The gentleman from California, Mr. Filner?

Mr. FILNER. [No audible response.]

Mr. APPLGATE. Mr. Hoekstra?

Mr. HOEKSTRA. Thank you.

Have you taken a look at what the cost ramifications of passage of this bill would be, what kind of requests Congress would receive from the different Federal agencies for capital improvements that would get them into compliance?

Mr. SCHAEFER. The only thing that I can tell you at this point in time, and certainly there would be dollars that were going to be involved, whether it would be dollars in the private sector as well as dollars at the Federal level. We do not know at this time how many or to what extent the various violations are across this country. All we know is that in many cases the Federal Government and its facilities are worse polluters than private industry itself, and one of the reasons in the past is because there hasn't been any lever by which to enforce them into the violations of RCRA or now the Clean Water Act. We in Colorado at Rocky Flats know that there has been violations of the Clean Water Act, and this comes from a Federal agency. So it's tough to tell exactly what the costs are at this point in time, because we don't know to what extent all violations are, all we know is that they are violating. So the figure would have to be put into their individual budgets.

The other thing is when, for example, DOE brings in a private contractor to run a facility, in many cases they build in that con-

tract cost of violations that they know are going to happen, and so, therefore, the contractor really is not out any money out of this, because it's all built prior into the contract itself. I am the ranking Member on the Oversight and Investigations Committee on Energy and Commerce with Congressman Dingell, and we're looking into this particular situation at this point.

Mr. HOEKSTRA. So in effect what we would experience is what we do to many States and private industries, where with passage of this bill we would be mandating standards for us to enforce, at which point in time, when agencies came back to us for improvements, we would most likely be pretty prone to pass funding for the improvements.

Mr. SCHAEFER. Well, you have to look at the basic philosophy, I think, and that is how is it that we can ask private industry to have to do this when we're not doing it ourselves at the Federal level. Why not? And I think it's real bad policy. The Chairman pretty well laid it out. Just the perception of the Federal Government not complying with environmental laws which they pass themselves is ridiculous. So certainly this would have to be all included when it comes around to the appropriation process.

Mr. HOEKSTRA. I'm not disagreeing with your point.

Mr. SCHAEFER. No, sir, I understand that.

Mr. HOEKSTRA. I agree with it very strongly in terms of it's very ironic that we don't meet our own legislation, and I've only been here a short period of time. I wonder if when we went through the process it would help to know how much this was going to cost the private sector or States. I would just like to see in the future that as we pass legislation, we would know who's going to pay what to meet the requirements of a certain piece of legislation.

Mr. SCHAEFER. I appreciate the gentleman's philosophy on this. I guess the only thing that I can say to that is that every one of these violations will be a little bit different. Just take Superfund sites. We are now in the process of reauthorizing Superfund. What is it going to cost to clean up one site versus another site? We don't know that at this point in time. The EPA is still going through this particular process. We will not know to what extent a violation has been committed by a Federal facility dealing with the Clean Water Act until we finally start engineering it and designing it and trying to figure it out. Then they would have to come back and say, "Well, this clean-up or this violation that we have done over a period of time was going to cost X amount of dollars," and you would have to build that into this whole appropriation.

Mr. HOEKSTRA. Thank you.

Mr. APPELLEGATE. Thank you very much.

Mr. Menendez?

Mr. MENENDEZ. [No audible response.]

Mr. APPELLEGATE. Mr. Quinn?

Mr. QUINN. [No audible response.]

Mr. APPELLEGATE. Mr. Barcia?

Mr. BARCIA. I have no statement, Mr. Chairman, but want to thank the panel for appearing. I find the topic extremely and vitally important to my district back in Michigan.

Mr. APPELLEGATE. Thank you.

Dan, thanks again.

Oh, Mr. Horn, do you have anything?

Mr. HORN. [No audible response.]

Mr. APPLGATE. We certainly want to thank you very much for being in front of the committee.

Mr. SCHAEFER. I thank the Chair, and I do have a mark-up on reconciliation in E&C, so I have to get over there.

Mr. APPLGATE. We'll look forward to working with you.

Mr. SCHAEFER. Thank you, sir.

Mr. APPLGATE. Mr. Barlow, welcome to the committee. We're anxious to hear what you have to say.

**TESTIMONY OF HON. THOMAS J. BARLOW, A  
REPRESENTATIVE IN CONGRESS FROM KENTUCKY**

Mr. BARLOW. Thank you very much, sir. Mr. Applegate, Members of the committee, I appreciate the opportunity to appear before you, especially following these two fine Congressmen who were speaking for very important concerns and ones that I agree with wholeheartedly.

Let me just talk for a few minutes about western Kentucky, and south central Kentucky, both of which are in my district. I'm very concerned that at this particular juncture—and it's been coming for a while, and it's time that we need to stop and take a look—we're moving from having solved the major point source problems of our Nation for water pollution clean-up, problems of cities and large industries, and are now focusing our attentions in a broad, comprehensive way on rural areas.

Let me state from the outset, from personal experience, that I have some background in having worked with water pollution clean-up problems from the national level here in Washington back in the 1970s, but also more importantly, on the ground in western Kentucky in a rural area for a number of years now. I've seen EPA transformed into an agency that is operating in a harassing and a time-consuming and an expensive way when it comes to the impact that it is placing on small towns in rural America and farmers, who, as you know, are hard-put all the time to make a living. I would hope that the committee could look closely at the different approach perhaps that EPA ought to be taking not only on its own, but in conjunction with other agencies, as it reaches out to these rural regions and comes to grips with farms and small businesses and small towns.

You know, it's one thing to deal with a big city sewer authority or a large industry. Perhaps in that situation you want to be almost a policeman. But when it comes to rural areas, that's the wrong approach to take, and to tie people up in time-consuming paperwork—to give you examples, many, many small towns in my region are trying to come to grips with the needs for clean water and sewage clean-up and clean drinking water, and the water authorities are volunteer organizations essentially in terms of the people from the town serving on boards. And yet they are seeing standards applied to them and procedures applied to them that are duplicative of what a large metropolitan area would have to do.

This is an area that needs some close attention, and I would hope that as you go in to considering the Clean Water Act.—We in the Agriculture Committee want to reach out to you and help you

in any way we can in fashioning the legislation that might bring regulatory relief as we move into this phase of clean water.

Let me talk about a couple of specific areas. Many of us are traveling through our districts every weekend now, and a district judge in one of the counties in the eastern part of my district caught me last weekend as I was passing through town, and he said, "Listen, I want to tell you one of the biggest problems in my area here is that we have dumps back in far recesses of our county and on farms where people, over the years, just put stuff in the ravine and so forth just to get it out of the way, going back over 50, 100 years, and it's sitting there. Farmers in a position where they'd like to do something about it. They are very attentive to the needs of clean-up now, very aware of a problem that might be caused by run-off of leachate through these very informal dumps back in ravines and so forth. But they don't even want to bring it up on the table, because they're worried of liability and they're worried of regulatory harassment."

Might there be some consideration to having a grace period set forth in law, focused right on this problem of on-farm agriculture where people dump their trash? And it may be on the side of a stream. As you drive through rural regions, you'll see people have pulled off the side of the road by the bank of a stream and dumped things down. Maybe there might be a way to just relieve the regulatory reach in some oversight fashion, some liability fashion, and allow people during this time to get in there and get these things out of there, and then bring the regulatory outreach back on-stream.

I'd like to talk just about the difference here in farm areas with water compared to industry. People say, "Well, industry is cleaning up. It's putting on the sewage treatment or pollution control at the industrial operation, and they're paying for it themselves, and they're doing the job of clean-up by themselves, as required by law. Why shouldn't farmers bear the same full expense and do the same thing?" I would like to make one major distinction between water as industry manages it and water as a farmer manages it.

Industry, for the water that it needs in its operations, essentially reaches for the faucet, turns on the faucet, takes the water that they need, the volume that they need, and then turns the faucet off after they have finished getting the amount of water they need. Farmers are very different, as you would know. Rainfall, groundwater. A farmer may only need 2 or 3 or 4 percent of the total volume of water that inundates his land from weather, and yet he is looked to by the public to safeguard all that volume of water that comes off his land from whatever source.

I believe that this is a justification for the cost-sharing programs that we have applied in rural regions over the years with farm operators where the Federal Government, from the public's purse, is reaching out to the farmer and saying, "Hey, we realize that you are taking on an extra burden here, and we are the beneficiaries downstream, so we're grateful to you for taking the cost on yourselves of that portion which you use, or maybe a little more, and here's another outreach from us to help you along in making sure that all that water is cleaned up." And farmers are willing to do the job. They're willing to take it on, but they do need that cost-

sharing assistance, and we in the Agriculture Committee will help you in any way I know to fashion whatever authority to do the job there.

I'd like to talk just one minute about the problems with the underground storage tanks. We in the rural regions know these are a problem. Every small town in our region and most rural regions have tanks from abandoned or forgotten industry, small companies, filling stations that have closed and gone years ago. Many of these tanks, no one even knows where they are. But to come in with an approach where tens of thousands of dollars are going to be used on a tank, where you're going to dig the tank up, and then you're going to just start excavating soil in all directions, running up tremendous amounts of money, seems to me to be a little wasteful.

Now, the tank is a problem, and it needs to be gotten out of there. The soil, to the extent that it might be contaminated around the tank, is another problem. I would urge that perhaps we could take the problem here in slices and go after the tanks, get them out of there. It's a first step, it's an easy step. Locate them, extract them, get them out of there, and go do all the tanks first in a county. It may take a few years with the resources we might have available. Then come back and make a case-by-case judgment on what you're going to do about any contaminated soil, to the extent there is contaminated soil. And maybe we'll find methodologies, biological treatments, organic treatments that can be applied so we don't have to go to the tremendous expense of excavating and filling to get this soil out of there.

Essentially, when it comes to wetlands, we are trying in our region, under wildlife management plans, to do something that is very novel, and that is to create wetlands in conjunction with farm land. I don't know if they're doing it out in Ohio, but out in western Kentucky we're trying out—some farmers, on their own, are harvesting their crop, and then have a dike that's semi-permanent, and then in the late fall and winter months and early spring months, they flood the land for wildlife, for geese and ducks to come in. Then when spring planting time comes, they drain it, the geese and duck are gone, they open its sluice and drain it, plow it up, and plant it.

You're getting a tremendous two-fer here. You know, you're getting a breakthrough that we got with minimum tillage where we had the erosion problems there that were plaguing farm land in America, and we were, all of us in Agriculture, wondering how were we going to get on top of this corrosion problem without tremendous expense, and we came up with minimum tillage, which has increased production, is saving farmers money, and is saving the soil. I'd like to think that with these wildlife management plans that we can get wildlife management and agriculture production moving in tandem instead of at loggerheads, the way it can be built up sometimes.

In sum, we need simple, low-cost, easy-to-apply, effective techniques for pollution control. I would hope we would move away from the monitoring requirements. For instance, in my State, the Department of Natural Resources has come up with, in concentrated animal feed lot situations, pursuant to U.S. EPA mandates, they are telling us that we've got to put in test wells to mon-

itor groundwater at the cost of \$20,000 to \$30,000 per farm, and I would submit that this is coming up to the barn door after the horse has been stolen. We shouldn't be about testing so much as making sure that simple, effective, low-cost, and the best management practices are applied.

Let me just say in response to this outreach from the Department of Natural Resources where they were looking to farmers to put in \$20,000- to \$30,000-per-unit test wells, farmers came back very quickly, with the help of the Soil Conservation Service, and they're installing artificial wetlands in these concentrated animal feed lot situations at the cost of \$2,000 or \$3,000 or \$4,000 per farming operation, and the run-off is sluiced through these artificial wetlands, which are working magnificently in far western Kentucky and delivering water at the end of the process that is cleaner than the streams that it's going into. Here is an example where, in working in cooperation with farmers and with on-the-ground USDA agencies, we're coming up very novel and very imaginative and very effective techniques, and I would urge the committee to encourage this type of approach.

Farmers do need financial help, and the reason is because our farm programs are not a Government assist so much to farmers as a Government assist to consumers, and the price supports and the price levels keep a lid on prices. To be sure, farmers benefit from the steady financial support that farm programs supply, but they also operate as a lid on crop prices when the crop prices start to push upwards. Because with farm programs, we are always keeping a full larder in excess supply as a damper on market prices.

I use the analogy of what if the Government were in the business of supporting the automobile industry, and the equivalent structure would be every auto dealer would have 5,000 cars on his back lot, and wouldn't that put downward pressure on the price of the cars moving out the front door. The same is true in farming, and that's why I believe that for the future of the resource quality and resource strength, farmers need financial assistance for the public benefit side of the resource work that they're doing.

Thank you very much. I submit my testimony for the record.

Mr. APPLEGATE. Without objection, your prepared statement will appear in the record, and I appreciate your being here. You covered a lot. I'm not going to try to attempt to address all of these things, but one thing that you were just talking about was the wetlands and about what they do down in Kentucky. I don't think that we do that in Ohio, but they might.

My question is this: If you establish a wetland, and then you sort of dry it up and farm it, and then you bring the water back in for wildlife, it's still wetland. Is that legal?

Mr. BARLOW. Well, let's put the legal question aside for just a minute. [Laughter.]

Mr. BARLOW. Let's look at our goal, what we're trying to achieve. All of us want to boost our habitat. Farmers, just as people in cities, are appreciators of wildlife and waterfowl, and what we're trying to do here—and it's being done in a few situations to see how it works, and it's being tried by individual farmers on their own—they put some dikes up around a section of their fields, as I said in my testimony, and then they flood it after they harvest

their crop in the fall. It gets tremendous usage. We're in the Mississippi flyway there, and it gets tremendous usage. It's a great resource, a haven for ducks and geese on their way through.

The farmers that are doing it are very happy about it. They're getting a good feeling out of doing it, and then in the spring when it gets toward planting time, they pull the sluice and drain it and let it dry out and put it into crop production. Everybody's benefiting, including the ducks.

Mr. APPLGATE. I can understand what you're saying, and I think it makes common sense. But the question still comes down to, Is it legal for them to be able to do that?

Mr. BARLOW. Let's explore it, because I think there's an opportunity here to create some very worthy public-private cooperation in an area where we have been struggling in the past few years, and maybe we'll get an outcome from which everybody is saying there are benefits. That's what Congress is all about these days.

Mr. APPLGATE. We like to think so. You talked about underground storage tanks, and I think that that is a very serious problem. I have a lot of little gas stations that have that problem, people who have been out of the business for many years, and we'll deal with that mostly through the Superfund when we get into hearings, and we'll see how it ties into clean water, because I know what some of the leakage can do to getting into the aquifers. But your suggestion may be very good.

The difference between the use of waters by the farmers and the industry, I see you have good arguments on that. Certainly, I think that farmers probably know a hell of a lot more about the use of water than industry.

The regulatory relief that you're talking about as for illegal dumping by streams and places like that, I know that—

Mr. BARLOW. These are old dumps that I'm talking about. You can see them in the wintertime as you're driving along. It might have been done 40 or 50 or 60 years ago, before law had any application.

Mr. APPLGATE. Well, people are still doing it in some areas, too.

Mr. BARLOW. That's true, too, yes.

Mr. APPLGATE. And we're trying to eliminate that by tracking of hazardous and toxic waste and dumping of any kind of solid waste, and that, of course, comes within the jurisdiction of another committee that we have here and one with Energy and Commerce, which I had legislation in last year that didn't seem to go anyplace, but we're working on it.

I sympathize with you greatly when looking at the difference between the rural and the big cities, and I've said time and time again that I know that the big cities have big, big problems and it takes big, big bucks. If you talk about \$500 million for Boston Harbor, it's a drop in that harbor. They need a lot more than that. But if you take \$500 million and bring it back into the various States and put it into a fund whereby they could use it to help them to meet their obligatory needs, it can go a long, long way. So I understand that.

Let me just mention this one question, the fact that you did mention groundwater monitoring for farmers in your district. I'm not sure that there is any required groundwater monitoring under the

Federal Clean Water Act. Can you tell me what statute that monitoring is required under? Do you have any idea on that?

Mr. BARLOW. We'd have to research that, but this essentially was the Department of Natural Resources in Kentucky moving under the overall framework of the Federal Water Pollution Control Act, and I think that really is essentially as far as we need to go. They're moving in the framework that the Federal Government has created, and the route that they were going to take—it's now stopped—was to require these test wells, and that has created, as you can imagine, an awful lot of concern. Fortunately, we have, as I said, the remedy at hand, which is a very effective best management practice, in the artificial wetland.

Mr. APPEGATE. Well, I thank you for your testimony, and you can't be all bad. Your name is Thomas Jefferson Barlow, and that's one of my two favorite presidents, so that puts you one step up, anyway.

Mr. BARLOW. Thank you, sir.

Mr. APPEGATE. Mr. Gilchrest?

Mr. GILCHREST. Thank you, Mr. Chairman.

I found the diking system for alternating periods of growing crops and having wetlands intriguing. I represent a rather large agricultural area myself, and I would just like to find out a little bit more about that process to see how well it would work in my area. Could there, however, be a concern—there's a movement in agriculture now where the field basically is covered year-round, and there's a cover crop put on in the wintertime to help uptake some of the nitrogen that has been placed in the soil so that it doesn't leach into the ground and get into the groundwater. Is this at all a consideration, or has that been solved with this new solution?

Mr. BARLOW. I'm not sure that the chemistry interchanges have all been studied. This is something—you know, minimum tillage got started down in my district back in the late 1950s and early 1960s by farmers who were just trying it out as a technique and developing it on their own and hammering out the early technology to drag behind the tractor.

We're inventors, West Kentuckians. I like to say the engineers in Detroit take credit for the automobile industry as it developed in all its grandeur over the last 50 years, but it was really Kentuckians who did the job. And we're doing the job, I think, in a very effective and imaginative way here in terms of creating wetlands.

Now, we've got a lot of studies to do, but we'll get you more information on this one for the record, if that would okay.

Mr. GILCHREST. I would like to look into it a little bit further. It must also be pretty good for anybody that wants to rent out their farm for goose hunting. If you're attracting all those geese in that area, that would also be a lucrative part of the economy, I would imagine.

Mr. BARLOW. I believe that there is some interest there.

Mr. GILCHREST. I'll just make a couple other comments about what you said. A lot of rural areas have problems with old dumps. People would just put them out in the back 40 or something like this, and neighbors would also put it out in the back 40. I think it's a good idea to possibly have some type of grace period where

someone can say, "I have this dump," and maybe it's been used fairly recently, but we need to have some way for people to come out and say these things can be cleaned up instead of trying to hide them and then finding it generations in the future.

The cost-sharing, I think, is a positive thing for farmers to help them create a soil conservation plan to reduce the run-off, and all of that is very costly, whether it's buffer zones or waterways or reforestation or preserving wetlands on their property. We understand the importance of it, and now we all have to work together as a team to help make it happen.

There's one other quick item. We share an awful lot in common. Underground tanks on farms is a problem wherever you have an agricultural area, and we need to create a climate so that people aren't afraid to report that they have an underground tank and find a way to get the tank out and find a way to get rid of that toxic soil that's under there.

So thanks for your testimony, and I am interested in that alternating farm land/wetland situation.

Mr. BARLOW. We'll get some information from the Soil Conservation Service for you on it.

Mr. GILCHREST. Thank you.

Mr. BARLOW. Thank you.

Mr. APPELGATE. Thank you, Mr. Gilchrest.

Chairman Mineta?

The CHAIRMAN. No questions, other than to thank our colleague, Mr. Barlow, for his help in offering this suggestion. Thank you very much.

Mr. BARLOW. Thank you.

Mr. APPELGATE. Mr. Horn?

Mr. HORN. Thank you, Mr. Chairman.

I've enjoyed the comments of the gentleman from Kentucky. I grew up on a farm. I still own the farm. I'm very sympathetic to what you've described in rural America. You mentioned the wetlands, and I was rather intrigued by the progress being made on cleaning the water. The Corps of Engineers has responsibility for regulating the wetlands. How have you found that group to deal with on these problems? Are they understanding? What's your reaction to the Corps' efforts in this area?

Mr. BARLOW. I've never had any personal direct experience myself with regard to permits. There are concerns in my area. There's been litigation in my area between individual land owners and the Corps. In some situations, it has been a matter of principle. Many situations, I believe, are worked out quietly, and nothing really develops of a serious nature. But there is that concern that farmers—you're one—all farming people are very proud of their land and very careful of their ownership rights, and I believe that if they have a feeling that they are being addressed from on high, understandably they're going to rear back. That's always a problem with any agency, and I don't think the Corps is in a predicament here. I think they're doing a good faith job, but we've got to explore this whole area of wetland permits more.

Mr. HORN. Do you think there ought to be a new agency that just specializes in wetlands management and regulation?

Mr. BARLOW. I believe that that would be something to consider, yes.

Mr. HORN. Thank you. I thought your comments had great common sense and wisdom.

Mr. BARLOW. Thank you.

Mr. APPELEGATE. Thank you, Mr. Horn.

Mr. Filner?

Mr. FILNER. [No audible response.]

Mr. APPELEGATE. Mr. Hamburg?

Mr. HAMBURG. No questions.

Mr. APPELEGATE. Well, Thomas Jefferson Barlow, thank you very much for coming before the committee. We appreciate it. You've had some very intriguing ideas, and we'll be talking further with you as we move down that track.

Mr. BARLOW. Thank you.

Mr. APPELEGATE. Thank you very much.

Now we have two panels that we're going to move into, and we're going to do these things as expeditiously as possible. We have the Association of Metropolitan Water Agencies—and if you will, please come up and take a position at the desk where your name is—Mr. Buddy Williams is the Director; John H. Sullivan with the American Water Works Association; and Roland Geddes with the National Association of Conservation Districts and State Conservation Agencies.

Gentlemen, what we're doing here now, we've begun a little different procedure. We're going to recognize and stick to a five-minute rule on your presentations and on our questioning. But your full statements will be made a part of the record, and I can assure you that they will be read and scrutinized and utilized to the best extent possible.

With that, we will proceed with the panel, and we will listen to Buddy Williams.

**TESTIMONY OF BUDDY WILLIAMS, DIRECTOR, DEPARTMENT OF WATER AND SEWERAGE SERVICES, NASHVILLE, TN, ON BEHALF OF THE ASSOCIATION OF METROPOLITAN WATER AGENCIES; JOHN H. SULLIVAN, DEPUTY EXECUTIVE DIRECTOR, AMERICAN WATER WORKS ASSOCIATION; AND ROLAND GEDDES, WASHINGTON REPRESENTATIVE, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS, AND NATIONAL ASSOCIATION OF STATE CONSERVATION DISTRICTS**

Mr. WILLIAMS. Mr. Chairman, Members of the subcommittee, thank you for this opportunity to appear before you this morning. My name is Buddy Williams, and I currently serve as Director of the Nashville Department of Water and Sewerage Services. I also serve on the board of directors for the Association of Metropolitan Water Agencies, known as AMWA, and I am here on behalf of the association and the 80 million people served by our member agencies.

The Nashville Department of Water and Sewerage Services provides both wastewater and drinking water service to the people of Nashville and Davidson County. The Clean Water Act, traditionally viewed as a statute impacting only the wastewater side of my agency, has significant implications for the drinking water side as well.

My remarks will focus on some of the issues of interest and concern to the drinking water side of my agency, as well as the largest drinking water supplies around the country represented by AMWA.

The cost of complying with environmental requirements has steadily increased over the past several years for local communities. Nashville is currently in the midst of an 11-year \$740 million capital improvement program, all locally funded, for drinking water, sewer, and CSOs. Our rate payers have borne the cost through water rate increases of 260 percent since 1984 and sewer rate increases of 409 percent.

The protection of public water supplies is essential to ensuring that the Nation has safe and affordable drinking water. Reauthorization of the Clean Water Act offers the opportunity to reassess how to achieve water quality that provides for the protection of fish, shellfish, and wildlife, and the protection of drinking water sources.

Increasingly, it has become apparent to those of us at the local level that the traditional end-of-the-pipe controls for achieving the goals of the Clean Water Act are not enough and that we need to begin to address pollution in a comprehensive manner. From the water suppliers' perspective, clean, high quality source water is essential and directly related to the cost, types, and complexity of treatment processes used to make the water safe for human consumption.

For example, drinking water suppliers use—in fact, are statutorily required to use—disinfectants to kill harmful microorganisms often introduced into the water sources through agricultural and other non-point source discharges. There is currently no known disinfectant that does not create byproducts which may be potentially carcinogenic. No one would argue against disinfecting drinking water supplies because of the known risk from pathogens, but cleaner source water reduces the need for disinfection and, therefore, the potential for carcinogenic byproducts being created.

The cost to consumers of reducing risk from both pathogens and potential carcinogens will be somewhere between \$6 billion and \$45 billion, depending on the outcome of the rulemaking process. This cost for what is only one of the many drinking water regulations in place or yet to come will add to the bill that consumers are already experiencing as a result of increases in their water and wastewater bill.

With the cost of drinking water and wastewater treatment on the increase, it is essential that Congress give serious consideration to preventing and controlling what is at this time the largest cause of pollution—non-point sources. AMWA supports the development of comprehensive watershed management strategies as a valuable tool for addressing non-point source pollution.

Releases from impoundments, such as dams, can also have a significant impact on water quality. For example, research by our department into the quality of the Cumberland River has demonstrated that the single largest impact is the regulated stream flow. For an impoundment river, the agency controlling the stream flow actually causes the largest impact on quality. Watershed protection should not be viewed as a replacement for standards or as

a means of delaying implementation or present requirements, but as an additional tool for meeting water quality objectives.

Water quality reports are required every two years from each State on all the State's navigable waters, and we suggest that section 305(b), which contains this requirement, be modified to specifically include monitoring of contaminants affecting water quality alone, with the identification and ranking of the sources of contamination. The monitoring data should be of the type and quality determined by EPA to be appropriate for making analyses, estimates, and descriptions of water quality presently required by the statute. This data is essential for making informed decisions.

Another area of the Clean Water Act reauthorization with a potential ramification for AMWA members is water conservation. AMWA has supported a number of water conservation initiatives, including national plumbing product standards, and believes that the Federal and local water suppliers should generally encourage conservation. We also believe that water conservation requirements must recognize the significant regional differences in water resource availability, usage, climates, system capabilities, and system demographics.

There are many other aspects of the Clean Water Act that will impact suppliers. We're looking forward to working with you as the reauthorization continues.

Thank you for the opportunity to testify, and I'll be happy to answer any questions that you may have.

Mr. APPLGATE. Thank you very much, Mr. Williams.

Let's proceed on to Mr. Sullivan with the American Water Works Association.

Mr. Sullivan?

Mr. SULLIVAN. Thank you, Mr. Chairman, Members of the committee. As was mentioned, I'm Jack Sullivan with the American Water Works Association. Our universe of interest is the entire drinking water community. Our membership reaches out and touches about 180 million to 200 million Americans almost on a daily business.

Our real interest is in quality drinking water. To get that, we have long advocated the multiple protection barrier approach. Just earlier today you heard some discussion from one of the testifiers about cryptosporidium and the problems in Milwaukee, Wisconsin. That's an issue where the multiple barrier system has fallen down. There's been a lot of great work done under the Clean Water Act as far as pollution prevention is concerned; however, we still have a long way to go, as was illustrated by Milwaukee.

Protection of drinking water sources through the Clean Water, you'll find in our submitted testimony, is a major concern of ours. We are interested in ensuring that drinking water is given equivalent treatment under the Clean Water Act, particularly public health issues associated with drinking water. As far as all the other issues are concerned, there are several specific recommendations in testimony which we would ask you to consider in amending to the current package.

Non-point source pollution is of serious concern to us as well. In recent years, much has been documented about pollution from pes-

ticides, nitrates, and the microbial pollution that was illustrated, again, in the Milwaukee discussion earlier.

Water conservation, you'll see in our testimony. Certainly, we are for water conservation, all the aspects of water conservation, but it's not a simple issue. Therefore, we would suggest that water conservation should probably be handled off-line from the Clean Water Act or in the guise of the Safe Drinking Water Act.

We know what a contentious issue wetlands is, and I think basically all I'll say here is that changes to address the wetlands issue are needed to provide a better balance in the process that is currently in effect to both protect wetlands and all the good that wetlands do, and in the use of the wetlands necessary in both the agricultural community and in the development of Water Resources.

Compliance assistance and funding, I won't get into specific funding levels as far as what funding you should do. That's better left to the Congress. However, one of the things I think you must consider is that the small communities of our Nation are in trouble meeting environmental mandates, and, therefore, you've got to look at the issue of mitigating what the requirements are to the small communities, and in some cases that same issue extends to the large communities, particularly within large, poor urban areas.

I'll close my testimony at this particular point but would be more than happy to answer any questions during your question-and-answer period.

Mr. APPLEGATE. Mr. Geddes?

Mr. GEDDES. Thank you, Mr. Chairman, and Members of the committee. Good morning. I'm Roland Geddes, Washington Representative of the National Association of State Conservation Agencies. This morning I'm also speaking for the National Association of Conservation Districts. Both of our organizations have provided written testimony for the record. Most of our comments today are directed to the non-point source pollution sections of the Clean Water Act.

Many of our member State agencies have been designated by the governors of their State as the lead agency for non-point source pollution activities. In most other States, our members have at least been designated as the lead for agriculture, and in many other States, we have the lead for urban programs, such as erosion and sediment control from construction, stormwater management, and hydrologic modification. In nearly every State, the delivery system of the local soil and water conservation districts, which are political subdivisions of the States, are utilized in a non-point source program.

We believe that non-point source pollution is a function of land management and what occurs on the land. We are land management agencies at the State and local levels. Our comments are not new. They're based on about 50 years of experience in working with land owners and assisting them in protecting their soil and water and other resources.

Congressman Oberstar this morning mentioned Water Quality 2000. Our agencies were very active in developing the non-point source recommendations of that paper, and we are fully supportive of it.

We strongly believe that the basic principles and requirements of non-point source pollution control established in section 319 of the 1987 Clean Water Act are sound and should be continued as national policy. Under this section, the lead role for non-point source pollution, of course, was given to the State. We were required to assess our problems and to develop management programs to address them. The assessments were done. In most cases, the management programs have been written and approved by EPA. There are still a few that only have partial approval.

The assessment process is continuing through the 305(b) process of the Clean Water Act, but our group thinks it would be appropriate for any 1993 amendments to the Clean Water Act to require States to update their management programs and resubmit them to EPA for approval. These new comprehensive programs must integrate and coordinate all non-point source activities.

The plans that we developed to meet these requirements are just now starting to produce results. After approval by EPA in 1989, most States had to secure funding from State legislatures and from EPA grants. We had to employ and train additional staff and obtain new program and regulatory authority before significant accomplishments could be recorded. We think our States are on the right track, but, at best, progress for non-point source pollution abatement will be slow and expensive, given the widespread nature of non-point source problems and resource limitations.

We believe the Nation's water resources can best be protected through the development of comprehensive water quality plans on a watershed basis. Watershed plans must take a holistic ecosystem approach that addresses all sources of non-point source pollution and protects both surface and groundwater resources. These comprehensive plans developed at the local level can better identify problems and direct system-based solutions to meet water quality needs. Localized planning can provide the foundation for good investment decisions for funds.

A good State program is a mix of a number of elements, and they need to be flexible to meet the needs of that particular area in that particular State. But good programs have some common elements—they are research and development, education and demonstration, technical assistance, financial incentives, regulation and program management.

I'd like to just take one second on regulation. There's a lot of debate of whether non-point should be a voluntary program or a regulatory program. Actually, in all States that have good programs right now, we have a mix of voluntary and regulatory programs in place. Regulation may range from full-scale permit programs for concentrated animal units to back-up authority, such as non-degradation laws or bad actor laws, as has been mentioned already today. We believe the decision of which problems need to be regulated and the level of regulation required should be left to the individual States to address their own specific problems.

Funding has been mentioned this morning, and it's been one of our big problems as States try to implement the 1987 amendments. We heard Congressman Oberstar talk about the \$100 million that was authorized that we never got. We didn't even get half of it per year. We've done quite a bit of study within our States, and we

think that if you are really serious about States fully implementing these plans, you need to increase that funding to \$500 million per year for non-point source pollution for us to do all the things that have been laid out and that we know we need to do.

My time is about up. I would like to mention the Coastal Zone Management Act. We are moving forward with developing the plans required in that in our coastal States. The program is young, the implementation has not yet begun, we haven't written our plans yet. We think it should be given an opportunity to fully evolve to test the premise of enforceable measures to mitigate non-point source pollution. Until the enforceable provisions of CZMA are proven more effective than the comprehensive approaches of section 319, the enforceable provisions of CZMA should not be forced into State non-point source management plans.

We're happy with the relationship that the States have today with EPA and our other Federal partners. We think the lead for this should remain with EPA, but we think that USDA should be given the lead in providing technical assistance to States in implementing their non-point source management programs. USDA, through conservation districts, should also provide technical assistance to land managers in implementing their resource management programs.

Thank you.

Mr. APPELEGATE. Thank you very much, Mr. Geddes. You're talking about the fact that the States should have more flex in this, more authority in addressing the non-point problems. But which States do you think really have the exemplary program? Which ones are really doing something about it that's worthwhile to talk about?

Mr. GEDDES. There are some good ones. I am a former director of the Virginia Division of Soil and Water Conservation and had the lead of that program there. Obviously, I think that's a good one.

Mr. APPELEGATE. I'm sorry. Where was that?

Mr. GEDDES. Virginia.

Mr. APPELEGATE. Oh, okay.

Mr. GEDDES. Thanks to the funding from the Chesapeake Bay Program for these bay States, I think the States of Maryland, Pennsylvania, and Virginia got a little head start. There are lots of other good ones—Wisconsin, Oregon. They're all over the country. Many States are really starting to come ahead. And even the ones who lag, some of these States— I've done some work with the State of Arkansas, for example, on their poultry problems. I didn't realize what a struggle they are having to come up with the money. They want to do it, but they really need your help financially, and they're ready to roll. There are lots of good programs across the country and a lot more ready to break on the scene.

Mr. APPELEGATE. Does anybody else want to mention anything about that?

[No response.]

Mr. APPELEGATE. Let me ask you again, Mr. Geddes, the Senate considered your suggestions to allow Soil Conservation Service to prepare the delineations of wetlands for farm lands, and they

agreed to have a study done. Do you support that action by the Senate?

Mr. GEDDES. Yes, sir, I do. I was part of a committee that went out in the prairie pothole country in Minnesota, Iowa, and that area to look at this delineation. It's a very technical role, and those people are on the ground. It has to be done site-specifically. They're out there, they have the expertise, and I think that's the right place for it to be.

Mr. APPLGATE. Mr. Sullivan, I think this is sort of a procedural type of thing, and I think it's something that we get into on a lot of different subject matter, and it sometimes becomes a problem, but the comments you make that the Drinking Water and Clean Water Acts should work closer together, with which I agree—all water is part of the hydrologic cycle, though the House's committee structure wasn't set up based on that cycle, unfortunately. In the Senate, both drinking water and clean water do come under the same committee. Has it made it easier to get a consistent policy for the aims of both acts there, as opposed to the House? What are the problems that we have? I'd like to see it where there would be more jurisdiction where you could work these things together.

Mr. SULLIVAN. I think, as we indicated in our written testimony, there needs to be an overlap between the laws, and that needs to be written into the law in your amendments of the Clean Water Act. Does it work better in the Senate? It's hard to say that, simply because what comes out of Congress comes out as a single entity rather than a package between the two bodies. Certainly, we find it easier perhaps to work with the Senate on those issues because we don't have the jurisdictional issues to contend with.

However, I emphasize what I said earlier. Safe drinking water or high-quality drinking water is not just a responsibility of the drinking water utility manager. It is a responsibility of everyone, and it must be done through a multiple barrier system. You have to have pollution prevention, and you have to have, all the way to the faucet, controls on what kind of plumbing is used. The drinking water utility manager can't do it all. He's been expected to for years, and people think that they're going to turn on the tap and get absolute pure water, high-quality water. As we've seen in Milwaukee and other instances, that doesn't happen all the time.

Mr. APPLGATE. That's correct. Thank you very much.

Mr. Gilchrest?

Mr. GILCHREST. Thank you, Mr. Chairman.

I guess any of the three can answer this question, and it deals with a comment Mr. Sullivan made about not enough flexibility and balance in our wetlands policy up to this point as far as preserving wetlands and allowing agriculture and, I suppose, development to continue. If we take a watershed approach to the Clean Water Act and to wetlands, isn't there going to have to be—now, I understand the balance, and I understand the flexibility, but to a degree, do you see, if we take the watershed approach and if we accept the technical and scientific advice about the value of wetlands and their function, especially, for example, in the Chesapeake Bay, where much of the non-point source pollution is part of the problem, is there going to have to be some give, some sense that a watershed approach is going to have to require communities, in

their management plans, to designate some area as non-developable if it's a part of that watershed area?

Mr. SULLIVAN. Conceivably, yes. That is part of the development of the watershed planning process and the total integrated resource planning concept that is a part of it where we look at total water management. That's an issue we have fully supported. We were involved in Water Quality 2000 deliberations as well. I think that's the way we're going in the future. But I don't think you should kid yourself that that's going to be a simple solution, even if it's enacted in Federal law. There are huge institutional barriers to circumvent.

As you know, we've been working at Chesapeake Bay clean-up for a number of years, and we still have a long way to go in that area. There are many areas of the country where you don't have any structure at all to work on a watershed basis. Some places you're going to have areas where you're going to have conflicts between the watershed district or the watershed management group and the local community, and those all have to be resolved as part of the institutional controls and arrangements.

Mr. GILCHREST. I guess it is then incumbent upon us to move forward and use the Chesapeake Bay Program as a—would you say, Mr. Geddes, that the Chesapeake Bay Program can in fact act as a model?

Mr. GEDDES. It can for a lot of things. I was chairman of the non-point source program—of the entire Chesapeake Bay Program for several years. We know how to solve a lot of our problems from agriculture and some other things. Population growth and development, though, the kind of land use changes that we've been talking about, we don't have the answers to that in the Chesapeake Bay, either. We're working on it with several different kinds of legislation, particularly in Maryland and Virginia, but we don't have all the answers here.

I think we have a good model for non-point source pollution in general. For the control of population growth and development, it's a place to look and see some things that are happening, but to find answers, I don't think so.

Mr. GILCHREST. Then, the way you described it, it is time now to begin thinking about managed growth in all areas of the country, especially around large estuaries like the Chesapeake Bay. No matter how difficult it is, it's a challenge that must be met as soon as possible, I would imagine, rather than to let it go. I don't want to make any derogatory comment about any area of the country, but the Eastern Shore of Maryland and certain parts of Virginia could begin to look like Staten Island if there is no management growth plan.

Thank you.

Mr. APPLEGATE. Thank you very much, Mr. Gilchrest.

Mr. Poshard?

Mr. POSHARD. Thank you, Mr. Chairman. Just a couple of questions.

Mr. Geddes, the Association of Conservation Districts, in your testimony, supports a flexible no-net-loss wetlands policy, "highest priority should be given to protecting those wetlands with the most significant values and functions" and so on, and you say that the

Soil Conservation Service, USDA, should be in the forefront of recommending responsibility for wetland identification and so on. I'm just wondering about how you see the role, then, of enforcement with regard to your recommendations. Where does EPA fit into the scheme of things?

Mr. GEDDES. Well, right now, of course, enforcement is with the Corps of Engineers, with EPA having veto authority over the Corps. I happen to be a State representative, and I really think that the model that you all put in place for non-point source pollution in 1987 of requiring States to assess their non-point source pollution and develop a program to stop it or to control it would have worked much better for wetlands. Had you required States to identify their wetlands and develop a program to protect them and let the enforcement be at the State level, I don't think we would be in the mess we're in today in wetlands. That's my opinion.

Mr. POSHARD. So we should come up with a definition here, basically, and leave it up to the individual States to carry that out in terms of enforcement?

Mr. GEDDES. Well, subject to EPA oversight, and that's a major part of—I didn't put that in my non-point source testimony, but when these plans are approved—we're asking States to run it, but subject to oversight of EPA. And I agree with Congressman Oberstar, if a State just flat won't do it, then you have to have some kind of back-up to come in on a Federal basis.

Mr. POSHARD. I'm assuming, I guess it was Mr. Sullivan, one of you, are you in agreement, then, with the Hayes bill, basically? Are you familiar with that?

Mr. SULLIVAN. We have reviewed the Hayes bill. We don't agree with all the aspects of the Hayes bill. We do feel that there needs to be some kind of evaluation process on wetlands. However, we're doing some of our own independent research on wetlands, and we'll make our call when that's up for discussion again.

Mr. POSHARD. But you do agree that all wetlands are not of the same value—

Mr. SULLIVAN. Correct.

Mr. POSHARD [continuing]. And, therefore, do not deserve the same standard level of protection.

Mr. SULLIVAN. That's correct.

Mr. POSHARD. Okay. Thank you.

Mr. APPLGATE. Mr. Horn?

Mr. HORN. Thank you, Mr. Chairman.

I've enjoyed your testimony. Two of the most controversial wetlands permit vetoes involved proposed water supply projects. That's Two Forks Dam in Colorado and Ware Creek in Virginia, where you have a lot of experience. Does section 404 currently provide enough deference to the water supply management officials in the areas to meet public water quantity and quality?

Mr. SULLIVAN. I'd be more than happy to take a shot at it. First of all, the 404 process—there are literally thousands of 404 permits that are handled on a routine basis by the Corps of Engineers and never really come to the forefront. Normally what happens is the political process intervenes at some level, and it becomes a political issue more than a scientific issue or a straight economic issue. In the two cases you mentioned, that became a concern.

If you look at past history on 404, water supply, because of the nature of water supply as a public health-type issue, had never been a veto issue in the past. Now all of a sudden we have some 19 or so, major water supply reservoirs that have become political issues.

One of the things that needs to be considered is the tradeoffs in that program. If we're going to make those as political decisions, then you have to look at the tradeoffs as well, and all the factors have to be considered—the total integrated resource planning process has to be looked at. Yes, you do have to consider conservation, yes, you do have to look at future needs and all those sort of things, but if it becomes a political issue, then you have to look at all the political tradeoffs too.

Mr. HORN. Would you like to add to that at all based on the Virginia experience?

Mr. GEDDES. Well, that's a tough one. The Ware Creek issue, of course, got its permit from the State Water Control Board as a water quality certificate first. Then the 404 process was lengthy with lots of hearings on it, and the Corps issued its permit, which we thought was appropriate. Then EPA came back and vetoed it. We had testimony on such things as we ought to tow icebergs up the James River as an alternative. Some of them got pretty hard.

The alternatives, in my opinion, in many cases are far worse than building Ware Creek, but it's a tough call, and, of course, politics get into it. But these are hard decisions. I don't know that I can fault EPA. I think that we need to get along one way or the other with it.

Mr. HORN. In terms of the 404 process and processes within that broad outline, would you change those in any way? And if so, what would you do?

Mr. GEDDES. Well, I wasn't personally heavily involved in that, but from the outside looking at it occurring, it seemed to be a very appropriate process to me.

Mr. HORN. So you think it's a fairly rational process?

Mr. GEDDES. Yes, sir.

Mr. HORN. With various factors included at each stage?

Mr. GEDDES. I think so.

Mr. HORN. Any other comment on that? Any disagreement?

Mr. SULLIVAN. I think for that size project, it was probably done appropriately. I think one of the things that has to happen in the 404 process is we have to simplify the process for those small issues that come along. Now, a lot of them do move rather swiftly, but it is a rather bureaucratic process and a very intense bureaucratic process.

Mr. HORN. Could there be a two-track process based on complexity of the project?

Mr. SULLIVAN. Perhaps.

Mr. HORN. What's the maximum length of time you think ought to be involved in running the hurdles of that process?

Mr. SULLIVAN. I hesitate to really give a good guess at what the time line would be without looking at it further.

Mr. HORN. Well, if you have some thoughts on it, perhaps you'd like to file it for the record at this point. Thank you.

Mr. APPLEGATE. Thank you very much, Mr. Horn.

Gentlemen, thank you very much for your input. It was very educational. We will be calling upon you at some point in the future, hopefully, and we may need some more of your input, and if the possibility comes up, we may have questions that we will submit to you, and we would appreciate answers to those.

Thanks again.

Mr. APPLGATE. On our second and last panel, we have Mr. Szabo, representing the Wetlands Coalition; Milan Yager, National Home Builders Association; Scott McElwee, Associated Builders and Contractors; Robert Bowen, Associated General Contractors of America; and Gerry Dorfman, National Utility Contractors Association.

Gentlemen, welcome to the committee. Thank you for being here. We'll begin with Mr. Szabo.

**TESTIMONY OF ROBERT G. SZABO, COUNSEL, NATIONAL WETLANDS COALITION; MILAN P. YAGER, LEGISLATIVE DIRECTOR, NATIONAL HOME BUILDERS ASSOCIATION; SCOTT McELWEE, McELWEE-SCARBOROUGH CONSTRUCTION, GIBBSBORO, NJ, ON BEHALF OF ASSOCIATED BUILDERS AND CONTRACTORS, INC.; ROBERT L. BOWEN, PRESIDENT, BOWEN ENGINEERING CORP., INDIANAPOLIS, ON BEHALF OF ASSOCIATED GENERAL CONTRACTORS OF AMERICA; AND GERRY DORFMAN, PRESIDENT, DORFMAN CONSTRUCTION CO., WOODLAND HILLS, CA, ON BEHALF OF THE NATIONAL UTILITY CONTRACTORS ASSOCIATION**

Mr. SZABO. Mr. Chairman, thank you very much. My name is Bob Szabo. I'm Counsel to the National Wetlands Coalition. I appear today on behalf of our chairman, who was unable to attend because of a prior commitment.

The members of the Coalition are very pleased, Mr. Chairman, with the recent statements by leaders of this committee that the committee would likely address this wetlands policy issue in the context of the Clean Water Act. We very much agree with Mr. Oberstar's statement earlier today that this has become a very broad program on a very narrow legislative base. We also agree with the statement by Mr. Barlow that perhaps new approaches need to be explored in the wetlands policy arena.

We're also pleased to note that Senator Baucus has made a commitment similar to the commitment of the leaders of this committee that the issue will be dealt with during Clean Water Act reauthorization in the Senate. We are also pleased to note that the White House has indicated it would develop a task force of cabinet-level officers and others to try to find consensus on this difficult issue.

Our Coalition certainly pledges our cooperation in any process like that. This Coalition was formed, Mr. Chairman, for the purpose of participating in this debate. It is a single-purpose group. It is a membership-driven and-governed group. We thought we were going to participate in a debate over no net loss of wetlands. That debate changed over time due to things that have occurred.

We support the conservation, and enhancement of wetlands, but we also believe that the program that is there today is not a pro-

gram that reaches that result, and the program is creating difficulties that need to be addressed, we think, by this committee.

Mr. Chairman, we believe that the problems that have occurred in the last last few years with respect to this program, that have caused it to move from being a minor irritation to a major controversy were caused by three basic actions that were taken without any Congressional vote or without any public rulemaking, that being the pledge of no net loss, which has never been adopted; the delincation manual, which was adopted without any public input; and, finally, something that people don't focus on very much, which is the Memorandum of Agreement of February 7, 1990, that changed this program from being a program that attempted to balance different interests to a program that attempts to "avoid" wetlands.

When avoidance became the pivot of this program, that new concept, connected with the fact that 75 percent of wetlands are privately owned, created a conflict that is unavoidable. That is, if people are to avoid using wetlands within private ownership, the cries you have heard about takings of private property are almost unavoidable.

We believe there's a better way to approach this program, and we do support the existence of a President's program in this area. We believe the better way to approach the program is set forth in H.R. 1330, the Hayes bill. H.R. 1330 certainly is not perfect, but it, as an approach, moves in the right direction. Just very quickly, Mr. Chairman, we think the bill does a good job of addressing exactly what should be considered to be a wetland, not from a scientific perspective, but from a matter of public policy. Which wetlands will be subject to the Federal power to regulate? That's really the issue of what is a wetland in this program.

We think the program should employ classification or regional diversity or some such concept that focuses the power of the Federal Government on the most valuable wetlands. We believe that the program should be expanded to cover some activities that are not covered today, including draining, excavating and channelizing a wetland. We believe that if the program is made more flexible, you can avoid conflicts with land owners and you can enlist land owners much in the way Mr. Barlow was speaking today. Of course, Mr. Chairman, you're correct, what some folks are doing in western Kentucky is probably not legal under the current 404 program.

Finally, Mr. Chairman, we believe the concept of mitigation banking and compensatory mitigation is a critical element that can facilitate the compromise that's necessary to have development and yet have preservation of wetlands resources. We also believe that the role of the States should be enhanced in this program, as was the original intent of Congress.

Mr. Chairman, thank you for the opportunity to testify before you today, and thank you for your interest in this issue.

Mr. APPLEGATE. Mr. Yager?

Mr. YAGER. Good morning. My name is Milan Yager. I'm Legislative Director for the National Association of Home Builders. We're an association of over 160,000 member firms engaged in all aspects of residential construction. This morning we want to focus our com-

ments strictly on section 404, the Wetland Regulatory Permit Program.

The current system for protecting wetlands does not work. It lacks balance between needed protection of wetlands and the need for economic development and jobs in our local communities. Furthermore, the current system is a bureaucratic nightmare, full of overlapping jurisdictions, costly delays, burdensome confusion, and inefficient regulations. We are encouraged, though, in recent weeks, as my colleague has just said, by comments by Mr. Mineta and others that now is the time, regardless of how challenging the task, to address wetlands reform.

The first challenge will be to establish a clear congressional definition of what land shall be a Federal jurisdictional wetland. By defining waters of the United States, we're not asking Congress to consider specific criteria for hydroponic vegetation, hydric soils, or wetlands hydrology. Leave that to the scientists. However, we do believe it is responsible, even necessary, for Congress to require that lands subject to Federal jurisdiction should have independent indicators present for all three wetland parameters. Congress should also require surface water during the growing season. These two changes alone would return the regulatory program to regulating the types of lands that most of us call wetlands—swamps, marshes, and bogs.

Issue two. It has often been believed that all activities undertaken within a jurisdictional wetland require a 404 permit; however, this belief is wrong. Many activities that are specifically harmful to wetlands are not regulated. If our Nation's remaining wetland resources are to be managed, the Clean Water Act needs to be amended to include as regulated activities draining, channelization, and excavation.

Issue three. If the section 404 program is to be effective and efficient and reformed to manage our Nation's wetland resources, the program must be given to a single Federal agency to administer. Today no other Federal regulatory program gives two agencies direct authority over the same permit. Establishing a single agency will not only bring efficiency to the program and reduce cost and confusion to applicants, but it will place total responsibility and accountability with a single agency. No longer will one administrator be able to point to another and claim that it wasn't their responsibility to promote wetlands protection, research new restoration techniques, or undertake aggressive mitigation banking.

In this regard, we urge the Congress to vest not only the authority to regulate wetlands, but also the mission to protect this Nation's wetland resources, with the Army Corps of Engineers, and we'd give this mission to the Corps because of their extensive network of district offices and their larger field staff necessary to run a regulatory program that involves over 75,000 local permit actions each year.

Issue four. Since 1972 the section 404 program has regulated all Federal jurisdictional wetlands equally. In recent years EPA, wetland scientists, and environmental groups have begun investigating classification of wetlands into a few broad groups based on their functional values. Such investigations are based on the diversity of wetlands throughout the United States and the foresight toward

maximizing wetlands management to serve the larger purpose of watershed resource management.

This change in focus can only be achieved if wetlands are considered a managed resource. Wetlands of exceptionally high functions and values to a watershed may merit a management strategy of avoidance. A significantly different watershed management strategy is appropriate for abundant or marginally functional wetlands. The fact that a classification system will be difficult to establish and administer does not change the fundamental reality that we are serious about resource management.

Issue five. As anyone knows who has applied for a 404 permit, the costly and burdensome regulatory permit process is full of individual decisions upon individual decisions upon individual decisions. Even with small, relatively simple projects, disagreements arise. Sometimes these disagreements can be resolved, but many other times the applicant is left with few options—withdraw their application, modify the project and reapply, or if, and only if, the application has been formally denied, you have a right to bring suit against the Corps or EPA. At no time does the Clean Water Act provide the applicant an administrative appeal. This is wrong, and we urge the committee to change it.

Finally, the concept of mitigation banking. It's similar to an ordinary bank account. The bank owner creates, restores, enhances, or preserves wetlands in advance of a need. The wetland values are quantified, and the bank owner would be able to sell these credits. The idea of mitigation banking is not new. The Fish and Wildlife Service has used it since the early 1980s. The current case-by-case, site-by-site approach to mitigation leads to a series of small unrelated mitigation projects scattered throughout a region. They are often too small and disjointed to maximize wetlands benefits, and they sometimes suffer from inadequate monitoring and maintenance. If this Nation is to achieve a goal of no overall net loss of wetlands or to reach beyond to the goal of increasing the Nation's wetlands base, we must address the issue of mitigation banking.

Mr. Chairman, I appreciate your time and your interest, and we look forward to answering questions you and the other Members of the committee may have. Thank you.

Mr. APPLGATE. Thank you, Mr. Yager.

Mr. Bowen?

Mr. BOWEN. Thank you, Mr. Chairman, Members of the subcommittee. My name is Robert L. Bowen. I'm President of Bowen Engineering Corporation and a general contractor from Indianapolis. The AGC is a national trade association of more than 33,000 firms, including 8,000 general contractors. We build highways, bridges, buildings, factories, and sewage treatment plants. In short, we build America.

The AGC respectfully urges that the subcommittee reauthorize the State revolving fund in the amount of \$3.4 billion per year through the end of this century. Additionally, we urge the subcommittee to authorize funding for additional programs, such as the stormwater run-off, the combined sewer overflow, in the amount of an additional \$1.6 billion per year. The SRF Program has been highly successful. A failure to reauthorize these funds

today could undermine the success we've achieved over the last 20 years.

A 1990 EPA survey projects \$80 billion in needs for new sewage treatment plants and sewers. The 1992 estimate, which is not completed yet, we understand is estimated at \$120 billion needed. There are many old plants built in the 1960s and 1970s that are becoming beyond their useful age, and they're going to need to be upgraded and/or replaced. Apogee[?] Research has estimated the cost of those plants at \$60 billion. So you're talking about a total of \$180 billion in needs to build new and replace sewage treatment plants and sewers throughout the United States.

We believe the SRF Program is the way to go. These localities are required to repay their loans and are, therefore, more innovative. They reduce costs, they develop user fees, and they operate the systems more efficiently. Many States are even implementing leverage options to increase the amount of funds for their new sewage treatment plants.

The goal of the SRF is to be self-funding, but today we don't have enough funds yet to make the program self-funding. Now is not the time for the United States Government to abandon its commitment to clean water funding. For this reason, AGC urges Congress to fund the program in the amount of \$3.4 billion per year through the end of the century.

AGC also urges that funding be provided in the form of Title VI capitalization grants to the SRF, not Title II grants for specific projects. We believe that funding specific projects undermines the very fabric of the loan program. If you have communities who can fund their plants through the grant program, they'll simply wait out the system and wait for the Government to bail out the program.

AGC realizes there are many small impoverished, disadvantaged communities unable to repay loans regardless of the interest rate. We recommend that these communities fall under and be included in the Rural Development Administration Program. That program is developed for grants and loans to rural areas, and we would like to see wastewater treatment included in that program.

In conclusion, AGC believes that the Nation's Clean Water Program should be viewed for what it is: an investment in the future economic viability of the United States of America. Each \$1 billion invested in sewage treatment construction provides 50,000 jobs, and that's a conservative number. Most importantly, wastewater treatment creates an opportunity for economic development in communities by allowing new industries and new homes to be built.

Wastewater facilities are a fundamental element of our Nation's infrastructure, which is necessary to economic vitality. At this time, when our global competitors are recognizing the importance of infrastructure as the vital foundation of economic growth, the United States must provide needed capital investment to remain competitive. AGC urges Congress to reauthorize the Clean Water Act and to provide continuation of the capitalization funding.

Thank you very much.

Mr. APPLGATE. Thank you.

Mr. Dorfman?

Mr. DORFMAN. Thank you, Mr. Chairman, Members of the committee. My name is Gerry Dorfman. I'm President of Dorfman Construction Company, Woodland Hills, California, and President of NUCA, the National Utility Contractors Association. I represent about 2,000 contractors and suppliers, and what we do is what we're here about today. We construct and repair sewers, storm drains, water mains. That is our expertise.

Before I start, Mr. Chairman, I would say two and a half hours ago you said somebody left you that little pipe, and I must confess we are the somebody, and we'll get into that in a minute.

My testimony today is to take you through a couple of job sites, because that's what my expertise lies in, in doing the work, and telling you what we are seeing out there, what our contractors throughout the country—not only in California, but everywhere—are seeing. My testimony is about rebuilding our wastewater infrastructure, is about protecting our freshwater supply, is about saving our water.

Let me lead by example. Antiquated. What is antiquated? That is combined sewage overflow systems, over 1,100 throughout the country. From 1975 through 1984, our firm constructed two large projects in northwest Oregon. One of the systems was a combined sewage overflow, which, when you get periods of inclement weather, rain gets into the sewer system, and you have to stop work. Members of the committee, how many times can I tell you that our work was stopped while our people waited for the pipeline to discharge the water and sewage mixture into the Great Columbia River or the beautiful Willamette? That's antiquated.

What is failed? Failed is a system like I constructed in a rural community in northern California three and a half years ago, a federally funded project where the sewer system, septic tank, leach system had failed. Before bidding the job, I had to go inspect it, find out where the new septic tanks were going to go in the back yard and the front yard. The second house I knocked on to get permission to go into the back yard to see where the septic tank was to go, the lady said, "You can't go in there because of the standing water." I said, "Well, I have to see it. I have to know what the improvements are." She said, "Be careful." That wasn't the only house. Many, many homes that I went into, in the back yard you could not walk for the standing sewage. That is a failed system.

What is deterioration? Look to my right on the easel, similar to what you have, Mr. Chairman. Here is a pipe. That pipe is 100 years old. It's from a domestic water system in service in a small community in Rhode Island where the housewives have to boil their water before using it. That is a deteriorating system. That pipe is 100 years old. This pipe is 50 years old.

One part that isn't in my testimony is a project that we bid about 10 days ago in San Diego. I would call it a potential disaster. We were not the successful bidder. It was a contract to rehabilitate an eight-and-a-half-foot-diameter pipe built in the early 1960's, because I know my father bid on the job. In the specifications, the city required—and this was a clean water program—that the contractor include an emergency response program. Why? Because that pipe, eight and a half feet in diameter, is potentially ready to

collapse. That pipe lies about 1,500 yards from San Diego Harbor, and that is where we are with our infrastructure today.

The problem we have in our own industry trying to tell you folks what's going on is because it's kind of out of sight. If you want to take a bridge and they close it because they recognized a weakness in a strut, you know that. If your car hits a chuckhole, you know it. If you see the back-up on the freeway, people talk about mass transit. But who knows about what's underground? Very few of you, and that's what I'm trying to sell. It's out of sight, it's out of mind. Probably the housewife in Pawtucket, Rhode Island, knows, because she boils the water. Probably the children in the small rural community of northern California know, because they can now use the back yard and play or the family can barbecue.

We have a lot of work to do out there. We ask your support in reauthorization of the Clean Water Act.

Thank you very much.

Mr. APPLGATE. Thank you very much, Mr. Dorfman. Just taking a look at this, counsel just asked me, "What is all this stuff in here?"

Mr. DORFMAN. Corrosion, encrusted sediment from over 50 years. Impurities in the water that cling to the pipe.

Mr. APPLGATE. How is that going to be eliminated?

Mr. DORFMAN. Well, you're going to put in a new water system.

Mr. APPLGATE. What happens in 50 years from now?

Mr. DORFMAN. Well, there are improvements in the pipes that are used now that probably address most of those issues.

Mr. APPLGATE. So through a new and improved system, that would alleviate a lot of that, probably extend the life of that pipe for maybe twice as long or more.

Mr. DORFMAN. Yes, sir.

Mr. APPLGATE. Mr. Szabo, you talked about the wetlands and probably that we need a new definition to more finely define what wetlands would be. What do you see coming out of the NAS delineation study? Do you have any idea at all what they might be doing? Is it a good idea?

Mr. SZABO. Well, we always think studies are good ideas. However, this one has not yet begun, as we understand it. The scientific panel has not yet been established. I think the latest estimate is they won't bring anything back for at least a year, until next summer.

We think there are two aspects to the question. One is, scientifically, what is a wetland? I think that's developing science that will get better over time. The second question is what you, as Members of Congress, think should be considered to be a wetlands for purposes of activation of the Federal power. So we think you can make that judgment without waiting for the study.

Mr. APPLGATE. Okay. I just wanted to throw that out.

Mr. McElwee?

Mr. MCELWEE. Thank you, Mr. Chairman, and Members of the committee. My name is Scott McElwee, with McElwee-Scarborough Construction Corporation. Our company, based in Gibbsboro, New Jersey, has built water and wastewater treatment facilities in both the public and private sectors for the past 30 years. As a member of the Associated Builders and Contractors'

National Infrastructure Committee, I appreciate this opportunity to comment on reauthorization of the Clean Water Act.

ABC represents over 16,000 merit shop contractors, subcontractors, material suppliers, and related firms. With 75 percent of construction done today by merit shop contractors, ABC is proud to be their voice.

ABC believes inadequate and insufficient water and wastewater treatment facilities represent a large segment of the clean water problems facing our Nation today. According to the EPA, there is a need for over \$100 billion to meet the current wastewater treatment demands alone, and this will likely continue to rise. The cost of insufficient attention to clean water issues are indisputable. Our Nation's water quality and environmental infrastructure could not be more vital to our health, safety, and overall quality of life.

Unfortunately, the \$18 billion funding level committed to in the 1987 act to capitalize State revolving loans has not been met over time. ABC believes the Federal Government must meet its original commitment. President Clinton's budget for fiscal year 1994 of \$1.2 billion, however, falls well short of the anticipated \$2 billion funding level for this program.

With the Federal Government's role in providing funding for water and wastewater treatment needs scheduled to end in 1994, we support continued Federal funding beyond 1994 to further capitalize State revolving funds, and we anticipate the Administration's approval of a new four-year reauthorization. ABC would also endorse a limited grant program to provide necessary treatment facilities to disadvantaged communities without the capacity to support large capital investments. In addition, any funding plan should consider that States may have to impose user fees to meet their share of requirements.

Another major concern of ABC members related to reauthorization of the Clean Water Act is wetlands. As contractors, our members have experienced significant problems with wetlands regulations. ABC recognizes the environmental value of wetlands. We wholeheartedly support efforts to protect legitimate wetlands, but believe a more streamlined and efficient process is in order.

Since the issuance of the 1989 Federal wetlands manual, our members have experienced the costly brunt of improper wetland delineations. The inconsistencies allowed by the 1989 manual undermined its intent to provide a uniform national procedure for wetland identification and delineation. We are hopeful that the Clinton Administration will take into consideration the confusion which resulted since adoption of this manual. We are eager to work with the Administration to revise the manual and further streamline program requirements. The previously proposed changes to the 1989 manual should still be considered in the overall framework of wetlands policy.

ABC believes the current wetlands regulatory system could be improved by streamlining the permit process, establishing an inter-agency technical committee to address wetlands classification, implementing mitigation banking, and increasing the State role in the 404 program. ABC believes all authority for wetland permits should be transferred to the Corps, with no EPA veto authority. Additionally, establishing a clear permitting process with an out-

lined time table is critical for necessary planning functions. To further expedite the permit process, ABC believes the use of general permits should be expanded.

Recognizing all wetlands are not equal, ABC supports a priority ranking system to classify wetland areas and appropriate use. Distinct definitions for wetland areas must be articulated, and regional differences must be taken into account. We believe any effort to improve wetland management should consider the use of a mitigation banking system to restore, enhance, or create wetlands when appropriate.

ABC believes compensation must be made available to land owners whose land is significantly devalued or deemed unusable under wetland classification guidelines. With three-quarters of the Nation's wetlands being privately owned, it is imperative to enact a rational and reasonable policy which balances protection of valuable wetlands with the rights of private property owners.

Finally, ABC believes it is vital for States to play an active role in developing and defining wetlands policy. States should be encouraged to assume greater responsibility of the 404 program. States should also be allowed to tailor their classification program to fit their individual circumstances. In cases where applicable, joint Federal and State permit review should be considered. In all cases, however, the method of delineating wetlands should be consistent between State and Federal programs.

On behalf of the ABC, I again want to thank the committee for the opportunity to be here today. I will be happy to answer any questions you may have.

Mr. APPLEGATE. Okay. Thank you very much. I appreciate that and all of your input.

Let me ask this question of a couple of you who had talked about wetlands, and I think there was one reference as to one agency authority rather than having the dual. Would you be happiest with the Corps or the EPA, or which direction would you like to go?

Mr. SZABO. I'll try to answer it first, Mr. Chairman. I think it's abundantly clear none of them are the best choice. However, given the options on the deck today, our Coalition would choose the Corps, primarily because they have experience and because they have field personnel. In my home State of Louisiana, there are no EPA people in the field. I think, from what I can understand, that's generally true around the country. There aren't many field personnel.

I think all the members of our Coalition, most of which are not in agriculture, are very sympathetic to the Soil Conservation Service because there's an individual in each county or parish that's with the Soil Conservation Service. However, we didn't think Congress would make that radical a choice, so we limited our view to the Corps of Engineers.

Mr. YAGER. We share the comments that Bob just made as far as the National Association of Home Builders goes. The fact is that this is a program that involves very small land owners. As I mentioned earlier, there are 80,000 individual permits issued a year. These are people that need to be able to go and discuss their land, their project with a local official. EPA does not have the personnel

and the district offices to do that. Once again, we share the thought that the Corps is probably the best alternative.

But it needs to be a single source, because, Mr. Chairman, it's not only just getting the permit, but what we were trying to express in our statement was that we need to have a single agency that's got the mission of wetlands, because it's more than just giving a permit. It's somebody out there advocating wetlands protection, it's somebody out there advocating education, restoration, mitigation banking. Right now EPA has got the charge of enforcement, the Corps has got the charge of permitting, but no one is doing the task in between, and a single agency will have that mission.

Mr. APPLGATE. Yes, I believe that's correct. I think that's exactly where it ought to be, and I think there ought to be a little bit more common sense invoked into that whole wetlands study and definition.

You had mentioned, I think, Mr. Bowen, about greater funding for the wastewater treatment facility construction and rehab programs and all, which I don't think anybody really objects to, except we're not sure where we're going to get the money as far as the integrity of the State revolving funds, which we believe in very strongly. I was very supportive of the President's proposition in the stimulus plan to move \$845 million from 1994 to 1993, get into the construction season, help these communities to meet the mandates of the EPA. Unfortunately, that didn't pass, and I thought it was necessary.

But I do think that the State revolving funds need to be addressed at at least \$2 billion, at the very, very minimal amount, and perhaps more, and also addressing the clean drinking water, which I think is absolutely imperative, and we should include that into the State revolving fund under different subtitles, but I think it's important.

Let me ask you whether any of you have given thought to what we've been hearing as a proposition—the principal subsidy. In other words, I was interested in trying to direct some grant monies back to small communities particularly, and this is not to drive a wedge between big and small, but I happen to represent small, and small is big all over the country. So you take and offer some grants back to help in technical assistance or designing and different things like that, and the grant program itself doesn't go over as a big hit with a lot of people, but the idea of the principal subsidy so that you can utilize the monies that are in the fund and take the interest from that and put it back into another fund, which then could ultimately be divvied out back to, say, areas of 10,000 or less either in grant form or no-interest loans or something like that.

Has anybody given much thought to that, if that sounds like a pretty good idea? Or do you know anything about it at all?

Mr. BOWEN. Would you include that in the SRF Program?

Mr. APPLGATE. Yes.

Mr. BOWEN. We suggested working through the Rural Development Administration for smaller communities.

Mr. APPLGATE. Well, that program exists, too, and we'd like to see that retained, too. But this could offer some additional monies

that would help some of the smaller communities, so that there would be monies made available from the use of the payback of these other monies.

Does anybody have any comments on any of it? Is anybody familiar with any of it?

Mr. YAGER. Mr. Chairman, we just don't have a policy on that. Certainly, the rural communities are having difficulties, and there needs to be something addressed there, but right now we don't have any policy on that proposal.

Mr. APPLGATE. Yes. Because we know what the big problems are in the big cities, and if you go into New York and some of those places, it's monumental. I've talked to people from the Boston Harbor. They're talking \$3.5 billion, which, you know, there just isn't enough money. I know that they're in dire need and in terrible shape, as a matter of fact, and how we address that, and we're talking maybe in terms of \$100 million, which is a relatively small amount of money to them. To us in our small areas, \$100 million is a lot of big bucks and could handle a lot of small territories.

Well, that's what I had.

Mr. Gilchrest?

Mr. GILCHREST. Thank you, Mr. Chairman.

I have quite a few questions, and if you just want to say yes or no, that's okay.

Mr. Dorfman, I was curious, especially the pipe that's on the table there, can you make plastic pipes and have them be safe so that there is—would there then not be the same type of build-up?

Mr. DORFMAN. Yes, you can, and also, of course, that pipe being 100 years old, you have other pipes—ductal iron and lined pipes—that compete with plastic that also can do that.

Mr. GILCHREST. I see.

Mr. DORFMAN. The answer to your question is, yes, you can with a plastic pipe.

Mr. GILCHREST. Thank you.

I guess, Mr. Szabo and Mr. Yager, you talked most about H.R. 1330—or, actually, Mr. McElwee. You three mentioned specifically, I think, in your testimony H.R. 1330, and I'm just curious, briefly, you mentioned classifying wetlands as far as their value, which ones to preserve, which ones not to preserve, and so on. Who would be the—and I think you might have said us. But who would determine that classification?

Mr. SZABO. Well, let me rearticulate what you said. It wasn't that they would not be protected. It's the level of protection they would receive, from the most rigid to the least rigid.

Mr. GILCHREST. I understand that, but who would determine the classification?

Mr. SZABO. I would think you, as the Congress, should make some initial policy judgments, but you should direct an agency to do that, whichever agency you make responsible for the wetlands program.

Mr. GILCHREST. Suppose we designated the National Academy of Sciences to make that classification. Would that be—I'm not being cynical or—

Mr. SZABO. The National Academy of Sciences is not an agency of the Federal Government.

Mr. GILCHREST. Right. But suppose we, as Congress, designated NAS to do that study, or suppose we designated EPA. Do you have a suggestion for an agency that could do that?

Mr. SZABO. Well, I think you should do it through the Corps, and you should enlist a multiagency task force, as was done on the manual, both manuals, to try to achieve a cross-fertilization of ideas, but I would not give it to an agency that's not under your direct jurisdiction and your direct supervision.

Mr. GILCHREST. But you do agree that there should be some science to the development of that classification?

Mr. SZABO. Well, I think all the—you know, the Corps came up with guidelines in 1987, after five years of effort. That was based on science. The manual of 1989 was based on science. People just didn't agree with the judgment, what were based on that science. The manual of 1991 was based on science, but, again, people didn't agree with the judgments that were based on that science. So I think all of these judgments have been based on science and clearly science has to be involved in these decisions.

Mr. YAGER. Congressman, first off, we think any type of categorization, you, the Congress, needs to set that policy, as we do with fishable, swimmable, and other sorts of things, set the parameters that you want done. Then it needs to be turned over to a Federal agency to be executed. They need to turn to the scientists and to the public to determine how that should be done.

The problem with going to the National Academy of Sciences and others is that we don't have an Administrative Procedures Act. We, as the public, have no way to participate in that process. Congress, as we do with every other program, lays out the policy matters, and we turn it over to our agencies, the people that are experts in these areas, to bring in the science about how to execute that policy.

One of the concerns we have so often with the 404 program is that the public is left out. When the 1989 manual was developed by 11 Federal scientists, the public was not even—

Mr. GILCHREST. Excuse me. I don't mean to interrupt, but I do have another question.

Mr. YAGER. Okay.

Mr. GILCHREST. I agree with you, I think the administration of the wetlands program has been really abysmal in a lot of areas, and we do need to clear it up. An NAS study is just a recommendation to us, as Members of Congress, to develop a policy based on their understanding of what a wetlands is.

In H.R. 1330 there is a section that talks about classification, A value, B value, whatever. In H.R. 1330 it's my understanding that only a percentage of any given county in the country can be classified as A value wetland, which then would be regulated, which then the owner would be compensated for. Suppose you have a—and I don't know what the percentage is. Twenty percent or something like this. Let's just say it's 20 percent, and there is a classification for A value wetland. Suppose that county, based on the classification that's accepted, has 60 percent A value wetland. What would then be the policy? What should be the policy?

Mr. SZABO. H.R. 1330 says that type A wetlands can be compensated at the option of the land owner. The land owner can

choose to keep it with the restrictions. The Louisiana Members that helped develop the bill put the 20 percent limit in because so many of the parishes in extreme south Louisiana are 100 percent wetlands, and they didn't know the percentage that might be considered type A wetlands.

However, some of those parishes have 100,000 people living in them and I think the judgment made by those Members in putting the bill together was that they still had to have a tax base in those parishes, they still had to have economic development, they still had to have places for homes, and they didn't want to turn their parishes into national parks, and that was, I think, what drove their judgment. Whether 20 percent is the right number, whether any number is proper, is really a judgement in which the Coalition did not participate. It's a judgment by the Members of what was important to their districts.

Mr. GILCHREST. I see.

Mr. YAGER. Congressman, the other thing that's important to remember there is that that does not mean that the other 80 percent will be lost. If in fact they all or 60 percent of the county are wetlands of national significance, as defined in the Hayes legislation, it would only mean that 20 percent would qualify for that immediate compensation later found in the legislation. The other wetlands, the other 40 percent that are of national significance, would still be required to have a permit for any activity that would go on in those, and it would still be regulated, as we do any other important wetlands in the country. It was a way to set some as more important than all others. It would provide more protection than we currently have under the existing law.

Mr. GILCHREST. Some standard. Understanding how zoning laws have been in the past, and understanding the idea which is becoming a fairly accepted practice of understanding water from the perspective of watershed management and how it all interrelates and interacts, would you agree that communities really need, especially for future generations that will be the recipients of what we do, some type of comprehensive managed growth plan so that we can see into the future what impacts development is going to have and population growth?

Mr. YAGER. Congressman, no question about it. In fact, we've been managing growth since the early 1970s. One key component of your question, though, was the issue of management. Right now we don't manage wetlands at all. The national policy is strictly avoidance, that nothing should occur. The fact is that if wetlands are to be part of a managed water resource, then you've got to have some growth management, you've got to use some other tools, but you have to manage as a resource. You can't just go in there with a regulatory program saying, "No, you can't do anything."

Mr. GILCHREST. Sometimes managing the resource of wetlands means doing nothing to those wetlands.

Mr. YAGER. Oh, very definitely. But that's part of a management plan for high-value wetlands or wetlands of limited resources. Within a watershed, there's lots of management tools that you would get there. But to say right now, as we do across this country, that if you have a Federal jurisdictional wetland, no activity will occur, is not management.

Mr. SZABO. Mr. Gilchrest, if I could answer that, just take a stab at it, you may be correct that more land use management is where the country is moving. I would think that members of our Coalition would have two requests: that you, to the maximum extent, do that from the local level and not the Federal level and be very careful, perhaps about where you should use the Federal power to mandate local judgments; and, second, when you do exercise the redends anything, please do it through the front door. Say what you're doing and let's debate it. Let's don't do it through the back door—

Mr. GILCHREST. I couldn't agree with you more. Thank you.

Mr. APPLGATE. Mr. Geren?

Mr. GEREN. Thank you, Mr. Chairman.

I'd just like to ask one question to anybody on the panel. One hundred days does not an Administration make, except in the eyes of all the people who make their living writing columns. But do you all have any kind of sense if there's been a change in these first three months of this Administration in the enforcement of wetlands policy over what we saw over the last several years under the Bush Administration and the Reagan Administration preceding that?

Mr. SZABO. Mr. Geren, we've seen two things. When Mr. Bush said no net loss of wetlands, suddenly folks started making a lot more rigid judgments out in the field against some test that they thought was coming. Recently, we've seen some more rigid judgments in south Louisiana than we've ever seen before. We've seen some permit problems during the first 100 days if this administration that we've never seen before. I don't think that's necessarily coming from the new Administration, but it's perhaps like the Bush reactin to the "no set less" pledge, was, in anticipation of what they think might be the right way to do this permitting.

We've had some permits denied. The Archdiocese of New Orleans had a permit challenged recently on land that they were trying to preserve from erosion and saltwater intrusion that was the type but has not been challenged in the past.

Mr. YAGER. The home builders are not experiencing any radical change in the administration of the program since the new Administration has taken over. The best thing that has happened happened before, when we went back to the use of the 1987 manual, and that has made a dramatic change. There are still problems out in the field, but not nearly as many as we had when they used the 1989 manual.

Mr. GEREN. All right. Thank you very much.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Geren.

Mr. Horn?

Mr. HORN. Thank you, Mr. Chairman.

I want to congratulate the panel on bringing us reality from the field of life experiences that your members have related to you.

Mr. Dorfman, I'm just curious, what kind of pipes are you mostly finding? What metal are the pipes basically that have corroded such as this?

Mr. DORFMAN. I'm not sure I can answer that, because this is a particular situation. I think you find metal pipes, depending on when they're put in. I have to caution that this is a 50- and 100-year-old pipe. There are two different pipes here. The new pipes

now have lining, are made of different components that correct those problems that you're seeing here.

Mr. HORN. Well, I just wondered if any were lead pipes.

Mr. DORFMAN. Oh, they're still lead pipes. It depends on the agency. There are cities throughout the country that have their way of using whatever they want.

Mr. HORN. Sure. It seems to me there are major public health problems there probably in terms of the quality of those pipes and what's happened into the water supply.

Well, let me move to another question, and that is, the statement was made that people have not agreed on the science, and I think that's true. Let's face it, there are different people that have different interests in this particular area. How would you describe those different interests when you look at them and they reject "science" because the study just doesn't agree with what they think ought to happen to wetlands, either less wetlands so defined or more wetlands so defined? What's your analysis of it?

Mr. SZABO. Well, we've been right in the middle of this debate, and I'm afraid much of this debate has been between good and evil and between developers and non-developers. It's taken on kind of a not-always-pleasant tone. I think, however, that primarily people of good spirit can disagree with what is a wetland. The more fundamental question is, whether certain land with wetlands values is important enough to require Federal protection? There hasn't been much guidance from Congress in this area. We ask you to provide that guidance.

Mr. HORN. Well, you're expecting Congress to do what the "people" can't seem to do. I mean, we're fragmented, too. The old story I mentioned the other day about where you stand depends on where you sit.

Mr. SZABO. That's right.

Mr. HORN. There are differing views here, and that's often why the language is so vague. You can either turn it over to an administrative agency and keep your fingers crossed, and then when we're unhappy with it, we can club them once in a while.

Mr. SZABO. I don't think Congress voted to get into this program, to be honest with you. This was a navigable waterways "dredge and fill" permitting program. Mr. Oberstar mentioned that it grew substantially not just because of the Corps, but because of court decisions and a lot of other things. I think, unfortunately, it's kind of grown out of control, and we have to look to you, as our elected officials, to bring some order to the program. I know that's going to be difficult, but we certainly wish to help you in that, to the extent we can, and we understand it's a difficult task.

Mr. HORN. Mr. Yager, you had a comment?

Mr. YAGER. Yes. Congressman, the science can get into what types of vegetation should occur, and when you get into the browning of leaves and what does that mean about when the water was here and so forth, but when I go back to talk to builders across this country and I tell them that a Federal jurisdictional wetland that must be protected by the Federal Government because of water quality issues is any land that had water within 18 inches of the surface, they wonder, how do you call that a wetland?

I think if Congress wanted to say, "Listen, there needs to be surface water, and we leave it up to the scientists to determine types of saturation and duration and things such as that," but Congress has to set some parameters around the Government regulation of that land if it's important for water quality purposes. The same thing goes with the parameters. In 1987 it seemed to be important that we had all three parameters. You had to have some type of water, you had to have some type of hydric soils, you had to have some types of vegetation. Suddenly, we had an 1989 manual that said, "Well, listen, if you've got one, you can assume a second," and later in the manual it said, "If you've got two, you can assume the third." Congress should have said, "Listen, you need to have independent indicators of all three. Leave it up to the scientists to determine what those independent indicators are."

Frankly, I've spent a lot of time on this issue, and I get confused when I have to start getting into independent indicators. I don't expect Members of Congress to do that, but I do expect Members of Congress to say, "Listen, we don't want to regulate all land that may have some water characteristics as important for water quality purposes, section 404, but what we do want to say is some wetlands, because of flooding or water purification or other such things, need to be protected from Federal jurisdiction, and we're going to lay out the parameters and let the scientists go in between that." That's what we expect the Congress to do, because that's what's missing from the statute.

The Academy, I don't know in one year, for \$400,000, they're going to come up with new science. What they're going to do is what we're asking Congress. They're going to come up with some policy concerns, and that's what we expect Members of Congress to do in one year, for \$400,000, is to come up with those broad parameters.

Mr. HORN. Sure. Let me ask one last question. There seems to be a bipartisan consensus here that we ought to have one agency making these decisions, not two. But could two agencies be involved but have separate jurisdictions? For example, the Soil Conservation Service has been mentioned. Agricultural lands have been mentioned extensively this morning. Would it make any sense to have the Soil Conservation Service, which does have an extensive network around the country, even more than the Corps of Engineers, involved in the problems of wetlands as related to agricultural lands versus the Corps handling everything but agricultural land?

Mr. SZABO. Well, obviously, you can do whatever you all wish to do. Two considerations, however. Agricultural lands to most farmers will someday possibly be commercial land. Most farmers don't want to give up their right to sell if the city comes close and they can sell it for development. I think you need to think through at what point it might shift from one agency to the other.

I was more intrigued, candidly, by your comment earlier that maybe we ought to have a new agency that was missioned for this purpose and made up of resources from all agencies. I know that's something Congress doesn't always do, but perhaps this one area is complicated enough that that approach makes some sense.

Mr. HORN. Yes.

Mr. YAGER. Congressman, it needs to be a single agency for everyone, whether it be USDA or whether it be the Corps or EPA. We prefer the Corps. But let me give the example of food safety in this Nation. When we wrote the food safety laws in other committees, they didn't say, "Listen, because pesticides, which kill things, are applied to food, we should have multiple agencies involved in the regulation of the pesticides." They gave the regulation to a single agency. FDA, Food and Drug, EPA all have a role. We think a number of different Federal agencies may have a consulting role, and that's what we do with food safety. But with food safety, we don't say, "Well, the permits should be regulated by two different agencies, with each coming to different conclusions." We said only one agency.

And it should be the same thing with wetlands. Allow a number of agencies to have a consultive role, but only give it to one agency. You know the old book, "Reinventing Government." Congress made one mistake in 1972, when they started a dredge and fill prevention pollution program and said, "Well, we have EPA and we have the Corps, and we don't want to make a decision, so let's give it to both." Let's not make that same mistake again.

Mr. HORN. Right. The one disadvantage I can see with the Soil Conservation Service is it might be considered too much of an "old buddy" system, because you've got local farmers on those citizen boards, and that could either work in favor of or against, depending upon local biases in relation to particular farming operations. But I think you've raised a good point, and it ought to stimulate some discussion in this committee as to how you place responsibility, how you get the job done in a timely manner so people don't have money tied up in decisions, with the clock running, and we haven't been responsive in terms of the executive bureaucracy.

Thank you, Mr. Chairman.

Mr. APPLEGATE. Thank you, Mr. Horn.

Gentlemen, thank you very much for appearing before the committee today.

Mr. APPLEGATE. The meeting is adjourned until 9:30 a.m. tomorrow morning.

[Whereupon, at 1:09 p.m., the subcommittee recessed, to reconvene at 9:30 a.m. on Wednesday, May 12, 1993.]

PREPARED STATEMENTS OF WITNESSES

U.S. REPRESENTATIVE TOM BARLOW'S  
TESTIMONY BEFORE THE HOUSE SUBCOMMITTEE  
WATER RESOURCES AND ENVIRONMENT

May 11, 1993

Chairman Applegate, members of this subcommittee, I welcome the opportunity to testify before you today.

I represent Kentucky's First District. My district is an agricultural district encompassing nearly one-third of Western and Southern Kentucky. The Mississippi, Ohio, Tennessee and Cumberland rivers either flow through or run along the borders of my district. Accordingly, one of the most important issues facing my district concerns the Clean Water Act and its enforcement.

**A. Ground Water Monitoring:**

While farming is the single largest industry in my district, farms are generally small in acreage and are best described as "family farms." Farmers in my district raise corn, soybeans, wheat and tobacco. There are also many farmers that raise livestock such as cattle and hogs. All farmers are concerned with how to comply with environmental laws and regulations that seem designed for industries other than farming.

One of the most troubling issues involves "groundwater monitoring." Farmers are being advised that they must construct expensive "monitoring wells" in order to comply with both state and federal environmental laws. I am told that one monitoring system can cost between \$20,000 and \$30,000. Farmers simply cannot afford such a cost, especially when farm incomes are declining.

The fundamental problem involves the application of "strict liability" to the agriculture industry. Unlike other industries that use water, farmers are unable to "turn off the spout" and control the quality of the water that they use. Rain contains various impurities that affect the ground water. Farmers must use some chemicals in order to maintain profitable operations. Cattle and hogs produce waste that may impact the groundwater. Current laws and regulations that seem to require drastic steps are not realistic.

A better approach would require farmers to use "best management practices" ("BMP") and relieve farmers from strict liability if a farmer follows BMP's recognized by the industry. Absent willful misconduct, it is not fair to subject farmers to "strict liability" if farmers engage in BMP's. Farmers should not be required to monitor groundwater quality absent strong proof that a farmer willfully fails to follow BMP's.

**B. WETLANDS:**

While working in Washington for the Natural Resource Defense Council during the 1970's, I became very familiar with the many problems that face wetlands in this nation. In response, Congress enacted tough wetlands legislation. Today, it is my belief that Congress should modify its approach in this area.

Landowners and wetlands must coexist. The federal government must be careful when telling a citizen what he or she can and cannot do with his or her property. I propose that we look for new ways to encourage wetlands preservation.

**C. Conclusion:**

We must protect the environment of our planet. The farmers of my district understand this since their very existence depends on whether they properly manage the air, water and soil which provide the foundation for their industry. At the same time, we must not destroy the industry that feeds our nation and the world. Agriculture and environmental protection must coexist. Good farmers follow best management practices and must not be forced out-of-business because of water quality concerns that are unreasonable and out of their control.

Once again, I appreciate the opportunity to testify before this subcommittee about the concerns of the constituents that I serve.

TOM BARLOW

**Testimony of  
Robert L. Bowen**  
on Behalf of  
**The Associated General Contractors of America**  
Presented to the  
**House Public Works and Transportation Committee**  
**Subcommittee on Water Resources**  
on the Topic of Reauthorization of  
**The Federal Water Pollution Control Act**  
May 11, 1993

The Associated General Contractors of America (AGC) is a national trade association of more than 33,000 firms, including 8,000 of America's leading general contracting firms. They are engaged in the construction of the nation's commercial buildings, shopping centers, factories, warehouses, highways, bridges, tunnels, airports, water works facilities, waste treatment facilities, dams, water conservation projects, defense facilities, multi-family housing projects and site preparation/utilities installation for housing development.

The Associated General Contractors of America  
1957 E Street N.W., Washington, D.C. 20006-5199, (202) 393-2040, Fax (202) 347-4004

My name is Robert L. Bowen and I am a construction contractor from Indianapolis, Indiana. With me is Brian Deery who is with the national staff of the Associated General Contractors of America. The Associated General Contractors of America (AGC) is a national trade association of more than 33,000 firms, including 8,000 of America's leading general contracting firms. These firms are engaged in the construction of the nation's commercial buildings, shopping centers, factories, warehouses, highways, bridges, tunnels, airports, water works facilities, wastewater treatment facilities, dams, water conservation projects, defense facilities, multi-family housing projects and site preparation/utilities installation for housing development.

AGC appreciates the opportunity to present its position on the important topic of reauthorization of the Federal Water Pollution Control Act. AGC respectfully urges this subcommittee to continue to provide capitalization grants to the State Revolving Fund (SRF) program through the end of the century at \$3.4 billion per year and increase this funding to \$5 billion per year if new eligibilities, such as addressing stormwater runoff problems, are to be funded with SRF loans. AGC also recommends that Federal clean water funding not be provided as direct grants for specific projects. Recognizing that some small, impoverished communities may not be able to repay loans, AGC recommends that the water and wastewater grant and loan program of the Rural Development Administration be expanded to provide funds to these communities.

AGC makes these recommendations because we believe that this program has been highly successful in significantly improving the quality of our nation's waterways and the program provides significant short-term and long-term economic benefits.

AGC is concerned, however, that the tremendous clean water progress of the past 20 years will be undermined and there may actually be a decline in water quality if sufficient funds are not available for states to make loans to local governments to provide and upgrade wastewater treatment facilities. Wastewater treatment needs continue to grow. While most of the larger municipal wastewater treatment facilities are in compliance with water quality standards, a significant percentage of small systems are not. EPA's 1990 Needs Survey projected \$80.4 billion in capital investment necessary to address the nation's wastewater treatment needs. In addition, states identified \$30.2 billion in needs which did not meet EPA's documentation criteria but which nevertheless do exist. Therefore, the total estimate of needs over the next twenty years, based on this survey, is \$110.6 billion.

Many of the systems that were built in the mid-1970s are beginning to approach the end of their useful lives and will need modernization, replacement and overhaul. The estimate of cost for addressing these needs is not included in EPA's Needs Survey. A study by the consulting firm Apogee Research, however, projects that capital expenditures for replacement of existing wastewater facilities may be as much as \$59 billion between 1993 and 2000. Also, new water quality projects to control non-point source pollution and to correct combined sewer overflow problems will compete with the more traditional projects for the limited available funds. The cost to correct the combined sewer problem alone has been estimated at over \$100 billion.

Already there are signs that the nation is losing ground in its effort to continue

progress toward clean water. The estimated \$110.6 billion in wastewater treatment facility needs included in the 1990 Needs Survey represents nearly a \$17 billion increase in needs since the last Needs Survey was reported in 1988. EPA is due to release its 1992 Needs Survey in the very near future. Early indications from EPA are that the needs figure in this survey will exceed \$120 billion. Some of this increase is due to better documentation of needs and new enforcement requirements to control such things as: toxics, combined sewer overflows, non-point source pollution and stormwater runoff. Other organizations have developed their own treatment needs assessments, which exceed these numbers. Regardless of which projection of needs is used it is clear that the needs are great. If clean water progress is to continue, federal funding must be continued and increased.

AGC strongly supports the State Revolving Fund (SRF) program as the best means for meeting wastewater needs. The SRF program has placed the authority for addressing water pollution problems where it belongs, at the state level. States work in cooperation with local governments providing easier and less costly administration. According to the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), administration of the program at the state level has led to a 50 percent faster completion rate and lower project costs as compared to the traditional construction grants program. Because the funds are provided to local governments as loans to be repaid, there is an incentive for localities to be innovative, reduce costs, develop appropriate user fees and operate the systems more efficiently. Many states are experimenting with leveraging options to increase the amount of funds that will be available for meeting wastewater needs.

The goal of the SRF program is, of course, for it to become self supporting through the repayment of the loans by local governments. Eventually this will happen. However, the amounts provided to the SRFs thus far are not sufficient to make it self supporting at this time. Loan repayments have not yet begun to flow back into the SRFs in amounts sufficient to continue the necessary level of investment to make progress against the ever growing needs. Because of the growing gap between the amount of funds being invested in wastewater facilities and the increasing needs, now is not the time for the Federal government to abandon its commitment to clean water funding. For this reason AGC calls on Congress to authorize funding of \$3.4 billion per year through the end of the century.

As the clean water effort begins to focus on such problems as combined sewer overflow correction, toxics removal, stormwater management and nonpoint source pollution, more funds will be needed. These problems should be addressed with funding from the SRFs. However, the \$3.4 billion per year in funding we have called for will not be sufficient to meet these additional water pollution problems which are not currently eligible for SRF funding. Therefore, AGC recommends an additional \$1.6 billion per year in capitalization funding if new water pollution projects are to be eligible for funding from the SRFs.

AGC also urges that all funding be provided as title VI capitalization grants to the SRFs and not as direct title II grants for specific projects. AGC believes that providing direct grants to specific projects undermines the long-term viability of the program because this funding is not repaid into the SRFs. Also, providing direct grants sends the message to other local communities that if you wait long enough and

do not address your water treatment problems, the Federal government will eventually step in and provide funding. This is the wrong message.

AGC realizes that there are some small, economically disadvantaged communities which are not able to repay loans, regardless of the interest rate being charged. These communities certainly need to be provided assistance. AGC recommends that the wastewater grant and loan program of the Rural Development Administration be expanded to address these specific needs. This program has established criteria for making grants and loans in rural areas which could be extended to communities which are not currently included.

In conclusion, AGC believes that the nation's clean water program should be viewed for what it is -- an investment in the future economic viability of the nation. Each one billion dollars invested in the construction of a wastewater facility generates nearly 50,000 jobs. More importantly, however, wastewater treatment creates opportunity for economic development in communities by allowing new industries and new homes to be located there. Wastewater facilities are a fundamental element of the nation's infrastructure which is necessary for the economic vitality of any community. At this time, when many of our global competitors are recognizing the importance of infrastructure as the vital foundation on which future economic growth is based, the United States must provide the needed capital investment to remain competitive. AGC urges Congress to move expeditiously to reauthorize the Clean Water Act and to provide for the continuation of capitalization funding for the highly successful clean water program.

**PREPARED STATEMENT OF GERALD E. DORFMAN  
PRESIDENT  
NATIONAL UTILITY CONTRACTORS ASSOCIATION**

**BEFORE THE**

**U.S. HOUSE OF REPRESENTATIVES  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT**

***THE UNSEEN CRISIS:  
AMERICA'S CRUMBLING CLEAN WATER INFRASTRUCTURE***

**MAY 11, 1993**

**CONSTRUCTORS OF WATER, SEWER AND UNDERGROUND UTILITY SYSTEMS**

Mr. Chairman and Members of the Subcommittee, I am Gerry Dorfman, President of the National Utility Contractors Association (NUCA) and President of Dorfman Construction of Woodland Hills, California. I have been in the business of building water supply and wastewater treatment facilities for over thirty years.

### **I. The Situation At Hand**

The various scientific studies and statistical assessments that are used to document water pollution problems are useful and important but sterile. They fail to convey the nature of the harm in stark, realistic terms.

I want to tell you first-hand that the water infrastructure needs in the United States are tremendous in terms of the investment required for construction and rehabilitation and in terms of the devastating social, environmental, and economic opportunity costs that result from our reluctance to devote sufficient resources to the problem.

A renewed federal commitment to clean water construction should be an easy choice, not a tough choice. I don't need to tell you the importance of fresh water to everyday life. Clean Water Act construction programs have improved the quality of the nation's water resources immensely to the benefit of all. Clean water construction funding must become a top priority.

#### **A. Deteriorating Sewer Systems**

Not long ago, my company replaced a septic system that served a rural neighborhood in Northern California. Financing for the job was provided by the federal government. While I was prospecting the site before preparing my ultimately successful bid, I was absolutely dumbfounded to discover that the

NUCA  
page 2

families' backyards were saturated with raw sewage that had overflowed from failed leaching systems. These families were literally trapped in their homes. The children could not play outside. The entire neighborhood was a public health hazard. The impact on the quality of life was immeasurable.

The federal investment in this community was necessary and sound, and it is important for me to tell you that the neighborhood in question is thriving since the completion of the job. People now enjoy simple pleasures, such as family barbecues on the patio.

The sewer problem is urban as well as rural. On a project for a major city in Southern California, we recently replaced a sewer pipeline that had failed earlier than expected due to unstable ground conditions. When we uncovered the pipe, we found gaping holes where raw sewage had been escaping into the surrounding ground for an unknown period of time. The devastating part of the story is that the collapsed system was located less than 100 yards from a fresh waterway. Whenever the tide rose, the pipe carried fresh water to the treatment plant. When the tide went out, so went the sewage. We had uncovered a daily exchange of raw sewage and fresh water.

#### **B. Combined Sewer Overflows**

A second problem occurs with combined sewage overflows. On a project in the Northwest, our firm replaced a large-diameter brick sewer built in the early 1900s. There were numerous delays when work was suspended due to heavy

NUCA  
page 3

rainfall. On more than one occasion, I stood with my superintendent watching raw sewage and rainwater discharge into a great river because the infrastructure could not process the influx added by the storm. This was not an isolated event. All 1,100 of the nation's combined sewer systems need to be augmented so they are either a storm system or a sewer system, not both.

**C. Leaking Drinking Water Systems Exacerbate Contamination**

Thousands of miles of old and decaying drinking water lines also contribute to water pollution. My son recently replaced a 10,000-foot water line for a community in Southern California. He was continually plagued with suspension of work because the adjacent line, which his work was to replace, leaked like a sieve. As you can imagine, this situation entailed an incredible loss of water to the community as well as enormous construction costs, but that is not my point.

The leaking clean water contributed to water contamination when it merged with sewage from leaking sewers beneath. The increased volume of contaminated water flowed to the closest aquifer or waterway. In addition, some of the leaking clean water entered the sewer and returned to the treatment plant. As you can see, the water pollution ramifications of a drinking water system failure are extensive. The people who suffer the consequences are unsuspecting, downstream.

NUCA  
page 4

**D. Lessons From Experience**

I have drawn a number of observations from these and other experiences in the field since the Clean Water Act was last amended in 1987.

- First, I find it particularly poignant that any of my fellow NUCA members, from any state in the land, could appear before this Subcommittee this morning and tell similar stories. That is the appalling reality of the situation, despite great progress under the Clean Water Act.
- Second, the most important needs are not new or particularly complex. It is simply a matter of core infrastructure -- pipes in the ground -- falling apart because they have not been replaced in half a century. Too often, we try to construct bigger and better treatment plant facilities, while ignoring the source of the problem. An incisive and rigorous attack at the source, the ancient pipes, will swiftly and effectively stop the contamination of the water supply. In addition to these important traditional needs, we must simultaneously address new threats to water quality.
- Third, and despite the frequent occurrence of water quality emergencies such as those I have described, Americans continue to ignore the water infrastructure crisis because collection, delivery, and treatment facilities are generally out of site and therefore out of mind in the absence of crisis. Unlike a pothole in the highway, you can't preempt a water catastrophe

unless you look for it.

- Fourth, the problem itself has become so egregious that even those individuals familiar with the issue are repulsed by the massive remedy that is so clearly necessary. Too often, a listener's eyes glaze over when I mention a growing \$200 billion clean water infrastructure deficit. The cynic in me wonders how many deaths, such as those caused by the recent water contamination crisis in Milwaukee, Wisconsin, must occur before we get serious.
- Fifth, correcting these problems will generate immediate and lasting economic benefits. Functioning clean water infrastructure is an obvious and absolute precondition for industry, agriculture, retail commerce, professional services, government, schools, hospitals, emergency services, recreation, affordable housing, and everything else. Furthermore, the people who work for me do not consider their careers make-work. They are educated, make good wages, pay plenty of taxes, save a little, and plow the rest right back into the private sector.

## II. NUCA Recommendations

### A. The Level And Source Of Funding

For the eight-year period 1993 to 2000, NUCA recommends annual authorized funding of at least \$5 billion for the wastewater SRF Program. This recommendation corresponds to the most conservative assessment of investment

NUCA  
page 6

needs -- investment needs above and beyond what the states are likely to spend themselves. We have not inflated our estimates, and we cannot in good conscience recognize lower funding levels as adequate.

NUCA strongly supports the creation of a new revenue generating program targeted directly and exclusively to clean water infrastructure. This revenue raising program should incorporate a user-fee principle. We encourage the Subcommittee to explore new sources of dedicated revenue for needed clean water infrastructure and recommend that the Subcommittee conduct a public hearing to examine the merits of various revenue-raising mechanisms.

## **B. The Structure Of The Program**

### **1. Loans, Not Grants**

NUCA does not play a direct role in the administration of federal clean water funds. Companies in our industry simply bid on funded projects when bids are solicited by project owners. Nevertheless, the utility construction industry has a direct stake in the efficient use of precious federal resources.

NUCA favors the continuation of the State Revolving Loan Fund Program (SRF). While the SRF can be implemented more effectively with minor legislative adjustments, its fundamental characteristics are preferable to direct grants. First, we embrace the intent of the

program, which is to provide states with a revolving, permanent pool of capital. Of equal importance is the fact that SRFs can be leveraged to create bigger lending pools, which means that more projects are built. Extended amortization periods beyond the current 20-year maximum loan term, loan principal subsidies, and other adjustments should be made to make the SRF a more attractive source of financing to small and/or hardship communities that have not been able to participate.

NUCA opposes funding for project-specific grants because they encourage communities to postpone projects in the hope of receiving a grant and tarnish the reputation of the construction program by calling into question the fair distribution of limited federal resources. Moreover, the Rural Development Administration already administers a growing wastewater treatment grants program.

**2. Eliminate The Restriction On Sewer Corrections**

NUCA strongly favors the elimination of restrictions on funding sewer collectors and combined sewer overflows [Section 201(g)(1) of the Clean Water Act]. The experiences described earlier demonstrate the necessity of removing this restriction.

In addition, we oppose the inclusion of special earmarks or set-asides designed to address singular water pollution problems. Each state should be given the flexibility necessary to address its unique blend of needs.

**3. No Money For Land Acquisition**

NUCA supports the current restriction on the use of SRF funds for the purchase of land. We recognize that this restriction may make the SRF a less attractive source of financing in some communities, especially rural communities that require land for collectors and interceptors. Nonetheless, we believe that the SRF funds must not be diluted at this time for this purpose.

**4. Private Sector Design And Construction**

We recommend that the Subcommittee clarify that all clean water infrastructure projects funded by the federal government must be publicly bid. This stipulation will ensure that public works projects are designed and constructed only by private sector firms, which must pay federal taxes and comply with federal OSHA requirements.

**5. Administrative Set-Aside**

The amount of money in an SRF that may be used for administrative expenses is limited to four percent of all capitalization grant awards received by the fund. It has been suggested that the four percent

limit can prevent efficient SRF administration -- especially in states that leverage their fund. NUCA hopes that the Subcommittee will explore ways to increase the administrative efficiency of the SRF that do not require the use of precious appropriated capital funds to cover operating costs. A separate grant for administrative costs or simply allowing the use of a small percentage of each state's total fund for administrative purposes are two alternatives.

**6. Construction Efficiency**

NUCA is presently examining additional minor changes to the Clean Water Act designed to make the actual construction of facilities more efficient and cost-effective for the taxpayer. We will submit these ideas to the Subcommittee following our Spring Board of Directors meeting later this week.

**C. Wetlands Regulatory Reform**

The United States is in urgent need of a comprehensive and coherent national wetlands program that protects vital wetlands from destruction, allows for the delivery of essential public services, minimizes burdens on the small business community, and enhances the over all quality of life. NUCA believes that federal decision-making power regarding wetlands management should be consolidated under the auspices of a single agency -- preferably the U.S. Army Corps of Engineers. Wetlands should be clearly defined, classified, mapped, and

NUCA  
page 10

indexed. The level of protection for each classification should correspond to its ecological value. Lands of marginal ecological value should not be regulated.

While NUCA supports reform of federal wetlands management, we are very concerned that congressional consideration of the wetlands issue will substantially delay or even preclude reauthorization of the Clean Water Act during the 103rd Congress. The wetlands reform debate must not hold the clean water construction program hostage.

### **III. Closing**

At NUCA, we suspect that federal funding for clean water facilities is more important to the families of this country and the future of this country than much of the domestic discretionary budget. The need for new sources of funding cannot be emphasized enough. We appreciate this Subcommittee's longstanding commitment to clean water infrastructure funding, and we are grateful for the opportunity to work with the panel. Thank you.

**Clean Water Construction Fact Sheet**

- A 1992 study conducted by Apogee Research, Inc., concludes that as many as 57,400 jobs are created for every \$1.0 billion invested in water supply and water pollution treatment projects.
- The seasonably adjusted unemployment rate for construction is approximately twice the civilian unemployment rate. The utility construction industry can put these unemployed people to work immediately -- just as soon as projects are funded.
- Thousands of necessary ready-to-go projects languish on the drawing board.
- Research conducted by Apogee Research, Inc., demonstrates that investment in water quality infrastructure enhances private sector productivity (output per manhour), increases private profitability, and stimulates private investment in plant and equipment.

Investment in this area also increases public tax revenues. For example, a one-time, \$2.5-billion investment in water and wastewater facilities (representing 1% of the net stock of clean water capital as of the end of 1989) is self-financing in the space of less than a decade. This payback period assumes an annual depreciation rate of 2.5%, an annual maintenance investment of \$0.062 billion, an average tax rate of 15%, and a discount rate of 10%.

- Clean water infrastructure protects our rivers, lakes, and streams and is a precondition for housing, consumer services, and industrial and agricultural production.

SUBMITTED BY ROLAND GEDDES,  
WASHINGTON REPRESENTATIVE

**Statement  
of the  
National Association of Conservation Districts  
on  
Reauthorization of the Clean Water Act**

**Presented to the**

**House Committee on Public Works and Transportation  
Subcommittee on Water Resources and Environment**

**May 11, 1993**

The National Association of Conservation Districts (NACD) represents the nation's 2,950 local conservation districts and the more than 15,000 men and women who serve on their governing boards. Conservation districts, special purpose units of state government, are charged with coordinating and carrying out comprehensive, local natural resource management programs including forest and range management, wetland protection and enhancement, erosion and sediment control, fish and wildlife habitat management, and nonpoint source pollution control.

Many issues will be reviewed as Congress considers reauthorization of the Clean Water Act. The nation's conservation districts very likely will be involved in many of the water quality and wetlands protection programs that are generated by this legislation. Of primary interest to NACD and the nation's conservation districts will be nonpoint source pollution programs, ground-water protection, sediment criteria, water quality standards, coastal zone pollution, and wetlands restoration and protection programs. Conservation districts are the lead local implementation agency for many local, state and federal programs that address these resource areas.

In general, NACD urges Congress to support reauthorization provisions that place primary emphasis on education, technical and financial assistance to assist land managers in addressing potential or existing resource problems. Our philosophy is nothing new to members of this subcommittee—we have testified here before and bring forward many of the same concerns we have shared in the past. We do, however, need to emphasize the urgency to move forward in developing and carrying out a comprehensive water quality strategy for the nation—especially where nonpoint source pollution is concerned.

In discussing reauthorization of the Act, it must be kept in mind that we are in the early stages of the discussions and numerous preliminary ideas and proposals have been offered as food for thought. At this point, NACD's positions state only broad and general policy recommendations for consideration in developing specific proposals later.

CLEAN WATER ACT — May 1993

**National Association of Conservation Districts**  
509 Capitol Court, N.E., Washington, DC 20002  
(202) 547-6223 / FAX (202) 547-6450

## GENERAL PRINCIPLES

The nation's water quality goals must be holistic and should seek to achieve and maintain clean water for all uses. Comprehensive resource management plans that include water quality goals should be developed on a watershed basis, targeting actions where they will do the most good. Pollution prevention should be the foundation of our water quality agenda. Within a national framework, state and local programs must be flexible to permit programs to address water quality problems as close to the source as possible. States also should have the lead in establishing program priorities and developing regulatory-nonregulatory mixes that work best in each state. Monitoring and assessing the state of our water resources are needed to provide accountability for state and local program efforts, as well as to target limited resources to the most pressing problems. Information and education, and technical and financial assistance must be utilized to empower all segments of society to address water quality problems. Funding, from all levels of government, must be increased to match the scope of the problem.

## NONPOINT SOURCE POLLUTION

There has been much talk about federal programs to manage nonpoint source pollution during the past 15 years. Section 208 of the 1977 Clean Water Act amendments was the first substantive attempt to address nonpoint pollution through the Clean Water Act. Unfortunately, it's been mostly talk and little action at the federal level since that time. While many states have made substantial progress in developing nonpoint programs—especially in agriculture—the federal government has done little to help. Only in the past four years has Congress appropriated funds to help states carry out these programs. And the \$50 million per year in those four years is a mere drop in the bucket compared to funds directed toward point source problems. We believe it is critical that the federal government make a substantial commitment to help states carry out their nonpoint pollution management programs if we are to achieve our national water quality goals.

Addressing nonpoint source pollution requires a different institutional framework from the traditional command and control approach that has been so effective in controlling point sources. That approach is simply unworkable in addressing nonpoint problems. By enacting 1987 Clean Water Act Section 319, Congress recognized that the solution to nonpoint pollution lies in state and local action. Fortunately, states have made considerable progress in developing the infrastructure needed to control nonpoint pollution. With much of the groundwork in place, what is needed now is a serious commitment of manpower and funding from both state and federal governments to translate the nonpoint agenda into action.

NACD recommends that the 1993 Clean Water Act continue the strategy set forth in Section 319 whereby states are directed to develop nonpoint source pollution management programs that are responsive to local needs and conditions. The management programs should continue to emphasize technical and financial assistance, coupled with educational programs. The programs also should be built around economically feasible, technology-based systems to protect and enhance water quality. The standards and criteria should be based on existing or planned use of the water resource and be developed within a national framework with input from states and other groups including agriculture, industry, and conservation and environmental groups.

NACD also recommends that Congress, through the Environmental Protection Agency and the Department of Agriculture, provide financial and technical assistance to states in refining and carrying out their nonpoint programs. States, operating within the national framework, also should have the lead in establishing program priorities and developing regulatory-nonregulatory mixes that work best in each area.

### **POLLUTION PREVENTION**

NACD and conservation districts have long embraced the concept of pollution prevention. Over the years the district philosophy has been: Use each acre within its limits and treat it according to its needs. We believe this concept applies to water quality initiatives as well. We further support programs that target the highest risk-based priorities. Since nonpoint pollution is recognized as a significant contributor to water quality impairment, efforts should continue to focus on addressing state and local nonpoint priorities to prevent nonpoint pollution.

### **MONITORING AND ASSESSMENT**

NACD recommends that Congress expand and refine our national water quality research and monitoring program. Congress should seek to improve and expand the national water quality database so the condition of the nation's water resources can be thoroughly quantified.

### **WETLANDS**

NACD urges Congress to examine and restructure our national wetlands policy. A clear, concise, and fair policy is needed to effectively manage the nation's remaining wetlands. In addition, a standard and consistent national definition for wetlands that will eliminate interagency conflicts and public misunderstanding must be developed.

NACD supports an incentives-based approach that embraces education, technical assistance, and financial incentives such as tax credits, zoning variances, and assistance in developing economic enterprises to protect wetland resources. While regulatory mechanisms represent an important element in a comprehensive wetlands protection program, they should not be the primary tools. State and local government should be vested with primary responsibility for developing and implementing wetlands conservation programs that meet guidelines established within a national framework.

NACD supports a flexible "no-net-loss" wetlands policy that takes into consideration economic and environmental impacts and provides for strong state and local input. Highest priority should be given to protecting those wetlands with the most significant values and functions. NACD also supports wetland mitigations and tradeoffs in areas where wetland conversions are necessary.

The USDA Soil Conservation Service (SCS), with proven technical expertise in soil and water conservation, should be designated as the lead agency in developing the definitions of wetlands to be used by all federal agencies with jurisdictional wetlands responsibilities. NACD also recommends that the responsibility for wetland identification, mitigation and management on agricultural lands and forested lands for agricultural uses be transferred from the U.S. Army Corps of Engineers to USDA Soil Conservation Service.

## EDUCATION, TECHNICAL AND FINANCIAL ASSISTANCE

Information and education are key parts of preventive and corrective actions in pursuing the nation's water quality agenda. Educating and empowering the public will be crucial to successful cleanup as well as pollution prevention efforts. NACD recommends that states integrate rigorous information and education components in their water quality management programs

We also recommend that the federal government provide financial and technical support to assist states in developing comprehensive water quality protection programs. Further, it is essential that all levels of government provide adequate technical and financial assistance to help land managers protect, improve and maintain our water resources. Helping landowners plan and carry out responsible land-use and management decisions will be the most effective approach to protecting and improving the quality of the nation's water.

## REGULATIONS

Within the national framework of the Clean Water Act, states must have the flexibility to establish program priorities and approaches best suited to their individual needs. This includes developing the voluntary and regulatory mixes that work best in each individual state. NACD specifically endorses the use of iterative approaches whereby voluntary, incentives-based programs are the first-line approach.

In cases where land managers do not respond to voluntary approaches, NACD supports the concept of "bad actor" laws that provide for stronger regulatory measures where incentives fail to achieve results. Specifically, conservation district approved farm-level resource management plans should be required for all producers in watersheds where surface waterbodies or groundwater systems are impaired or where there is a probability that these waterbodies or systems will become impaired due to agricultural pollution. These plans should be developed based on an integrated evaluation of options for environmentally sound cropping systems and nutrient, pest, water, livestock and sediment management.

## FUNDING

Since funding is the single greatest impediment to solving nonpoint source pollution water quality problems, NACD strongly recommends that Congress fund Section 319 grants to states at a minimum level of \$500 million per year. This money should be made available to states for carrying out the nonpoint source pollution management programs mandated by the Act. In looking ahead to 1994 when state revolving loan fund programs have been fully capitalized, NACD recommends that Congress retain this roughly \$2 billion per year in the budget to continue addressing ongoing point and nonpoint source pollution problems. NACD further recommends that Congress greatly expand USDA's water quality program funding and responsibilities. These efforts should be carried out through local conservation districts, and coordinated with ongoing state and local conservation programs.

**Speaking for the Merit Shop**

**729 18th Street, N.W.**  
**Washington, D.C. 20005**  
**(202) 637-8800**

Good morning. I am Scott McElwee with McElwee-Scarborough Construction. Our company, based in Gibbsboro, New Jersey, builds wastewater treatment facilities as well as other heavy construction projects. As a member of the Associated Builders and Contractors' (ABC) National Infrastructure Committee, I appreciate this opportunity to comment on reauthorization of the Federal Water Pollution Control Act (more commonly referred to as the Clean Water Act).

Associated Builders and Contractors represents over 16,000 contractors, subcontractors, material suppliers and related firms from across the country and from all specialties in the construction industry. Our diverse membership is bound by a shared commitment to the merit shop -- the most efficient construction technique in America. The merit shop philosophy of awarding construction contracts to the lowest responsible bidder, regardless of labor affiliation, through open and competitive bidding, assures taxpayers and consumers the most value for their construction dollar. With 75 percent of construction done today by open shop contractors, ABC is proud to be their voice.

I would like to commend Chairman Applegate and the members of the Subcommittee for undertaking such a comprehensive look at the nation's water quality. The costs of insufficient attention to clean water issues are indisputable. Non-point source pollution, leaking toxics, stormwater run-off and coastal pollution pose grave risks to water quality. Our nation's water quality and "environmental" infrastructure could not be more vital to our health, safety and overall quality of life.

While ABC members are concerned regarding a number of clean water issues, I will focus my comments today on funding for the construction of sanitary waste treatment facilities and the designation of wetlands.

#### **FUNDING**

ABC believes inadequate and insufficient wastewater treatment facilities represents a large segment of the clean water problems facing our nation today. According to the Environmental Protection Agency, there is a need for \$83.5 billion to meet current wastewater treatment demands and this will likely continue to rise.

The commitment Congress made with the states beginning in 1972 to clean up the country's waters by funding projects relating to water supply and wastewater treatment is responsible for the significant progress made in restoring the quality of our nation's waters. When Congress decided to turn the program over to the states in the Water Quality Act of 1987, a schedule was set to phase out direct grants for construction and provide seed money to the states to establish revolving loan funds. These funds would eventually become self-sustaining and fund the states' wastewater treatment construction needs.

Unfortunately, the \$18 billion funding level committed to in the 1987 Act to capitalize state revolving funds has not been met over time. ABC believes the federal government must meet its original commitment and supports a \$2 billion funding level through 1994 to accomplish that goal; however, President Clinton's budget request for FY 1994 is much lower at \$1.2 billion.

Currently, the federal government's participation in providing funding to the states for wastewater treatment needs is scheduled to end in 1994. At this critical juncture in our nation's clean water history, we believe a complete cessation of federal funds to the states for this vital environmental infrastructure need would be devastating.

States simply have not been provided enough time or seed money to sufficiently capitalize their revolving funds. There are also many small communities which do not have the capital base necessary to support a state revolving loan fund. In addition, there are a number of other serious and growing threats to clean water which we believe can be addressed by funding a continued water program.

Combined sewer overflows, for example, are a significant problem in over a thousand cities nationwide. Billions of dollars are needed to clean-up previously overlooked and outdated systems. Conceivably, an extended program can also address improved drinking water filtration or solid waste disposal facilities.

ABC supports continued federal funding beyond 1994 to further capitalize state revolving funds for the construction of wastewater treatment facilities or other environmental infrastructure projects. We would also endorse a limited grant program to provide necessary treatment facilities to small communities without the capacity to support large capital investments.

The Clinton Administration has recommended allowing the current authorization to expire, but then establishing a new four-year authorization for wastewater and other clean water projects. The proposed program would be authorized at \$2 billion a year starting with FY 1995.

Clearly, our clean water needs are vast and the federal government must maintain a certain level of participation. Shifting resources to state revolving funds to provide a self-sufficient program and stable revenue source is a productive use of federal funds. Requirements for state revolving funds should be as uncomplicated as possible to facilitate an accessible and efficient program.

Other forms of innovative financing and cooperative efforts will expand the power of federal resources and should be encouraged. Privatization and public-private partnerships for example, are being used more frequently to augment federal, state

and local activities -- and they work. These efforts bring the experience, business savvy and financial strength of the private sector to government entities for the benefit of all.

ABC urges the committee to rely on market incentives rather than pursuing taxes to induce environmental conformance. In addition, any funding plan should consider that states will have to impose user fees to meet their share requirements.

Continued federal funding is not a panacea. A long-term integrated plan which takes into account new environmental problems and establishes realistic and achievable clean water goals should be adopted. We also believe every state must develop an environmental needs inventory and strategy for the future to ensure efficient management of resources.

#### **WETLANDS**

Another major concern of ABC members related to reauthorization of the Clean Water Act is wetlands. As contractors, our members have experienced significant problems with wetlands regulations.

ABC recognizes the environmental value of wetlands and is concerned by the recent estimates of significant wetland loss. We wholeheartedly support efforts to protect legitimate wetlands but believe a more streamlined and efficient process is in order.

The evolution of wetlands regulation is at the root of the problem. Regulations were established on a piece-meal basis as the ecological importance of wetland areas was realized and became increasingly valued.

Section 404 of the Clean Water Act is considered the primary statute providing for the protection of wetlands by requiring a federal permit for all dredging and filling activities. Additional wetland protections are contained in the Fish and Wildlife Service Act, the Wildlife Coordination Act and the 1985 Food Security Act. Furthermore, the preservation of wetlands is governed by four different federal agencies with 32 states possessing additional laws which address wetland issues.

The Federal Manual for Identifying and Delineating Jurisdictional Wetlands was adopted in 1989 to coordinate governmental policies and provide technical guidance for wetland regulation and use. In actuality, the manual dramatically extended areas regulated as wetlands and the jurisdiction of the Environmental Protection Agency (EPA) and the U.S. Army Corps of Engineers (Corps) over an already poorly functioning program. Additionally, the manual went into effect without public notice, without an opportunity for public comment and without any grandfather provisions.

The Memorandum of Agreement on mitigation between the EPA and the Corps further extended wetland regulations by requiring extensive impact analysis for permit approval of wetland areas. The results have been long delays for permits and canceled projects.

Since the issuance of the 1989 manual, our members have experienced the costly brunt of improper wetland delineations. The inconsistencies allowed by the 1989 manual undermined its intent to provide a uniform national procedure for wetland identification and delineation.

ABC was pleased that the Energy and Water Development and Appropriations Act of 1993 included language to allow those having permit applications or enforcement actions pending as of August 17, 1991 to request re-delineation under the 1987 Army Corps of Engineers manual. It is our understanding that EPA is using the 1987 manual with regard to enforcement to be consistent with the Act. We would, however, encourage a clear policy statement to confirm their intent.

We are hopeful that the Clinton Administration will take into consideration the confusion which resulted since adoption of the 1989 manual. We are eager to work with the new administration to revise the manual and further streamline program requirements.

ABC recommends that strong emphasis be placed on the requirement that independent indicators of all three wetlands parameters (hydrology, vegetation and soils) be present to support wetlands determinations. We support strict adherence to the three component requirement and exceptions, if allowed, should be extremely limited and scientifically valid. However, there should be no exceptions to meeting the hydrology standard. The criteria used to identify wetlands hydrology, hydric soil and hydrophytic vegetation must also be explicit and accurate if the three parameter test is to be truly meaningful.

Regarding the criteria for wetland hydrology, the 1989 manual standard of inundation or saturation within 18 inches of the surface for 7 days in the growing season was inadequate and contributed to inappropriate wetlands designations. ABC supports requiring saturation at the surface for 21 or more consecutive days during the growing season. We recommend inundation also be required for 21 or more consecutive days during the growing season, rather than 15 or more days as proposed. Although we support the proposed definition of hydrology as a great improvement upon the 1989 manual, we encourage EPA to consider the merit of extending the surface saturation or inundation period to 30 or more days during the growing season.

The revised definition of hydrology is potentially undermined by the availability of indicators. Primary indicators should be

restricted to inundation at the surface or free water at the surface of an unlined bore hole. The presence of cumulative secondary indicators should be substantiated by corroborative evidence to meet the definition of wetland hydrology. Indicators must be evident enough so that they can be determined through routine field investigation. Requiring surface saturation will best allow for this.

Furthermore, the three year hydrology study is unworkable for most situations. Even in dry years (with the exception of droughts), a one year study of water table elevations is sufficient to characterize hydrology.

Regarding vegetation, facultative plants should not be used as indicators of wetlands since they are equally likely to grow in upland areas as wetland areas. In lieu of the prevalence index approach, which is costly and time-consuming, the presence of facultative plants should be neutralized and only dominant species evaluated: if obligate wetlands and facultative wetlands exceed obligate upland and facultative uplands, then the vegetation criteria would be satisfied.

With respect to soils, the National Technical Committee for Hydric Soils (NTCHS) criteria is inconsistent with proposed hydrology revisions and therefore must be revised to include only those soils meeting the revised hydrology standard.

ABC encourages expansion of the section on newly created wetlands to address man-made sediment ponds used on construction sites to divert storm water run-off. Contractors have expressed concern that temporary sediment basins or detention ponds can over time develop wetland characteristics. To avoid improper delineations, these man-made ponds (intended to temporarily divert storm water and prevent sediment from leaving the construction site) should be excluded from wetland delineations so that they can be removed, as intended, when construction is completed.

ABC supports revising the manual to insure more accurate and consistent wetland designations. We therefore believe these revisions should benefit all landowners, not just those whose property was delineated after August 14, 1991. The government should extend the right to request re-delineation in accordance with the revised manual to all landowners. Finally, ABC believes the manual should be extensively field tested to ensure a sound and workable process.

In addition to manual revisions, ABC believes the current wetlands regulatory system could be improved by streamlining the permit process, establishing an interagency technical committee to address wetlands categorization, implementing mitigation banking, and increasing the state role in the 404 program.

While these proposed changes are a step in the right direction, they do not sufficiently address or more importantly definitively resolve these vital issues. Land use policy of this magnitude must be addressed in a legislative forum where public participation is allowed. Comprehensive wetlands legislation is essential to clarify, consolidate and improve upon current law.

ABC commends Mr. Hayes for his comprehensive legislation to create a workable wetlands management program. H.R. 1330 recognizes the great value of wetland areas and outlines a plan to achieve protection while creating an equitable and efficient permit process. ABC supports H.R. 1330 which calls for the ranking of wetlands according to their ecological value, restricts EPA's regulatory role, and allows for mitigation activities.

ABC supports a fair and balanced approach to classifying wetlands which takes into consideration environmental benefits and economic security.

Clearly, the layers of regulatory authority over wetland protection must be streamlined. While some larger contractors have the capability to manage the permit process in-house, most companies must hire environmental consultants to wade through the complicated permitting process at great expense.

ABC believes all authority for wetland permits should be transferred to the Corps with no EPA veto authority. Additionally, establishing a clear permitting process with an outlined timetable is critical for necessary planning functions. To further expedite the permit process, ABC believes the use of general permits should be expanded.

Recognizing all wetland areas are not equal, ABC supports a priority ranking system to classify wetland areas and appropriate use. Distinct definitions for wetland areas must be articulated and regional differences must be taken into account.

In a wetlands classification system, the strict sequencing test (avoidance, minimization and mitigation) for obtaining permits should only apply to the highest valued wetlands. A more balanced approach, taking into account cost/benefit issues, should be utilized for less environmentally sensitive areas.

ABC supports mitigation efforts to protect and compensate for the loss and degradation of wetland functions and values. We believe any effort to improve wetland management should consider the use of a mitigation banking system to restore, enhance or create wetlands when appropriate.

ABC believes compensation must be made available to landowners whose land is significantly devalued or deemed unusable under wetland classification guidelines. With three quarters of the

nation's wetland areas being privately owned, it is imperative to enact a rational and reasonable policy which balances protection of valuable wetlands with the rights of private property owners.

Finally, ABC believes it is vital for states to play an active role in developing and defining wetlands policy. States should be encouraged to assume greater responsibility of the 404 program. States should also be allowed to tailor the categorization program to fit their individual circumstances. In cases where applicable, joint federal and state permit review should be considered. In all cases, however, the method of delineating wetlands should be consistent between state and federal programs.

On behalf of the Associated Builders and Contractors, I again want to thank the committee for the opportunity to be here today. I will be happy to answer any questions you may have.

STATEMENT OF HON. JAMES L. OBERSTAR  
SUBCOMMITTEE ON WATER RESOURCES  
COMMITTEE ON PUBLIC WORKS  
Hearings on Clean Water Act  
April 21, 1993

Mr. Chairman, thank you for the opportunity to appear before you, to speak on behalf of my draft Nonpoint Source Pollution Prevention Act, legislation to strengthen the nonpoint source provisions of the Clean Water Act.

We have just been given a timely and dramatic illustration of the need for this legislation. In the last few weeks, thousands of residents of Milwaukee, Wisconsin, were stricken by a flu-like illness, traced to the protozoan *Cryptosporidium*. This is a waterborne organism which entered the city's drinking water system, in all probability, from a farm on a tributary to Lake Michigan, from which Milwaukee draws its water, and passed through the treatment system unhindered.

We call such disease organisms, toxics, sediment and nutrients, which originate on farms, forests, construction sites, city streets and mines "poison runoff," or "nonpoint source pollution." It is the last remaining major gap in Clean Water Act pollution control measures.

Though outbreaks like the one in the Milwaukee are not common, they are far from rare. EPA reports 76 such outbreaks of waterborne disease, striking 67,000 people, in the 5-year period 1986 to 1990. EPA stresses that these figures grossly under-represent the real incidence of such diseases.

While drinking water treatment must remain the first line of defense against waterborne pathogens, pollution prevention in this as in every other case could reduce the costs of water purification, spare our citizens the possibility of disease from organisms that get through the treatment process, and reduce industry costs as well.

The Federal Water Pollution Act Amendments of 1972 set the nation on its current cleanup course. As Committee Administrator at that time, I find myself now the only Member of Public Works and Transportation who remembers and contributed to the effort that went into its enactment.

The first line of that landmark legislation, in Section 101(a), declared it the objective of the Act "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." Congress added, in the 1987 amendments, "it is the national policy that programs of the control of nonpoint sources of pollution be developed and implemented in an expeditious manner so as to enable the goals of this Act to be met through the control of both point and nonpoint sources of pollution."

Since 1972, American citizens as Federal and State taxpayers have spent \$75 billion to clean up municipal point sources. Through 1989, industry, and citizens as consumers, have spent over \$130 billion on cleaning up industrial point sources, including \$67 billion in capital expenditures and \$63 billion in operating costs. Ninety percent of municipalities, and 95% of industry, currently comply with the Act.

Yet, despite that costly sacrifice, and high compliance rate, fully one-third of the Nation's assessed waters have not attained water quality standards. Less than half of our total waters have been assessed, meaning that a much more significant though unknown number of waterbodies are impaired, and more are threatened.

The major cause of this failure to meet the standards is nonpoint sources of pollution – or poison runoff – the unfinished agenda of the 1972 Act.

The National Research Council has estimated that the total economic costs associated with agricultural runoff alone are between \$2 billion and \$16 billion per year – and this is only one category of nonpoint sources! As this Subcommittee well knows, the Army Corps of Engineers alone spends about \$450 million a year dredging sediment from our harbors and waterways. Many industries have to treat water before they use it because it is too befouled for their processes. They treat it again at the end of their process and return it cleaner at the outfall than at the intake. How much cheaper to keep pollutants out of the water in the first place!

Mr. Chairman, it is time to complete the task set forth in 1972, to attain the objective of chemical, physical and biological integrity of the nation's waters, and to make sure that the American people, who have already paid so dearly, get their money's worth in terms of fishable, swimmable waters, or as the Act more elegantly if ponderously terms it, "protection and propagation of shellfish, fish and wildlife, and recreational activities in and on the water."

As author of Section 319 of the Clean Water Act, Nonpoint Source Management Programs, which became law as part of the 1987 Amendments, I have developed and circulated a discussion draft of new legislation which would strengthen Section 319, treat nonpoint sources with the same determination as we have addressed point sources, and at long last close the last remaining gap in the Clean Water Act.

This draft is intended to build on the assessments and planning which should have already been done under Sections 208 and 319; and not to impede actions taken since, under Section 319, under the Coastal Zone Act Reauthorization Amendments (CZARA) of 1990, and, under the Department of Agriculture's Water Quality Incentive and other conservation programs. For example, a farmer participating in certain USDA programs such as the Water Quality Incentives Program would be considered in compliance with my bill.

The bill rests on shared responsibility: the States and, to the extent possible, local jurisdictions and organizations, would be the main implementors, along with individual land owners/operators. The Federal government, as it does now, would provide direction, guidance, and financial support.

The program is based on watersheds, and targets those which are impaired or threatened.

The bill tracks closely the recommendations of Water Quality 2000. It includes site-level plans, voluntary and enforceable state programs, and reliance on the expertise of USDA and other agencies for technical assistance and funding. It builds on existing Section 319 programs, adopts the management measures developed by EPA and the National Oceanographic and Atmospheric Administration under CZARA as well as the enforceable mechanisms required by that Act; and uses the site-level approach of various Department of Agriculture conservation and water quality programs.

It offers incentives for so-called "good actors," those who have and are implementing approved site-level plans, while preparing a necessary enforcement fall-back for "bad actors" who refuse to clean up.

The bill sets as a goal the full restoration and protection of the nation's waters. This is defined as the attainment and maintenance of water quality standards; the protection and propagation of a balanced, indigenous population of aquatic and aquatic-dependent species, aquatic ecosystem biodiversity, and habitat restoration and maintenance; protection of public

health; restoration and maintenance of recreational activities in and on the water; and protection of underwater sediments through pollution prevention activities.

It requires states to revise their on-going management programs under Section 319, targeting those watersheds which are classified as impaired or threatened under various CWA provisions. States are to prioritize these watersheds, divide them into fifths, and implement Watershed Implementation Programs, starting with a new fifth each year.

The Watershed Implementation Programs would be composed of site-level plans (patterned on USDA's site-level plans for agriculture) developed by land owner/operators along the watershed. The program would borrow heavily on the Soil Conservation Service's technical assistance and experience in working with farmers, to help them develop these plans. EPA would approve the states' revised plans, but not the individual site-level plans.

Implementation would be an iterative process. Four years after implementation, the state would assess the watershed and, if full restoration and protection have not been achieved, would require additional measures, either by owner/operators already implementing plans, or by other sources. This process would be repeated every two years thereafter until full restoration and protection have been achieved. Monitoring in subsequent years would assure that full restoration and protection are maintained.

The bill requires states to develop enforceable mechanisms -- as are already required for coastal states under CZARA. As long as an owner/operator has developed and is implementing a state-approved site-level plan, he or she would not be subject to enforcement.

The bill also ensures that states will participate in the program. Under the point source enforcement program, the National Pollutant Discharge Elimination System (NPDES), EPA can take over and implement a state's permit program if the state no longer meets the requirements of Section 402. However, I did not believe it appropriate for EPA to become involved in implementing site-level plans under a nonpoint program. Therefore, while EPA could under my bill develop a nonpoint source management program for a state, it would not be able to implement this program. Rather, the state not meeting nonpoint requirements would not be able to approve new (as opposed to simple extension of existing) Section 402 permits, or Section 404 permits, either statewide or, if other watersheds are complying, in a single non-complying watershed, until EPA finds the state is meeting requirements.

The bill also establishes a Federal nonpoint source control program, directly under the President, for lands owned or managed by the Federal government.

It requires EPA to establish water quality criteria for those nonpoint pollutants for which such criteria have not yet been set.

It codifies existing Federal antidegradation policy.

It contains provisions to assure that new sources of nonpoint source pollutants are identified prior to any action being taken, and that state-of-the-art controls are used on these new sources before they cause pollution.

And, finally, the bill creates a Citizen Watershed Monitoring Program to assist states in monitoring their waters. The states would by contract, cooperative agreement or other means develop citizen programs, provide training, and implement quality control and assurance measures to make sure that the data gathered by citizens are useful to the state. The nonpoint and other amendments to the CWA will put heavy monitoring burdens on states, and I believe a citizen program, properly designed and run, can assist states in this effort.

Finally, comes the crucial element of funding for this program. I have tentatively proposed \$100 million per year from the State Revolving Fund. I would welcome other suggestions, both on the adequate level, and the source, since loans are not always as easily made to individual land owners/operators as to municipalities. Hopefully, the Soil Conservation Service will remain a major source of assistance for farmers implementing site-level plans under the Water Quality Incentives and other USDA programs as well as this one.

Also, the States will need adequate administrative funding for this and the other new tasks that will be imposed upon them under the new legislation. I fully sympathize with the complaints of the states as to ever-increasing federal mandates with no concomitant increase in federal funds.

I know that this Committee will face many competing demands for funding as you develop the bill; but since nonpoint sources are the major cause of water pollution, I would hope that this program would receive a share of control and prevention funding commensurate with the task.

Mr. Chairman, I believe that this bill is fair and necessary, if America is to achieve the goal of clean water. We have several choices. We can continue to charge taxpayers and industry for ever-more-costly wastewater treatment and for maintenance of navigation on silt-choked rivers. We can continue to inflict losses on commercial fishing and shellfishing, and deny water recreational opportunities to our people. Or, we can finally consummate the goal of the 1972 Act, and close the last remaining gap in that Act's ability to protect America's waters.

I would add that the bill is a discussion draft. It has been very widely distributed, and I have begun to receive comment on it. I hope to have the bulk of the comments by the end of this month, then to review them and incorporate as much as possible in a revised version.

Ultimately, of course, I hope my Nonpoint Source Pollution Prevention Act can be included in the Clean Water Act Amendments you will be writing later this year. I will be happy to work with you and your staff on this, and look forward to doing so.

## NONPOINT SOURCE WATER POLLUTION PREVENTION ACT OF 1993

## Summary

**GOAL:** To attain, within three decades of the enactment of the Federal Water Pollution Control Act of 1972, restoration and maintenance of chemical, physical and biological integrity, by closing last gap in that Act, and controlling and preventing nonpoint sources of pollution.

**GUIDING PRINCIPLES:**

- . Stability and continuity: least disruption to, maximum coordination with, on-going programs – Section 319, Clean Water Act (CWA); Section 6217(g) of the Coastal Zone Act Reauthorization Amendments (CZARA); USDA's water quality programs
- . Shared responsibility: States and, to extent possible, local jurisdictions and organizations, to be main implementors, along with individual land owners/operators; Federal government to provide guidance and financial support
- . Base program on watersheds, targeting those which are impaired or threatened

**DISCUSSION**

The bill is patterned on the recommendations of Water Quality 2000 for a strengthened and expanded national nonpoint source pollution prevention program including enforceable state programs, site-level plans, reliance on the expertise of USDA and other agencies for technical assistance, and funding from a revolving loan fund. It builds on existing Section 319 Clean Water Act Nonpoint Source Management programs; adopts the management measures developed under the Coastal Zone Act Reauthorization Amendments as well as that Act's enforceable mechanisms; and uses the site-level approach of various Department of Agriculture programs.

The bill is fair and necessary, if America is to achieve the goal of clean water. American consumers, taxpayers and industry have paid hundreds of billions of dollars for point source controls, but the goal remains illusive because of nonpoint source pollution. The nation can continue to charge taxpayers and industry for ever-more-costly wastewater treatment and for maintenance of navigation on silt-choked rivers; can continue to inflict losses on commercial fishing and shellfishing, and recreational water uses; and perpetuate degradation of our water resources and the wild and aquatic life dependent on them; or address the problem of nonpoint sources, the last remaining gap in the Clean Water Act's programs.

**DESCRIPTION****Schedule**

- . Within 1 year of enactment, EPA to publish implementing regulations and guidelines
- . Within two years of publication, States to revise nonpoint management programs, identifying and prioritizing watersheds to be included in program, dividing them into fifths for implementation over a 5-year period

- . EPA has 6 months to approve or disapprove all or portion of program
- . Revised program to include watershed implementation plans, based on site-level plans developed in cooperation with land owners and operators, and other interested parties including point sources on the watershed.
- . Implementation is an iterative process, with a goal of full restoration and protection of America's waters within 15 years for all fifths
  - . First 4 years after approval – management measures; if full restoration and protection not achieved,
  - . 5th, 6th year – additional measures; if full restoration and protection still not achieved,
  - . 7th, 8th year – more stringent measures
  - . Beyond 8th year – continued application of more stringent measures until full restoration and protection are achieved.
  - . Monitoring to assure full restoration and protection maintained.

**Enforcement:** based on "good actors, bad actors"

- . State is required to have enforceable mechanisms
- . land owners/operators: identified o/o must develop and implement site-level plans; flexibility in identification provided
- . after sixth year, water quality standards become enforceable
- . "good actor" provisions: compliance with USDA conservation and water quality programs; with CWA NPS program and Sec. 402; with enforceable provisions of CZARA; with Chesapeake Bay Preservation Act; constitute compliance with this Act, act as shields against enforceable mechanisms
- . State: must revise and submit Nonpoint Management Program under Sec. 319;
  - if State does not submit, EPA designs program BUT **does not implement** if State does not submit or implement:
    - . no funds
    - . permits for new or increased discharges cannot be approved under Sec. 402, CWA; no permits under Sec. 404 of CWA;

**OTHER PROVISIONS**

- . creates a Federal nonpoint control program directly under the President
- . expands water quality criteria and standards to cover nonpoint pollutants
- . contains provisions for new sources of NPS
- . creates a Citizen Monitoring Program to assist states in monitoring

**COMMENTS:** Please address views and comments to

STATEMENT OF CONGRESSMAN DAN SCHAEFER IN SUPPORT OF H.R. 340  
WATER RESOURCES SUBCOMMITTEE

MAY 11, 1993

Thank you, Mr. Chairman and Members of the Subcommittee for allowing me to testify on behalf of legislation I introduced, the Federal Facilities Clean Water Compliance Act.

For those members of the 102nd Congress, the title of this bill, H.R. 340, may have a familiar ring. For good reason. Just last year, Congress gave its overwhelming approval to similar legislation introduced by Representative Eckart and myself. That measure, which was signed into law last October, enhanced EPA's and the states' ability to enforce the Resource Conservation and Recovery Act (RCRA) at the nation's federal facilities. Unfortunately, our work is not yet finished.

Federal agencies, particularly the Departments of Energy and Defense, have also proven to have woefully inadequate incentives to comply with the Clean Water Act. Not surprisingly, as we discovered with RCRA, the lack of effective enforcement has translated into a federal facility non-compliance rate of about twice that of private industry. Far from setting a good example, we have found that federal agencies are continually among the worst violators of the nation's environmental laws.

In fact, as recently as September 1991, an alarming twenty percent -- one in five -- major federal facilities were cited by EPA as being in significant non-compliance with the Clean Water Act. Even more disturbing, a General Accounting Office study

showed that of those government facilities in violation of the CWA, more than 40 percent remained so for a year or longer. GAO's recommendation to Congress was clear: EPA and the states need to improve enforcement at federal facilities.

Unfortunately, efforts by state and federal regulators to improve compliance rates have been frustrated. Because Congress -- as the Supreme Court recently confirmed -- has failed to waive sovereign immunity under the Clean Water Act, federal agencies have largely been protected from state-levied civil penalties and administrative enforcement actions. This has set up the curious situation in which EPA and the states are prohibited from assessing against federal facilities enforcement methods they routinely use against private companies.

I believe this double-standard must stop. There is simply no reason why the federal government should not be forced to abide by the same rules it imposes on others. H.R. 340 would correct this inequity by waiving sovereign immunity for violations of the Clean Water Act, thereby subjecting federal agencies to state and EPA enforcement actions. It is closely modeled after last year's successful RCRA effort which -- by the way -- passed the House with three no votes.

Recently, I spoke with individuals in the federal facilities office at EPA regarding the effect waiving sovereign immunity has had on their ability to enforce provisions of the RCRA statute. The answers I received were encouraging. I was told that while just months ago federal environmental regulators were dealing with lieutenants and captains, that now they are finding generals

across the table. I believe this is the kind of priority the American people -- particularly those living near federal facilities -- would want placed on protecting the environment.

It is with no pride of authorship that I bring this legislation to this Committee. In fact, having just finished a five-year struggle on the RCRA side, I would certainly have no objection to its inclusion in the upcoming Clean Water Act reauthorization bill. In fact, I urge the Committee to do just that and would welcome an opportunity to work with you in that regard.

In closing, I would ask that a resolution adopted unanimously by the National Association of Attorneys General in support of H.R. 340 be made a part of the record. Again, I thank the Subcommittee for allowing me to testify and would be pleased to answer any questions you may have.

103D CONGRESS  
1ST SESSION

# H. R. 340

To amend the Federal Water Pollution Control Act relating to Federal facilities pollution control.

---

## IN THE HOUSE OF REPRESENTATIVES

JANUARY 5, 1993

Mr. SCHAEFER introduced the following bill; which was referred to the Committee on Public Works and Transportation

---

## A BILL

To amend the Federal Water Pollution Control Act relating to Federal facilities pollution control.

1 *Be it enacted by the Senate and House of Representa-*  
2 *tives of the United States of America in Congress assembled,*

3 **SECTION 1. SHORT TITLE.**

4 This Act may be cited as the "Federal Facilities  
5 Clean Water Compliance Act of 1993".

6 **SEC. 2. APPLICATION OF CERTAIN PROVISIONS TO FED-**  
7 **ERAL FACILITIES.**

8 (a) IN GENERAL.—Section 313(a) of the Federal  
9 Water Pollution Control Act (33 U.S.C. 1323(a)) is  
10 amended—

1           (1) by striking the third sentence and inserting  
2           the following new sentences: "The Federal, State,  
3           interstate, and local requirements, administrative  
4           authority, and process and sanctions referred to in  
5           this subsection include, but are not limited to, all  
6           administrative orders and all civil and administrative  
7           penalties and fines, regardless of whether such pen-  
8           alties or fines are punitive or coercive in nature or  
9           are imposed for isolated, intermittent, or continuing  
10          violations. The United States hereby expressly  
11          waives any immunity otherwise applicable to the  
12          United States with respect to any such requirement,  
13          administrative authority, and process and sanctions  
14          (including, but not limited to, any injunctive relief,  
15          administrative order or civil or administrative pen-  
16          alty or fine referred to in the preceding sentence, or  
17          reasonable service charge). The reasonable service  
18          charges referred to in this subsection include, but  
19          are not limited to, fees or charges assessed in con-  
20          nection with the processing and issuance of permits,  
21          renewal of permits, amendments to permits, review  
22          of plans, studies, and other documents, and inspec-  
23          tion and monitoring of facilities, as well as any other  
24          nondiscriminatory charges that are assessed in con-  
25          nection with a Federal, State, interstate, or local

1 water pollution regulatory program. No agent, em-  
2 ployee, or officer of the United States shall be per-  
3 sonally liable for any civil penalty under any Fed-  
4 eral, State, interstate, or local water pollution law  
5 with respect to any act or omission within the scope  
6 of the official duties of the agent, employee, or offi-  
7 cer. An agent, employee, or officer of the United  
8 States shall be subject to any criminal sanction (in-  
9 cluding, but not limited to, any fine or imprison-  
10 ment) under any Federal or State water pollution  
11 law, but no department, agency, or instrumentality  
12 of the executive, legislative, or judicial branch of the  
13 Federal Government shall be subject to any such  
14 sanction.”; and

15 (2) by striking the sentence which begins “No  
16 officer, agent, or employee”.

17 (b) ADMINISTRATIVE ENFORCEMENT ACTIONS.—  
18 Section 313 of such Act is further amended by redesignat-  
19 ing subsection (b) as subsection (c) and by inserting after  
20 subsection (a) the following new subsection:

21 “(b) ADMINISTRATIVE ENFORCEMENT ACTIONS.—

22 “(1) IN GENERAL.—The Administrator may  
23 commence an administrative enforcement action  
24 against any department, agency, or instrumentality  
25 of the executive, legislative, or judicial branch of the

1 Federal Government pursuant to the enforcement  
2 authorities contained in this Act. The Administrator  
3 shall initiate an administrative enforcement action  
4 against such a department, agency, or instrumental-  
5 ity in the same manner and under the same cir-  
6 cumstances as an action would be initiated against  
7 another person. Any voluntary resolution or settle-  
8 ment of such an action shall be set forth in a con-  
9 sent order.

10 “(2) OPPORTUNITY TO CONFER.—No adminis-  
11 trative order issued to such a department, agency, or  
12 instrumentality shall become final until such depart-  
13 ment, agency, or instrumentality has had the oppor-  
14 tunity to confer with the Administrator.”.

15 **SEC. 3. DEFINITION OF PERSON.**

16 Section 502(5) of the Federal Water Pollution Con-  
17 trol Act (33 U.S.C. 1362(5)) is amended by inserting be-  
18 fore the period the following: “and shall include each de-  
19 partment, agency, and instrumentality of the United  
20 States”.

**AMERICAN WATER WORKS ASSOCIATION  
TESTIMONY BEFORE  
THE SUBCOMMITTEE ON WATER RESOURCES  
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
U.S. HOUSE OF REPRESENTATIVES**

**ON  
THE REAUTHORIZATION OF THE CLEAN WATER ACT**

**PRESENTED BY  
JOHN H. SULLIVAN  
DEPUTY EXECUTIVE DIRECTOR  
AMERICAN WATER WORKS ASSOCIATION**

**May 11, 1993**

**INTRODUCTION**

Good morning, Mr. Chairman, members of the Subcommittee. My name is John H. Sullivan. I am the Deputy Executive Director of the of the American Water Works Association (AWWA) and I am here on behalf of the members of AWWA to present the association's views on the reauthorization of the Clean Water Act.

I want to thank you and the members and staff of the Subcommittee for providing us the opportunity to comment on the reauthorization of the Clean Water Act (CWA). AWWA and its members commend you and the other members of Congress who are taking the leadership on this issue of vital concern not only for the environment but for public health in America. AWWA supports efforts to assure continued high quality water resources for the nation.

AWWA is the world's oldest and largest scientific and educational association of water supply professionals. Founded in 1881, we now have over 55,000 members. We include public drinking water departments and authorities, private companies, scientists, educators, engineers, managers, and individuals engaged in the water supply profession. Our members represent over 80 percent of the drinking water delivered in the United States. In addition, many of our members have dual responsibility for both drinking water and waste water. The membership of AWWA comprises the most extensive network of knowledge and experience for the whole spectrum of water supply concerns. The AWWA expertise encompasses managers and operators running public water systems, public health officials overseeing regulatory programs, engineers designing distribution systems, scientists analyzing water quality, researchers developing new treatment technologies, academicians studying innovative water management techniques, and educators imparting knowledge concerning water. AWWA stands ready to share this knowledge and experience with you. As a scientific and educational organization, the purpose of AWWA is, and has been since its founding, to promote public health, safety and welfare through provision of quality drinking water. As such, we have a continuing interest in protecting America's water supply from contamination.

## ENVIRONMENTAL CONTAMINATION OF DRINKING WATER

Today, the people of the United States enjoy the highest quality safe drinking water in the World. Largely through the efforts of the members of AWWA over the years, water borne diseases from drinking water have been minimized in the United States. The Clean Water Act has been a significant factor in this effort by reducing the dumping of raw sewage and toxic substances into our nation's water. However, despite the advances made in cleaning up water pollution in America through the Clean Water Act, we still are faced with the continuing and growing problem of environmental contamination of drinking water from pollution in our nation's source water. This is a challenge we in America must address to provide safe drinking water for ourselves and our posterity.

This challenge was dramatically illustrated for the nation by the recent outbreak of disease in Milwaukee, Wisconsin, in March and April of this year. The disease outbreak was caused by a protozoan, called Cryptosporidium, that contaminated the drinking water in Milwaukee and ten surrounding communities. Dr. Jeffrey P. Davis, the state epidemiologist, estimated that the disease sickened at least 183,000 people and possibly as many as 281,000. Six deaths are being investigated in which Cryptosporidium may have been a contributing factor.

Studies on the environmental occurrence of Cryptosporidium began in 1985 and in 1988 the Environmental Protection Agency (EPA) added Cryptosporidium to the Drinking Water Priority List for possible future regulation, but it is currently not regulated under the Safe Drinking Water Act (SDWA). According to the National Academy of Science, Cryptosporidium qualifies as one of the new and emerging microbes that could spring up to threaten the nation's health. The detection, treatment and removal of Cryptosporidium is very difficult. In response to the growing cases of cryptosporidiosis in humans since 1976, the American Water Works Association Research Foundation has undertaken a total of 35 projects costing \$9.2 million relating to Cryptosporidium. AWWA, in conjunction with EPA, conducts the only analytic method training available for Cryptosporidium.

In a statement presented to the subcommittee in August 1991, AWWA highlighted the growing problem concerning Cryptosporidium. The Milwaukee case is only the latest and most publicized. In January 1987, an outbreak occurred in Carrollton, Georgia, with 10,000 estimated cases. In Medford (Jackson County), Oregon, an outbreak occurred during the months of January through June of 1992 with an estimated 3,000 to 15,000 cases of cryptosporidiosis. Additionally, there may have been many more smaller outbreaks that have not been documented because individual doctors may not have been aware of the cause of the illness they were treating or if the illness was part of a larger pattern. Clearly, pollution prevent in our nation's drinking water sources, is necessary to help protect the American people from Cryptosporidium as well as other waterborne pathogens and toxic chemicals.

The case of Cryptosporidium in Milwaukee serves as clear indication that the Clean Water Act requires amending to further protect the health of the American people. The Safe Drinking Water Act alone, without measures in the Clean Water Act to address pollution of drinking water supplies, cannot do the job. In the remainder of this statement, we would like to briefly bring several issues and concerns to the attention of the Subcommittee which will help protect our nation's drinking water sources, as well as other issues related to drinking water. AWWA believes that these issues should be addressed during the reauthorization of the Clean Water Act

and appropriate amendments to the Act made.

### **PROTECTION OF DRINKING WATER SOURCE SUPPLIES**

Conspicuous by its absence in the Clean Water Act, is any consideration of the protection of drinking water sources as a major goal of the Act. The Congressional Declaration of Goals and Policy of the Clean Water Act states that it is a national goal to achieve water quality that provides for the protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water. In addition, Section 304 requires that the Environmental Protection Agency (EPA) provide guidance on the factors necessary to protect aquatic life and recreational activities in and on the water, and Section 305 requires state reports on water quality to address their progress in achieving water quality that protects aquatic life and allows water recreational activities. Clearly missing from these sections is the protection of water as a drinking water source. AWWA strongly recommends that the Clean Water Act provide the same status for protection of drinking water sources as it does for the protection and propagation of fish, shellfish, wildlife, and recreation.

The Congressional Declaration of Goals and Policy should include the protection of drinking water sources and public health in the objective of the Act. This is essential, so that protection and consistent emphasis is provided in all sections of CWA, especially where program development is required to carry out the objectives of the Act.

Further, this change to the Clean Water Act would compliment and thus be consistent with the Safe Drinking Water Act (SDWA), by requiring the development of programs to provide for the protection of drinking water sources. The SDWA emphasizes source water protection and encourages water purveyors to use the highest quality sources. National Primary Drinking Water Regulations require public water systems to conduct sanitary surveys which emphasize the characterization of actual and potential pollutant sources for the drinking water supply and identify measures which should be taken to improve drinking water quality. An amendment to the Clean Water Act is needed which would protect drinking water sources. The amendment would provide for the development of programs to implement sanitary survey recommendations to control the discharge of contaminants regulated under the SDWA and other pollutants in drinking water sources, including microbial and toxic contaminants.

In Section 304 of the Act, the EPA Administrator should be required to provide information to the states on factors necessary for the protection of public water supplies to help them develop water quality criteria and effluent limitations which adequately protect public water supplies.

Section 304 of the Act requires the EPA to promulgate regulations concerning, among other things, the monitoring requirements for National Pollutant Discharge Elimination System (NPDES) permitted discharges. However, the current monitoring requirements for point source discharges are not specific enough with respect to all designated uses. Additional monitoring requirements are necessary to cover pollutants whose levels are regulated in drinking water as contaminants by the National Primary Drinking Water Regulations promulgated pursuant to the SDWA. Clearly, monitoring for regulated drinking water contaminants should be required for discharges to navigable waters which are also designated as source water supplies for drinking water. Further, the public health effects of curtailing any discharge should be considered as well

as the effects on fish, shellfish and wildlife. We believe that water quality standards must be broad enough to address the critical issue of balancing both the human health and ecological risks. These standards should continue to be set by the states based on greatly improved guidance from the federal level.

In Section 305 of the Act, the state reports on water quality should be required to include information concerning the extent to which all navigable waters of the state provide for the protection of public water supplies. The Clean Water Act primarily provides for reducing the discharge of pollutants to already impaired water bodies and does not focus on pollution prevention for those water bodies at risk of water quality degradation. The state water quality report, being the primary source of water quality information for all navigable waters of a state, identifies water quality problems which require attention in state water quality control plans. Clearly the protection of drinking water source water supplies should be a key element of these plans. Planning efforts should be directed to execution on a watershed or aquifer basis to adequately control critical water resources for all intended purposes and with a full understanding of both quality and quantity issues.

### **NON-POINT SOURCE POLLUTION**

AWWA believes that the control of non-point source pollution is a critical component of the Clean Water Act. The current provisions of the Clean Water Act have reduced water pollution from point sources (end-of-pipe). Water pollution could be reduced further through the control of non-point sources such as agriculture runoff, combined sewer overflows and urban storm sewer runoff. In particular, agriculture runoff containing herbicides and pesticides is found with increasing frequency and at high concentrations in rivers and streams and poses an ecological and public health threat.

Public water suppliers have been active on non-point source pollution from agriculture sources. The Missouri River Public Water Supply Association (MRPWSA) has conducted an intensive monitoring study of the Missouri River by analyzing samples collected from sites on a daily basis in May, June and July. The sites were selected to bracket the major tributaries feeding into the lower Missouri River and also based on their proximity to a U.S. Army Corps of Engineers river gaging station. A total of 589 samples were analyzed in 1991. Of the 589 samples, the following herbicides were measured above the detection level: simazine was detected 2 times; alachlor was detected 104 times; and atrazine was detected 441 times. 165 samples were above the atrazine maximum contaminant level (MCL). The average atrazine concentration ranged from 0.72 micrograms/liter (ug/l) to 3.22 ug/l at the sampling sites. The maximum atrazine concentration ranged from 6.71 ug/l to 11.10 ug/l at the sampling sites. The study was repeated during 1992 and is now in progress for 1993. The data from 1992 is not yet fully analyzed; however, it shows the same general trends as in 1991, with several days above the MCL.

In addition, the United States Geological Survey (USGS) is monitoring herbicide concentrations at several Midwestern locations. In 1989 and 1990, USGS conducted a reconnaissance study from 149 randomly selected sites in 122 river basins. Samples were collected in three phases during March and April (pre-planting); in May and June (post-planting); and in October and November (harvest). Fifty samples were collected in the first phase and 12 and 145 in the second and third phases, respectively. Atrazine was detected in 91 percent of

the pre-planting samples and 98 percent and 76 percent of the post-planting an harvest samples, respectively. Several of the herbicides were found to exceed their MCLs. 52 percent of the sites exceeded the atrazine MCL, 32 percent for alachlor, and 7 percent for simazine. 29 percent of the sites exceeded four times the atrazine MCL, which would cause an immediate violation of the Nation Primary Drinking Regulations promulgated pursuant to the SDWA for a public water system. Exceedances of the MCLs were also found for combinations of herbicides. In the post-planting phase, 23 percent of the sites exceeded the MCLs for two herbicides and ten percent for three herbicides.

AWWA feels that this data indicates a potential problem with pesticide and herbicide contamination in drinking water sources. The contamination levels for a multi-month period pose a potential problem to public health without final drinking water treatment. This issue alone could force installation of extensive granular activated carbon at billions in capital expenditures that will be a burden on the public at large, rather than the "polluter." This potential problem could be reduced by addressing the issue under non-point source pollution in the reauthorization of The Clean Water Act.

Other non-point sources of pollution should be controlled such as nitrates from fertilizer runoff which can cause methemoglobinemia or "blue-baby syndrome" and runoff from cattle feeds lots which contain a much higher concentration of pathogenic organisms such as Cryptosporidium than natural background concentrations. Overflows from combined sewers can also increase the concentration of pathogenic organisms and other pollutants during storm events. Additionally, urban storm sewer runoff contains many pollutants such as oil, gasoline and other synthetic organic chemicals. The use of best management practices can greatly reduce the pollutant load from non-point sources such as agricultural runoff, combined sewer overflows, and urban sewer runoff. We recommend that the Clean Water Act be amended to reduce pollution from these sources.

Section 402 of the Clean Water Act provides an exemption from NPDES permit requirements for agriculture return flows. As a result, the return flows to the nation's waters is not strictly regulated nor are there monitoring requirements. A monitoring program is necessary to identify contaminants and determine their levels and assess. With this information, the effects of the contaminants and best management practices can be established to minimize the discharge of the contaminants and protect the source water supply as designated use of the nation's waterways. In addition, monitoring agriculture non-point sources of pollution is necessary to implement and evaluate the progress of the Agriculture Water Quality Protection Program which will be developed pursuant to Section 1439 of the Food, Agriculture, Conservation, and Trade Act of 1990 (1990 Farm Bill). The present language of the Clean Water Act is clearly inadequate for these purposes. An amendment which requires monitoring may lead to better management practices of agriculture, silviculture (forestry) and livestock management that are more beneficial to the enhancement of water quality and protection of the environment and public health.

### WATER CONSERVATION

Water conservation is an effective method of reducing per capita water consumption which will, in turn, reduce sanitary sewer influent. AWWA supported the plumbing products efficiency standards enacted in the Energy Policy Act of 1992 in the 102nd Congress. The

members of AWWA have developed, funded, implemented and evaluated most of the water conservation measures being used today. Typical water conservation measures include:

- the use of low-flow plumbing fixtures.
- distribution system leak detection and repair programs.
- toilet leak detection and repair programs.
- metering of all water service connections.
- low-water demand landscaping (xeriscaping).
- conservation water rate structures,
- public information and education.

Water conservation research is an area which deserves increased emphasis in the Clean Water Act. However, regulatory authority for drinking water conservation should be placed under the Safe Drinking Water Act or in separate conservation legislation since water conservation affects many statutorily diverse programs. It is critical that attention also should be paid to interagency coordination of water conservation among EPA, the Bureau of Reclamation, the US Army Corps of Engineers, etc. Often multiple federal agencies are working on the same task without each other's knowledge. AWWA suggests the establishment of a National Clearinghouse on Water Conservation.

We also suggest other conservation measures such as the use of alternate sources of water supply, including desalinization and reclaimed water. Section 303 of the Act, outlining requirements for the development of water quality standards should aggressively encourage the effective reuses of reclaimed water in ephemeral streams, creation of reclaimed water dominated streams to recharge aquifers and other beneficial use of reclaimed water which would promote water conservation and not pose a threat to public health or the environment.

AWWA supports efforts to establish a positive federal guidance role in water conservation that is beneficial to customers and purveyors of water alike. Because of widely divergent conditions throughout the nation, water conservation programs should be controlled at the local level and tailored to the specific conservation needs of the area.

## WETLANDS

Wetlands are important natural resources deserving protection. True wetlands have a significant ecological function and are critical to water quality and supply. Drinking water supply facilities by their very nature are directly connected to wetlands. The dual objectives of supplying adequate quantities of safe drinking water, while at the same time enhancing the national wetlands resources, must be achieved wherever possible so that high quality, adequate water supplies are not sacrificed for wetlands, nor vice versa. Many modern drinking water development projects can be consistent with the goal of achieving a no-net-loss of wetlands. Because wetland ecosystems vary widely, they are not all of equal quality or functional value. Wetlands must be indexed according to functional value and protected accordingly to balance the true water demands of the future for both human and ecological purposes.

Public water supply projects involve public policy considerations unique to drinking water and essential to the protection of public health. Even though public water supply projects are water dependent, they are evaluated under the same procedures and guidelines used for other

projects which are not water dependent or are not essential for public health. Additionally public water supply projects must be planned two to five decades in advance of need; therefore, a reliable stable regulatory system is essential to assure the future drinking water needs of the American people. AWWA supports changes to the Section 404 permit process to achieve an effective, equitable and predictable regulatory system to meet the objectives of preserving wetlands and meeting justifiable water supply needs for the future and to protect public health.

#### COMPLIANCE ASSISTANCE AND FUNDING

And as our final point, AWWA supports the continuation of the federal contribution to the Clean Water Act state revolving fund (loan) program. We further suggest consideration of supplementing the state revolving funds through a tax on polluters (pesticides, herbicides, fertilizers, etc.) to support clean up efforts resulting from non-point source pollution. Some type of economic incentives should also be considered for enhanced water quality and efficient water demand. The overwhelming requirements of environmental laws and regulations on small communities must be mitigated. Although the details for administering such a program and achieving the goals of environmental laws need to be worked out, a program to effectively implement the nation's environmental laws in small communities which do not have the capability to comply in the time periods established by law is essential. Assistance not enforcement is the key to compliance for small communities.

AWWA thanks the Subcommittee for this opportunity to present our views on the reauthorization of the Clean Water Act. Clean water is essential to the nation's public water supply and AWWA supports the efforts of the Subcommittee to achieve that goal. We are continuing to develop and investigate issues pertaining to the Clean Water Act and would be pleased to provide the subcommittee updated information on these issues. We welcome the opportunity to continue to work with the Subcommittee to develop appropriate legislative language on the issues and concerns that we have raised, as well as others.

---

This concludes the AWWA statement on the reauthorization of the Clean Water Act.

Thank you for this opportunity to present our views. I would be happy to address any questions or comments that you may have.

**TESTIMONY**

**OF**

**ROBERT G. SZABO**

**THE NATIONAL WETLANDS COALITION**

**BEFORE THE**

**HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE**

**SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT**

**REAUTHORIZATION OF THE CLEAN WATER ACT**

**MAY 11, 1993**

Mr. Chairman and Members of the Subcommittee, thank you for providing The National Wetlands Coalition the opportunity to testify before you today. My name is Robert G. Szabo. I am a member of the law firm, Van Ness, Feldman and Curtis, and serve as Counsel to The National Wetlands Coalition. I am testifying today in place of our chairman, H. Leighton Steward, who is also President, Chairman and Chief Executive Officer of the Louisiana Land and Exploration Company. Mr. Steward had a previous commitment that prevented his appearance before you today.

The National Wetlands Coalition is a broad-based group of entities that engage in activities that are subject to the Section 404 permitting program. The Coalition was formed for the single purpose of participating constructively in the national debate over Federal wetlands regulatory policy. The Coalition is a membership organization that was formed on September 1, 1989 and is governed by a Board of Directors. A list of Coalition members and the Board of Directors is attached.

The members of the Coalition are very pleased with the recent statements of the leaders of this Committee that the Committee will address Federal wetlands regulatory policy during its development of Clean Water Act reauthorization legislation. During floor debate of the Department of the Environment Act on May 4th, Senator Max Baucus, Chairman of the Senate Energy and Natural Resources Committee, made the same commitment. Coalition members are pleased that the Congress is prepared to debate this important environmental and land use program for the first time since 1977.

The Coalition is also very supportive of another recent development that may provide an opportunity for private sector entities that have often been at odds over this issue to work together toward consensus positions on at least some aspects of this ongoing debate. On February 19, 1993, twenty House Democrats wrote President

Clinton requesting a "summit" on wetlands policy. A copy of this letter is attached. On April 28, 1993, seven Democratic Senators representing states that are part of the Lower Mississippi Delta Development Commission wrote President Clinton to request that he establish a task force of his cabinet to work with the Senators and others to develop consensus wetlands regulatory policies for inclusion in the Clean Water Act reauthorization legislation this Congress. A copy of the letter is attached.

As Governor of Arkansas, President Clinton chaired the Commission, which filed a report with Congress in May, 1990 recommending certain modifications of Federal wetlands regulatory policy. The relevant portions of the report of the Lower Mississippi Delta Development Commission are attached. On May 4th, during Senate floor debate, Senator John Breaux of Louisiana announced that the Administration had committed to establish the requested task force.

Mr. Chairman, The National Wetlands Coalition supports a workable and effective Federal wetlands regulatory program. Coalition members support the national goal of increased conservation and better management of our nation's wetlands. We are convinced that the goal of conserving and enhancing our nation's wetlands resources can be best achieved by a Federal regulatory policy that enlists the private sector in its implementation and recognizes the fundamental reality that 75% of the nation's wetlands are not in public ownership. The statement of principles that has guided the Coalition since shortly after its inception is attached.

The Coalition is prepared to participate in any reasonable process that is established by this Committee, the Administration or the Senate Environment and Public Works Committee for the purpose of assisting the Congress and the Administration to

develop, for enactment in the Clean Water Act reauthorization legislation, a reasonable and workable Federal wetlands regulatory process.

**THE CURRENT WETLANDS POLICY DEBATE:**

Mr. Chairman, the Section 404 regulatory policy has been controversial since several court decisions required the Corps of Engineers to regulate activities taking place beyond the "navigable waters of the United States," that is, in wetlands. The current continuing national policy debate was precipitated by three policy initiatives of 1989 and 1990, none of which were the product of Congressional action and none of which were preceded by public notice and an opportunity for public comment.

The first event was President Bush's stated commitment early in his Presidency to the national goal of "no overall net loss of wetlands". In fact, the Coalition was formed to participate in the anticipated Congressional debate over the specific policies that would be necessary to achieve that goal. This goal has never been incorporated by the Congress into the Section 404 program. The Coalition supports the goal of "no overall net loss of wetlands" so long as that goal is expressed in terms of the functions and values of wetlands and not acreage, the latter of which the Coalition believes to be unattainable. As President Clinton has stated, the no net loss policy should not turn wetlands protection into a "game of arithmetic." A strict acre-by-acre approach to no net loss is an ineffective measure of progress toward the real goal of conservation of higher value wetlands and the long-term restoration of the nation's wetlands resource base.

The second event was the issuance in March, 1989 of the Federal Manual for Identifying and Delineating Wetlands, which was developed without public input by the Environmental Protection Agency, the United States Army Corps of Engineers, the Soil

Conservation Service and the United States Fish and Wildlife Service. This manual became extremely controversial, at least in its implementation, as huge acreage of "dry" wetlands became subject to Federal regulatory jurisdiction. In August, 1991, the Bush Administration, through the Environmental Protection Agency, issued a new proposed manual in a rulemaking process. That manual was immediately criticized as defining wetlands too narrowly. That rulemaking is still pending. Today, both the EPA and the Corps of Engineers, pursuant to the direction of Congress through the Energy and Water Development Appropriations legislation, are using the 1987 guidelines developed by the Corps of Engineers to delineate wetlands.

The importance of the third event is not often noted, but in many respects this action has created the most difficulty with the current Federal wetlands regulatory program, including the conflict over the "taking" of private property. On February 7, 1990, the Environmental Protection Agency and the Corps of Engineers, again without Congressional action or public notice and opportunity for comment, entered into a Memorandum of Agreement regarding mitigation policy. That memorandum established "sequencing", a concept contained in the Section 404(b)(1) guidelines of the Environmental Protection Agency, as the methodology to be applied by the Corps of Engineers when determining whether a Section 404 permit should be issued. In their recent mitigation Memorandum of Agreement, EPA and the Corps have taken the view that "avoidance", the first step in the sequencing methodology, is the dominant consideration in the methodology. The new emphasis on "avoidance" makes it impossible for the Corps of Engineers to use the "public interest test" in the Corps' regulations that

emphasizes "balance" in determining whether and under what conditions to issue a permit.

The net result of these three events is a Federal regulatory program that now applies to much more land than ever before, most of it privately owned and much of it appearing to be "dry." Accompanying this vast expanse of jurisdiction is a much more rigid permitting methodology that substantially decreases the chances of obtaining a Section 404 permit in most circumstances. All of this has occurred, of course, without any vote by the elected officials of our nation and brings us to where we are today.

**THE NATIONAL WETLANDS COALITION**  
**SUPPORTS H.R.1330 AND OPPOSES H.R.350:**

Mr. Chairman, The National Wetlands Coalition recommends that the Congress transform the current Section 404 regulatory program from a rigid program focusing on "avoidance" to a more flexible program that limits "avoidance" to the highest value wetlands and enlists private landowners and land users in the effort to conserve and enhance our nation's inventory of wetlands functions and values. The members of the Coalition support H.R.1330, the Comprehensive Wetlands Conservation and Management Act of 1993, as the best approach to a workable and effective Federal wetlands regulatory program that applies primarily to privately owned land.

The National Wetlands Coalition opposes H.R. 350, the Wetlands Reform Act of 1993, as further complicating the Federal wetlands program by enhancing substantially the role of a third agency in the permitting process, the United States Fish and Wildlife Service, and diminishing the role of general permits, which have been of major importance to the implementation of this nationwide regulatory program. H.R. 350 also

is overly broad in its expansion of the activities that would require permitting under Section 404. The current exemptions from the Section 404 program and the authority to use general permits to implement the program were added by Congress in 1977 when the program's application to wetlands was in serious danger of being withdrawn. The Coalition believes the continuation of the current exemptions and the current general permits is critical.

**RECOMMENDED REFORMS OF THE SECTION 404 PERMITTING PROGRAM:**

The positions of The National Wetlands Coalition on several specific elements of the Section 404 regulatory program are as follows:

**THE DEFINITION OF WETLANDS:**

The definition of wetlands establishes the jurisdiction of the Section 404 program and, thus, is of critical importance. Because of its regulatory implications, the judgment of what should and should not be considered to be "wetlands" meriting regulation by the Federal government is a judgment that mixes science and policy. Congress has never made a policy determination regarding the extent of the land that is to be subject to the Section 404 regulatory program.

The Coalition believes that the final definition of wetlands adopted by the Congress must meet two criteria. First, it must cover valuable functioning wetlands, particularly those that preserve habitat. High value wetlands that appear on the covers of magazines will be easy to recognize. The more difficult task will be regulating marginal wetlands, primarily because most are privately owned. Congress' task will be to determine which wetlands are of sufficient environmental function and value to require regulation under what is in effect a federal land use permitting program. Second, the

definition must be fair to landowners; it must be understandable and must provide some element of notice to landowners and land users. When the 1989 manual defined wetlands as those hydric soil lands with hydrophytic vegetation and a water table that came to within 18" of the surface for seven days during the growing season, many landowners were not aware that their land was subject to Federal regulation. We support the concept in H.R. 1330 that wetlands should have water on the surface or be saturated to the surface for some reasonable portion of the year in order to notify landowners, land buyers and land users that the land in question might be a regulated wetland.

**ACTIVITIES TO BE REGULATED:**

Today, Section 404 requires a permit only for the discharge of "dredged or fill material" into a wetland. Permits are not required for draining, channelizing or excavating wetlands. The Coalition recommends, as did the report of the Lower Mississippi River Delta Development Commission, that Section 404 be expanded to apply to "draining, channelizing or excavating" a wetland. The Coalition does not support the much broader expansion of activities that is included in H.R.350. The Coalition does not support the broader definition because it is written so loosely as to apply to any "other alteration" of wetlands. The concern of the Coalition is that any "other alteration" could interfere with ordinary maintenance activities or recreational use, and could cause great confusion, as well as placing unlimited discretion in the hands of the regulators. The Coalition may support the regulation of other specifically defined activities, if the need for inclusion can be shown.

**CLASSIFICATION OF WETLANDS:**

The Coalition believes that one of the biggest shortcomings of the Section 404 permitting program today is that the program applies to all wetlands equally. The truth, however, is that all wetlands are not of equal value. Therefore, the Coalition recommends that wetlands be classified into different categories for different levels of regulatory protection. The Lower Mississippi Delta Development Commission report refers to the need to "differentiate the quality of wetlands" and consider "relative wetlands values."

H.R. 1330 recommends three categories of wetlands, with the highest category receiving stricter protection than current law: a middle category requires 404 permits to be obtained by following the "public interest" methodology instead of "sequencing." We believe that most areas (other than high value areas with obvious wetlands functions) that might be subject to significant development will fall into this second category. A third category will include lands that "serve limited wetlands functions," and therefore by definition would not serve significant wetlands functions and values. Further, the bill provides for monitoring of these lower value wetlands. If significant impacts are found through monitoring, a basis will be laid for possible future federal regulation. Others have recommended applying the "sequencing" methodology to only the highest valued wetlands and the traditional "public interest" test for moderate valued wetlands.

Other categorization systems are available and used by the states. The Lower Mississippi Delta Development Commission report recommends differentiating among wetlands to avoid placing marginal and pristine wetlands in identical protection categories. Regardless of the approach taken, the fundamental principle is that the

Section 404 permitting program should be modified to adjust the rigidity of the regulatory program to the level of functions and values present in the wetlands in question.

#### **ENHANCED ROLE FOR STATES AND LOCAL GOVERNMENTS:**

When the Federal Water Pollution Control Act was enacted in 1972, Congress directed that the Section 404 program be administered by the states under the supervision of the Federal agencies. To date, only one state, Michigan, has received the delegation of the Section 404 program.

The Coalition recommends enhancing the role of the states in the Section 404 program, whether through delegation or other methods. Regional diversity of wetlands requires flexibility in the implementation of the program. States are in an excellent position to implement the program to maximize wetlands functions and values.

#### **REGULATORY REFORM**

##### **SINGLE AGENCY PERMITTING:**

One of the greatest recurring complaints about the Section 404 permitting program is the number of Federal agencies involved in the process. This was the theme of bipartisan complaints during Senate consideration of the Department of the Environment Act on May 4th. Unlike any other Federal program, one agency, the EPA, can veto the decision to issue a permit that is made by a second agency, the Corps of Engineers.

The Coalition recommends that Congress designate only one agency to make the determinations required under the Section 404 program. The Coalition recommends the

Corps of Engineers for this role, primarily due to the Corps' experience with this program and the number of field personnel stationed around the country with the Corps.

**PROCEDURE FOR OBTAINING PROMPT DELINEATION DECISIONS AND A PROCESS FOR APPEALING AN ADVERSE DELINEATION DECISION:**

Undoubtedly the Members of this Committee have received numerous complaints from their constituents regarding the amount of time that is required to receive a wetlands delineation decision. The Congress should ensure that delineation decisions are available within a very short period of time, perhaps 30 days. Moreover, under the current program, there is no method for appealing an adverse delineation decision. The only method of appeal available today is for the landowner to apply for a Section 404 permit, whether or not the landowner intends to undertake the activity requiring the permit. If the permit is denied, then the applicant can appeal the permit denial, which can include issues relating to the delineation of the wetland.

A straightforward method for appealing an adverse delineation decision should be included in the program by the Congress.

**TIMELY DECISIONS:**

Another general problem relates to the time required to obtain a Section 404 permit. If any concerns are raised regarding the proposed permit, the process becomes endless. The Committee should ensure that the permitting system is streamlined and that an opportunity for a low-cost and prompt appeal is provided when permits are denied and so heavily conditioned as to be unusable.

**MAPPING AND PUBLIC NOTICE:**

In general, the Corps and the EPA must find better methods for educating the public, including the legal profession practicing in wetlands areas around the country, about the Section 404 program. More public notice of wetlands decisions should be provided.

While the Section 404 program is, in some respects, a Federal zoning program, there is no mapping of wetlands in specific areas that notifies landowners, prospective land buyers or land developers regarding which land is a Federal wetland subject to the jurisdiction of the Section 404 program. Perhaps wetlands maps should be posted in every county or parish courthouse where deeds to property are recorded.

**MITIGATION BANKING AND COMPENSATORY MITIGATION:**

The Coalition strongly supports the greater use in the Section 404 permitting program of the concept of mitigation banking and compensatory mitigation as the basis for resolution of the current wetlands policy dilemma. Wetlands preservation and enhancement is a national goal; most wetlands are located on private land; and there is a need for continued economic growth and development on private land including, in some instances, land that is considered to be wetlands for purposes of the Section 404 program.

To maintain the current strict "avoidance" concept as it has been developed under the "sequencing" methodology invites continued complaints regarding the "taking" of private property. However, a more flexible program under which landowners and land users are allowed to alter some wetlands if they restore wetlands functions and values elsewhere to the environment avoids many of the takings concerns. Mitigation banks

that preserve and enhance wetlands can be used to offset the wetlands functions and values that might have been altered by an economic activity. Moreover, mitigation banks provide a method for preserving and enhancing larger areas of wetlands, rather than the very small mitigation plots that are often required under today's system.

The Coalition recommends that Congress direct the Corps and the EPA to make greater use of the mitigation banking concept in implementing the Section 404 program.

#### **THE GENERAL PERMIT PROGRAM**

Most of those involved in federal wetlands policy agree that the general permit program is the one facet of the existing program that is operating relatively efficiently. Under the general permit program, in place of individual permits, the Corps may issue five-year permits on a nationwide, regional, or state-wide basis for categories of activities that, by definition, have minimal adverse environmental impact, either individually or cumulatively. General permits involve significantly less paperwork and delay than individual permits. The Coalition is concerned that the provisions of H.R. 350, whether intended or not, could undermine the only device that has been effective in regulating vast amounts of land and land use activities. H.R. 350 require EPA approval of every general permit, and would require review of every general permit after only two years. Rather than constricting this important program, Congress should be looking for ways to relieve regulatory burdens and enhance the role of the states by expanding the general permit program.

**COMPENSATION FOR PRIVATE PROPERTY, THE USE  
OF WHICH HAS BEEN SUBSTANTIALLY DIMINISHED  
BY THE OPERATION OF THE SECTION 404 PROGRAM**

The current wetlands policy debate has brought into focus the difficult issue of fairness for landowners when the use of their private property has been completely or substantially restricted due to the operation of a Federal regulatory program. This issue has implications for the Federal budget and for private landowners, but also for economic development, most of which occurs on private land, and for the local tax base, a major portion of which is collected from property taxes. As long as the Federal wetlands program applies primarily to privately owned lands and focuses on the "avoidance" of activities on privately owned wetlands, the "private property rights" issue will remain intense.

The issue of compensation for landowners is more than just a constitutional issue. In Lucas v. South Carolina Coastal Commission, the United States Supreme Court affirmed that compensation is due a landowner when a regulatory program, adopted after land has been purchased, restricts all of the economic use of that land. The Supreme Court has not yet determined clearly, however, the extent to which the economic use of property must be diminished before a "taking" occurs under the Fifth Amendment to the Constitution.

The broader "takings" issue raises two issues. First, how far will Congress allow a Federal regulatory program to diminish the use of private property before compensating the landowner for that lost value? Again, the issue is difficult and the implications are great. However, the fact remains that a fundamental precept of our form of government is that actions for the public good are funded by the public through the treasuries of the

Federal, state and local governments. It is simply not fair to place the total cost of wetlands preservation on individual landowners or even on local communities that may be located in or near wetlands areas.

Second, what mechanism will Congress establish for landowners to seek compensation from the Federal government? The suggestion has been made by some that no mechanism is needed because landowners who believe that their land has been "taken" can file claims against the United States government in the United States Claims Court. In fact, such claims are on the rise. Over 150 "takings" claims are pending in the United States Claims Court. Four plaintiffs have been successful in obtaining Claims Court judgments granting compensation for "takings" that occurred due to the denial of a Section 404 permit. However, the fact also remains that most Americans cannot afford to retain an attorney to fight the Federal government in the Claims Court.

The Coalition is very supportive of the manner in which H.R. 1330 addresses the issue of "takings". First, H.R.1330 attempts to make the Section 404 program more flexible, including a greater use of the concept of mitigation banking, in order to avoid the "takings" conflict. Second, H.R.1330 provides a special compensation mechanism for Type A wetlands, those wetlands under the classification scheme in H.R. 1330, where most economic activities are presumed to be impermissible. A landowner whose land is classified as a Type A wetland would have three options: accept the classification and the resulting restrictions on the land use; seek a permit and, if denied, file a "takings" claim in the United States Claims Court; and pursue the mechanism in the bill which establishes a negotiation between the Federal government and the landowner. In this negotiation, the Federal government could offer, and the landowner could accept, surplus

Federal land, tax credits or other items of value, including cash. If the negotiation is unsuccessful, the landowner would then have access to the Claims Court to determine the value of the land "taken" and to obtain a money judgment against the Federal government. The consequence of this payment is that title to the high value wetlands passes to the U.S. government. In administering the public trust, the government may restrict the use of the wetlands as it would any other land acquired for conservation purposes.

H.R. 1330 does not, as some have alleged, attempt to amend the Constitution and does not provide compensation for any wetlands other than Type A wetlands.

The Members of the Coalition believe strongly that the Congress must address the important issue of landowner rights. The Coalition believes that the Federal wetlands regulatory program should be designed and implemented to avoid "takings" and extra-judicial mechanisms should be developed for dealing with this important issue in specific fact situations.

**CONCLUSION:**

Mr. Chairman and Members of the Committee, we appreciate the opportunity to present to you the views of the Coalition. We encourage you to stand fast in your commitment to debate the current wetlands policy and look forward to working with the Members of the Committee as you develop a workable and effective Federal wetlands regulatory program.

President Bill Clinton  
The White House  
1600 Pennsylvania Avenue N.W.  
Washington, D.C.

Dear Mr. President:

Over the last four years the undersigned have followed closely the controversial and frequently changing policies on wetlands proposed by the Bush Administration. We have heard from our constituents that the current wetlands regulatory program has caused them severe hardships and has greatly diminished the value of their property. Our local public officials have described their difficulties in attempting to meet important infrastructure needs and the loss of taxes related to wetlands regulatory requirements.

A number of serious errors have been made in the implementation of this program. Those errors include:

1. Failure to adequately support restoration of existing wetlands through adequate private sector incentives and public funding.
2. Adopting broad wetlands definitions and regulatory procedures without public input and comment.
3. Frequently changing policies and procedures so that it is difficult and in some cases impossible to meet the requirements of the regulatory program.
4. An inflexible and dogmatic approach to the issuance of permits for activities in wetlands.
5. Failure to pay due respect to the Constitutional guarantee that private property shall not be taken without the payment of just compensation.
6. Unduely burdensome, costly, and lengthy permitting procedures with which many low and middle income constituents cannot comply.
7. Failure to meet the basic requirements of due process by allowing appeals of administrative decisions restricting property uses.
8. Failure to consult with local and state governments in making wetlands determinations which impact local economies, particularly in those areas with disproportionate wetland acreages.

We are hopeful that your administration will bring together in a spirit of cooperation all of the diverse interests associated with this issue. We believe that a summit, similar to your economic summit, could debate these

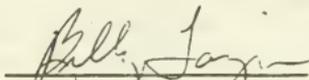

issues and propose sound measures for accomplishing the goals of wetlands protection while respecting the Constitutional rights of property owners.

We also urge you to refrain from further rulemaking on this issue pending this wetlands summit to allow your administration to propose a well thoughtout and comprehensive wetlands proposal.

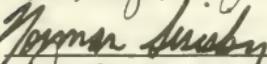

If this issue is not adequately addressed by your administration, the next few years will see a flood of lawsuits seeking compensation for property values taken and will result not only in the loss of public acceptance of this program, but also the loss to the public treasury of many millions of dollars.

As fellow Democrats we wish to work with you to organize and promote a national ongoing dialogue on wetlands. We look forward to working with you to address this important issue.

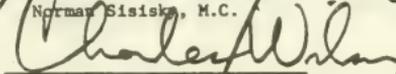

Best Wishes,

Billy Tauzin, M.C.

**United States Senate**

WASHINGTON, DC 20510

April 28, 1993

President Bill Clinton  
The White House  
Washington, D.C. 20500

Dear Mr. President:

Among the most controversial and difficult unresolved issues currently facing us is the future of Federal wetlands policy. Last year, both the Congress and the Administration were unable to break the political gridlock that continues to threaten the effectiveness of and public support for the wetlands regulatory program. We now have the opportunity to resolve this issue fairly as we move forward with reauthorization of the Clean Water Act. We ask you to join us in an effort to seek a reasonable compromise on this important issue.

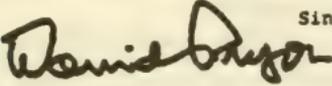

You may remember that the Lower Mississippi River Delta Development Commission, which you chaired, filed a report with President Bush and the Congress in May of 1990 that found that the nation's wetlands policy was the source of "significant problems for agriculture, aquaculture and commercial and industrial development" in the Delta Region. The Commission's report contained realistic and progressive recommendations regarding improvements to Federal wetlands policy. These recommendations included a clear and fair jurisdictional definition, recognition of the differences in functions and values of wetlands, incentives for landowner conservation, reduction of regulatory duplication, regulation of activities that drain wetlands and expanding the role of the states in the Federal regulatory program.

We ask that you establish a working group of all appropriate members of your Cabinet, including the Administrator of the Environmental Protection Agency, and the Secretaries of the Interior, Agriculture, Defense, Transportation, Energy and Housing and Urban Development, to work with us, other Congressional leaders and the public during Congressional consideration of the Clean Water Act to forge a consensus on this difficult policy issue.

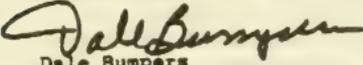

President Bill Clinton  
Page 2

We look forward to working constructively with you on this vital environmental issue which is of such great importance not only to our region but to our entire nation.

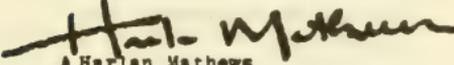

Sincerely,

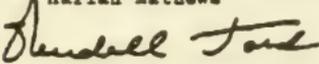

David Pryor

Dale Bumpers

# **FINAL REPORT THE DELTA INITIATIVES MAY 14, 1990**

## **LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION MEMBERS**

### **State Commissioners**

- Chairman Bill Clinton, Governor of Arkansas
- Vice Chairman Ray Mabus, Governor of Mississippi
- Secretary Ed Jones, Former U.S. Congressman
- Charlie Kruse, Missouri Department of Agriculture
- Buddy Roemer, Governor of Louisiana
- Lee Troutwine, Kentucky Department of  
Local Government
- Dr. Rhonda Vinson, Department of Economic  
Development, Southern Illinois University  
at Carbondale

### **Presidential Appointees**

- Webb Franklin, Former U.S. Congressman
- John Shepherd, Attorney at Law

**Lower Mississippi Delta Development Commission**

May 14, 1990

The President  
The White House  
Washington, D. C. 20500

Dear Mr. President:

This is the final report to you and the Congress of the United States of America on the work of the Lower Mississippi Delta Development Commission. It is more than just another government report to be added to countless shelves of government studies that have gone before.

This is a Handbook for Action -- one that can turn the Delta and its 8.3 million people into full partners in America's exciting future, full participants in the changing global economy.

The Lower Mississippi Delta Development Commission was established under Public Law 100-460 in October 1988 through legislation introduced by a bi-partisan group of senators and representatives from the seven states making up the Lower Mississippi Delta region, as well as Congressmen from other parts of the nation. The Lower Mississippi Delta area is comprised of 219 counties in Arkansas, Louisiana, Mississippi, Missouri, Illinois, Tennessee and Kentucky. Together they form the poorest region of the United States.

The Commission was given this mission: to study and make recommendations regarding economic needs, problems, and opportunities in the Lower Mississippi Delta region, and to develop a ten-year regional economic development plan.

To begin its work, the Commission had to collect all the information, opinions and ideas available in the region. And that is exactly what has been done. We have blanketed the Delta, seeking input from many thousands of people who attended public hearings, spoke to us, gave us written testimony or participated through providing research and statistical information. We have reviewed a mountain of material and considered every single, specific suggestion made by the citizens of the Delta -- and they had many ideas on how to improve the overall quality of life for all the people of the region.

In October 1989, we issued an interim report entitled "The Body of the Nation", which outlined the problems and opportunities of the Delta, the vast human and natural resources and many impressive efforts now underway to move our region forward.

We agreed that the Delta was an enormous, untapped resource for America, that it can and should be saved. We agreed that our goal should be nothing less than full partnership for the Delta: rates of employment and income at or better than the national average.

The President  
May 14, 1990  
Page 2

Now, in this Final Report, all of the information, all of the opinions and ideas we have collected have been put together into an ambitious, aggressive plan for the development of the region.

It is a handbook for action that anybody can pick up -- a congressman, a governor, a legislator, a chamber of commerce president, a mayor, a teacher, or a student -- and see what he or she can do to help.

We also believe the plan comes just in time for the Delta and its people. The 1990s have brought us an entirely new world marked by the triumph of democracy and market economies. This new world provides economic opportunities for Americans prepared to compete in it, and enormous challenges for those who are not. The people of the Delta cannot become full partners in America's future without an honest assessment of where we are in the emerging global economy and what we have to do to increase the capacity of all our people to succeed in it. That is what we have tried to do in our interim report of October 1989 and in this final report.

If we do not implement a single recommendation made in this report, a lot of Americans who live in the Delta are going to do fine in the 1990s: those who are well-educated, on the cutting edge of change, and able to take advantage of the emerging global economy. But millions of people will be left behind, and the region as a whole, including its successful residents, will not achieve its full potential.

We call on you, our Congress, our state and local leaders, and our citizens to assume responsibility for the Delta's future.

Being in the vanguard of change need not be a distinction limited to the freedom-hungry citizens of Eastern Europe or Poland or the aggressive business people of Singapore or Korea. The people of the Delta belong in that vanguard. They want to be there, and they can be if each of us will do our part.

Respectfully,

Bill Clinton  
Chairman

## Natural Resources

**ISSUE:** Wetlands ( Freshwater)

**TEN YEAR GOAL:** All remaining high quality wetlands will be protected without preventing economic development by the year 2001.

**SITUATION:** The national wetlands policy has caused significant problems for agriculture, aquaculture and commercial, and industrial development. More than 21 million acres of Lower Mississippi River Delta land is designated as wetlands. The "Joint Federal Manual for Identifying and Deleting Jurisdictional Wetlands" increased the river delta lands, described as wetlands in the region from a former 15-18% of the land to approximately 70%-80%. The Manual is used for Section 404 permits and the Food Security Act regulation. Serious questions have been raised concerning the exact intent of Congress and inadequate public access to the Manual.

Current definitions do not adequately differentiate the quality of wetlands. For example, a pristine cypress swamp and a commercial loblolly pine plantation may be placed in the same wetlands classification. Relative wetlands values are not considered. All these problems place individuals and industries in a state of confusion.

Landowners and planners are not adequately informed of the new wetlands policies, and farmers are not accustomed to obtaining permits to improve land that has a long history of cultivation.

Current interpretations of the national wetlands policy have placed major limitations on the Delta's economy because commercial and industrial development is being impaired.

Expansion of the successful catfish, crayfish, and baitfish industries is severely limited.

Construction of surface water storage systems to preserve critical ground water supplies and increase economic returns through irrigation from agriculture also has been hampered.

"Determination of mitigation" requirements showing the effects of construction are not being made early enough in the permitting process to allow for reasonable financial planning. With up to 80% of river delta land classified as wetlands, large-scale mitigation may not be practical. Current interpretations of national policy even require land users to create new wetlands when croplands are improved or converted to commercial, industrial or aquaculture uses.

**RECOMMENDATIONS:**

- **All levels of government and the private sector** should actively support preservation of high quality wetlands. The North American Waterfowl Management Plan is one example of active support for this recommendation.
- **States** should establish an area-wide system of "mitigation banking," for land converted from wetlands. (See glossary.)
- **Congress** should eliminate the "dredge removal" loophole in Section 404 of the Clean Water Act of 1972 (CWA 72). Present rules allow wetlands to be drained if the removed material is hauled away and deposited in a non-wetlands area.
- **Congress** should establish a wetlands protection program with incentives for landowners to protect and establish high quality wetlands; the program should put emphasis on the conservation and re-establishment of bottomland hardwoods.
- **Congress** should exempt pre-Food Security Act (FSA) croplands from wetlands regulations of Section 404 of the CWA 72 and the Food Security Act of 1985.
- **Congress** should direct appropriate federal agencies to develop procedures that clearly identify mitigation requirements.
- **Congress** should direct appropriate federal agencies to establish minimum-sized wetlands for regulation.
- **Congress** should assign the responsibility for identification and maintenance of a wetlands inventory to one agency, and require consultation with other affected agencies.

## Natural Resources

**ISSUE:** Coastal Marshlands, Wetlands

**TEN YEAR GOAL:** Establish an equilibrium in the loss of coastal marshes and wetlands by the year 2001.

**SITUATION:** Louisiana contains 40% of United States coastal marshes and 80% of the nation's coastal marsh loss is occurring in the state. Current loss is estimated to be thirty-five square miles annually. This is an urgent crisis and should be given top priority for resolution.

Louisiana wetlands serve as incubators for 90% of the commercial fish and 42% of the recreational fish harvested in the Gulf of Mexico. The Louisiana commercial seafood industry economic impact is estimated to be \$2.3 billion.

Coastal marshlands and wetlands are valuable habitats for wildlife. Louisiana wetlands provide wintering habitat for 66% of the ducks and geese using the Mississippi flyway. Wetlands provide essential habitat for many non-game species of wildlife. National flood control and navigation policies, although designed to foster national economic development, have caused in large part the loss of lower Mississippi Valley marshlands and wetlands.

### RECOMMENDATIONS:

- **Congress** should require the U.S. Army Corps of Engineers (CoE) to create marshes with dredged material from Corps-maintained channels in the Lower Mississippi Delta.
- **Congress** and **states** should develop an approach for meeting the goal of an immediate no net loss on permitted wetland activities.
- **Congress** should require stabilization of banks along river and stream channels maintained by the CoE.
- **Congress** and **states** should direct appropriate agencies to accelerate planning and construction of approximately 20 freshwater and sediment diversions designed to replicate natural action of the river to restore vegetated marshlands and wetlands.
- **Congress** and **states** should direct appropriate agencies to accelerate installation of non-point source discharges into coastal wetlands to offset salinity intrusion and improve quality of water flowing into oyster reefs and fishing grounds.

## Natural Resources

**ISSUE:** Natural Resource Conservation and Development (RC&D)

**TEN YEAR GOAL:** By the year 2001, establish a model for effective rural revitalization and reduction of soil erosion rates consistent with USDA Soil Conservation Service tolerance levels.

**SITUATION:** The need to revitalize the rural Delta has been firmly established through state testimonies, conference reports, and research documents. Resource Conservation and Development Councils are organized and active in 164 of the 219 Delta counties, parishes. Consistent and adequate rural development assistance is not currently provided to some counties in the region.

Soil erosion continues to plague many Delta locations. Areas of Southern Illinois, West Kentucky, West Tennessee and Northern Mississippi suffer from excessive soil loss. The Conservation Title of the 1985 Food Security Act (FSA) has helped address this problem by requiring a conservation plan for highly erosive cropland which must be implemented by 1995. Shortages of technical assistance and cost-share funds for implementation of these plans contribute to degradation of this natural resource and inhibits farm profitability.

**RECOMMENDATION:**

- **Congress** should authorize and fund the Resource Conservation and Development (RC&D) program of the USDA to allow for expansion of, or approval of new RC&D Project Areas which include the remainder of the Delta Commission counties and parishes.
- **State governments** should develop a model "rural economic development" structure for each county and parish.
- **Congress** should increase USDA funding targeted toward technical assistance and cost-sharing to assure completion of conservation plans for highly erosive cropland.
- **Congress** should maintain conservation compliance and sodbuster provisions in the conservation title of the new 1990 Farm Bill.
- **State governments** should provide supplemental technical assistance and cost-share funds to assist farmers in complying with the 1985 Food Security Act requirements.
- **States and local organizations** should develop a pool of resource persons, both paid and volunteer, to assist farmers with technical layout and construction of conservation practices with EARTH TEAM, VISTA and ACTION being lead players in supporting volunteer involvement.

## Lower Mississippi Delta Development Commission Members and Staff

**STATEMENT OF PRINCIPLES  
THE NATIONAL WETLANDS COALITION**

---

The National Wetlands Coalition is a geographically and economically diverse group of public and private sector entities that have joined together to participate in the efforts of the Congress and the Administration to establish a comprehensive policy for effective conservation and management of the Nation's wetlands. The National Wetlands Coalition will support the adoption of the specific programs and policies that advance the objectives of wetlands conservation, consistent with the following principles:

1. THE CONGRESS OF THE UNITED STATES AND THE PRESIDENT SHOULD ESTABLISH A COMPREHENSIVE FEDERAL PROGRAM FOR MANAGING THE NATION'S WETLANDS RESOURCE BASE IN A MANNER THAT EFFECTIVELY AND SENSIBLY ACCOMMODATES THE COMPETING, LEGITIMATE DEMANDS FOR CONSERVATION AND USE OF WETLANDS RESOURCES.
2. GIVEN THE NUMBER AND DIVERSITY OF PEOPLE AFFECTED, AND THE ECONOMIC AND ENVIRONMENTAL IMPORTANCE OF THE WETLANDS RESOURCE BASE, A COMPREHENSIVE FEDERAL WETLANDS POLICY SHOULD BE THE PRODUCT OF A NATIONAL CONSENSUS-BUILDING PROCESS.
3. "NO OVERALL NET LOSS OF WETLANDS VALUES" IS AN APPROPRIATE GOAL FOR ACHIEVING THE EFFECTIVE CONSERVATION OF SIGNIFICANT WETLANDS VALUES AND FUNCTIONS. THIS GOAL SHOULD BE PURSUED BY IMPLEMENTATION OF A VARIETY OF THE REGULATORY AND NONREGULATORY PROGRAMS DESIGNED TO: CONSERVE THE HIGHEST VALUE WETLANDS; ENSURE THAT DEVELOPMENT ACTIVITIES IN WETLANDS CONSERVE WETLANDS VALUES AND FUNCTIONS TO THE MAXIMUM EXTENT PRACTICABLE; ELIMINATE OR STREAMLINE PROCEDURES FOR USE OF WETLANDS OF MARGINAL RESOURCE VALUE; AND, PROVIDE INCENTIVES FOR PRIVATE WETLANDS CONSERVATION EFFORTS.
4. PROTECTION OF THE NATION'S HIGH-VALUE WETLANDS, AND RESTORATION OF WETLANDS GENERALLY, WILL REQUIRE AGGRESSIVE NONREGULATORY PROGRAMS INCLUDING PUBLIC ACQUISITION AND INCENTIVES FOR SET-ASIDES AND FOR RESTORATION ACTIVITIES. FEDERAL FUNDING REQUIRED FOR SUCH PROGRAMS SHOULD BE FROM THE BROADEST SOURCES POSSIBLE WITH NO SINGLE INDUSTRY REQUIRED TO BEAR A DISPROPORTIONATE SHARE OF THE COST.
5. SUBSTANTIAL REFORM OF THE SECTION 404 PERMITTING PROCESS IS NECESSARY TO CONSOLIDATE AGENCY RESPONSIBILITY, TO EXPEDITE ROUTINE PERMITTING, TO INCREASE FLEXIBILITY IN THE PROGRAM, AND TO PROVIDE GREATER PREDICTABILITY IN ALL CASES. CRITICAL TO THE ESTABLISHMENT OF A SENSIBLE PERMITTING PROCESS IS THE RECOGNITION THAT ALL WETLANDS ARE NOT OF EQUAL VALUE AND THAT THE LEVEL OF REGULATION AND MITIGATION IMPOSED SHOULD VARY DEPENDING UPON FUNCTIONS AND VALUES OF AFFECTED WETLANDS, DEGREE AND DURATION OF IMPACT, AND THE SURROUNDING LAND USE.

ASSOCIATION OF METROPOLITAN WATER AGENCIES

**ASSOCIATION OF METROPOLITAN WATER AGENCIES**

***U. S. House of Representatives***

***Statement on***  
***Reauthorization of the Clean Water Act***

***May 11, 1993***

***presented by***  
***Buddy Williams, Director***  
***Department of Water and Sewerage Services***  
***Nashville, Tennessee***

***Testimony before the House Subcommittee on Water Resources  
and the Environment  
House Committee on Public Works and Transportation  
on Reauthorization of the Clean Water Act  
May 11, 1993***

Mr. Chairman, Members of the subcommittee, thank you for this opportunity to appear before you this morning to discuss reauthorization of the Clean Water Act. My name is Buddy Williams and I currently serve as director of the Nashville Department of Water and Sewerage Services. I also serve on the Board of Directors of the Association of Metropolitan Water Agencies and I am here on the association's behalf.

The Association of Metropolitan Water Agencies is a non-profit organization comprised of the directors and managers of the nation's large municipal and publicly-owned water supply agencies. Our membership includes cities from Nashville to Cleveland, New York to Los Angeles, Houston to Chicago and Tampa to Seattle. AMWA members provide high quality drinking water to over 80 million people.

The Nashville Department of Water and Sewerage Services provides both waste water and drinking water service to the people of Nashville and Davidson County. The Clean Water Act, traditionally viewed as a statute impacting only the waste water side of my agency, has significant implications for the drinking water side as well. The following statement outlines some of the issues of interest and concern to the drinking water side of my agency as well as to the largest drinking water suppliers around the country represented by AMWA.

Members of the subcommittee, the cost of complying with environmental requirements has steadily increased over the past several years for local communities. EPA in a report titled, "The Cost of a Clean Environment", has projected that by the year 2000, local governmental cost will increase from \$19 billion a year to over \$32 billion (in 1986 dollars) in order to meet new standards for drinking water, waste water treatment and other environmental requirements. Given what we know today about the needs of local communities, and the mandates of the federal government, this figure is an underestimate.

Environmental requirements, whether imposed at the federal or state level, have implications for local communities both in terms of capital requirements and increased user charges. Communities will need additional capital investments to expand and replace or rehabilitate environmental infrastructure including water systems and we will have to increase household user charges to pay for these improvements.

Nashville is currently in the midst of an eleven-year \$740 million capital improvement program, all locally funded, for drinking water, sewer and CSO improvements. Our rate payers have borne the cost through water rate increases of 260% since 1984 and sewer rate increases of 409%.

## **Reauthorization of the Clean Water Act**

The protection of public water supplies, one of the stated objectives of the Clean Water Act, is very important to AMWA's membership and is essential to ensuring that the nation has safe and affordable drinking water for this and future generations. Reauthorization of the Act, a process that has just begun, offers Congress and all interested parties an excellent opportunity to reassess how to achieve water quality that provides for the protection and propagation of fish, shellfish, and wildlife and the protection of drinking water sources.

Increasingly, it is becoming apparent to those at the local level that the traditional end-of-pipe controls for achieving the goals of the Clean Water Act are not enough and that environmental and public health needs make it essential, from an effectiveness and cost perspective, that we begin to address pollution in a comprehensive manner that includes both nonpoint source strategies and prevention efforts.

From the water supplier's perspective, clean, high quality source water is essential and directly related to the cost, types and complexity of treatment processes employed to make the water safe for human consumption. Just as publicly-owned treatment works (POTWs) use technology and chemicals to reduce pollution discharges, public water supply systems use technology and chemicals to create potable water for people to drink. For water suppliers however, particularly those with poor source water, the treatment process employed to reduce or eliminate harmful pollutants can cause other public health concerns.

For example, drinking water suppliers use, and in fact are statutorily required to use, disinfectants to kill harmful microorganisms often introduced into water sources through agricultural and other nonpoint source discharges. There is currently no known disinfectant that does not create by-products that may be potentially carcinogenic. No one would argue against disinfecting drinking water supplies because of the known risks from pathogens, but cleaner source water reduces the need for disinfection and therefore the potential for carcinogenic by-products being created.

The cost to consumers of reducing risks from both pathogens and potential carcinogens will be somewhere between \$6 billion and \$45 billion as currently estimated in the ongoing negotiated rulemaking process on disinfectants and disinfection by-products. This cost, which is for only one of the many drinking water regulations in place or yet to come, will be added to the same consumers' bill that is already experiencing an increase in their water and waste water bill.

## **Watershed Protection and Control of Nonpoint Sources**

With the cost of both drinking water and waste water treatment on the increase, it is essential that Congress give serious consideration to preventing and controlling, what is at this time the largest cause of pollution – nonpoint sources.

Watershed protection and reduction of nonpoint source pollution are essential for meeting the goals of the Clean Water Act and for preserving water sources suitable for drinking water purposes. While it may be possible to address nonpoint source reduction separately from watershed protection approaches, the opposite is not true. A watershed approach, by definition, must consider nonpoint sources of pollution.

AMWA supports the development of comprehensive watershed management strategies. We believe this is a valuable tool for addressing the control of more complex and diverse sources of pollution such as urban and agricultural run-off and which could provide for the development of local or regional strategies that address the most important risks to a particular watershed.

Releases from impoundments can also have a significant impact on water quality. For example, research by our department into water quality in the Cumberland River has demonstrated that the single largest impact is the regulated streamflow. For an impounded river the agency controlling streamflow actually becomes the largest point source discharger. These agencies whether TVA, Corps of Engineers or other agency must be involved in the water quality equation.

During the reauthorization debate, much discussion will center on top-down command and control verses bottom-up approaches to watershed programs. Over the long term, a combination of approaches, as inherent in our understanding of watershed protection, is likely to prove the most effective. From the top-down must come the clear requirement that intended protected uses of the nation's waters be achieved. From the bottom-up must come the realization that those who are part of the problem must be part of the solution; local ownership and commitment is necessary to insure economic and environmental success.

The debate will also focus on regulatory approaches verses voluntary ones based on education, and technical and financial incentives. A balance between the two is likely to prove most effective with an essential ingredient being the commitment of all stakeholders to improving the quality of our water resources. We do believe, however that States should maintain their present central role in the process and that water quality standards provide the common denominator for action. AMWA also believes that a clear expression of performance expectations and a clear role for EPA should those expectations not be met, be included.

Watershed protection is not, and should not, be viewed as a replacement for standards, or as a means of delaying implementation of present requirements, but as an additional tool for meeting water quality objectives. Water quality standards developed to achieve clean water objectives, however, must be based on good science with local communities provided the flexibility to meet those standards using the most appropriate and cost effective means available.

nation's water resources. There have been a variety of water conservation proposals placed before this subcommittee during previous testimony. A common characteristic of the proposals has been a "one size fits all" approach to the subject. The Clean Water Act since its inception has recognized that in water resource issues one size does not necessarily fit all - that the needs and requirements of different regions of the country, specific watersheds, and the states can and do differ. The Act reserves to the states a variety of responsibilities and rights in recognition of these differences.

AMWA urges the subcommittee when considering conservation measures to recognize the significant regional differences in water resource availability, usage requirements, system capabilities, and demographics. These differences combined with local, legal, climatic, source, economic and environmental differences speak strongly for retaining maximum local, state and regional flexibility in determining appropriate conservation measures.

### **Water Quality Monitoring**

Water quality reports are required biennially from each state on all the state's navigable waters. AMWA suggests that Section 305(b), which contains this requirement, be modified to specifically require monitoring of contaminants affecting water quality along with identification and ranking of the sources of contamination. The monitoring data should be of a type and quality determined by EPA to be appropriate for making the analyses, estimates and descriptions of water quality presently required by the statute. A clear picture of the nation's water quality is not possible without such data which can be compared from report to report to identify trends, characterize existing and emerging problems, and provide the public, regulators, and legislators with accurate and usable information.

AMWA further recommends that this effort be coordinated with the U. S. Geological Survey (USGS) National Water Quality Assessment Program through an entity such as that which will replace the Intergovernmental Task Force on Water Quality Monitoring (ITFM). The ITFM is developing an institutional framework for nationwide integrated monitoring to obtain better information on water quality through the coordinated use of present resources. The framework will be directly usable for state water quality monitoring under Section 305(b). It will include data collection methods, data management and information sharing, and assessment and reporting features. Once ITFM has developed the framework, the task force will be replaced by a new national implementation committee.

Members of the subcommittee, I will conclude my testimony today on the CWA reauthorization with a few comments on the establishment of a drinking water State Revolving Loan Fund.

Watershed protection can be a very effective tool for preventing pollution and for reducing the need for costly treatment. Major cities such as Seattle, Portland, Tacoma and New York use watershed protection as a cost effective means of maintaining high quality source water, that meets federal requirements and which allows them to avoid installation of costly treatment. For these few cities alone, billions would be needed to install treatment to replace watershed protection. The Clean Water Act should explicitly recognize the relationship between protection of drinking water sources and programs to promote watershed protection and reduction of nonpoint source pollution.

Nonpoint source control is addressed in a variety of laws and a multitude of agencies. Currently Section 319 of the CWA, the National Estuary Program, the pesticides program under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA), and a variety of Department of Agriculture, Department of Interior, Department of Commerce, and Corps of Engineers programs all touch on some of the aspects of nonpoint source pollution prevention. In total, they represent a vast store of expertise and financial resources, but fall short of an integrated federal approach to this problem.

In general, we believe the subcommittee should consider strengthening the links between federal and state efforts to control nonpoint source pollution. Some of the characteristics of a state program could include: (1) identifying land uses which contribute significantly to degradation of water quality, (2) implementing economically achievable management measures, (3) providing technical assistance to local governments and the public in implementing management measures, (4) providing for public involvement in the program, and (5) establishing mechanisms to improve coordination among state and local agencies and officials responsible for land use programs and permitting, water quality permitting and enforcement, habitat protection, and public health and safety.

Provisions similar to these could provide a strong foundation upon which communities could build to identify and solve local water quality problems in conjunction with local, state, federal, and private sector expertise and resources.

The subcommittee may wish to consider establishing a federal coordinating committee consisting of representatives from EPA, the Department of Agriculture, the Department of Commerce, the Department of Interior, the Corps of Engineers, the States, and other appropriate agencies to insure coordination of existing programs and existing management measures, education and incentive funding sources with nonpoint source efforts.

### **Water Conservation**

AMWA has supported a number of water conservation initiatives including national plumbing products standards and believes that federal, state and local water supply policies should generally encourage the conservation of the

### **Drinking Water State Revolving Loan Fund**

The needs of the drinking water community in this country are tremendous. There currently exists over 200,000 public water supply systems regulated by the federal government. The vast majority of these systems serve fewer than 10,000 people with a great many serving as few as 15 to 25 people.

Any loan program developed to assist communities with drinking water problems, must be based on a clear picture of the problems that exist in order to identify appropriate solutions. We simply can not exacerbate a problem that is already of overwhelming proportions.

Members of the subcommittee, we also need to put the proposed loan program for local communities into perspective. Even assuming the SRF is funded at the levels proposed by the Administration – perhaps an optimistic assumption – the lion's share of the water supply infrastructure costs, needed to expand, improve, repair and replace existing water infrastructure, will be met locally.

This will be particularly true for larger cities. The Administration has been clear in identifying small and rural systems as those most in need of financial support. Given this fact, AMWA has to assume that the amount of money potentially available to meet the needs of large city water supply systems will be substantially less than the aggregate funding levels of any drinking water SRF, and very substantially less than the needs large cities will face over the next decade.

We feel it is important that Congress recognize the cost and be fiscally responsible for the programs it mandates. We also believe that Congress needs to evaluate the cumulative burden of existing federal mandates (prior to creating new ones), and ensure that they provide the public and the environment with a benefit commensurate with the cost.

### **Conclusion**

There are many other aspects of previously introduced or draft CWA bills that will impact water suppliers. This testimony has concentrated on some of our specific interests that will help to insure that the drinking water provided by public water systems to over 220 million citizens remains the best in the world. We are pleased to have had the opportunity to make our views known to the subcommittee, and look forward to working with you as the reauthorization process unfolds.

Thank you for the opportunity to testify and I would be happy to answer any questions you may have.

**REAUTHORIZATION OF THE CLEAN WATER ACT**

**MAY 11, 1993**

## REAUTHORIZATION OF THE CLEAN WATER ACT

Good morning, my name is Milan P. Yager and I am Legislative Director of Environmental Policy for the National Association of Home Builders. I am pleased to be here this morning representing the National Association of Home Builders (NAHB). NAHB is an association of over 160,000 member firms engaged in all aspects of residential construction.

### THE NATIONAL ASSOCIATION OF HOME BUILDERS

NAHB and its' 800 state and local affiliate builder associations have been heavily involved for many years in clean water policy debates at the federal, state and local levels. Many of our members have been leaders in wetland restoration and preservation projects, stormwater discharge control and management, and pollution prevention for land development across the country.

NAHB is made up of small business people, with over half of our members building fewer than 10 homes per year and close to 75 percent of our members building 25 or fewer homes. These are truly small business people. However, collectively, home building plays a significant role in our nation's economy. The investment in fixed residential structures, in real dollars, is equal to 4.3 percent of our nation's GDP and when you include spending on new residential appliances, carpets and home furnishings, the gross housing output is greater than 7 percent of GDP.

### SECTION 404

This morning we would like to focus attention on the Federal Water Pollution Control Act (Clean Water Act) Section 404, the wetland regulatory permit program.

From the outset, let it be very clear that NAHB recognizes the importance and value of our nation's wetlands, and, we want to protect wetlands and our environment. However, the current system for protecting wetlands does not work. It lacks balance between needed protection of wetlands and the environment, and the need for economic development and jobs in our local communities. Furthermore, the current system is a bureaucratic nightmare full of overlapping jurisdictions, costly delays, burdensome confusion and inefficient regulations.

Mr. Chairman and members of the committee, it is high time we move past the rhetoric of who is for and against wetlands and instead, focus our energy on how to make the current system work. We have been encouraged in recent weeks by statements by Chairman Mineta and others that it is now time, regardless of how challenging the task, to address wetland reform. Many of you were elected or reelected with the mandate to break the gridlock in Washington that is holding hostage important legislation needed to get this country moving again. Regardless of your position on wetland reform, it is time to roll up your sleeves and hammer out a Clean Water Act Reauthorization that includes an effective and efficient wetland permit program.

### MAKING THE CURRENT SYSTEM WORK

To address the failures of the current program and balance the needs of wetland protection and economic development in our local communities, NAHB recommends Congress adopt a comprehensive wetland reform package that includes the following:

- 1) Establish a Congressional definition of a Federal jurisdictional wetland for purposes of Federal regulatory protection under the Clean Water Act and exclude from regulation all land areas which fail to meet a strict three parameter definition of wetlands.
- 2) Focus wetland protection on our nation's most valuable wetlands by classifying all wetlands into three categories and providing regulatory protection accordingly.
- 3) Streamline the current regulatory program by transferring all wetland permit authority to a single federal agency, improving efforts for state assumption of the permit program, establishing deadlines for consideration of permits, implementing an administrative appeals program, instituting a wetland mapping program and requiring that all program regulations and guidelines be subject to public notice and comment.
- 4) Establish an effective wetland mitigation banking system to help achieve the goal of no-overall-net loss of wetlands and, ultimately, to help increase the nation's wetlands resources.

### LEGISLATIVE ACTION IS NEEDED...NOW

NAHB believes the time to implement the above suggestions is now! The Final Report of the National Wetlands Policy Forum, highlighted the needed call to action by saying, the "current regulatory and nonregulatory program leave much to be desired...in short, current programs are too cumbersome and the responsibilities too diffuse to guarantee anyone -- landowners, the regulated community, conservationists, or even the regulators themselves, consistency, predictability, timeliness, or effectiveness. It is a system that allows hundreds of thousands of wetland acres to continue to be lost or degraded annually, almost unnoticed, while substantial resources and time often are devoted to determining the fate of a few relatively small acres." As remarkable as it may sound, these remarks were made in 1988 and remain as relevant today as they were then.

### CONGRESS NEEDS TO ESTABLISH WETLAND POLICY

To begin with, NAHB believes Congress needs to establish the public policy for the protection of our nation's wetland resources. The Congress has neglected this responsibility and has left policy for this important resource in the hands of judges and name-less administrators and regulators. This has got to end. These are, after all, "waters of the United States" and the policy regarding these waters should be established by Congress.

Only Congress can stop wetland losses by bringing under the regulatory umbrella activities that are destructive to wetlands such as draining, channelization and excavation. Only Congress can end the bureaucratic nightmare of overlapping permit jurisdiction and vetoes by establishing a single permit agency. Only Congress can increase the efficiency of the program by establishing categories of wetlands to allow regulators to focus additional protection on the nation's most valuable wetlands. Only Congress can establish fairness to the permit program by granting applicants appeal rights. Only Congress can permit the use of mitigation banking as a way to restore millions of acres of lost wetlands in an attempt to increase this nation's wetland resources. I hope it is becoming clear that only Congress can change the law to make this program efficient and effective.

#### PUTTING "WET" BACK IN WETLANDS

NAHB believe this Committee should begin the process of wetland reform by approving a legislative reform package to Section 404. The first component of your legislative reform package should be a clear Congressional definition of what land should be delineated as a wetlands.

By defining water of the United States or wetlands, we are not asking Congress to consider every specific criteria for hydrophytic vegetation, hydric soils and wetland hydrology. However, we do believe it is responsible, even necessary, for Congress to establish the definition of what types of lands should be jurisdictional for purposes of the Clean Water Act. In this regard, the Congress needs to begin with how wet a wetland should be to be considered a "water of the United States." The hydrology criterion is, in fact, the most critical factor which differentiate land as either upland or wetland.

Last year over 80,000 people commented on the first ever public rulemaking on the Manual for Delineation of Federal Jurisdictional Wetlands. Most of us are familiar with how controversial this rulemaking has become. Some have suggested the difficulty is the lack of good science. If only that were the problem. Instead, the problem is the lack of good national policy as to what types of land should be delineated as Federal jurisdiction land important to the nation's clean water.

In 1972, when Congress first passed the Clean Water Act, it did not use the word "wetland" or define what land should be considered a Federal jurisdictional wetland. Instead, Congress defined jurisdictional waters as "waters of the United States." In 1977, Congress recognized that it had not provided clear direction regarding the definition of jurisdictional lands. The House of Representatives proposed to restrain the reach of Section 404 jurisdiction to navigable waters and adjacent wetlands, with specific definitions of each term (See Section 16 of HR 3199, as reported) The Senate, however, favored delegation of Section 404 to the States without a specific wetland definition. It was thought that by delegating the Section 404 program to the States, each state could protect its wetlands as it deemed appropriate, within guidelines set by the U.S. Army Corps of Engineers (The Corps). Consequently, the 1977 amendments simply reaffirmed that Congress did not intent to use a narrow "navigability" definition but rather something broader. Congress

passed the Clean Water Act reauthorization in 1977 without a clear definition of "waters of the United States," and no legislative definition of jurisdictional "wetlands."

Today, the issue is not whether Congress should define the types of plants found in particular jurisdictional wetlands. That should be left to the scientist to determine. But Congress should require that lands subject to Federal jurisdiction should have independent indicators present for all 3 wetland parameters (wetland hydrology, hydrophytic vegetation and hydric soils). Congress should also require surface water for 21 or more consecutive days during the growing season. These two changes would return the regulatory program to regulating the type of land most of us call swamps, marshes and bogs.

#### NATIONAL ACADEMY OF SCIENCE STUDY

As we discuss the need for Congress to define the types of land subject to Federal jurisdiction under Section 404, it is appropriate to say a few words about the National Academy of Science (The Academy) study for which Congress appropriated funds in the 102nd Congress. Unfortunately, this study has not begun and it appears the study may be months, if not more than a year behind schedule. The Section 404 permit program only applies to lands that are jurisdictionally defined as Federal "wetlands" under the Clean Water Act. But what types of land qualifies as jurisdictional? Unfortunately, as we have stated, the Clean Water Act is silent on this policy question. It was not until the 1977 amendments that wetlands were even mentioned in the statute and they are defined as areas such as "swamps, marshes and bogs." In the 102nd Congress, a number of groups, including NAHB, urged Congress to establish in the law the policy criteria for the types of land that should be regulated under the scope of the Federal jurisdiction. Other groups urged Congress to avoid addressing this policy issue stating that further science was needed and they urged a study by the Academy.

This idea was proposed, debated and defeated by the House of Representatives by a vote of 181-241. Many lawmakers believed that after 20 years of research and volumes of field data it was unlikely the Academy would discover any new science during a one year study. After all, the 1987 Manual was written after 10 years of research and field testing at a cost of over \$5 million. However, at the close of the session, such a study was included, without hearings or debate, in the Environmental Protection Agency (EPA) appropriations bill. The study was to be completed within one year of enactment and at a cost of \$400,000. Seven months later, EPA and the Academy are still negotiating the terms of the study. The Academy is seeking additional time and money.

The issue of whether additional scientific or policy criteria are needed was addressed by the Supreme Court in the Avoyelles Sportsmen League v. Alexander case when the court stated, *"It is quite obvious from this history that the term 'waters of the United States' and 'wetlands' are not terms of pure science. They are not meant to be. 'Wetlands' is a jurisdictional term, the product of the legislative process... Thus the 'wetlands' definition does not answer a scientific need, it satisfies*

*a practical, a social, a political need, the need to define the scope of Section 404 jurisdiction."*

This question was further addressed when Janet Hathaway, Senior Attorney for the Natural Resources Defense Council stated, *"I'm always a little queasy when groups claim they have no interest other than science. These are policy matters, and everybody has some kind of evaluative point of view...Its' important to put this on the table and not hide behind the usually bogus claim of science and objectivity."*

For over twenty years scientists have collected data on the criteria to determine if land is a "wetland". However, different criteria are used depending on what types of land should be included. The type of land is usually defined in the Federal, state, or local statutes. These laws do not define the scientific delineations necessary to identify specific lands but instead, establish the policy criteria that justify the regulation of the land.

The accumulation of knowledge and scientific research on wetland delineation makes one fact inescapably clear: there is simply no body of information that will provide easy, certain answers to wetland delineation questions without Congressional action to define the type of land that should be regulated under the Section 404. Congress must demand that if this study is to be completed, it needs to begin now, without further delays, and within the budget appropriated.

#### SCOPE OF REGULATED ACTIVITIES

Section 404 of the Clean Water Act requires permits for the discharge of dredged or fill materials into navigable waters, which the statute defines as "waters of the United States." Once Congress more clearly defines "waters of the United States," as we have discussed above, NAHB believes it is critical the regulated activities of Section 404 be expanded.

It has often been believed that all activities undertaken within a wetland requires a Section 404 permit. However, this belief is wrong. Many activities that are specifically harmful to wetlands are not regulated. A GAO study found that "many activities resulting in substantial wetland losses are not regulated by the Section 404 program." Section 404 regulates only one limited class of activities: the discharge of dredged or fill materials from a point source. Activities associated with home construction generally are included in this class of activities if undertaken on land considered a jurisdictional wetland.

The limited scope of the program can be explained by Congress' intention that the 1972 Clean Water Act be a pollution control program from point sources and not a wetland regulatory permit program. Furthermore, it is clear Congress did not mean to regulate activities in jurisdictional wetlands but rather the sources of pollution. In the legislative history of the Act, Congressional Research Service wrote that Congress focused on the fact that the dredged soil resulting from the creation and maintenance of navigable waterways was often contaminated and concluded that the common practice of disposing of dredged spoil in other areas of the navigable waters ought to

be regulated. The limited scope of the Clean Water Act Section 404 program is a major reason why Congressional gridlock must end and comprehensive reform be included in the reauthorization.

While judicial decisions and citizen suits have attempted to increase the scope of the permit program, the clear statutory language and legislative history have restricted many such efforts. If our nation's remaining wetland resources are to be managed, the Clean Water Act needs to be amended to include as regulated activities draining, channelization and excavation.

In this regard, NAHB supports passage of HR 1330 which would address this significant problem by regulating not only the discharge of dredged and fill materials, but also the draining, channelization, or excavation of wetlands.

However, adding additional regulated activities alone will not protect our wetland resources. The expanded scope of activities should be part of a larger, comprehensive reform of Section 404 moving this program from solely a pollution control program to a wetland resource management act.

#### **SINGLE AGENCY ADMINISTRATION**

Another area that must be addressed by Congress is the burdensome, confusing, and inefficient overlapping jurisdictions of the program by the Corps and the Environmental Protection Agency. If the Section 404 program is to be efficient and effective and reformed into a wetland resource management act, then the program must be given to a single Federal agency to administer. This will not only bring efficiency to the program and reduce costs and confusion to applicants but will place total responsibility and accountability with a single agency. No longer will one administrator be able to point to another and claim that it wasn't their responsibility to promote wetland protection, research new restoration technics or undertake aggressive mitigation banking to increase the nation's wetland resources.

The problems of bifurcated agency administration goes back to the beginning of the program. The Section 404 permit program originated with the 1972 Clean Water Act, a program intended to control pollution from point source discharges of dredged or fill material. During the debate, Congress avoided the decision of who should be responsible for the program by granting the Corps of Engineers permit issuance authority and, the newly created EPA a significant parallel authority to set general permit standards and the power to veto specific permits. No agency was charged with the responsibility to educate the public about the importance of wetlands, research efforts to reduce losses or develop proposals to restore these valuable resources or establish mitigation banks.

As the program evolved, the Corps and EPA too often developed different interpretations of the Act's permitting requirements which resulted in confusion and chaos. Furthermore, the Corps, EPA, Fish and Wildlife Service and the Soil Conservation Service all established different delineation manuals. It became possible for a landowner to get a permit from one agency and, based on the same facts, to be

denied a permit by another agency. Even today, no other Federal regulatory program gives two agencies direct authority over the same permit authority.

Not only has this bifurcated administrative structure lead to interagency disputes and costly inefficiencies, the requirements of the two agencies are often conflicting, and the results are unpredictable. The task of unraveling the conflicting policies and requirements of the two agencies fall upon the landowner. Unlike other Federal permit programs which often involve large corporations, these local landowners are least able to resolve this Federal permit maze.

It is time for Congress to end this administrative gridlock of conflicting policies, lengthy permit review delays, unnecessary permit costs and confusion. With no one in charge, opportunities for public education, research and wetland advocacy are lost in the bureaucratic chaos.

NAHB believes the wetlands regulatory program would be greatly improved by Congress giving sole regulatory authority to a single Federal agency. In this regard, we urge Congress to vest not only the authority to regulate wetlands, but also the mission to protect this nation's wetland resources with the Army Corps of Engineers. To achieve such a goal, we support HR 1330 which would grant the Corps sole authority to administer the Section 404 program.

We support giving the Corps this mission because of their extensive network of District Offices and larger field staff, two essential components necessary to run a regulatory program involved in over 75,000 local permit actions each year. Finally, there is one additional reason why the Corps should be the sole agency to administer the Section 404 program. Approximately 40 percent of the permits the Corps processes are for Section 404 and Rivers and Harbors Act Section 10 activities. Because Section 10 authority rests with the Corps it makes additional sense to give sole authority for Section 404 to the Corps.

#### WETLAND CLASSIFICATION BY FUNCTION AND VALUE

Since 1972, Section 404 has regulated all Federal jurisdictional wetlands equally. However, Florida's wetlands differ significantly from the mountain bogs of Maine, just as the functions and values of the wetlands of the Chesapeake Bay differ significantly from the rural wetlands found on farm land in Ohio. The only common factor is that the Federal government regulates all these lands and all activities on these lands, as the same.

Today, competing social, economic and environmental objectives merit a wetland classification system to meet the needs of water resource management. As drafted, Congress provided no classification system for categorizing "waters of the United States." In 1972, the program was written to regulate dredge and fill pollution activities in "navigable waters of the United States." As the law was amended in 1977 to include areas such as "swamps, marshes and bogs," the geographic scope of the program changed, while the focus remained primarily on prohibiting all dredge and fill pollution from entering the nation's waters.

As the geographic scope of the program continued to expand over the years from swamps, marshes and bogs in riparian areas to prairie potholes, isolated wetlands and man-made highway drainage ditches, the regulatory program began looking more like Federal land-use planning. Regulatory tools such as sequencing (requiring avoidance, minimization and mitigation in sequence) were implemented. These tools focus less on maximizing the return of a particular water resource and more on no-net-activity on the land.

In recent years, EPA, wetland scientists and environmental groups have begun "investigating classification of wetlands into a few broad groups based on their functional values." Such investigations are based on the diversity of wetlands throughout the United States and the foresight toward maximizing wetland management to serve the larger purpose of watershed resource management.

Wetlands occur in a broad spectrum of geographic and climatic regions. They also operate as part of a larger watershed resource. Northern and prairie state wetlands are very different from southern and coastal wetlands. Their value as a natural resource and their function in watershed management vary significantly. Classification should be the regulatory connection to wetland functions and values. It would change the attention from delineation of hydrophytes and hydric soils, and of loss acreage, to flood protection and pollution filtration.

However, this change in focus can only be achieved if wetlands are considered a managed resource. Wetlands of exceptionally high functions and value to a watershed may merit a management strategy of avoidance. A significantly different watershed management strategy is appropriate for abundant and marginally functional wetlands. This approach focuses on the net-environmental benefit to water resources as opposed to no-net loss of wetland permitting. The fact that classification systems are difficult to establish and administer does not change the fundamental reality that we are serious about resource management from an economic, as well as a watershed and environmental protection point-of-view.

We strongly urge Congress to authorize a classification system for Section 404 wetland resource management. This system will increase regulatory efficiency by providing a framework for decisions and actions. The classification system should occur during an advance identification effort or early in the permit process. This will allow permit, personnel and enforcement allocations to more critical water resources. It will also reduce uncertainty and inspire new public support and compliance in the permit program.

One such classification system the Committee should consider is found in HR 1330. HR 1330 would establish a three-tier classification scheme for wetlands based on their functions and values. Type A -- those with the highest values -- would be those determined to be critically significant to the long term conservation of the ecosystem in which they are located. Type B wetlands would be those which provide habitat for a significant population of avian aquatic or wetlands dependent wildlife, or provide other wetlands functions including significant enhancement or protection

of water quality, or natural flood control. Type C would be those which serve limited wetlands functions and are of least significant environmental value.

Classification as envisioned in HR 1330 is a significant environmental benefit for wetland preservation. Under the existing regulatory system, all wetlands are treated as if equal and are given regulatory protection against the discharge of dredged or fill materials. However, under a classification system it is possible to extend a higher level of wetland protection - one that is much closer to the preservation of the land - to the nation's most valuable water resources.

Classification also improves and targets the regulatory system to the nation's most valuable wetlands. Less time would be spent issuing permits for activities in wetlands of marginal value (Type C) and more time spent assuring that the functions and values of higher quality wetlands are protected. Thus, classification would maximize Federal efficiency by focusing attention on wetlands most valuable in protecting water quality.

#### PERMIT DELAYS

Improving the efficiency of the regulatory system through a classification system is desperately needed as the permitting demands have far exceeded the Federal agencies' resources. One Corps District Engineer wrote to the Corps Headquarters, "We are imposing severe time delays on the public and foreclosing development options on considerable tracts of land. It appears that we have lost our focus on what we are regulating and why we are regulating it."

Former EPA Administrator Reilly recognized this fact when he stated, "The second complaint most frequently encountered from owners of wetlands is, if a person is subject to wetlands permitting regulations, can they expect a decision in a reasonable time?"

To address this problem, deadlines for permit reviews must be included in wetland reform legislation. NAHB specifically supports the legislative language as drafted in HR 1330. We hope the members of this Committee will support such language.

#### MAPPING WETLANDS

One of the greatest frustrations for many land owners is the discovery that land they have owned for many years has suddenly been declared a wetland. It is equally as frustrating to home builders to learn that land they have just acquired may be subject to Section 404 regulatory permits even though the land has no signs of water.

In these situations the land is seldom a swamp, marsh or bog. It is usually land that is wet for only a short time each year. The adoption of a more responsible definition of a Federal jurisdictional wetland should eliminate many of these problems by delineating only wet wetlands as "waters of the United States." Regardless, it is

high time this country invest in efforts to map wetlands to help everyone know where such lands exist.

In most every town, parish or village in America, maps exist showing soil types, flood plains and elevations. Yet, if you were to consider purchasing a site for a new residential neighborhood there is no map to which you could refer to determine if the site is a wetland. What better tool to direct development and other regulated activities away from wetlands than mapping?

NAHB supports a mapping provision included in HR 1330 which would require the identification and classification of wetlands within 10 years after enactment. The mapping project would involve notification to land owners to assure their participation in the mapping process. Environmentalists would also benefit as the identification of wetlands would, to the fullest extent practicable, become part of property records in the county, parish or borough in which such wetlands are located. As home builders, we carefully review such records and I can assure you there is no better form of avoidance for a home builder than knowledge that a site contains a wetland.

Mapping would be expensive, it would often not be perfect, nor always accurate and occasionally the maps would have to be updated to reflect environmental and other actions that may impact a wetland's size or location. However, the cost of choosing not to map is even greater. Without maps activities are going to accidentally occur in wetland areas. Landowners are collectively going to spend billions of dollars on engineering and consulting fees reviewing and delineating wetlands. And, the Federal regulatory program will remain in the dark ages -- struggling to delineate one property at a time, each time an activity is proposed in an area that could potentially be a wetland.

#### REPLACING ALTERNATIVE ANALYSIS

Under the current interpretation of the Section 404(b)(1) guidelines, the key standard in the permitting process is to avoid a regulated activity in a wetland. Permit applicants must provide evidence to convince the Corps that there are no practicable alternative sites available to the applicant and that the applicant has avoided impacts on site to the extent practicable. Unfortunately, neither the Corps nor EPA have issued regulations on how to conduct and document an alternative analysis. When builders attempt to show they have considered all the alternatives, they are often forced to resubmit their applications several times in response to hypothetical alternatives that EPA and the Corps want them to consider.

For example, EPA has said that home builders are accountable for having to evaluate all alternatives, including purchasing non-wetlands sites not owned by the applicant, at the time they "enter the market." Yet, again, EPA has not defined when an applicant enters the market. Is it when the home builder first sees a "For Sale" sign on a tract of land? Is it when the home builder first discusses the purchase price with the owner, or is it when he/she signs a purchase option agreement? Equal uncertainty exists over the required geographic scope of the search for alternatives. Is it the applicant's market region, or the political subdivision? Is an applicant

expected to evaluate alternatives within some region broader than a political subdivision or county? As a result of this lack of guidance, applicants waste time and money responding to hypothetical and often unreasonable alternatives. Clearly, the alternative analysis is not working.

NAHB believes the best replacement for alternative analysis is useful maps identifying and classifying wetlands.

#### ADMINISTRATIVE APPEAL

As anyone who has applied for a Section 404 permit knows, the costly and burdensome regulatory permit process is a nightmare of individual decisions, upon decisions, upon decisions. First comes the decision of whether the land in question is a Federal "jurisdictional" wetland -- is the land wet, for what duration, what indicators should be used to relate surface water, should secondary indicators be used, can aerial photographs satisfy the hydrology criterion, or should the squeeze and shake test confirm surface saturation? Then come the questions regarding vegetation, soils and exceptions to the Delineation Manual. Once the land is delineated as a jurisdictional wetland the applicant faces the 404(b)(1) guidelines which involve questions about practicable alternatives for the projects; whether the project will cause or contribute significantly to the degradation of the wetland and whether appropriate and practicable steps have been taken to minimize potential adverse impacts.

Even after the Corps considers all comments, conducts its public interest review, determines that the project complies with the 404(b)(1) guidelines, and decides to issue a permit, more decisions still face the applicant regarding mitigation. How much mitigation should be required, where should the mitigation occur and how should the mitigation be maintained and enforced.

As you can see, the process involves hundreds of decisions and each and every decision impacts the cost and design of the project. Often these decisions are reached through consultation and cooperation. However, even with small, relatively simple projects, disagreements arise. Some times these disagreements can be resolved. Other times, the applicant is left with few options -- withdraw their application; modify the project and reapply; or, if, and only if your application has been formally denied, you have the right to bring suit against the Corps or EPA. At no time does the Clean Water Act provide an applicant the right to an administrative appeal.

Furthermore, the Clean Water Act precludes judicial review. Applicants are only provided the right to sue the Corps or EPA if their application has been formally denied. Consider this possibility: A land owner attempts to build a garage or addition on to their existing home. The Corps claims the land is subject to jurisdiction under Section 404 of the Clean Water Act and requires the home owner to obtain a permit. The applicant wants to challenge this claim. However, because there is no administrative appeal process and the Clean Water Act precludes judicial review unless a permit has actually been denied, the applicant must apply for and go through

the entire process, until his permit is denied, in order to appeal the government's claim that their land is subject to Section 404 regulation. For an application to be denied the landowner must submit a request for a permit, agree that their land is subject to Section 404, complete the 404(b)(1) guidelines and consider mitigation proposal. Only after completing the entire process, and only if the application is denied can the applicant seek judicial review. Not only is this process time consuming for everyone, costly to the applicant and the government, and inefficient for all parties, it is wrong!

We strongly urge the Congress to correct this inefficient, inappropriate process by adopting an administrative appeals procedure similar to most every other government permit program or environmental law.

### COMPENSATION FOR TAKING

The Fifth Amendment to the United States Constitution prohibits the government from "taking" private property for public use without just compensation. In the context of the regulatory arena, the Supreme Court has found a taking where a regulation deprives a property owner of all economically viable uses of his land and where the regulation was not substantially related to a legitimate public interest. In July 1990, the United States Claims Court issued two rulings that denial of Section 404 permits resulted in takings for which the property owners must be compensated. In *Loveladies Harbor, Inc. v. U.S., No. 243-83C [Ct. Ct. July 23, 1990]*, the court awarded over \$2.7 million in damages, plus interest and attorney fees. In *Florida Rock Industries v. U.S., No. 266-82C [Ct. Ct. July 23, 1990]*, the court awarded the plaintiff \$1 million. These appear to be just the beginnings of legal taking challenges.

The issue of "taking" is central to the question of wetland regulation since more than 70 percent of all wetlands are located on private property. Individuals have a right to expect that if the government is going to restrict development opportunities, and thus all economic value of their land, that they will be compensated for the fair market value of the land.

Some claim this is an unreasonable request because of the government's current budget deficit. However, can a price be placed on the principles upon which this government was founded? NAHB strongly believes if private land owners have their land "taken" from them by the Federal government the principles of this government require that they be compensated. The benefits of the government's regulation of wetlands are benefits that all citizens enjoy and the costs of such benefits should be equally shared by all Americans.

NAHB does not believe that all land owners of jurisdictional wetlands should be compensated for their property. Assuming a reasonable wetland permitting program, compensation should only be granted when the economic value of the land has been taken due to the denial of a wetland permit. These are areas where the public protection of such wetlands is believed to be greater than the benefits of the proposed project.

HR 1330 achieves this goal by allowing property owners whose land has been designated as containing the highest quality wetlands to apply for compensation within two years of their designation as Class A wetlands. Compensation would be provided at fair market value. NAHB supports this provision.

Finally, it is important to note that regardless of whether a private land owner is able to prove a successful takings claim against the Federal government the regulatory program is not without costs to the general public. When new schools, hospitals, residential neighborhoods or economic development projects are stopped because of Section 404, jobs are lost, growth is restricted, school and local property tax bases are reduced, and the value of local private property is diminished or totally lost. Although no funds are expended from the Federal government treasury, many different people pay the price.

This is not to suggest that all proposed activities in wetlands should be approved. Instead, we believe the Federal government must recognize that wetland protection has a price. If private lands are to be taken through the Section 404 regulatory program, private land owners should be compensated. Unreasonable demands should not restrict responsible activities in and around wetlands. There is room for wetland protection and economic development to responsibly exist together.

#### MITIGATION

Although Section 404(b)(1) guidelines and the Corps regulations have general sections on mitigation, the most far reaching policy on mitigation was adopted -- without public notice and comment required of a rulemaking -- in a Memorandum of Agreement (MOA). In the MOA, the agencies adopted a strict sequence for making wetland decisions: avoidance, minimization, and compensation. Once an applicant proves that he/she has no alternative to the activities for which they seek a permit they must minimize the amount of wetlands to be disturbed and compensate for any damage by mitigating the impacts of any unavoidable activities.

This process, starting with avoidance and allowing compensatory mitigation only as a last resort is inefficient and in some cases, counter-productive from an environmental standpoint. This "policy" forces permit applicants to focus all their efforts and most of their resources on documenting why they cannot avoid the wetland. This may involve developing several different site development plans with varying levels of wetlands disturbance and a breakdown of the cost impacts of each development plan. This analysis typically results in a Corps' decision that the wetlands cannot be avoided completely. However, to get to this point the applicant must spend considerable time and large sums of money preparing worthless, multiple site plans.

The sequencing requirement can also lead to less than optimum permit decisions with respect to the environment. By divorcing the evaluation of the applicant's mitigation proposal from the evaluation of alternatives to activities in a wetland, applicants are precluded from presenting a comprehensive picture of the net environmental impact of their project.

Furthermore, because there is no formal, comprehensive Federal policy on mitigation, particularly on the role of compensatory mitigation in the Section 404 program, mitigation gets decided on an ad hoc basis. As a result, applicants again, waste time and money arguing over mitigation requirements.

The current case-by-case, site-by-site approach to mitigation also leads to a series of small, unrelated mitigation projects scattered throughout a region. They are often too small and disjointed to maximize wetland benefits, and they sometimes suffer from inadequate monitoring and maintenance.

If this nation is to achieve the goal of no overall net loss of wetlands, or to reach beyond this goal to increasing the nation's wetland base we must address mitigation efforts. This Committee needs to provide the leadership for developing an appropriate mitigation policy that will return this nation to a course of wetland restoration.

NAHB supports the mitigation policy included in HR 1330 which recognizes that for mitigation efforts to be successful all interest must work together. Furthermore, we believe mitigation banking is an essential component of any successful mitigation policy.

#### MITIGATION BANKING

The concept of a wetlands mitigation bank is similar to an ordinary bank account. The bank owner creates, restores, enhances or preserves wetlands in advance of the anticipated need for mitigation requirements that would be part of a Section 404 mitigation policy. The wetlands values created, restored, enhanced, or preserved in the bank would be quantified, and the bank owner would be able to sell these mitigation credits to Section 404 permit applicants. Withdrawals from the bank can be made as long as mitigation credits are available.

The idea of mitigation banking is not new. In fact, the Fish and Wildlife Service has used mitigation banking since the early 1980s to off-set the environmental impacts associated with development projects. However, mitigation banking has not been fully incorporated into the Section 404 program because of the lack of Congressional leadership and EPA's concerns over the scientific uncertainty of wetland creation. NAHB believes that regardless of whether wetlands can be created there is significant opportunity for wetland restoration, enhancement and preservation efforts.

We urge the Committee to consider some of the merits of mitigation banking, including:

- 1) *Mitigation banking increases the chance that wetlands mitigation projects will succeed.* By aggregating the many small wetlands mitigation projects that would be scattered throughout a region if a mitigation banking system is not allowed, the bank can provide a "more environmentally valuable area that is more efficient and more economical to develop and manage than several scattered sites." [FWS Mitigation

Banking, July 1988, p. 2] In addition, mitigation banks can be strategically located within the local landscape to satisfy the wetlands needs of the affected region and, unlike on-site mitigation projects, bank sites can be selected on the basis of the likelihood of wetlands mitigation efforts actually being successful.

2) Mitigation banking provides mitigation in advance of the loss. Wetlands restoration or enhancement projects often take several years to become fully functional wetlands. If mitigation banking were embraced by Congress and the resource agencies, banks would be created in advance of their use for Section 404 mitigation credits, and the lag time between wetlands losses and compensation for those losses could be reduced or eliminated.

3) Mitigation banking will enhance EPA and the Corps' ability to monitor and enforce mitigation requirements. EPA and the Corps do not have sufficient staff to inspect all the mitigation projects that are currently required under the Section 404 program. Mitigation banks will reduce the number of sites that need to be inspected for compliance.

4) Mitigation banking provides an economic incentive for the bank to make the mitigation project succeed. Because the bank needs to sell mitigation credits to Section 404 permit applicants, there is an economic incentive to make the mitigation efforts work. If mitigation banking were the cornerstone of a no overall net loss policy, bank officials would have a powerful incentive to ensure that mitigation projects are effective and properly maintained. If the Corps were to determine a mitigation effort was not successful the bank would be restricted from selling the mitigation credits to permit applicants.

NAHB supports provisions in HR 1330 which would require the Corps to establish mitigation banks in each state for purposes of compensating the loss and degradation of wetlands functions and values under Section 404. The development of these banks would be fully coordinated with the Fish and Wildlife Service and the Governor of each state.

#### STATE PERMIT PROGRAM ASSUMPTION

NAHB also strongly urges the Committee to take actions to encourage state assumption of the Section 404 permit program. Section 404 of the Clean Water Act provides a mechanism for states to apply and assume the Section 404 permit program. Since wetland characteristics and functions vary from region to region and water resources deviate from watershed to watershed, everyone seems to agree the regulatory permit program should be administered by the states. State assumption could deliver permits faster, offer one stop for state and Federal permits, provide more intimate knowledge of the resource, project and local land use planning, and administer greater long-term oversight. These merits save time, money and confusion. Despite the merits and the broad agreement on assumption, Michigan is the only state that has assumed the program and it recently warned in testimony before the Senate, that it may withdraw because the Federal program has become unworkable.

This breakdown in state assumption is particularly disappointing when one considers that while the Federal government is focused on regulatory gridlock the states have lead in wetland planning, restoration and management. All coastal states provide wetland regulatory protection and management, and 18 inland states have adopted freshwater wetland regulatory statutes. In addition, an estimated 5,000 local governments have adopted wetland protection regulations. Many additional state and local governments are poised to take on larger wetland management roles, particularly if encouraged and provided incentives to do so.

Many suggest states have not assumed the program based on the lack of Federal financial assistance. While this is a significant problem, a number of factors actually contribute to the assumption failure. The most often mentioned obstacles are EPA inflexibility, the lack of clear, consistent program goals, and the failure of the Clean Water Act to provide a well thought-out partnership role.

High on the list of obstacles is the inflexibility of the EPA. Guidelines issued by EPA are too rigid to allow states adequate leeway to design a permit program. EPA believes that the Clean Water Act program requirements for compatibility mean that states need to change their statutes and regulations to be identical to the rigorous Federal program. States should be allowed to design programs that are consistent with Federal program goals even if the program itself is not identical. Indeed one state testified that were this allowed, it would assume the permit program.

States have also objected to EPA's permit-by-permit review and veto. They have acknowledged the need for Federal oversight but object to EPA's individual permit veto. They prefer annual program reviews. States have also objected to the constant changes in program policy issues and the lack of state involvement in the regulatory decision-making process. States want a partnership role in consistent, stable program regulations.

NAHB supports HR 1330 which encourages such action by the establishment of state programs that address wetlands conservation on an ecosystem or watershed basis.

### CONCLUSION

Mr. Chairman, the result of our current wetland regulations is that in addition to wetlands being lost, jobs are also being lost, economic development opportunities missed, tax assessments are threatened, and housing costs are rising. It is time Congress reform this nation's wetland law. Accordingly, NAHB urges Congress to:

- Transfer all authority for wetland permits to the Army Corps of Engineers;
- Establish a responsible definition of water of the United States;
- Exclude from regulation under Section 404 all land areas which currently fail to meet a strict three parameter definition of wetlands;

- Focus wetland protection on our nation's most valuable wetlands by classifying all wetlands into three categories and provide regulatory protection accordingly;
- Improve the regulatory process by establishing a wetland mapping system, an administrative appeals process and setting permit processing deadlines;
- Develop a mitigation banking system;
- Compensate property owners who own the highest category of critically significant wetlands; and
- Require all program regulations and guidelines be subject to public notice and comment.

In short, we urge adoption of HR 1330.

Thank you for this opportunity to testify and share our views with the Committee.

#####

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

---

WEDNESDAY, MAY 12, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to call, at 9:30 a.m., in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. Welcome. This morning the Subcommittee on Water Resources and the Environment will complete its series of hearings on the reauthorization of the Clean Water Act. Our witnesses today include representatives of industry, local government, and research organizations. The hearings have produced a wide array of testimony on subjects relating to reauthorization.

This testimony, together with that obtained from the extensive hearings the subcommittee held last Congress, should be enough to provide us with ample information to consider as we review the options for inclusion in a reauthorization bill. I want to thank all of the witnesses who have participated in these hearings. It has been extremely important.

And we will go to the panel, but before going to our first panel, I will yield to the sit-in Ranking Member, Mr. Hutchinson from Arkansas.

Mr. HUTCHINSON. Thank you very much. Thank you Mr. Applegate. The subcommittee meets for another day of testimony on reauthorizing one of this Nation's most important and successful environmental statutes, the Clean Water Act. Yesterday we heard from a wide variety of interests advocating reforms to our clean water supplies and to protect wetlands. Members of Congress and others also addressed rural community needs, nonpoint source pollution, and watershed base protection efforts.

Today we will hear from an equally broad array of experts and interest groups and we will receive critically important testimony from various industrial, commercial, developmental, and governmental organizations as well as academic and scientific representatives.

Mr. Chairman, I want to thank you for your leadership in working to protect this country's water resources, our infrastructure, and our jobs base and I look forward to working with you and with Chairman Mineta in the weeks and the months ahead. Thank you, Mr. Chairman.

Mr. APPLGATE. Before we begin I wish to yield to my friend from California, Mr. Filner.

Mr. FILNER. Thank you, Mr. Chairman. You may recall the lonely end formation of decades ago. I feel like the lonely end here. I appreciate the chance to briefly talk to you and the committee. Certainly in this current series of hearings, this freshman Congressman has learned much about the needs of rural areas, smaller cities, and wetlands, but we have not yet focused our attention specifically on coastal areas.

Today I want to briefly discuss with the subcommittee an exciting new development in our coastal water quality protection efforts.

Back in 1989, Congress directed the EPA to commission an outside review of clean water policies in coastal urban areas of the United States. No such review of the policies laid down by the Clean Water Act had been conducted since 1975. The EPA, in turn, requested that the Water Science and Technology Board initiate this review.

Three weeks ago, almost four years later, that study, entitled "Managing Wastewater in Coastal Urban Areas," has been completed and its results promise new scientific advances in our efforts to protect water quality in coastal areas.

The purpose of the study was not to review past decisions but to identify opportunities for improving the current systems through which coastal urban wastewater and storm water are managed. The study found that although significant progress had been made in improving the water quality over the past 20 years, many coastal areas continue to suffer from persistent environmental problems and can expect to encounter new problems in the future. The study also found that today's coastal water quality management practices do not provide adequate protection from some types of problems and in some cases are overprotective of other types. The report identifies several key areas in which specific progress could be made and recommends a new more comprehensive—and for my City of San Diego, importantly—a more cost-effective framework for coastal management.

The approach we have been looking at in the 1972 Clean Water Act produced rapid and effective improvements in many areas, but it has not always allowed a process that adequately addressed regional variations in environmental systems around the country or responds well to changing needs in science and more complete information. In many cases, it has mandated costly wastewater treatments which produced no significant improvement in ocean water quality.

But, since 1972, important changes have taken place in government, science, and engineering and the expectations of the public in regards to wastewater and storm water management in environmental protection. This study comes to the important conclusion that while treatment plant and outfall technologies have often dominated discussions of wastewater issues over the last two decades, they are only two of many important pieces that together make up a coastal wastewater management strategy.

Our hearings to date have identified the many successes and some of the shortcomings of Clean Water Act since 1972. As we approach reauthorization on this act, I believe it is critical that we

incorporate the most current scientific advances made over the last two decades. The information contained in the report that I mentioned is both cutting edge and crucial to water quality protection and management in coastal areas.

For these reasons, I am respectfully requesting that the Chair take under advisement the possibility of holding one additional hearing on the Clean Water Act in order to examine and evaluate the information contained in this report, "Managing Wastewater in Coastal Urban Areas." I know the hearings were scheduled for completion today, but I believe, given the importance of the recommendations, we must, in fact, cover the Nation's coastal areas with the kind of comprehensive protection offered by the conclusions of this report.

I expect to be joined in this request by the mayors of the cities of Seattle, New York, Boston, Baltimore and, of course, San Diego.

I think, Chairman Applegate, that this report will provide our subcommittee, under your leadership, with the opportunity to put our own stamp on the Clean Water Act reauthorization. Its conclusions will allow us to refine and enhance this important piece of legislation using the scientific advances and experience that we have gained over the last two decades. And as we move into the 21st Century, let's seize the chance to develop a 21st Century Clean Water Act.

I appreciate your cooperation and leadership in allowing new Members of Congress to learn and to participate in this process.

Mr. APPLEGATE. I thank the gentleman and my friend of California and I suppose what I could do is amend my original statement and say that this nearly completes the series of hearings and that we will take that under advisement and I will be working with you and with the possibility that we could hold some hearings and bring those people in and see what conclusions we can arrive at. I don't know whether there will be a solution or not but we will be glad to do that.

Mr. FILNER. Thank you very much.

Mr. APPLEGATE. Now, we have, who has returned to us from other hearings, Mr. Boehlert.

Mr. BOEHLERT. Mr. Chairman, first of all, I want to open up initially with an apology. That is not something people hear too often around here, but my apology to all of those who are following very carefully the day-to-day developments on this very important legislation, but yesterday I had to be in Boston and I missed the hearing. I was in Boston testifying before the Base Closing and Realignment Commission. People on the other side of the river had the audacity to suggest that they should close Griffiss Air Force Base involving 8,000 jobs and that is in my district, and I won't surprise anyone in this room, to me, that I don't think that is in the national security interest.

Today marks the final day of scheduled hearings on the reauthorization of the Clean Water Act. Over the past four months, this subcommittee has heard testimony from representatives of all major interests in the reauthorization of the act, including the agriculture community, environmentalists, industry folks, and officials from the municipalities across the Nation.

Throughout the course of these hearings, certain themes were consistently repeated and it is around these themes that we will begin crafting a bill. Continued capitalization of the SRF, greater flexibility for States in administering the SRF, expediting the wetlands permitting process, applying significant new resources to nonpoint source pollution and developing a holistic watershed approach to water protection are some of the themes around which we will be working.

Today's witnesses will undoubtedly shed further light on the direction which the Clean Water Act should take. I look forward to their testimony today and to working with them in the coming months as reauthorization legislation is developed. And I would like to particularly commend you, Mr. Chairman, for your diligence in pursuing this.

Some people have an attitude around this town, "What is the rush?" I think this is extremely important legislation and I don't want to put it off until next year. I want to get it moving this year and I know you are committed to that proposition, and I thank you for your leadership and look forward to working with you in a bipartisan way to fashion a bill that meets the great demand that is out there all across America. Thank you.

Mr. APPELATE. Thank you, Mr. Boehlert.

I would only say that I concur wholeheartedly in what you are saying and I think we will work together and I feel very confident that we will come up with legislation this year that will be beneficial to everybody and that will be a real trick.

Mr. Zeliff.

Mr. ZELIFF. Thank you, Mr. Chairman. This is the last, obviously, of a series of hearings that the subcommittee will hold on reauthorization of the Clean Water Act. Testimony we have heard so far on the act has been informative and constructive and will no doubt be very helpful as we look to ways to improve the act and assist local communities faced with clean water needs. There is no question we need to address the problems affecting the Nation's rivers, lakes, streams, estuaries, and wetlands.

However, as we endeavor to do so we must remain mindful of the economic impact that new Federal laws and regulations have on those who must ultimately bear the cost. Today we will hear the important views of business and industry as they relate to the Clean Water Act and I would especially be interested in hearing their insights on the impact of the act as to their future ability to compete.

We will also hear the perspective of local government and planning organizations as well as the academic community. This legislation will represent the most important environmental initiative undertaken by the 103rd Congress and the testimony we receive today will no doubt further this subcommittee's understanding of the direction we should take with reauthorization of the act.

So, Mr. Chairman, thank you for your leadership. I look forward to the testimony.

Mr. APPELATE. Thank you, Mr. Zeliff.

I think we are ready to proceed and, first of all, we are going to have our first panel. As I call you, you may take your seats. We have Frank Hackmann of the U.S. Chamber of Commerce; Hugh

Campbell, Junior, of the Chemical Manufacturer's Association; David Norwine, National Association of Metal Finishers; James Batchelder, American Wood Preservers Institute; Jeffrey Silliman, American Textile Manufacturers Institute; Duane Marshall, American Forest & Paper Association; and John Stein, National Environmental Development Association.

We welcome you to the committee. We have had many, many people come before the committee and testify. However, you have a little different approach than a lot of them have and we welcome that, because it is something that we are touching on that is a little bit different and we need that kind of information.

So with that, we will just begin with Mr. Hackmann.

**TESTIMONY OF FRANK H. HACKMANN, PARTNER, U.S. CHAMBER OF COMMERCE, SONNENSHEIN, NATH & ROSENTHAL; HUGH CAMPBELL, JR., MANAGER, CORPORATE TECHNICAL RESOURCES, DuPONT CO., CHEMICAL MANUFACTURER'S ASSOCIATION; DAVID NORWINE, CHAIRMAN, GOVERNMENT AFFAIRS, HAWARD CORP., NATIONAL ASSOCIATION OF METAL FINISHERS; JAMES R. BATCHELDER, VICE PRESIDENT, KOPPERS INDUSTRIES INC., AMERICAN WOOD PRESERVERS INSTITUTE; JEFFREY SILLIMAN, MILLIKEN & CO., AMERICAN TEXTILE MANUFACTURERS INSTITUTE; DUANE MARSHALL, DIRECTOR OF ENVIRONMENTAL AFFAIRS, UNION CAMP CORP., AMERICAN FOREST PAPER ASSOCIATION; AND JOHN STEIN, DIRECTOR OF STRATEGIC ENVIRONMENTAL INITIATIVES, NATIONAL ENVIRONMENTAL DEVELOPMENT ASSOCIATION**

Mr. HACKMANN. Thank you. Good morning. On behalf of the U.S. Chamber of Commerce in the panel today I would like to thank you for the opportunity to present our views on some critical aspects of the Clean Water Act reauthorization. We particularly wish to thank the Chairman and the staff for devoting the time today to discussing new or evolving reauthorization issues which have not previously been addressed by our group in detail.

In order to maximize time for dialogue on these new issues, each of us will take three to five minutes to highlight key areas. We will also submit our full written statements for the record.

I have practiced environmental law for more than 20 years and worked as an environmental engineer before that. I believe most commentators would agree overall that the Clean Water Act is one of the most successful environmental programs we have. However, there are several recent developments which concern us. These relate to increased regulation by memorandum and policy guidance. Departures from sound science to highly conservative, if not unrealistic mathematical models, coupled with adherence to rigid numerical standards and the increasingly complex storm water regulations and permitting process without, in our opinion, corresponding environmental benefit. We look forward to a dialogue today on these emerging issues, plus, of course, on any other concerns the committee has. Thank you.

Mr. APPLGATE. All right.

Mr. Campbell.

Mr. CAMPBELL. Good morning. My name is Hugh Campbell. I am Manager of Corporate Technical Resources for the DuPont Company. I am appearing today on behalf of DuPont and the Chemical Manufacturers Association to discuss our views on pollution prevention in the context of the Clean Water Act reauthorization.

Mr. Chairman, I want to make two points today. First, the Clean Water Act is a pollution prevention statute. Second, flexibility is key to the continued success of this act. The act challenges us to look beyond treatment to other pollution prevention practices and policies such as source reduction and recycling. The results have been nothing less than remarkable.

According to information supplied to EPA's toxic release inventory, Clean Water Act standards adopted in 1987 have helped to reduce chemical industry discharges to America's waters by 77 percent in just five years.

Let me give you a couple of examples of how the Clean Water Act encourages companies to prevent pollution, not just treat it at the end of a pipe.

The act, as you know, has very strict technology effluent guidelines for our industry, but they are performance-based. We are free to develop and implement our own solutions to meet these limits. At DuPont's Deepwater, New Jersey complex that has meant spending more than \$10 million on a number of projects to recover and reduce waste. We were able to reduce the volume of toxic pollutants we send to our wastewater treatment plant by 1 million pounds per year. At our Belle, West Virginia, plant DuPont implemented 10 separate source reduction programs to meet effluent guidelines for both conventional and toxic pollutants. We substituted solvents in our manufacturing process and increased product recycling.

The result was a 50 percent reduction in toxic pollutants sent to our wastewater treatment plant, and more importantly, our project led to nearly complete elimination of three toxic pollutants from our discharges.

The Clean Water Act controls on industrial discharges have improved water quality because these controls are designed to ensure continual improvement. The law requires EPA to revise technology-based standards as technology improves. Moreover, water quality based requirements are playing a bigger and bigger role in reducing discharges. Just to meet these increasingly stringent limits, industry will have to engage in even more source reduction and recycling techniques. To meet these challenges we believe flexibility is key.

Pollution prevention is not a one-size-fits-all proposition. Each of DuPont's pollution prevention projects had to be individually tailored to the facility.

In summary, we believe that the Clean Water Act contains ample incentives for companies to practice pollution prevention. We do not think that additional pollution prevention authority needs to be written into the act, but if this committee wants to promote additional pollution prevention through the act it would have to be made much more flexible. CMA's written statement addresses this question in detail. I would like to thank this committee for the op-

portunity to testify and I would like to offer CMA's written statement into the record.

Mr. APPLGATE. Let me say at this point that each of your statements will be made a part of the record. Mr. Norwine.

Mr. NORWINE. Mr. Chairman and members of the committee, good morning. I am David Norwine, Vice President of Haward Corporation, a small electroplater plant in New Jersey. Today I am here on behalf of the National Association of Metal Finishers which represents 800 of the over 4,000 metal finishing companies in America. This industry has been on the front line of environmental regulation for over a decade. The results have been nothing short of spectacular.

The metal finishing industry is now one of the most protective of our environment. The Clean Water Act is one of this country's real success stories. Most of the industrial pollution of 10 years ago has been reduced to the point that today the remaining majority is now coming from nonpoint sources. When the provisions of the present act are fully carried out, the industrial contribution will be reduced even further. The present EPA effluent guideline plan lists 21 ongoing and additional regulations and 11 pre-regulatory studies. This all takes us up to the year 1999.

EPA estimates that one SIC code alone will regulate another 855,000 sites. NAMF serves as a participate member of this judicially mandated guidelines task force. The collaborative process of bringing in all the interested parties is an outstanding example of how environmental policy can and should be made. The perceived need for and call for consistency is particularly strong from local authorities. Regulated industries, communities and POTWs have all made significant investments in technologies and facilities in order to respond to effluent limitations.

Any major changes to the program will affect the precarious competitive status of our industry. The Clean Water Act is working very well.

Now, I want to touch on one other aspect of the Clean Water Act water quality standards in 1972. The Clean Water Act used the phrase, "latest scientific knowledge".

NAMF wishes to bring the issue of scientific validity to the attention of the subcommittee with the emphatic suggestion that the Congress must compel EPA to revamp its development procedures to use good science. The current water quality standards attempt to regulate metals to levels far below background levels which will lead to extremely high cost with negligible results in water quality improvement. NAMF members understand clearly the meeting and exceeding of standards.

We get upset when the regs are based on flawed logic, appeals to emotion or are written in the fog of bad science. We hope the Congress will use the reauthorization of the Clean Water Act as an opportunity to address environmental issues in the bright light of good science. NAMF wishes to thank the committee for this opportunity to provide testimony.

Mr. APPLGATE. Thank you, Mr. Norwine.

Mr. Batchelder.

Mr. BATCHELDER. Mr. Chairman and members of the subcommittee, thank you for the opportunity to present the views of the

American Wood Preservers Institute on the Federal Water Pollution Control Act reauthorization.

I am Jim Batchelder. I am Vice President and Manager of Environmental Affairs for Koppers Industries, Inc., in Pittsburgh. We own and operate 13 wood-preserving plants in the United States, providing approximately 600 jobs. These are jobs of modest skills, well paying for their areas. They include benefits and I believe very important to the rural areas in which we operate.

The Institute is a national trade association representing the wood-preserving industry. We submitted previously written testimony which includes five comments. But because of the necessity of brevity I will stress just one that is very important to our industry. That most critical issue to our industry is the need to retain the domestic sewage exclusion in Section 1004 of RCRA which enables us to discharge our listed wastewaters to POTWs when pre-treated and subject to Clean Water Act permit standards. Our industry depends on it. Loss of it would be crippling.

A quick regulatory history will explain why our position is so critical. The original standards and guidelines, effluent standards and guidelines for the wood-treating industry were established back in 1972 over 20 years ago and called for zero, no discharge to surface waters. These guidelines have not been changed or updated in those 20 years. EPA is too consumed with developing new regulations to update and revisit these.

Industry complied with this no-discharge standard by establishing surface impoundments on our plant sites for retention of our wastewaters. In 1980, RCRA identified the bottom sediments sludge from these water systems as hazardous waste and therefore these ponds constituted storage of these hazardous waste. This necessitated closure of these systems. The response was to treat these waters and move toward a spray irrigation biological field technology again not allowing any discharge from the site. This was a combination of biological action and evaporation.

In 1991, RCRA acted again with a major listing involving our industry broadly listing waste and these listings included our wastewaters. Therefore, our spray field technology as then interpreted as land disposal, this practice had to cease. This only left us one regulatory option and that was to discharge to POTWs. The industry invested huge capital to build state-of-the-art retreatment facilities to meet the permit requirements of the various POTWs. It also included the costly establishment of lines and connecting costs to the POTWs. That is established and is working well.

We personally have 11 plants discharging. We have no problems, technical or otherwise. I believe it is mutually beneficial for the communities in that the local POTWs enjoy the revenues from treating our wastewaters. The domestic sewage exclusion is necessary to this process. It provides the mechanism to transfer regulatory control of our wastewaters from RCRA to the Clean Water Act so the POTWs can receive it. It does not avoid regulation; I want to emphasize that. All these discharges are permitted, pre-treated and modified to meet the limits. They are further treated when those wastewaters go to the POTW and discharged under their NPDES permit. The environmentally protected loss of it would leave us no viable option.

AWDI and Koppers support responsible legislation and regulation. We ask you to consider our concerns in your deliberations and we would welcome the opportunity to work with the committee as you consider this. Thank you very much.

Mr. APPLGATE. Thank you, Mr. Batchelder.

Mr. Silliman.

Mr. SILLIMAN. My name is Jeffrey Silliman and I am the Corporate Environmental Manager for Milliken & Company. I am here today on behalf of the American Textile Manufacturers Institute. I thank you for soliciting the advice of those of us in the industrial community who are regulated by the Clean Water Act. I, like those with me today, feel we can speak to the front-line successes and shortcomings of this act.

To begin: Metals. Regardless of whether they are naturally occurring, coming from corroding pipes or emanating from the commercial use of various products, metals, ranging from copper to mercury to lead are present in small amounts in municipal and industrial discharges to our Nation's waterways. There is not a member of this subcommittee that doesn't have a constituent interest here, be it a metal-finisher in Steubenville, Ohio; a computer manufacturer in San Jose, California; a photo-finisher in Utica, New York; a dentist in Beckley, West Virginia; a textile plant in Toccoa, Georgia; or a municipal wastewater plant in New York City.

For example, the water you and I sit here and sip, gentlemen, cannot be legally discharged from some manufacturing facilities in the United States because of the toxicity associated with its copper content. In other words, the general public can drink water with more potentially toxic copper than the EPA and some States will permit textile companies to discharge in their wastewater.

But while not all forms of metals are toxic or present a danger to human health and the environment, EPA does not distinguish between those that are and those that aren't and encourages, by guidances, the adoption of overly stringent metals limits by State permit-writers, requiring enormous capital and operating cost to meet, even when the metals present no documented danger. Such is the case with metals found in textile discharges emanating from some textile dyestuffs.

For example, one textile company has spent upwards of \$300,000 in four years attempting to demonstrate to the State of South Carolina that the metal in some textile dyestuffs, in this case copper, is not bioavailable nor toxic and therefore should not be subject to EPA and the State's strict copper standards. The State agreed, but the permit has yet to be issued. Similar stories with even higher price tags can be recited throughout the textile industry.

Therefore because of the prevalence of industrial and municipal wastewater facilities directly and indirectly impacted by EPA's water quality criteria for metals and the excessive costs incurred by industries and municipalities which treating metals to these low limits, Congress should require EPA to undertake its desired scientific review of its metals criteria within the next 12 months and to act upon its finding within the next 24 months. Industrial competitiveness and municipal solvency is at stake.

Second, allow industrial facilities that can demonstrate to EPA that they have in EPA's terms, no potential for storm water con-

tamination to exit the storm water permitting system and be managed under urban storm water management plans. This would minimize paper shuffling at both EPA and the affected facilities.

In addition, it would allow the agency to focus on the truly bad actors where storm water contamination presents some real problems and allow other affected facilities to focus on complying with other pressing environmental mandates.

For example, many textile companies not only manufacture fabric, but also cut and sew their fabric products into apparel. These cut and sew operations use minimal if any chemicals and have minimal potential for storm water contamination, but by virtue of being manufacturing operations where industrial activity takes place, they are subject to the storm water permitting requirements.

Finally, AMTEX, a lot has been said here and in the White House about transferring military research and development for industrial purposes. In March an agreement between the U.S. Department of Energy and the American textile industry was signed that will open up DOE's labs to textile chemists, plant engineers, and environmental managers for up to \$15 million in cooperative research. The environment is one of five areas selected for this research, in this instance, focus on waste minimization through the use of technology that facilitates reuse and recycling and more importantly by fundamental manufacturing process changes to eliminate waste in all forms.

Gentlemen, thank you for your attention. My additional comments have been submitted for the record.

Mr. APPELEGATE. Thank you, Mr. Silliman.

Mr. Marshall.

Mr. MARSHALL. Mr. Chairman and members of the subcommittee, my name is Duane Marshall. I am Director of Environmental Affairs for Union Camp Corporation. I am testifying today on behalf of the American Forest and Paper Association, the National Trade Association of the U.S. Forest Products, Pulp and Paper Industry.

Nationwide our industry accounts for 7 percent of all U.S. manufacturing output. AFPA's member firms directly employ 1.6 million workers and rank among the top 10 employers in 46 of 50 States.

At the outset here we have one message: The Clean Water Act works. EPA has the authority it needs to solve most of our Nation's remaining water quality concerns. As you review proposals to change the law, ask the question: Does EPA already have sufficient authority?

The pulp and paper manufacturing side of the industry estimates that since 1972 it has invested more than \$5 billion to comply with Federal and State clean water requirements. We expect to spend an additional several billion dollars in order to fully implement the requirements of the 1987 amendments, the Great Lakes initiative and the new coastal nonpoint program.

In fact, recent trends indicate that 20 percent of all future paper industry capital expenditures will go to pollution abatement efforts.

Since 1975, the amount of conventional pollutants, BOD and total suspended solids discharged from pulp and paper mills has been reduced by as much as 75 percent per unit of production.

Dioxin releases from the pulp and paper mills have been reduced by more than 90 percent since 1985.

EPA is currently developing new effluent guidelines for pulp and paper mills which will include the installation of stringent best available technology. These regulations will be finalized by 1995. With this in mind we strongly urge the subcommittee to avoid additional amendments that would disrupt this ongoing public process.

With respect to the Water Quality Standards Program, AFPA supports continuing to provide States the flexibility to adopt criteria and to designate the use of a particular water body. Additional water quality criteria should be developed but only on the basis of sound science.

Early in these hearings, Chairman Mineta rightfully noted that our ability to detect pollutants has sometimes overtaken our ability to develop additional control technologies. In fact, we can now detect to near zero levels and zero keeps moving.

To require zero discharge of some pollutants as some have proposed, even after best available technology is installed and water quality standards are being met, simply does not make scientific or economic sense.

EPA estimates that approximately one-half of water quality impairment comes from nonpoint sources. If we are to achieve water quality improvements, it is appropriate to consider additional approaches in this area. Since the passage of the 1972 act all States with significant forest management activities have either passed forest practice laws or developed best management practices programs approved by the EPA.

Our industry has been implementing nonpoint source BMPs for a number of years and we continue to improve.

As a result, EPA now documents that forestry contributes on average only 6 percent of the loadings attributable to nonpoint source pollution.

Mr. Chairman, we ask you to move forward with extreme caution in any nonpoint legislation, and to avoid a Federal regulatory approach.

First, we urge you to recognize the highly successful efforts already being made by those now implementing BMPs, particularly in silvicultural management.

Second, BMPs are and should continue to be developed on the basis of State-specific characteristics. AFPA generally supports the views of the Governors and State administrators which call for a State-based bottom-up approach.

Third, any nonpoint source program should avoid prescriptive Federal land use planning.

Finally, any new program should include all nonpoint sources. Identifying a small select group of easy targets will not result in measurable water quality improvements. As amendments to Section 404 are considered, we would like to point out that national wetlands policy forum has acknowledged forestry as an economic activity compatible with wetlands and has concluded that silvicultural exemption under Section 404 should be retained.

In conclusion, Mr. Chairman AFPA appreciates this opportunity to share its views with your subcommittee. Thank you.

Mr. APPLEGATE. Thank you Mr. Marshall.

Mr. Stein.

Mr. STEIN. Good morning, Mr. Chairman. I am John Stein and I am the Director of Strategic Environmental Initiatives to the Anheuser-Busch Companies.

This morning I am pleased to offer the views of the National Environmental Development Associations Clean Water Project on issues concerning the reauthorization of the Clean Water Act. My statement is meant to summarize and highlight the key points of NEDA's views.

In my testimony, I plan to discuss briefly four significant issues in the reauthorization of the Clean Water Act: Market based approaches, toxic use reduction, toxic pollution control and enforcement.

Market-based approaches to environmental protection can improve the quality of the Nation's water resources while insuring that the goal is reached in the most cost-effective manner. In particular, provisions for the trading of effluents in individual watersheds should be explicitly added to the Clean Water Act.

A tradable permit system should allow companies to use trading to meet BAT requirements and retreatment agreements.

In all situations, the antibacksliding provisions of the Clean Water Act should be clarified to permit trading.

With respect to toxic use reduction, the NEDA Clean Battery Project believes that Congress should not grant regulatory agencies the authority to make decisions that legitimately belong to the private sector. A recent legislative proposal would have given EPA authority to make decisions regarding production in the guise of protective water quality. Placing such authority in the hands of the regulators would have serious implications for the growth and competitiveness of the U.S. economy.

Current law provides sufficient authority to establish standards. These should be continued along with market-based approaches, innovation and flexibility. Likewise, in toxic pollution control the NEDA water project believes that Congress should not summarily prohibit the use or release of substances without carefully considering the consequences. Recent proposals to prohibit the discharge of certain chemicals do not consider the implications of such bans. Such decisions should consider the economic consequences to consumers as well as producers and the technical feasibility of achieving zero discharge along with the environmental effects of such restrictions.

In enforcement we agree with the unanimous Supreme Court decision that citizens should not be given the right to sue for violations of the Clean Water Act that occurred entirely in the past. This authority would eliminate the distinction between citizen and government action to punish past transgressions. Individual citizens are not bound by the government's need to pursue many public policy objectives and are not held accountable by the general public as is the government.

Granting citizens this right is entirely punitive. It will not improve print compliance or deter future violations. The NEDA water project also believes that natural resource damages should not be

made a part of the Clean Water Act enforcement. Environmental remediation is already provided for under other laws.

I would now be happy to answer any questions that you might have.

Mr. APPLGATE. Thank you very much, Mr. Stein, and thank you to all of you for certainly articulating your positions extremely well. It does not necessarily mean we are going to agree with everything that you said. We won't know that nor will you until we get a final bill passed and then you will know just exactly where we stand, but we do know where you stand and we are hopeful that we will be able to come up with some legislation that will at least have some pretty good support from all sectors.

Let me ask you this that it would appear that a lot of your comments were in response to Senate bill 1081, which has not been introduced this year by Senators Chafee and Baucus. Could you give me any idea as to why you think it is in response to some of the criticism that has been mentioned today? Anybody want to mention that?

Mr. MARSHALL. Well, I would only say, Mr. Chairman, that there have been and there has been additional testimony presented to you at an earlier hearing which seems to echo some of the provisions that had presence in 1081 earlier, so apparently there are communities that believe those actions are called for.

Mr. APPLGATE. Well, they seemed to be pretty excited about it last year, but nothing has happened this year. What they finally come through with would remain to be seen, but, of course, we don't have anything either yet. I think most of you support the domestic sewage exclusion.

Mr. BATCHELDER. Absolutely.

Mr. APPLGATE. Is your support based partially on the less stringent standards in the Clean Water Act as opposed to RCRA?

Mr. HACKMANN. Mr. Chairman, the answer to that is, no. From my perspective in having worked with these issues for a number of years, the thing we have to deal with in the domestic sewage exclusion is the fact that regular sewage from business of all types has constituents in it that under certain circumstances can be considered hazardous and there just has to be a way to deal with it.

The Clean Water Act has a regulatory structure to deal with that with pre-treatment standards and perhaps other members of this panel would also like to address that point.

Mr. CAMPBELL. Yes. I would like to point out that Congress asked EPA to do a study on the domestic sewage exemption and I believe that study was completed in 1986 and concluded that that exemption should be retained and that the proper vehicle for regulating those pollutants that go to a POTW is through the Clean Water Act pre-treatment provisions. As a result EPA pursued enhancing the general pre-treatment regulations in 1990 by adding more prohibitions, monitoring requirements and permitting for significant discharges and, in addition to those requirements, there are also local ordinances that limit any discharges that are in any harmful quantities. So we believe that is the right mechanism and that EPA supports that approach.

Mr. APPLEGATE. Okay. Well my time is up and I am going to abide by that little red light so I am going to, at least for the first round.

Now, I will yield to Mr. Boehlert.

Mr. BOEHLERT. Mr. Stein, in his testimony, his oral testimony, mentioned the concept of tradable permits. It is a concept I am somewhat enamored with. First of all, I would like to ask you if you have had the experience with tradable permits under the Clean Air Act and would you suggest a similar type program under the Clean Water Act and then I would like the other panelists, if they would, to comment on the concept of tradable permits.

Mr. Stein.

Mr. STEIN. Congressman, there has been a great deal of interest in watershed planning as an approach for achieving clean water goals. I think this dovetails very closely with a market-based approach to effluent reduction by looking at the experiences in the south coast basin of California with the reclaim program that is going into effect out there. I think you will see the basis for efficiently reducing pollutants within an air shed where impacts on an environment can be closely measured and controlled so there is positive environmental improvement. I think if you have a situation where industry A has the ability to overcontrol, but lacks the resources to do it; industry B doesn't have the technology, but has the resources, you can create a win-win situation.

Mr. BOEHLERT. Match the resources with the technology.

Mr. STEIN. Right and advance the cleanup of water quality and do it in a cost-effective way.

Mr. BOEHLERT. How broadly would you define a watershed? That is going to be something we are going to have to come to grips with.

Mr. STEIN. I think that is going to require some additional study to do that, but I think a watershed would be an area in which you can adequately model the water quality impacts and to determine how those pollutants interact in the water.

Mr. BOEHLERT. I am particularly sensitized to this issue because I happen to represent the New York City watershed area where in effect you have a metropolitan area of some 10 million people impacted by the activities of tens of thousands of people. So I am following this very, very closely.

Any others wish to comment on this? Mr. Marshall.

Mr. MARSHALL. I would only point out that under existing provisions of the law there have been regional planning waste load allocation-type initiatives taken at various places around the country and that there are indeed some watershed penalties such as the Pimlico Sound where localities are dealing with this question in a rather successful way, at least they believe. I think we need to be cautious here, though, in not adopting a watershed approach as a universal Band-Aid. I think it probably has merit in certain localized areas where there are finite and defined water quality problems. I think one issue that you raised is how to bring in a very large watershed and thousands of users, particularly where you start to integrate point and nonpoint source discharges. I think we have a limited, if at best primitive ability at this point to identify what the outcome of a given management practice might be on a

nonpoint source discharge. We can employ a best management practice and we can step back and evaluate it and determine what might need to be done differently, but in terms of predicting the outcome with any certainty in a trading-type scheme where nonpoint sources are involved, I think that would be a very difficult process.

Mr. BOEHLERT. The majority of problems in my case is from nonpoint source pollution, so it is a tough one to come to grips with. I see the red light is on. But I should be allowed, I would assume, to let the panel finish commenting on this one issue. Any other panelist want to address the issue of tradable permit, Mr. Norwine.

Mr. NORWINE. You mentioned New York City. New York City has a specific POTW, has a group of POTWs, has a very great difficulty with nonpoint source. Studies which were run in this last year showed that of the metals, which is the area that I am most interested in, of the metals reaching the POTWs, the very substantial amount did indeed come from nonpoint sources. In fact, they showed that of a daily receipt of 2,400 pounds of copper a day, only 61 pounds comes from industry.

The rest comes from nonpoint sources. In a study run by the City of Chicago, a number of these absolute sources have been identified and it appears that the homemaker is the big polluter. As a matter of fact, the Chicago study showed there is four times as much cadmium and six times as much lead in your toothpaste as a plater is allowed to discharge and that a hundred times more nickel in laundry soap and bath soap as a plater is allowed to discharge, that one of the most important sources of cadmium in the sewer lines is from laundry brighteners.

I don't know how we are going to get around this because America has reached a standard of living which we don't seem to want to give up and until we address this very difficult area, many of the POTWs will never make compliance with any water quality standard that anybody can think up. Until we get the trade-off with what the homemaker is doing it isn't going to happen.

Mr. BOEHLERT. Could we call that the gray shirt theory?

Thank you very much. My time is up and I will have more questions later.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Boehlert.

Mr. Filner.

Mr. FILNER. Just a brief comment, Mr. Chairman. I appreciated the testimony and the themes that came out of all the testimony: flexibility, use of latest science, and certainly the economic common sense that we ought to look at all parts of the act with, and certainly those are the criteria I will be advocating as we look at the coastal waste treatment systems also. So thank you for summarizing those points.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you.

Mr. Hutchinson.

Mr. HUTCHINSON. Thank you, Mr. Chairman and I want to thank the panel also for your analysis. I think it is one that we have

needed to hear in these hearings and I am very grateful for the presentations you have made today.

Now, as I listened to your testimony, as I read your written testimony, it seems to me that one of the common themes was that the Clean Water Act is working well. It is working fine and we don't need to make any radical or very dramatic changes in that.

Yet, in the testimony that we have heard in previous hearings, the evidence is that a large portion of the remaining pollution problems stem from nonpoint sources. And my question to the panel is would you recommend a Federal nonpoint program? I know one of the points made was that it should be left to the States, that we don't need a Federally-mandated program to handle the nonpoint source problem, that voluntary compliance or best management practices is the best way to handle it and that these measures should be given additional time. But I would be interested in the panel's thoughts on that issue. Anybody.

Mr. STEIN. Congressman, I think that if we go to a watershed-based approach that we can focus in on the problems that exist within that watershed and tailor the solution to the particular problem. I don't feel—NEDA does not feel that a Federal program is necessary to accomplish those goals. We need the flexibility to tailor a rifle shot approach to this problem as opposed to a former broad-based approach.

Mr. MARSHALL. I would only add that a Federal program tends to inevitably become terribly proscriptive and we see that the solutions to nonpoint problems tend to be far more localized and that local jurisdictions are best able to identify where the problem areas are and iterate the types of best management practices that might be called for to address those particular problems.

I think to comment further on your voluntary, let me say much of the progress to date has occurred without the strong arm of a Federal enforcement hammer. And we indeed believe that those firms, those companies, those landowners that have incorporated those practices have done a good job. But recognizing that that is not universal, there may be individuals who have not done what they might have most prudently done on a voluntary basis and certainly under those circumstances, we believe that the States should have some leverage to impose conduct on those individuals to employ best management practices.

Mr. HUTCHINSON. So you think it should be left on the State level.

Mr. MARSHALL. Without question.

Mr. HUTCHINSON. Mr. Hackmann, I was interested in reading what the Chamber's position was on the wetlands issue and that there should be a reliance upon the three traditional indicators as to what wetlands really are. But I would like you to expand a little bit on how you feel the wetlands issue should be handled, what the Chamber's position is on that, and perhaps what industry's position is on a very difficult problem that we are wrestling with when we apparently really don't have a definition of what wetlands are.

Mr. HACKMANN. Congressman, that was going to be the first thing that I was going to observe is that the biggest problem that I see with wetlands is not only the difficulty in answering the question of is it or isn't it, but the fact that depending on who you ask

you get different answers and the level of regulatory uncertainty is very great. If you have had experience of looking at some lands that, in fact, are classified as wetlands, it is easy to understand why people doing something with those lands would not think they were wetlands because oftentimes it is not readily apparent whether it is or isn't a wetland. So I think from my perspective and my experience and from the perspective as I understand it of the Chamber, one of the things that we want is a greater clarity of classification, and we also do not see a need for the greatly expanded definitions that we had in the last round of delineation manuals.

If we could have a somewhat simpler process of getting a clearance to the question of are we or are we not jurisdictional, that helps as well. The time period involved has been a big problem for me in some of the cases I have worked in and also the problem of retroactive classification where you find out after the fact that something was considered a wetland at one time and you have got retroactive permit issues and enforcement legitimizing what was there in the past. These are very, very difficult issues.

If anybody on the panel would like to add from their own industry's perspective, I would invite them to do that and we will be happy to submit some more material on this point to you in writing after the session today.

Mr. MARSHALL. I would only add from a forestry perspective or an AFPA viewpoint that classification as a wetlands should require the process or conformity with all three wetlands classifications, the criteria and that the burden of proof that a wetlands exists should rest on the government.

Mr. HUTCHINSON. Thank you. I think my time is up. Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Hutchinson.

Mr. Deal.

Mr. DEAL. Thank you, Mr. Chairman. I would first of all like to address my comments primarily to Mr. Silliman since he is the representative of the textile industry which is a heavy industry in my district. First of all, it is my understanding that the textile industry is the first industry to enter into a joint agreement for research with the DOE laboratories and I would commend the industry for doing that.

Secondly, I would like to ask you how pervasive and costly is the metals problem in the textile industry and are you working with EPA to resolve that problem?

Mr. SILLIMAN. Yes. To comment on the first point, the Department of Energy labs went out to find industrial partners for this, the textile industry, the only place where we had history of supporting private research institutions totally from industry funds and formed a natural interface between our industry and the national laboratories. That led to the formation of what is now called AMTEX.

The issue of costs associated with the metals issue. It is certainly very widespread. Just an informal survey of about 50 members on our environmental preservation committee within ATMI revealed about 97 plants of whom 80 some already had metal limits and about 25 of those were already very concerned about their abil-

ity to comply with those limits. On an individual plant basis we were looking at numbers of anywhere from 500,000 to a million dollars per facility both to upgrade and to attempt to meet the limits and an equal amount in annual operating costs.

Mr. DEAL. Thank you, Mr. Chairman.

Mr. APLEGATE. Thank you, Mr. Deal.

Mr. Zeliff.

Mr. ZELIFF. Thank you, Mr. Chairman. First of all, in hearing the DuPont testimony, having been a DuPont employee for 17 years, I can attest to the hard work you have done in terms of Deepwater and other areas as well. And certainly in the paper industry, very important up in New Hampshire relative to jobs in the economy and I recognize the need for flexibility. I guess there will be some pressure on us in terms of the act's fishable-swimmable goal and after 20 years of effort many will argue that it can only achieve zero discharge, if not now, when or could it ever have to be addressed through zero discharge? Anybody want to comment? How clean is clean?

Mr. CAMPBELL. I will start off with that. I would like to point out that EPA Administrator Browner addressed this issue in other testimony on May fifth. She indicated out that nearly 75 percent of the Nation's assessed surface water are meeting statutory goals. So that is our baseline we are working from. The zero discharge goal in the act is conceptually a great goal and we aim for it knowing that technically it is unachievable. It violates some basic laws of thermodynamics. As I think the committee Chairman, Representative Mineta, has pointed out, as we continue to get more sophisticated analytical approaches and we get closer and closer to zero discharge zero becomes a moving target. We face the law of diminishing returns. We think we need to be focusing on real risks through the water quality standard setting process and through regional, local approaches, as we try to step to different levels of sophistication in meeting the goals of the act.

We have got well in place significant technology-based controls. There are 50 some industries controlled today by technology-based controls and more in the pipeline. We have got varying degrees of implementation in the water quality standard-setting process throughout the States as levels of sophistication and improvements which are in the pipeline. We believe you need to focus on the real risk reduction as we go forward. And I think as the Chairman of this subcommittee has pointed out, it is impossible to reduce all risks, but we want to keep trying to focus on the real risks in trying to come up with as cost-effective an approach as we possibly can for those solutions.

Mr. ZELIFF. I think the same thing applies to Superfund as well. I think you get to the point where there is no need to be perfect.

There is no health need to be perfect and I got a kick out of the comments about the housewife. How serious is some of the run-off problems and, you know, in terms of the risk of toothpaste and laundry brighteners and things of that nature, maybe you can comment.

Mr. NORWINE. Perhaps run off is not the right context. Almost all the members of our association have shops that are in cities and they are all contributors to POTWs. How important is it? The study

that was run in Chicago about a decade ago was run by the Metropolitan Sanitary District. They hired a consultant to establish what metals were coming in, where did they come from.

The amazing thing they found was that on Saturday and Sunday metals kept coming in in the same quantities. They came in during the week when all the industry was closed which led to the further investigation of where does all this metal come from and it apparently does indeed come from household commercial establishments, things of that nature which are totally unregulated and for the most part are unregulatable. I don't know how you are going to get around that.

You used the words, "zero discharge," here a minute ago and it was said that it is a technical—it is not impossible. It can be done, but the cost is enormous. As you take one metal out of the water, you add some other chemical component to get the metal out and you end up with basically brine. And unless you put in a desalination plant, you can't get around that. There is no way and you must discharge this water.

Mr. ZELIFF. I would think that the Chamber's attitude representing smaller businesses, I think some larger companies can afford the technology investment, but what about the little guy? Do they just go out of business?

Mr. NORWINE. Yes, they do. EPA originally in 1972, with the establishment of the Clean Water Act, and in 1981, with the establishment of the present effluent guidelines, estimated 40 percent of our industry would indeed go out of business. We are now at 36 percent. Thirty-six percent of the metal-finishers in America have already gone out of business as a result of difficulty of complying with the Clean Water Act.

We have to be very careful about this tiny and fragile industry as there is not one piece of metal on our persons or in this room that did not pass through a plating plant somewhere. It is absolutely essential.

Mr. ZELIFF. Thank you.

Thank you, Mr. Chairman.

Mr. APPLIGATE. Thank you, Mr. Zeliff.

Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. I thank the panel for your contributions to what is a very thorny problem for us to grapple with here, the reauthorization of the Clean Water Act.

Another problem we are grappling with is we are attempting, again, to consider the question of whether the EPA should be elevated to cabinet level status and the Senate has dealt with that in recent days. One of the amendments that was attached to the Senate version which is causing some heartburn in some quarters is the provision that would say that risk assessment should be a part of any consideration before regulations are issued.

In other words, you would have to assess what risks are involved.

I would be interested in the view of whoever wants to address it as to what is the role of risk assessment in water policy? Is it something that should be a part of that? Is it something that should not be considered, should be out of the mix? How do we incorporate that if it should be incorporated in shaping water policy?

Mr. CAMPBELL. I will take a stab at that one. As I mentioned before, we have a level of technology-based control. We have got varying levels of water quality-based control and as we start to get more sophisticated in our analysis of the environment and its condition and try to improve it, we are reaching the law of diminishing returns. I think we have to focus on what the highest risks are with our limited resource base in this country. It is an international competition issue and we support focusing on the real risks and more targeted approaches.

I think Administrator Browner pointed that out in her testimony before this subcommittee. Targeted approaches dealing with real risk issues down to the local and regional areas is where we think we ought to be going.

Mr. MARSHALL. Risk assessment has utility first in prioritizing, as you point out, as well as comparing options. I think that we go too far, however, to build an absolute quality around risk. We tend to want to fix it at some particular point. I think that is a misuse of risk assessment. It is far, far more useful for comparing courses of action.

Mr. HACKMANN. If I could, one thing I would like to add to the discussion of risk assessment is conceptually we certainly support it. No question about that, but it is also vitally important just how the assessment is done. One of the things I have encountered in a lot of different environmental laws and interpretations of rules is that the pyramiding of one conservative assumption on top of another where maybe each individual assumption sounds reasonably straightforward, but when they are all sequenced out you have got risk margins, risk protection levels that are wholly out of sync with the underlying risk and impose enormous costs in order to guard against that computed risk.

We see it in Superfund and in some other areas so not only is it important that there be risk assessment, but that it incorporate plain English, common sense kinds of assumptions about what is the nature of the risk.

Mr. CLINGER. I see some real merit in that and I think that prioritizing for purposes of addressing the problems is clearly important. I think the objection that was raised by EPA to the amendment on the Senate side was that this was saying before you issue any regulations you would have to do an assessment of the risks before you can put that regulation out and they claimed that would be very disruptive of the regulatory process.

Do you think that is right?

Mr. HACKMANN. It may slow down the regulatory process, but I think from our perspective we would like to see in at least some rule-making a more clear-cut statement of why is this rule being put forward and just what is it that it is really going to guard against, and why does guarding against that make sense? I am not trying to be argumentative with EPA.

We share many common goals in the Clean Water Act process, but the storm water process is a good example of the complexity building on itself to the point where small businesses are just going to have tremendous burdens with these new rules.

Mr. CLINGER. I agree. Yes?

Mr. SILLIMAN. If I could make just an additional comment on that, the metals issue which I brought up in my testimony is a very good example of where you start with laboratory data and then you go down the chain of additional conservative assumptions as those get applied first to create what are called the water quality standards and then ultimately result in permit limits. And, again, there has to be a proper assessment of the real risk because we can measure at lower and lower levels parts per billion and trillion the costs skyrocket to meet that, and there are several levels that are safe and truly we should put our resources somewhere else.

Mr. CLINGER. I agree.

Thank you, Mr. Chairman.

Mr. APPELEGATE. Thank you Mr. Clinger.

Mr. Horn.

Mr. HORN. Thank you, Mr. Chairman.

Some of you mentioned market-based approaches as one solution. I wondered how all of you feel on market-based approaches and do you think they can be administered by a government agency, and does the role of taxes or fees have any place in market-based approaches as far as you are concerned? Why don't we just go down the line rapidly?

Mr. CAMPBELL. Well, I will speak to that. The taxes and fees, we think those are disincentives. We think of incentives more as tax credits, mission reduction banking approaches, flexibility, maybe accelerated appreciation schedules and of extended permit length compliance schedules. Those are the types of innovative approaches and incentives we would approach.

Mr. HORN. Where is the best success story you know of where that is working right now? Any State approaching it?

Mr. CAMPBELL. I don't have an answer for that.

Mr. HACKMANN. The one I would know emanates as the best success story is the reclaim program out in the south coast with the air pollutant trading to facilitate growth of the industrial expansion and reduction over time on emissions. I think one of the big conceptual issues with regard to fees or taxes versus regulations is that oftentimes we start with one and then add the other, and I think from a conceptual standpoint, we should make a policy decision of which way do we want to go so that we are not putting one type of program on top of another. But I strongly favor the trading and the market-based kinds of concepts because they give greater flexibility; the same, in fact, generally at a much lower cost.

Mr. BATCHELDER. Just due to the nature and spread of our business I don't see it would come into play in our industry and I would have no comment to offer.

Mr. SILLIMAN. I think on the issue of market-based approaches, our industry does not have a lot of experience with that, but intuitively it makes sense because if you stay a watershed area it allows the various people in that watershed to essentially trade off for the one that can most effectively reduce pollution levels and then establish a market value and trade those off, but it certainly intuitively makes sense, and I agree with the other comments as regards fees and so on.

Mr. HORN. Mr. Marshall.

Mr. MARSHALL. Our conduct is already governed by technology-based standards, by water quality standards and I think there is a temptation to impose a fee to drive that even farther. And for no sound environmental reason. I think there is a temptation to use fees as a revenue-raising venture unrelated to any environmental benefit associated with it. I think certainly there may be some merit depending on the structure and magnitude and caps and what have you in the use of fees for administering a permit program, for example. I think to go beyond that it would be clearly misbased.

Mr. HORN. Mr. Stein.

Mr. STEIN. With respect to fees, I think we would just say that environmental standards really should be based on environmental impacts. Fees and taxes may result in overcontrol in some situations and undercontrol in others. We would be supportive of the current approach of using environmental impact data to establish reasonable standards and then providing the flexibility to the dischargers as to how they would reach those.

Mr. HORN. Mr. Norwine, do you want to add anything to this?

Mr. NORWINE. No, I don't.

Mr. HORN. Mr. Campbell.

Mr. CAMPBELL. No, I spoke first.

Mr. HORN. Thank you.

Mr. APPLGATE. Thank you, Mr. Horn.

Mr. Gilchrest.

Mr. GILCHREST. Thank you, Mr. Chairman.

I would like to address my question to Mr. Hackmann and Mr. Norwine. First of all, I am going to start using baking soda to brush my teeth after your comment.

Mr. NORWINE. Good.

Mr. GILCHREST. Do you make baking soda? You both made comments during your testimony and during answering questions about nonpoint source pollution and wetlands regulations and the criteria to delineate wetlands and things of that nature.

From your comments, I would like you to comment on this question dealing with wetlands. We are looking at wetlands from a whole range of perspectives, one of which and I agree with you, a watershed approach.

Now, if we look at wetlands from a watershed approach, and we take into consideration the problem of nonpoint source pollution, should we then also take—and given the problem with toothpaste and soap and things like that that are flushed down the toilets and into or wherever they go, should we then also take into serious consideration managed growth as far as any watershed management plan is concerned and as far as any wetlands approach is concerned?

It might seem unrelated, but it does seem to me possible and logical that if you have during the week a certain amount of pollution getting into the system and when all the businesses are closed, the same amount or an equal amount of pollution getting into the system. Have we reached the stage of our development understanding that more population means more pollution?

In the Chesapeake Bay, where I am from, 90 percent of the nitrogen overload in the Chesapeake Bay is coming from the air pollu-

tion and 60 percent of that pollution comes from cars. Do we have to put into the equation any approach to wetlands, any approach to nonpoint source pollution, any approach to this problem at all, and understanding of what population does to a region? And do we have to consider the difficult task of understanding managed growth?

Mr. HACKMANN. I think your comments illustrate the problem. I was thinking of the Chesapeake Bay situation as you were raising your question. Without a doubt, population impacts and land use impacts can effect these factors. And from the wetlands perspective, I think we are in a situation where the real tread line is there won't be any more development on the wetlands, certainly not the kind of development we have seen historically. So from that perspective, I think the regulatory structure we have got will keep it from getting worse.

From the standpoint of what is sustainable population of a particular region and how should government work together to trade that off against other things, I would like to see that from my perspective and experience first by a local government issue and only as a last resort become a Federal Government issue.

Because questions of life-style and choice and how people want to live are very difficult ones to regulate from afar, but I think you are seeing the same thing in Los Angeles right now with the components of trying to have employers locate their businesses closer to where their manufacturing facilities are, they are trying to address these.

I don't have any good answer, as I said, but I will be happy to share some thoughts after the session.

Mr. GILCHREST. I think this element needs to be taken into consideration, the element of open space. The Chesapeake Bay region, there is a lot of economic activity as a result of the bay.

Mr. HACKMANN. Absolutely.

Mr. GILCHREST. And if you happen to be a commercial water man, which I understand is a fairly small part of the economy. Recreational activities are an enormous part of the economy. The key from talking to a lot of people to the solution, I will just throw this out, it is close to off color, but I think we can.

An older water man told me that the man that should be given the award for solving pollution problems is the man that invented the birth control pill, and he is a water man. He says the only problem in Chesapeake Bay right now is water quality, as far as making the bay productive. And these are, I guess—these are just things that need to be talked about in the context of this whole topic.

Mr. HACKMANN. I agree.

Mr. GILCHREST. Thank you.

Mr. APPLEGATE. Now, that was all right, Wayne.

Mr. Hamburg.

Mr. HAMBURG. Thank you, Mr. Chairman. I just had one particular question of Mr. Norwine and then a couple of more general questions.

Mr. Norwine, you talked about the process for recovery and reuse of excess metals in the plating operations from sludge. I just wondered if you could elaborate on how long those kinds of techniques

have been in use and if those are widespread techniques at this point. Just a little more information on that.

Mr. NORWINE. You are definitely going to run over time. Pollution prevention is something that has been carried out in the metal finishing industry for a long time. We didn't call it pollution prevention because that particular phrase wasn't popular.

When we started to get ourselves into compliance a decade ago, it was found that, hey, we are doing some wasteful things and maybe we shouldn't do it that way anymore. And there are two paths that are followed on reclamation and recovery.

One path is to do it yourself in your own plant. Keep the metals in the plating tank, recover as much as you can and put it back where it goes. The other part of the reclamation really falls under RCRA, and we can really expand this one.

Most of the metals that are produced by our industry as water treatment residuals are presently being encased in concrete, put in the ground, and lost forever, which we say is the most monstrous waste in the Nation. Those are available for recovery and they should be recovered.

The techniques for doing these things have been around for at least a decade. Some of the things that are spoken about rather than loosely like ion exchange and zero discharge and reverse osmosis, get to be very expensive. And in all cases where we talk about zero discharge, the problem gets to be that we can get the metal out of the water.

Now we have got real super clean water, but now we have a bucket of concentrated stuff, what do you do with that? So we are back where we started. We have created a waste and it doesn't matter how you do it. You are going to end up with a waste because metals cannot be destroyed. They can be transformed and moved around, but you can't get rid of them. They are ubiquitous and part of our environment.

Mr. HAMBURG. Thank you. I was particularly interested, Mr. Stein, in the testimony from you and from Anheuser-Busch. I had a chance to tour the large Anheuser-Busch plant that is in the southern part of my district, Mr. Stein. And I was very impressed with the efforts that are going on there.

I realize that a lot of those efforts are things that the company has done to get out ahead of law and several of you have spoken about the voluntary compliance and tax incentives and various ways to sort of use the carrot instead of stick.

I wonder if there are—Mr. Stein, if you could speak to the things A&B is doing or specific examples, particularly where voluntary efforts, on the part of industry are being effective and where we can look to the leadership of industry to take care of some of these problems before they arise.

Mr. STEIN. We have had a voluntary pollution prevention program in our beer company for the last three years and we have made some significant achievements by empowering our employees to look at their workplaces and use their specialized knowledge around where they work to come up with ideas for liquid waste reduction.

We have made major strides in water conservation which translates directly into the amount of water that goes into wastewater.

We have also made tremendous reductions in the amount of solid waste that goes to landfills by using that approach.

We see that as the real method of the future, is to use total quality concepts to unlock the power of the employees and the other people in the organization to bring about these improvements on a voluntary basis.

Mr. HAMBURG. Anyone else.

Mr. MARSHALL. I might also address to you the success EPA has had with their 33-50 toxic substances program. I think that has been a very real effort.

Mr. HAMBURG. Any others like to comment.

Mr. SILLIMAN. I would like to echo that because within my company, we signed on for the 33-50 program, which is against a base year of 1988, and we have already made a 99 percent. The actual goal was for 30 percent to 50 percent and was strictly voluntary, and we pushed that company-wide.

Mr. CAMPBELL. I would like to point out for the chemical industry, we have the Responsible Care program which has six management codes. One of those is a pollution prevention code in which we are trying to sustain ongoing and long-term reductions in emissions. I think that has been very successful.

Over the last four years, as measured by the TRI database, EPA's TRI database, we have seen close to a 40 percent reduction in waste emitted.

Mr. HAMBURG. Well. Thank you, Mr. Chairman.

I just want to comment that I think that, to the extent that industry can be out ahead of the curve, it is really especially helpful. I saw that at A&B and I was very impressed. I don't really know too much about what the rest of you are doing, but if you are using that kind of an example, I think it is a good one.

Mr. APPELEGATE. Thank you, Mr. Hamburg.

Mr. Quinn.

Mr. QUINN. Thank you, Mr. Chairman, Mr. Boehlert. And I thank the gentlemen for their testimony this morning.

Before I came up here to the Congress, I was a local official in western New York, and I am a firm believer in this flexibility that you've talked about. Indeed we have heard over the last few weeks here a wide variety of testimony on local flexibility.

Mr. Campbell, in your statement you talk about the fact that pollution prevention is not a one-size-fits-all proposition. I think you are right on target with that. Just one brief question, if I may, Mr. Campbell. And your testimony was very, very helpful to me.

You talk about promoting cross-media pollution prevention. Can you further explain that concept?

Mr. CAMPBELL. Well, as you know, when we go back into the process and look at pollution reduction opportunities, it involves possible emissions to the air, water, and waste. When you don't just focus on the Clean Water Act discharges, you look at it more holistically. We look for programs that will tackle issues that will reduce waste going to each of those medias.

Mr. QUINN. I thought you were talking about median pollution. I wasn't sure.

Mr. CAMPBELL. We have a lot of that.

Mr. QUINN. Thank you, Mr. Chairman.

Mr. APPLEGATE. Thank you very much, Mr. Quinn.

It looks like we have pretty much completed this and I appreciate all of your statements. I would just sort of zero in on what Mr. Zeliff said earlier about how clean is clean, and of course the technology that keeps finding ways to determine just how clean is, is advancing far beyond our abilities to be able to find the methods and the money to be able to set the standards, and it is making it very difficult.

I was going to ask Mr. Norwine just, you were talking about what do you do with the residue that is left after this is done? You have the pure, clean water and you have this bunch of gunk over here. Can they incinerate that? We have got a brand-new incinerator in my district, eastern Ohio, and it is looking for business.

Mr. NORWINE. Almost all of the waste coming from a metal finishing shop is inorganic and doesn't incinerate very well. It has zero Btu value. There is no point. You put a chunk of metal in here and you get a chunk of metal at the bottom.

Mr. APPLEGATE. Right, I understand that.

Mr. NORWINE. When I said that business about leaving some residue behind, typically, reverse osmosis, if what we are going to do is discharge really clean water. You can run it through a reverse osmosis system, that is great. If you got 20,000 gallons of water, it is going to reject about 15 or 20 percent of it and you are going to end up with 4,000 gallons of concentrated material and you are going to discharge medical grade water. You might as well use the water over.

Now, we have got a concentrated solution of 4,000 gallons. What are we going to do with that every single day? That is the problem.

Mr. APPLEGATE. Well. I thank you very much. Thank you very, very much for your input. It has been very educational. I think you have approached some new areas that we really haven't gotten into so much in depth and it may be that we will have some additional questions that we may get out to you and we look forward to receiving answers from you.

But in any event, I am sure we will be talking with you after we see just exactly what direction we are going to take. So thank you very much for being here.

Our second panel—and if you would please come to the table—we have the National League of Cities represented by Jeff Wennberg; Northeast Ohio Regional Sewer District, William Schatz; and National Association of Regional Councils, Steven Arndt.

Okay. Thank you very much. We welcome you before the committee as we nearly complete our series of hearings. Mr. Wennberg, we will begin with you. I should address you as Mayor Wennberg.

**TESTIMONY OF HON. JEFFREY WENNBERG, MAYOR, RUTLAND, VT, ON BEHALF OF THE NATIONAL LEAGUE OF CITIES; WILLIAM B. SCHATZ, GENERAL COUNSEL, NORTHEAST OHIO REGIONAL SEWER DISTRICT; AND STEVEN M. ARNDT, CHAIRMAN, TOLEDO METROPOLITAN AREA COUNCIL OF GOVERNMENTS, ON BEHALF OF THE NATIONAL ASSOCIATION OF REGIONAL COUNCILS**

Mr. WENNBERG. Thank you, Mr. Chairman, and Members of the subcommittee.

I am Jeff Wennberg, Mayor of Rutland, Vermont, and Vice Chair of the National League of Cities' Energy, Environment and Natural Resources Committee. My testimony on behalf of NLC and the 16,000 American cities and towns we represent, will speak to those Clean Water Act issues which are of greatest importance to municipalities.

Over the past 20 years, this committee has provided a significant Federal financial commitment to help us attain secondary treatment. This is the main reason why we have made major strides in restoring our rivers and streams, unquestionably the most significant national environmental achievement of the last two decades.

But now we live in a different era, an era of scarce resources for all levels of government. Current Federal requirements are overwhelming the ante of local governments to comply with the law. Yet the reconciliation instructions are clear, there will be less Federal assistance, not more, regardless of authorization levels.

We believe, therefore, we have a mutual responsibility to manage with what we have. Local Governments must be assured that no new responsibilities for liabilities will be imposed by this committee or any other until we have resolved what is already before us.

The trend of unfunded mandates must cease. From the perspective of municipalities, a Clean Water Act reauthorization must, first of all, clarify congressional intent and revise the stormwater management program. It must address the requirements for combined sewer overflows. It must clarify Federal wetlands policies. And it must continue a Federal financial commitment to municipalities to implement the Clean Water Act mandates.

Regarding stormwater, normally it would be senseless for Congress to codify specific requirements for program implementation into the law. Unfortunately, when it comes to stormwater, we believe that you really have no other choice. The 1987 amendments for stormwater requirements occupy less than one page in the statute. It seems fairly straightforward-implement best management practices to the maximum extent practicable.

However EPA's regulations far exceed this standard. When this committee acted last year to delay implementation of the stormwater program for smaller communities, we applauded. But as I am sure you recognize, that action was only a place-holding stopgap. The whole issue of managing urban stormwater runoff for all cities must still be revisited.

Put directly, we seek a legislative prohibition on requirements for end of pipe standards. It is unreasonable for the Federal Government to force municipalities to accomplish what no one knows how to do at a price that no one can afford. If the NPDES program

cannot be amended to accommodate a lesser standard, a whole new stormwater management program should be established.

Regarding combined sewer overflows, EPA has taken significant positive steps in addressing the problems of combined sewers in their recently announced guidance. We seek added flexibility for the use of alternative technologies by smaller cities and towns.

According to EPA, over half of the communities with combined sewers have populations below 5,000. It is unrealistic to expect these small communities to pay for expensive studies or facility construction. We would prefer to see the Clean Water Act allow small CSOs at their option to use innovative alternatives to high costs and potentially high risk technologies.

Regarding wetlands, most of all municipalities need a consistent policy on wetlands. The national policy should recognize the value of economic and physical development as well as the need for environmental protection.

Our criteria for rational wetland policy are to allow development where wetlands are of marginal value to prevent development where they are irreplaceable, to provide compensatory mission where wetlands are of highest quality, and to forgo mitigation where they are abundant.

Even with the changes listed above, municipal compliance will require Federal loans and grants. We face in excess of \$300 billion in unfunded Clean Water Act mandates alone. Without some combination of repayable loans—and the operative loan is repayable—and grants, it is unlikely that municipalities will be able to comply with these mandates. And it is truly need to use any available funding for the Clean Water Act mandates.

Finally, while it is not NLC, you might consider capping expenditures at some percentage of household income. The Clean Water Act, the Safe Drinking Water Act, other Federal mandates could be prioritized and applied against a total of household income until the limit is reached. Mandates not completed by the affordability priorities, would be deferred, waived, or eligible for 100 percent grants.

Mr. Chairman and members of the subcommittee, I want to thank you again for the opportunity to present the views of the National League of Cities and I will be happy to answer questions.

Mr. APPLEGATE. Okay. Thank you very much, mayor. I appreciate that.

Mr. Schatz.

Mr. SCHATZ. Mr. Chairman, Members of the committee, I appreciate the opportunity to appear before you today.

My role is somewhat different than usual. Normally I would be here advocating the position of the Association of Metropolitan Sewage Agencies. However, today I come with a specific problem and a specific item that I would ask your consideration for.

The Northeast Ohio Regional Sewer District treats wastewater for the City of Cleveland and 48 communities in the greater Cleveland area. Back in the late 1960s and early 1970s, USEPA had touted a new technology, a physical chemical wastewater treatment process as the technology of the future.

The Northeast Ohio Regional Sewer District was one of the first to embrace in technology and in fact then proceeded to build the

largest physical chemical treatment works in the United States. The total cost of upgrading this facility was approximately \$120 million. This technology, as we discovered through the 1980s, was flawed and it prohibited the district from meeting its NPDES requirements.

In the late 1980s, the district made a determination that, given the flawed technology that must go forward, convert the facility into a conventional biological treatment works and has proceeded to do so. The district has completed its first contract, that is of site preparation. It has let three additional contracts to go forward with the rehabilitation and conversion of that facility.

The cost of the conversion of the physical chemical part of the treatment works to a convention that biological facility is approximately \$35 million. To add insult to injury, USEPA then commenced an enforcement case against the district seeking some \$35 million in civil penalties for ongoing violations of the district's permit, particularly the permit requirement for BOD.

The third insult was the setting aside by USEPA auditors of the construction grants that the district received to upgrade that portion of the facility and convert it into the physical chemical treatment process over the years.

Had there been an innovative or alternative program when the district received its grants, arguably, then the district could have gone back to USEPA and sought assistance in the rehabilitation and changeover of the facility into a conventional biological treatment works. However, since the construction grants were received prior to the INA provisions of the Clean Water Act, this was not possible.

We appear today solely to request your assistance in recognizing that there should be an authorization and there should be some level of funding provided initially and thereafter because of this mistake that was made. This was technology that was not initially accepted by the district. It was technology that was accepted by its predecessor, the City of Cleveland.

When the district came into existence in 1972, it did embrace the representations of USEPA. Now USEPA disavows any responsibility for this travesty and we believe that it is fundamentally unfair to the citizens of Northeast Ohio for this to continue.

I would be prepared to answer any questions that you may have today and I appreciate again, Mr. Chairman, and Members, the opportunity to appear before you today.

Mr. APPLGATE. Thank you, Mr. Schatz.

Mr. Arndt.

Mr. ARNDT. Thank you. Good morning, Mr. Chairman, members of the committee, and staff.

I am Steve Arndt and this morning I am here on behalf of the National Association of Regional Councils, NARC, and the NARC Advocacy Service Group. NARC represents over 500 regional councils across the country. The Environmental Service Group is the advocacy carrying arm of the regional councils most directly affected by water and environmental legislation.

A list of Members is included in the gold portfolio of information that you received from NARC. I certainly hope you have received this document.

In the packet you will see a copy of "Accomplishments in Regional Water Resources Management, Success Stories of Regional Councils," a compilation of approaches our regional councils have taken to deal with a variety of water resource issues.

Mr. Chairman, I would ask that the packet of information, including the National Association of Regional Councils' policy suggestions be entered into the record along with my testimony. Thank you.

Mr. APPLIGATE. Yes.

Mr. ARNDT. As chairman of Toledo Metropolitan Area Council of Governments and an Ottawa County Commissioner, I am also speaking on behalf of the Northwest Ohio and Western Lake Erie water issues. On behalf of all those that I am representing today, I would like to thank you for asking us to provide our views on water resource issues, especially as they relate to the reauthorization of the Clean Water Act.

As a county official, I feel it is very important that at a local level we have an important role to play in the Clean Water Act. I would like to tell you a little bit about my background and be somewhat frank as one elected official to another.

Five years ago, my first trip to Washington was to secure additional funding for an EPA mandated sewer project in my county. My county has a population of about 40,000. In the summer months, in just two townships, our population increased 70 percent. We are a highly recreational, fishing, tourist-related area, and we swelled to a population of about 250,000. That is primarily, as you can see, all located within two townships. We had 68 percent well contamination that was primarily caused by failed on-lot septic systems.

It was also caused by a number of package treatment plants, 49 in total, which were all privately owned and operated in residential areas. Both of those townships now have wastewater treatment plants. Both of those are totally residential in nature, other than the obvious commercial related for fishing industry.

I will get into that horror story a little bit farther down in my presentation. NARC has 10 areas that are outlined in our testimony, because as an elected official, we certainly agree with all those points. And we have heard some testimony today about having the local level being able to incorporate, as needed, policies and regulating their land use plan basin-wide approaches for wastewater and the like.

The reason why I want to mention those is because the last time we were down here, we were in the Catch-22. We did receive 55 percent grant funding for our Portage and Catawba Sewage Project. That particular project is rated number one in the State. Without that Federal funding, we would never have been able to build that project.

But unfortunately, we had Federal funding that we were trying to secure as low interest loans from Farmers Home that also said you cannot exceed a level of your monthly user fee because it is not affordable, yet you have EPA saying you must install or we will issue findings and orders in as a small county.

In the last decade, we have spent over \$68 million installing wastewater treatment systems. That is more than the county has

spent in that same period for its entire county operations. We certainly have and will continue to have clean water as our priority.

One of the most frustrating things that we continue to see is that EPA issues the permits to install for package treatment plants to the private sector. In a seasonal and recreational area such as Ottawa County, those package plants simply do not function.

With the ever-changing flow, it is impossible to meet their NPDES permit, which brings up another nice issue. EPA does not issue NPDES permits or require testing from the private sector. If it was owned by the public sector, it certainly would. They continue to issue those, even though our land use plan has shown that they do not work and we have turned them down in a regional planning, later only to recreate the same problem we spent \$68 million trying to solve.

We heard a little bit about testing of not only heavy metals, but dechlorination now. Grease and oil removal. One of our sewers is a lagoon type system. We have no industry, as I mentioned before, and it is what is frustrating that local elected official, to be focusing dollars to not only dechlorinate and test for heavy metals which we know are only there from our drinking water and to remove the oil and grease when in that same sewage district we have untreated sewage from failed systems, septic systems and package treatment plants going to our streams.

It just seems ludicrous, as far as we are concerned, as far as cost-effectiveness, as whether we should be putting our money for dechlorination or for expanding our collection system.

One final point, on the basin approach. I have already mentioned that Ottawa County has spent \$68 million. We are in the top five recreational spots in the country. Right along our city beach in the City of Port Clinton where we have all our tourists coming in, we have over six cities—six counties, five cities and 25 villages that are into that Portage River Basin.

We only have control over what is in Ottawa County and it is a little bit infuriating for us to sit there and see our city beaches closed because we have not addressed that on a basin-wide basis.

I am somewhat emotional because this has been very near and dear to me, and it really is frustrating when we see we do not have the interagency or intraagency relationship with EPA and our local officials and land use planning in the basin.

I thank you for your time. I certainly hope that I can answer any particular questions that you have later. I have cards, if you would like to go into some of these horror stories that we have in the past.

I thank you.

Mr. APPLGATE. I thank you, and I can understand how you can get a little bit emotional. We have people who do, either before or not before the committee, because there are a lot of horror stories.

Mr. Schatz, in talking about your particular issue and knowing the problem that you have up there, and from our good mutual friend, Dick Sullivan, who keeps me informed on a lot of things. You are in litigation on this, as I understand.

Mr. SCHATZ. Yes, we are, Mr. Chairman. We were sued by USEPA with an enforcement case. We also have a third-party complaint that we filed against the designer.

Mr. APPELGATE. What is the status of this at this point?

Mr. SCHATZ. We are still in discovery. The litigation was filed, I believe, September or October. We are coming up on three years. We have not had a significant pretrial as of this point in time. We have our first pretrial, I believe, scheduled in about another three weeks. We literally have probably a ton of motions, and discovery requests, and motions to suppress, and all of the things that are filed in complex litigation.

Mr. APPELGATE. What are you asking?

Mr. SCHATZ. In terms of our complaint against the designer?

Mr. APPELGATE. Yes.

Mr. SCHATZ. We are seeking to recover a certain level of funding for their failure to identify and recognize during the mid-1980s that the process was flawed. And therefore, we are seeking a sum certain from them of approximately \$25 billion.

Mr. APPELGATE. And the EPA has pushed you toward this? And do you—but you had no—you have not come back to the EPA; is that correct?

Mr. SCHATZ. Well, since the Clean Water Act provides essentially for strict liability, I mean, we can't deny the plant is out of compliance with its permit. So, therefore, we essentially have answered USEPA by saying, yes, the plant is out of compliance, but as one of our affirmative defenses against USEPA, we have said you are part of the problem.

The reason that we went forward and spent all this money and accepted some level of construction grants is because you touted the process along with the engineer who we argue at some point in time should have realized that these plants across the country were not working and would not have met permit.

And our legal position with the engineer really applies to going into the 1980s and us spending additional sums of money to repair and replace some equipment that we had problems with rather than going back to the selection of the original process.

Mr. APPELGATE. What is it you think the committee can do to assist you in your particular problem or as maybe a general answer to anticipated problems?

Mr. SCHATZ. We are seeking three things. First of all, an authorization. Secondly, we are seeking some level of funding initially. And thirdly, we are seeking some assistance in the legislation providing us some comfort with USEPA in their enforcement case against us.

Mr. APPELGATE. When you are talking you are seeking dollars and cents, what kind of dollars and cents are you talking about?

Mr. SCHATZ. Our overall request is for \$35 million, which we believe is the total cost to correct the problem that was there through the selection process of the physical chemical process and we have suggested an appropriate level of funding initially would be \$12 million.

Mr. APPELGATE. My time is up, and I would yield to my good friend, Mr. Boehlert.

Mr. BOEHLERT. Mr. Schatz, was the project in question, was that under the construction grant program?

Mr. SCHATZ. Yes, it was.

Mr. BOEHLERT. Well, counsel was just advising me he has a better memory than I do that EPA at one time had a program that, if you used innovative alternative technology—was this considered that?

Mr. SCHATZ. No. The grants received for this particular project were received prior to the innovative or alternative provisions of the Clean Water Act.

Mr. BOEHLERT. That wouldn't apply here?

Mr. SCHATZ. That is correct. We did receive one grant for an INA project that related to the use of ozone in the process. That is not included within our request.

Mr. BOEHLERT. Because under that program, if you used the innovative and alternative technology and it didn't work, the EPA would step in and make you whole.

Mr. SCHATZ. The underlying problem with the end of the construction grants process EPA says we don't have any money to fund the INA portion, in any event.

Mr. BOEHLERT. I have a question for the mayor. You speak for your association and strongly advocate a grant program. Some of us think that the loan program stretches the buck a lot farther and helps a lot more communities.

Are you familiar at all with the principal subsidy approach that has been suggested?

Mr. WENBERG. No.

Mr. BOEHLERT. Let me tell you a little bit about it. I am a former county executive, elected county executive in New York, so believe me, I know the problems of local government. And the mandates really are very difficult to address and I understand that, mandates without the resources.

But under the principal subsidy program, we would continue to fund—and I think we have to fund—at a much larger level the State revolving funds, and then the individual States would have some flexibility in using those funds. They could subsidize the interest rate, lower interest rate or no interest rate, or in those exceptional cases where the community is just hard pressed and a loan isn't good enough for even a low interest loan, the State would have the authority to use funding to subsidize the principal or, in effect, a rose is a rose.

In effect, this is some form of a grant program. Would you find that acceptable?

Mr. WENBERG. Well, I think it is an improvement over a straight loan program. The problem with the loan is there are several problems with it. First of all, I want to make it very clear that we don't oppose the SRF program. We just don't think it is enough and it has limitations.

And one of the big limitations is that the communities that are best able to qualify, that have the best credit, the best able to qualify for a loan, are the ones that are obviously best able to pay it back and probably least in need for the funding, are lower in need of the funding as those that are unable or least likely to be qualify for the loan.

So you have got a problem where the funding mechanism discriminates against those who need the funding and probably have done less in terms of water quality protection than many of the

other communities that have been making those investments over the years because they have had the resources to do so.

Mr. BOEHLERT. Are you telling that story to the State capital because, really, you know, we don't regulate the SRF. We don't set the terms of the SRF, the individual States that administer the program do.

Mr. WENBERG. I understand that, but the concern is that the general, basic nature of a loan does not meet all the needs of a community, especially those that have the biggest job to do and have the fewest resources to address it. The problem with the loan as the sole means of funding these projects is that it has to be repaid.

There is a need for both a loan, especially in those communities that have the ability. In my little example that I gave, if you wanted to set some kind of a limit or a cap on a median household income or something like that in the community, then the loan would be used and whatever that does to your rate structure or fee structure would fit within that cap.

If you reach that cap, which in many communities, any reasonable cap you would come up with, you probably already surpassed. A loan essentially doesn't do any good. Even if you are able to secure the funds, they don't have the financial capacity to repay.

Mr. BOEHLERT. I appreciate that. I am very much concerned about that and some jurisdictions around the country are less endowed compared to others, and I think they have real legitimate needs we have to address. That is why I find very attractive the principal subsidy concept.

Mr. WENBERG. It is a step in the right direction, but it would depend on how the States chose to implement it.

Mr. BOEHLERT. At the risk of sounding too Republican—and I happen to be a liberal Republican, and I don't run away from that word—we do have what is called a \$4 trillion national debt which means we are spending \$900 million a day in interest on the national debt which leads me to the Rural Development Administration.

We are spending \$900 million a day in interest on the debt. They have \$900 million for their grant program, you are familiar with that, I hope?

Mr. WENBERG. Congressman, I very much appreciate and am very sensitive to that issue as well. We however, at the local level, don't have the same accountants you have, so we don't have the ability nor should we nor do we seek it to finance projects with revolving debt. What we have to do is we have to find the money.

Mr. BOEHLERT. I am not apologizing for the operation of the Federal Government.

Mr. WENBERG. If the mandate is there, Congressman, we need the help, especially in those communities where the costs are really getting out of line.

Mr. BOEHLERT. I am here to help. You know one of the great lies of all time from the Federal Government? "I am here to help." I appreciate that, but the point is I would urge you and your association to take a good hard look at the principal subsidy program because here is the dilemma we face.

I mean, we are not going to come close to authorizing the funds. We really need to attack the problems simply because we have got all these other competing demands, and as someone who comes from local government, I have been in your position and I am not unmindful of the very difficult circumstances you find yourself in.

So what I am trying to do is fashion a program up here that gets the most money out into the marketplace and covers the most communities in real need. And I am suggesting, if we put money in a grant program that is used one time and we don't recycle it, if we can be a little bit innovative in using the principal subsidy concept in a State like my own of New York, where you have affluent counties like Westchester, they would pay the prevailing interest rate because they can afford it.

You have some less affluent counties, that they can't find two nickels to rub together, and then the State may decide with the SRF to not only not charge any interest, but in effect subsidize the principal. I would like you to think about that, if you will, and let your organization give us some response.

Mr. WENNBERG. We would be happy to respond to that.

Mr. BOEHLERT. Thank you so much. I don't envy you your task, it is very difficult. I applaud you for your willingness to serve.

Mr. ARNDT. Congressman, I think I would have a few additional remarks on that particular question. In my testimony—and I certainly hope you will take the time to read it, because I did completely deviate from it—but what we are proposing is we need to have more local control to prioritize our projects because there are very few funds available.

We just—and I mentioned a little bit about one of our projects. It was a \$38 million project and I can guarantee you as the mayor, a lot of communities just do not have the bonding capability, the one particular project. And we were able to receive one of the last grants from USEPA for 55 percent, which has incorporated that new and alternative and innovative technology.

Had we not received that grant, a \$4 million—it was a \$13 million grant, I believe. We received \$4 million of a low-interest loan from Farmers Home Administration. We received \$1.5 million from our States revolving loan fund and the rest was financed locally.

And here is the problem that the local communities end up in. Farmers Home says we will not lend you the money because your costs are starting to get to the point where it is not affordable for the people. Our monthly obligation for those residents is \$600 a year. Had we not been able to get that grant, a grant one that does not have to be repaid, that user fee would have been \$875.

And we have a court order. Not only did we have EPA forcing us to install this system, to solve the problems from the package plants that they issued the permits to install, we have the residents of the community having us in court. And, in fact, we had to build a courtroom large enough to hold all the appellants during the construction of that project.

And it is on record in court that our monthly user fees cannot exceed the cost of \$600 a year. Not only locally was it not acceptable, but even at the Federal level it was said it was not affordable. We do need some form of grant program in order to share that burden. Obviously, the States have a good role there, but I think we

need to go back to and give more discretion to the local councils of government of prioritizing where these dollars are best going to be spent to receive the best benefit for the majority of the people.

Mr. BOEHLERT. I want to give a lot more flexibility and a lot more control, and I would encourage you to give some consideration to the principal subsidy approach because, once again, and I repeat myself, I think this offers a possible solution for those communities that are so hard-pressed, you just can't ask the people that do not have an ability to pay or even the people that have an ante to pay to go with those exorbitant charges for—I understand.

Thank you very much.

Mr. APPLEGATE. Thank you, Mr. Boehlert.

Mr. Horn.

Mr. HORN. Thank you, Mr. Chairman. You heard the previous panel and we asked about market based approaches. Now, that is often considered unusual when you are talking to a government agency or representatives of government agencies. But a lot of you I know have read or heard of David Osborn's book on Reinventing Government where he went around America for five years and found local governments and local authorities such as the ones you represent doing immensely creative things with a more market-oriented or what we traditionally think of as business-oriented focus.

Do you see any opportunities along that line that maybe ought to be in the law that would provide incentives, provide new approaches for you representing different types of governmental agencies to get the job done in a more effective way?

I just wondered if you had a chance to give any of that a thought because we seem to be talking grants and other loans. Is there something we can talk beyond that that would be helpful to you in any way?

Mr. WENNBERG. I would suggest that you generate the financing from the mandates. And I think the opportunity for local jurisdictions to be creative and innovative in achieving environmental—the priority environmental standards and objectives has got to look at not only the financing of those mandates which the State and the Federal Government place on us, but also the timing, the order, the level of technology employed.

If you give local governments with appropriate oversight from EPA and the States the opportunity to address the priority environmental needs—and I understand this is a problem speaking to a subcommittee which deals with the Clean Water Act and I don't know who it is that deals with Safe Drinking Water, and who it is that deals with RCRA, I have got it listed here, but not here.

I know that you can only deal with those mandates that really are within your jurisdiction. But the entire House of Representatives and the entire national legislature, I think, has a responsibility to recognize that when these requirements, these costs, these mandates finally come together, the first place that happens is when it hits my desk and the second place that happens is when it shows up in the user fee bill.

And if there would be some way to coordinate and provide local governments with a structure to limit the various time lines and so forth to extend deadlines in certain areas in return for compliance in other areas in understanding that there are limited finan-

cial resources, I think you could see some very creative approaches and very successful approaches.

My biggest concern is we could go out four or five years and find that a huge number of local jurisdictions in this Nation will be spending far more money litigating and defending against EPA lawsuits and citizen suits and everything else, rather than spending that money on environmental protection. It is impossible, quite frankly, given many of the schedules and all of those acts that we have today and the limited financial resources that we all have, it is impossible for municipalities across this country to comply.

If we recognize that and provide some kind of a mechanism to be innovative, I think we can work the whole thing together. But this body, as a part of the entire House of Representatives, is going to have to look at the big picture and give us the opportunity to do the same.

Mr. HORN. I would think the National League of Cities, this might be a very worthwhile project if some thinking was done in this area, and you submitted it to the chairman of the subcommittee and shared it with the Members. Maybe some good would come out of all of it.

We have got a time line here, also, in order to get your foot in the door of this and thinking that some of these ways, where flexibility and certain trade-offs might occur. Any other comments from you?

Mr. ARNDT. Congressman, the one project that I was talking about, the Portage and Catawba Sewage Project, with the new and innovative technology, we incorporated a lot of very interesting things. We have one of the only 26 sole source aquifers in that township, so we are constantly looking for new and alternate means of accomplishing the same thing.

And, unfortunately, EPA does not seem as though they have the time or the ability or the staff to evaluate whether or not these new innovative means of trying to accomplish something is acceptable or cost-effective. And obviously they are always looking as cost-effectively as we are, but a lot of times, a lot of good ideas and approaches just don't materialize because of inflexibility of EPA.

We had a sole source aquifer with 63 percent contamination. We were forced to have special pipe manufactured in 40-foot lengths, all plastic pipe wrapped in bentonite clay. The list can go on and on. They call that innovative technology.

I don't think that is what I am looking for, and I don't think that is what you are looking for. But we need to have the flexibility to look at some of those other things, and it certainly was not there either at the local EPA or USEPA.

Mr. HORN. I guess the question we need to ask ourself is, to what degree does the Federal agency have flexibility based on the laws we have written? Is that discretionary authority there? Could they have experimental programs where they try to approach the same problem in different ways and see what happens in terms of all the variables that are involved in human conduct and everything else?

Mr. ARNDT. One of the interesting things in that particular project, I believe we spent close to \$26,000 evaluating what the groundwater condition was before the construction project. No tests or follow-up was done after the project was installed to indeed ver-

ify whether or not those methods were proved cost-effective or even effective for that matter.

Mr. HORN. Well, if you are aware of provisions in the law that you think block that type of flexibility, I wish you would point them out for us and let us know.

Mr. SCHATZ. Mr. Congressman, if I might just briefly respond, because I represent a major metropolitan POTW. One of the major problems that POTWs face is a lack of consistency in terms of what Congress does. And for instance, in our particular situation, we plan to finance most of our new construction through the issuance of bonds. We are able to do that with a very favorable rating.

We have extended about a billion dollars and we have another billion in front of us to pay wherever we go with the control.

The SRF that was established in the State of Ohio, we thought originally was established for the benefit of small communities and we would not see the opportunity to obtain any of those funds. What occurred was that the small communities were unable to do the type of things necessary to go forward with their projects and the SRF funding then became available for us and we have become actually the largest taker of SRF funding in the State of Ohio.

We didn't think that was envisioned by Congress when it was first proposed, however, in the State of California, where there was a significant match in pooling of State resources, and SRF funds, the major metropolitan wastewater agencies there campaigned for the SRF program where we campaigned to try to maintain the grant program. Since we are trying to reach some type of consensus through our association, we ended up advocating the SRF funding.

The next problem is the level of that funding needs to be revisited. Many of us have predicated our programs on what we thought was the deal made back during the Bush administration with Congress as to the level of funding.

We see a decline in that funding now. We see a proposal to put in a drinking water SRF and take additional funds away from wastewater.

There has got to be a resolution, in our opinion, in Congress that there is consistency in whatever program is adopted.

Mr. HORN. A very good point.

Thank you, Mr. Chairman.

Mr. APPELATE. Thank you, Mr. Horn.

Mr. Barcia.

Mr. BARCIA. Thank you very much, Mr. Chairman.

First, I would like to salute your leadership once again on having the vision and foresight to hold hearings on such a vital issue that is before the Congress in terms of the reauthorization of the Clean Water Act and tell you that representing the Fifth District of Michigan, my congressional district encompasses some 700 miles of shoreline, along Lake Huron.

And of course being from the State of Michigan in general, I am very concerned about the quality of our Great Lakes, the world's largest supply of fresh water. And so this act is of particular importance to the Great Lakes Basin and the Great Lakes States, as well as the rest of the country.

I would like to thank the distinguished panel for their comments and sharing their insight with the subcommittee members and say

that I have just two concerns that I would like to mention which perhaps you could respond to. And the first is that I agree with the last gentleman's statement and response to the inquiry from the member regarding combined sewer overflows and urban communities being able to have the resources necessary to prevent discharge of raw sewage, untreated water, and industrial waste into tributaries and to the Great Lakes such as the Saginaw River and Saginaw Bay.

We have one community, the City of Saginaw, which is faced with about a \$75 million cost in terms of upgrading their water treatment and sewage treatment system in their basins to prevent CSOs. We have also a smaller community, the City of Essexville with less than 2,000 residents facing a \$10 million bill to try to prevent their combined sewage overflow problems.

So it is certainly my hope that we will have resources available from the Federal level so that the Federal Government can be a partner with State and local taxpayers in helping us to protect our precious resource, our fresh water supply.

But I have a concern, also, with regard to Farmers Home Administration and their traditional role of being a partner with small rural communities as they attempt to meet the increasing standards for safe drinking water and I know that the Safe Drinking Water Act is before this subcommittee and this full committee.

It is an issue that we will be devoting a lot of time and attention to in the weeks and months ahead. But if you could respond to both the need that communities across the country have for Federal assistance in upgrading their water treatment systems and also comment, if you can, I am not sure if you have the knowledge, and I am just kind of throwing this at you cold without the time to prepare. But could you envision a greater role for Farmers Home Administration in terms of providing assistance to small rural communities that so often lack the technical expertise and, in many cases, the resources to meet the standards for the Safe Drinking Water Act?

Mr. ARNDT. I certainly think that Farmers Home needs to play a much bigger role especially from a rural county. I mentioned I am from a rural county. 40,000, I think, would constitute as a rural county.

The Safe Drinking Water Act and the concerns at least in our particular community, it is sort of interesting you bring that point up, because I just got mentioning how we spent \$68 million in wastewater. We also have on our drawing table right now, a regional water plant and distribution system trying to replace a number of municipalities, water treatment plants that are fairly small in size because they just cannot afford to refinance and upgrade their existing wastewater treatment plants. They just don't even have the bonding capabilities.

So the only one in our particular county that has the bonding ability is Ottawa County and we are looking at a \$100 million project. When I look at Farmers Homes' participation in our past sewer project of only financing a low interest loan of only \$4 million on a \$38 million project, I would certainly hope they could become more of a partner for our small and rural counties, because that would certainly be able to allow those smaller counties, rural

areas, a smaller portion that they have to finance locally, and maybe it would come within their financial reach as far as being able to bond and sell those notes.

Mr. BARCIA. Thank you.

Mr. WENNBERG. Congressman, I very much appreciate you bringing up the issue of the Safe Drinking Water Act because, from our standpoint, from a financial or administrative standpoint, at the local level you can't separate these issues as easily as can be separated among the committees and subcommittees and so forth here.

In fact, the big picture is really only seen from the local level in terms of all the various mandates. The City of Rutland, we are in the process as a result of the mandates in the law, and it is good public policy, we don't oppose it, but the filtration plant would be under construction in a matter of a few months that is roughly \$6 million, very limited Federal and State assistance on that.

We are doing a CSO Phase I project of \$1.5 million under construction now. We have phosphorous removal at our wastewater treatment facilities as required by the State mandate. This is all capital costs, it is \$1 million. And the State of Vermont also has some very peculiar regulations regarding sludge disposal which drive that cost right up through the roof.

The total effect of these things, plus the operating cost that is getting built in on an ongoing basis is over a five-year to six-year period doubling of combined water-sewer bill for the users in our system. As a matter of fact, the rate increase was 18.9 percent, last year 13.8. Next year 13.7.

Believe me, when you pass these rate hikes on live TV in one night with the board of aldermen with 15 percent of your county's ratepayer/voters watching and they are going to catch you on the street the next day, you get a real sensitivity training, in-depth, as to how much people need and ultimately, in fact, can pay.

The need we have—we feel there is a need to look at the big picture here, as well as at our level, and see if we can find a way to coordinate these things so we don't find ourselves in an adversarial position, each community failing to meet certain standards when those deadlines approach.

Mr. BARCIA. Thank you very much.

Mr. APPLGATE. Thank you, Mr. Barcia.

Mrs. Byrne.

Mrs. BYRNE. No questions.

Mr. APPLGATE. Gentlemen. Thanks again. You represented your positions extremely well, and we may be calling upon you to answer some other questions. But we appreciate you being before the committee.

Thank you.

Our final panel will be made up of the American Enterprise Institute, Robert Hahn; and the Water Environment Research Foundation, George Barnes.

And if you would please come to the desk.

Gentlemen. Thank you for being with us this morning, and we will just go right ahead and begin with you, Mr. Hahn.

**TESTIMONY OF ROBERT HAHN, RESIDENT SCHOLAR, AMERICAN ENTERPRISE INSTITUTE; AND GEORGE BARNES, CHAIRMAN, WATER ENVIRONMENT RESEARCH FOUNDATION**

Mr. HAHN. Thank you, Mr. Chairman. And thank you distinguished Members for inviting me here today to testify. I have been asked to convey to you today in five minutes what it might take a semester for students at Harvard to digest and a lunch for some of my colleagues at the American Enterprise Institute.

Nonetheless, being somewhat foolhardy, I will proceed full speed ahead. I have spent over a decade now working on a very simple idea. It is captured in a commercial that most of you have heard which talks about Lite beer, the fact that it is less filling and tastes great.

I have tried to promote environmental proposals that will get you more environmental quality at less cost, a concern that you raised a little bit earlier, Congressman Horn. Specifically, during the Clean Air Act, I worked on the White House drafting team as part of the Council of Economic Advisers. We developed a market-based approach for acid rain that cuts sulfur dioxide in half by 10 million while saving as much as \$1 billion over a conventional mandated approach, which would have required scrubbers.

I have also advocated and would like to submit for the record a similar approach for the Everglades where they are confronting a political logjam. The idea is to break the logjam by setting up a market-based approach where the Government defines the allowable level of pollution and then leaves it to farmers and business to decide how best to achieve environmental goals.

I would like to begin my presentation with a definition of the problem, which is best characterized by a woman question once posed by a great economist from England. Joan Robinson asked: "Why is there litter in the public park, but no litter in my back garden."

I think most of us know the answer. We have a strong incentive to take care of our home and our own backyard, but a natural tendency to say, "let the other person do it" when it comes to taking care of our local park.

I would argue that the same problem arises in managing our water resources because we collectively own most of our major water bodies. Essentially none of us has a very strong incentive to take care of these resources.

The problem for you, as our elected representatives, is basically to change the incentive structure, that is, embark on a new form of regulation that is like Lite beer, less filling and tastes great—gets you more environmental quality at a lower cost.

How do you get there from here? The way you do it is to adopt what we economists call economic approaches for environmental protection and improved management of our water resources.

In addition to adopting new economic approaches for improving water resource management, you need to think about the appropriate goals for public policy. What kind of standards do you want in the Great Lakes? What kind of standards do you want in the Hudson River? I think economists can make constructive contributions to defining water quality goals to both of those and designing innovative methods for achieving these goals.

Let me start with a "favorite" topic, of yours, which is cost-benefit analysis. Is that red light telling me my time is up?

Mr. APPLEGATE. Well, you can go ahead and proceed for a while. Your full statement will be made a part of the record.

Mr. HAHN. Thank you. I will make it brief. The bottom line is that EPA hasn't done the job of cost benefit analysis of water quality standards very well. I urge in my recommendations that you give them a gentle push so that you can assure the public that, when you are developing standards for the Clean Water Act, you are actually increasing the average standard of living of the U.S. consumer.

Let me turn now to the central focus of my talk, which is the idea of introducing market-based approaches in the Clean Water Act. I suggest in my written statement that you have several opportunities to do that.

You can encourage trading between what are called point sources—different industries that are along a river. You can encourage trading for wastes that are going into a treatment plant—that is called pre-treatment trading. You can encourage trading to bring the large number of nonpoint sources into the regulated system. If we don't regulate these sources, we are not going to have substantial improvement in environmental quality in many of our water bodies over the next decade.

You can do many of these market-based approaches now under the current Clean Water Act.

What is really be helpful would be for you to lend support to these ideas. EPA should be encouraged to use market-based approaches unless they can show why command-and-control is better.

I think government knows best how to set broad environmental standards. At the same time, industry, the private sector, and municipalities have the kind of knowledge that will allow you to get there from here in the least expensive way. I think last recommendation in my written statement summarizes my views. It says Congress should insert language in the new Clean Water Act that demonstrates its commitment to the widespread use of marketable permits for improving the quality and economic value of the Nation's water resources.

You have got to get out on the stump and make the case to the American people. You also need to provide incentives for bureaucrats that are not used to behaving in the reinventing government framework.

In conclusion, we have the technical know-how to implement economic approaches for improved water quality and management. The question is quite simply whether we have the political will.

I am optimistic, based on my experiences in Florida and some work that I am doing in Australia with the New South Wales Government. There is going to be greater experimentation with these approaches. My only question is whether Washington will lead the charge or follow.

The reauthorization of the Clean Water Act provides you with a unique opportunity to lead the charge, and I hope you take advantage of that opportunity to benefit the health and welfare of the American public.

Thank you very much.

Mr. APPLGATE. Thank you very much.

Mr. Barnes.

Mr. BARNES. Mr. Chairman and members of the committee, my name is George Barnes and I am Director of the Bureau of Pollution Control for the City of Atlanta, Georgia.

I am here before you today on behalf of the Water Environment Research Foundation in my role as the chairman of the Board of Directors of the Water Environment Research Foundation, specifically to ask for your support of our request for \$2.5 million in funding from the fiscal year 1994 budget.

After being here for several hours and hearing the problems stated by industry and municipalities, I am tempted to just simply say, give us the money and we will help solve these problems. I would like to take a few minutes to highlight the written testimony that we submitted to tell you a little bit about the Research Foundation, the activity that we have going on, and tell you that I think it is important that you do support our request for funding.

The Research Foundation was started in 1989 by professionals who have worked most of their careers to support clean water. And it was started really to fill a gap that many of us saw because the Federal Government abandoned funding research, and also because we were faced with regulations coming from EPA that we found were really not supported by sound scientific research.

The Foundation has grown to its current level of about 150 subscribers which represents municipalities, industry, consultants, and equipment manufacturers. We represent more than 60 million people in this country. We are governed by a board of directors which represents our subscribers. We also have a research council that is made up by leading experts in the field of clean water.

And their role is to help develop the research projects, to set priorities and then to oversee the work.

We are doing research in all the areas that affect clean water, but I would like to highlight a couple to illustrate the benefits of the work that we are doing.

Specifically in the area of residuals management, we have finished the first phase of a research project related to sludge and incinerator emissions. This project was undertaken because those of us who employ this form of sludge disposal were concerned that our operations were safe, that they were protective of human health and the environment.

And also we saw the need to work with EPA so a sound standard could be developed. We were very fortunate in working with EPA and other municipalities on this project. And through its results, we have helped develop, I think, a very good standard EPA established in its sludge regulations. It is an economical standard, it is protective, but it has resulted in a standard that will save us and the other municipalities millions of dollars in fuel costs simply because we have used good science to establish a good regulation.

Another critical area that we are embarking on relates to the Great Lakes initiative. I think this presents an outstanding opportunity for us and everyone that is concerned with clean water to work together to develop good, sound water quality criteria. We were going to solicit funding from municipalities, EPA and industry

to help work on this project, which I think can have nationwide benefits.

In closing, I would like to give you an example of the dilemma that managers like myself face daily. On the one hand, we want to get clean water. On the other hand, we must convince our elected officials and our ratepayers that we need to raise rates to fund capital improvements. So we have a constituency that wants clean water, a risk-free environment. On the other hand, they don't want to pay a lot for that, and they want to be sure that the money they spend is going for good science and for good operation.

So there is an opportunity here through research for us to stand up and confidently say that we are doing programs based on good science and that we are doing it in the most economical way.

In closing, I would encourage you to continue the Federal support of the research foundation. It is a good investment. You are getting a two-for-one return on your dollar, and the great benefit is we are saving money for everybody in this country through the good research we are doing.

Thank you very much for your attention, and I will be glad to answer any questions.

Mr. APPLGATE. Thank you very much, Mr. Barnes.

The only thing I can tell you at this point is we will look at your request, and we appreciate your input and the information that you gave us.

I am sorry that we are trying to limit the time so that we can get everybody in. I know it is very difficult to get all that you want to say into a five-minute package, particularly when you have hours to talk.

It reminds me of the story by Mark Twain when he once wrote a 20-page letter to a friend. At the end he says, I would have sent you a one pager, but I just didn't have the time.

So it makes it very difficult to try to condense that down to get the important points in.

But, Mr. Hahn, let me ask you this. You have brought forward several creative ways to address the water pollution problems, and many of these proposals, I am sure, had at least some vocal support from the Reagan and the Bush administrations, but neither one ever offered anything in the way of a proposal to the Congress. Can you tell me why? With regard—based upon the market—

Mr. HAHN. I don't really have a good response. It is quite clear that President Bush spent a lot of political capital in moving the Clean Air Act and the acid rain amendments forward. Also, credit should go to the late Senator Heinz and Senator Wirth and several other distinguished Members of the Congress.

So I don't see this as a partisan issue. I think people are generally beginning to recognize—

Mr. APPLGATE. It wasn't brought up to be a partisan issue. I am just asking the question because, you know, they support that, but they didn't offer any proposals.

Mr. HAHN. Your point is well taken. But the point I wanted to make is simply that people are recognizing that the old style of regulation has reached the point of diminishing returns, and there may be new opportunities out there if we can think in terms of reinventing government by using market-based approaches.

Mr. APPLEGATE. Mr. Boehlert.

Mr. BOEHLERT. How did you know, Mr. Chairman, I am very enamored with the market-based approach? As you recall, I was very much involved in the Clean Air Act amendments which was a lasting tribute to our departing President. That is not a partisan statement here.

How do you deal with nonpoint source pollution with tradable permits?

Mr. HAHN. The answer is, it is generally difficult to deal with nonpoint sources. But let me give you the Everglades as a concrete example. It so happens that you can measure the phosphorus coming off one farm or several farms at the point at which they pump the water that goes south to the Everglades. So that gives you an ideal opportunity.

Things aren't always that simple, as you very well know, in which case you have to make some rough estimates.

For example, in Australia, I am dealing with a problem. How much credit do you want to give a farmer who puts a fence 50 yards from the stream so his cattle don't wander over to the stream? Well, these are things that you can begin to assess using scientific experimentation and research. They should be assessed irregardless of the regulatory approach. If EPA puts in a regulation that says, "Thou shalt put in a fence," you still owe it to the public and the farmer to say, this is the environmental improvement you will get.

Mr. BOEHLERT. I appreciate your debate on resources, and I am very enamored with this approach, and you are going to be hearing from us, so I would like to work with you.

Mr. Barnes, are you doing any special research on innovative or low-cost alternatives for wastewater treatment for the small, rural communities?

Mr. BARNES. Yes, we are. I can't tell you specifically what it is, but we have provided information to the committee and also will be glad to provide a copy of our five-year research plan. That is an area that is of particular importance to EPA, and we are and will be doing research in that area.

Mr. BOEHLERT. Getting back to Mr. Hahn, I just looked at a question I had marked down here. What do you do about toxics? When you are dealing with tradable permits and you have got marketable permits as they relate to industrial point sources, the concern is about toxics, particularly acute toxics, which have an immediate impact on the area of release. What are your thoughts on that?

Mr. HAHN. Let me speak to your more general question. What should you do when you have a hot spot in your backyard? Would market-based approaches work? The answer is, generally not. If you have a real problem in your backyard that is only affecting your backyard, you have got to clean that up.

But you may have a system like we adopted in the Clean Air Act. Sulfur is a generally well-mixed pollutant, but if it looks like it is all coming down in one place, you want to avoid that; so you have to put constraints on a market-based approach to ensure you get the right environmental result.

Mr. BOEHLERT. What do you think—as you are looking at a market-based approach, what do you think are the biggest pitfalls we should avoid? Do you have any specifics in mind?

Mr. HAHN. I think you want to avoid one of the big pitfalls that exists with command and control, which is to promise the world, but fail to deliver. What you want is concrete performance-based regulations with teeth.

For example, in the Everglades, government should define responsibilities for the farmer. Then you go out there and measure the results and enforce the system.

Mr. APPLGATE. Thank you, Mr. Boehlert.

The gentlelady from Virginia, Mrs. Byrne.

Mrs. BYRNE. Mr. Hahn, I, too, have some experience with cutting phosphorus in Virginia to protect the Chesapeake Bay. And we did that by a combination of banning detergents that have phosphorus and with best-management practices by farmers, and we were able to achieve fairly good results from that system which—I assume that is not your model of cost benefit.

But I would like to ask you just a little bit about cost benefit because it is something that sounds so good, you know. It really does. We don't want to spend more money than we have to to get the benefit that we need. And I think on page 2 it is even defined as incremental costs of improving exceed the incremental benefits, and that is basically what we are talking about.

My experience has been in cleaning up the Bay and some other areas of water quality that we never talk about the cost of not doing anything. The Chesapeake Bay is a \$16 billion resource, and that resource is never quantified in cost-benefit analysis. It is only the costs of doing something in accord to the costs of the benefit derived. The cost of doing nothing is never quantified.

And so doesn't that really skew what we are trying to do here? Is—if we don't take the total cost, the total cost of either doing something or incrementally doing something to improve the quality vis-a-vis the cost of doing nothing to improve the quality, doesn't that skew the whole system?

Mr. HAHN. You raised two important points. One relates to the fact that, as you pointed out in the Chesapeake Bay, you were able to get phosphorus reductions by stopping people from using detergents and requiring farmers to institute best-management practices. No one ever questioned that command and control could get you those things. The argument for the market-based approach is you have the opportunity to get more environmental quality using fewer resources. It is not that command and control can't work at all.

The second point you raise is a potential indictment of cost-benefit analysis, namely that cost-benefit analysis doesn't necessarily look at a do-nothing option.

I would argue that cost-benefit can look at a do-nothing option. It can look at several options. I am not arguing that it is the be all, end all. I am arguing that that the results from cost-benefit analyses should be a major input into your decision process. You should then determine how to best allocate the public's money after you take into account what economists and scientists might say

about the potential damages from pollution and costs of pollution control.

So I think you are right. You should look at the do-nothing option and say, if there are major costs associated with that, we may want to consider doing something.

Mrs. BYRNE. Right. Whenever I see it defined, it is always the costs of improved exceed the costs of the benefit, as you defined it here.

And let me just go back to our marketable permits for a minute. You quote Joan Robinson about litter in her yard. I am trying to apply marketable permits to that situation. If we have a standard in a neighborhood for litter, and I don't have any and my neighbor has a ton, so I sell my permit to my neighbor, on the whole we may have a neighborhood standard that is less, but I am still living next to a pigsty, right?

Mr. HAHN. You are absolutely correct. That is why, in the case of the Clean Air Act, using just acid rain as the prototype, we decided we didn't want to have a pigsty, that we were going to reduce our litter, in this case  $SO_2$ . We cut it in half and then allowed trading to occur.

So if your point is that you need to think about goals as well as means, we are fully in concurrence.

Mrs. BYRNE. And it is one of the real questions about marketable permits that we look at aggregates. We don't look at specifics. When we can trade, sell these permits, we are not really focusing in on the person or the company or the institution that is doing the most harm. We are allowing them off the hook so to speak, aren't we?

Mr. HAHN. No. We can design a system that effectively addresses the damages.

But getting back—

Mrs. BYRNE. But going back to the control model that you don't like.

Mr. HAHN. Marketable permits reward results rather than the process. In other words, if a business can reduce pollution by a certain amount, it can trade credits to someone else. So you spur environmental innovation. You don't micromanage the company's production process and say, "put on an end-of-point pollution-control device."

You do allow flexibility among the emitters, but you should design the system intelligently so that if there is a particular constraint you are concerned about, like some part of the Chesapeake Bay, you limit trading accordingly.

Mrs. BYRNE. Back to that control model.

Mr. HAHN. That's right. I don't think it is one or the other.

Mrs. BYRNE. Thank you.

Mr. BARNES. Mr. Chairman, if I might, I had a brief comment to that from a municipal standpoint.

I have seen a number of different approaches, the bubble permit and the market permit. One thing that we are concerned with and probably would be opposed to is where you have done a study and figured out what the problem is. Some of it is municipality. Some of it is the industry. Some is some other group that is not always defined. We sometimes find out that the cheapest solution is to give

that to somebody else to clean up, since it is so much cheaper to let the city pay for it. We don't like that.

And if that approach is taken for market permits, it is not a good one. We think if that is the most cost-effective solution, then that entity should go ahead and spend the money and do it, not the municipality.

Mr. APPLGATE. Mr. Horn.

Mr. HORN. Thank you.

Just to pursue a little bit of the last dialogue. I am interested in that because I share some concerns of getting off the hook, if you will, by buying up credits that others have created when you could do a little bit more to get rid of air pollution. I have a few cases in my part of southern California that have burned me when I have read about it in the paper.

But one of the problems could be the costs are at one point, the benefits are at another, when you have a cost benefit analysis. And what is your feeling as to what that does to the effectiveness of that approach? Somebody is going to be bearing the greater part of the pain, fiscal or otherwise, and other people are going to be benefiting without having really had to pay much of the cost.

Mr. HAHN. That is precisely why, Congressman Horn, that I suggested that I didn't think cost-benefit analysis was the be all, end all. I think it is a useful input for you, but you need to weigh those equity considerations that you just raised.

I would also like to address your initial point about marketable permits in Los Angeles-southern California.

As you well know, one of the reasons we are looking at this system now in southern California is because we have run out of quick fixes with command and control. We are looking for a way to stimulate environmental innovation by making pollution prevention pay. And if we can set up the broad targets and then meet these targets by using the market, I think it is a much more effective way to stimulate environmental innovation than having the government try to do it through a big program.

Mr. HORN. Let me ask you one more along the line of how you get a market-based approach, especially in nonprofit or government organizations.

I found bureaucracies are bureaucracies, and often whether they are private enterprise or government has nothing to do with it. They are corporate culture. They all drag their feet the same way. They are all defensive the same way. They are all risk avoidant in the same way, and some of the most efficient human organizations I have known are some of the largest American corporations, not just large parts of the American government.

When you look at the political and institutional obstacles that can exist within the institutions and you try the market-based approach, you try economic incentives, what do you think are some of those obstacles and what can we learn from the studies that have been done on corporate culture and organization and everything else? How do you as an economist take those factors into account?

Mr. HAHN. I really would like to defer to my distinguished former colleague, Herb Simon, who is a Nobel laureate, who made

the point that you did—that private and public corporations exhibit a good deal of similarity.

No one is saying that markets are perfect. What we are saying is that compared to what we have been doing we see an opportunity to get more environmental bank for our buck. Moreover, as you very well know, if you open up the Congressman Smith lemonade stand, you have to pass a market test.

The idea is to incorporate the cost of the environment in your decision-making so you won't take it for granted. That is the whole point of these market-based approaches. So while they may not be a panacea, I would suggest that the time is right to look at them.

Mr. HORN. I think you are right on that it is sort of like Churchill's view of government, that democracy is the least worst and when you look at it in that, if we tried everything else and we aren't making too much progress, why don't we have the guts to take the risk and try this approach and see what incentives can encourage a change in behavior which is often behind most of our problems anyhow, not simply institutional.

Do you have any other factors that come readily to mind from your studies as to some of the obstacles we might well be and we ought to be aware of and we might well confront should we go into a market approach experiment in the area of environmental pollution control?

Mr. HAHN. Well, I think the credit system or property rights have to be very well defined so people know what the rules are. If you are going to change the rules on folks every two years in response to the political winds, a market system is going to be no better than command and control. But if you can guarantee them that the rules aren't going to change dramatically between now and the year 2000—that you are going to ask for a 25 or 30 percent reduction and then revisit the standard in the year 2000—then I think there is a real opportunity for the private sector to deliver the kind of environmental innovation that people like Vice President Gore would like to see.

Mr. HORN. Thank you.

Mr. APPELATE. Thank you very much, Mr. Horn. And I think you are right, Mr. Churchill did say something to the degree that democracy is the worst form of government there is except for all others. And we will have to agree with that. I suppose government at best isn't the most efficient democracy, isn't the most efficient way, but it is the best. It has worked for well over 215 years and sometimes people have acknowledged that maybe government gets too involved in their private lives and business lives, but somebody has to look out for the people in general, too. And if it wasn't for government, why, we would be in quite a pickle most of the time.

And that is why we have a law. We are not a completely free Nation. There isn't really such a thing as total freedom, otherwise we would be in utopia. That went out in the book of Genesis. But thank you very much for being here before the committee.

I appreciate your input and it certainly will be useful to us as we look forward to trying to put together some very important legislation. Thanks again.

This committee is at adjourned until further call.

[Whereupon, at 12:31 p.m., the subcommittee was adjourned, subject to the call of the Chair.]

STATEMENT BEFORE THE  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
OF THE  
HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

Relating to

WATER RESOURCE MANAGEMENT AND PLANNING

By

STEVEN M. ARNDT  
Ottawa County Commissioner

On Behalf of the

NATIONAL ASSOCIATION OF REGIONAL COUNCILS  
ENVIRONMENTAL ADVOCACY and SERVICES GROUP and as  
CHAIRMAN, TOLEDO METROPOLITAN AREA COUNCIL OF GOVERNMENTS

May 12, 1993

NARC Testimony 5-12-93  
 ..... Clean Water Act Reauthorization  
 Commissioner Steven M. Arndt  
 Toledo Metropolitan Area COG

Good morning, Mr. Chairman and members of the Committee and staff. I'm Steve Arndt, and this morning I'm here on behalf of the National Association of Regional Councils (NARC) and the NARC Environmental Advocacy Service group. NARC represents the over 500 regional councils across the country and the Environmental Service Group is the advocacy arm of the regional councils most directly affected by water and environmental legislation. A list of members is included in the gold portfolio of information you received from NARC. Also in the packet, you'll see a copy of "Accomplishments in Regional Water Resources Management, Success Stories of Regional Councils", a compilation of approaches our regional councils have taken to deal with a variety of water resource issues.

Mr. Chairman, I would ask that the packet of information, including the National Association of Regional Councils' policy suggestions, be entered into the record along with my testimony today...Thank you.

As Chairman of the Toledo Metropolitan Area Council of Governments and an Ottawa County Commissioner, I'm also speaking about Northwest Ohio and Western Lake Erie water issues. On behalf of all those I'm representing today, I would like to thank you for asking us to provide our views on water resource issues, especially as they relate to your reauthorization of the Clean Water Act.

The present Act has a strong, substate, regional management and planning component, but, because of limitations in federal funding and because of the general movement away from "incentive-based" federalism toward "regulatory-based" federalism, both the Congress and the previous two Administrations have, wittingly or unwittingly, abandoned implementation of this important component.

Further, the present inadequate level of federal assistance, combined with increasingly higher wastewater treatment standards, are forcing local agencies to charge higher local hook-up and treatment fees which, in turn, are pushing up the cost of housing. (Steve Arndt to cite Ohio numbers relating to this point)

In reauthorizing the Clean Water Act, therefore, the Congress should ensure that the nation's water resources are managed and planned in a comprehensive manner by legislatively encouraging regional approaches to, and, where practicable, multi-jurisdictional solutions for, the water quality problems facing local and state governments. Within this planning context, the reauthorization should recognize that further, more stringent standards should only be imposed if such mandates are adequately funded.

NARC Testimony 5-12-93  
 ..... Clean Water Act Reauthorization  
 Commissioner Steven M. Arndt  
 Toledo Metropolitan Area COG

As a county official, I feel we have an important role to play in protecting water quality...but we can't do it alone. The Federal Government's approach has been to issue mandates and leave local government with sole responsibility for implementation. Moreover, the mandates lack a sense of priority.

The Ottawa County sewage treatment plant in Danbury Township is a lagoon system, serving a lakefront residential and recreational area. During a weekend in good fishing weather it's not unusual to have a 4 county population of over 250,000 while in the dead of winter that population in the township dwindles to 4,000. The area doesn't have industry, but we're mandated to test for metals that aren't in the raw sewage, add to that mandates to remove grease and dechlorinate and we have a real cost/benefit dilemma. These mandates don't make a lot of sense in light of our problem. We could get a lot more water quality benefit for the money by extending sewer lines and closing package plants that degreasing or dechlorinating.

The National Association of Regional Councils would like to submit the following 10 legislative suggestions, and I'd like to augment or reinforce them with specific examples and concerns from an Ohio perspective (to be supplied in oral testimony).

Reauthorization of the Clean Water Act should:

1. Return to the original, fundamentally sound strategy of dealing with natural resource issues at the regional level and reemphasize the need for a federal, state and local partnership in, instead of a regulatory-based approach to, resource management
2. Re-establish the mandate for the states to develop and maintain water resource management plans through substate-regional, basin-wide planning processes.
3. Require federal interagency and intragency coordination in regulatory and financial-assistance decisions.

I'll share an example of the Catch-22 of non intragency cooperation. EPA, by allowing private businesses to install "package" sewage treatment plants, development goes ahead without sewers, and the County loses control over its own land use planning. When those neglected treatment plants fail and cause pollution problems, EPA orders the County to take responsibility. This is what happened in Catawba and Portage Townships, and the same thing is happening all over, again, in other lakefront areas.

Luckily on the Catawba/Portage Township project, we got one of the last 55% construction grants, of about \$14 million. Even with that and a special State grant of \$1.5 million, the users are burdened with higher sewer rates. Today, without construction grants, we would not be able to build the project at all, and some 68% of the wells in the area would still be contaminated.

At great cost, we've addressed the issue, but here's the Catch-22. Did EPA stop issuing permits to build these plants, even in areas where they could tie into or extend the sewer system? No, in spite of our pleas, we had to seek relief from our State Legislature to assure that we wouldn't be building the next generation of future problems. Hopefully, the policy and financial implications will tie together better in you Reauthorization. It's sure had to explain back home.

4. Where state or local governments have made long-term financial commitments to meet federal water quality standards, more restrictive federal requirements should not be imposed unless the federal government provides 100 percent funding for such increased costs.
5. Recognize that water pollution and water supply issues are interrelated and that the reauthorized federal program should provide for integrated water resource planning and management processes at the basin and substate regional levels.

Clean water and good fishing bring people to Ottawa County. Protecting those resources is very important, but we don't have complete control. A lot of pollutants come down the Portage River and out into Lake Erie. There are six counties, four cities and about twenty-five villages in the Portage Basin. We want a clean Lake Erie. We want to see an end to beach closings at Port Clinton. We need a clean Lake Erie to protect our own economic base.

- We have pollution coming into the Portage from throughout the basin, and if we're going to address the problems, we have to do it on the basin level. We've seen the Remedial Action Plans use this approach with success in Ohio, and we should apply it to the other river basins as well, like to Portage and the Sandusky
6. Revise the schedule for meeting federal standards for managing combined sewage overflows to reflect the financial capacity available at the federal, state and local levels to deal with this problem.
  7. Emphasize the need for regional approaches and solutions in state and substate management and implementation processes.

NARC Testimony 5-12-93

..... Clean Water Act Reauthorization  
Commissioner Steven M. Arndt  
Toledo Metropolitan Area COG

8. Recognize and strengthen the essential role of local governments in implementing nonpoint-source management provisions.
9. Provide adequate financial assistance to address priority problems mutually identified and agreed upon by the states and localities and coordinated through substate regional councils.
10. Use consistent, interagency-coordinated definitions for water quality terms and standards.

In opening these Clean Water Act Reauthorization hearings, Chairman Mineta talked of the use of State Revolving Loan funds and the possibility of tying the Clean Water and Safe Drinking Water funds together. Developing a "bigger pot" and better financing options are certainly worth your careful consideration.

NARC and its Environmental Advocacy and Services Group would welcome the opportunity to work with you as you develop the water policies that will guide us into the next century. As with transportation and air quality, water issues don't stop at jurisdictional boundaries. They demand and deserve attention, planning and management at the substate regional level.

Again, my thanks for providing this opportunity to share our concerns and suggestions. I'd be happy to entertain any questions from the Committee.

**THE 21ST-CENTURY AMERICA PROGRAM:  
Making the U.S. More Competitive**

There is a growing national consensus that the U.S. must enhance its competitive position in the global economy if it is to retain economic leadership during the 21st Century. It has been long recognized that the U.S. economy is really a composite of many subnational economies. During the first half of the 20th Century, our cities were the principal subnational economic units. They contained our industries, labor force, major consumer markets and housing. Today, our subnational economies are considerably more expansive and complex. City boundaries, and often even the more inclusive county boundaries, no longer circumscribe all the components of a local economy. Similarly, state boundaries usually do not contain the larger U.S. economic regions (e.g., the Northeast U.S., the Southwest, etc.). Technological innovation in travel and communications has produced a pattern of growth in our urban and rural regions that has radically altered the configuration of our subnational markets.

The patterns of growth that have blurred local jurisdictional boundaries in our metropolitan areas have produced large economic and market regions that are incongruent with the smaller political jurisdictions comprising them. As a result, public decisions on investments for infrastructure, education and training, health care and other public facilities and services are often disjointed, unfocused and conflicting, making it difficult for these regions to function effectively as economic entities.

NARC recommends that the Administration and the Congress initiate an **intergovernmental, consensus-building process to establish America's investment priorities for the 21st Century**. This is a **"Putting People First"** program, and the **federal government should take the lead** by providing funds to the states to initiate these processes. The products of these state-initiated processes are **state and regional "Strategic Investment Programs."** These processes would identify and set priorities for coordinated public- and private-sector investments in public works, R & D, job training and retraining, and human resource development needed to meet state and regional economic-growth and resource-protection goals for the 21st Century. Funds for these strategic investment processes should be allocated to the states with a requirement for mandatory pass-through of funds to local governments and/or regional councils. The level of funding for each state should be based on present and projected levels of population, modified by each state's level of poverty and unemployment relative to the national levels.

Following gubernatorial acceptance of substate and interstate strategic investment programs, federal financial assistance to assist in implementation should be in the form of supplements to existing, and any appropriate new, federal financial assistance programs. Where a state does not wish to initiate such a process, its local units of government may, through their established substate or interstate regional

councils, request federal funds to participate in the preparation of regional plans that accomplish the same purposes set forth above (on a regional scale).

## II A. PRIORITIES FOR STRATEGIC INVESTMENT PROGRAMS

- ☛ **Repair and construction of infrastructure systems**, particularly transportation and wastewater facilities, to bring them up to "adequate facility standards."
- ☛ **Public- and private-sector "research and development" (R&D) on and installation of, state-of-the-art technologies** specifically in the areas of transportation (e.g., high-speed rail/mag-lev; intermodal termini), communications (e.g., nationwide fiber optics), energy (e.g., solar), automation (e.g., "chip" technology) and waste management (e.g., recycling, biodegradable packaging) systems, to reestablish America's technological leadership by the beginning of the 21st Century.
- ☛ **Job-training and retraining programs** for displaced, unskilled and unemployed workers, to prepare a 21st-Century workforce.

## II B. MINIMUM STANDARDS FOR STRATEGIC INVESTMENT PROGRAMS

- ☛ **Strategic investment programs should cover a period of 6 years (1994-2000) and be ready for implementation by mid-1994.**
- ☛ **Strategic investment programs should fully integrate and coordinate objectives and priorities for overall local and regional community development, including at least *transportation, natural resource and environmental protection, human resource development, housing, waste disposal and recycling, economic development, job training and other programs* into a coordinated "blueprint" for action.**
- ☛ **Strategic investment programs should identify specific actions, and sets of action, necessary among all levels of government to effectively manage both the supply of and the demand for public services and facilities.**
- ☛ **Strategic investment programs should evolve through bottom-up, open, collaborative processes** that produce a consensus among units of government, citizens, private-sector leaders and others at the substate, or interstate, regional level.
- ☛ **Strategic investment programs should be coordinated regionally during their development with other local governments.**

- ☛ **Strategic investment programs should provide for a monitoring and evaluation system**, based on a comprehensive data management system, that tracks the relative effectiveness of plan's policies and priorities in achieving statewide goals and objectives.

**REQUEST FOR AUTHORIZATION FOR FUNDING  
FOR  
WATER ENVIRONMENT RESEARCH FOUNDATION**

**PRESENTED  
TO  
HOUSE WATER RESOURCES & ENVIRONMENT SUBCOMMITTEE  
PUBLIC WORKS AND TRANSPORTATION COMMITTEE**

**BY**

**GEORGE D. BARNES, P.E., DIRECTOR  
BUREAU OF POLLUTION CONTROL  
DEPARTMENT OF PUBLIC WORKS  
CITY OF ATLANTA, GEORGIA  
AND  
CHAIRMAN, BOARD OF DIRECTORS  
WATER ENVIRONMENT RESEARCH FOUNDATION**

**MAY 12, 1993**

Chairman Applegate and members of the Water Resources Subcommittee. My name is George D. Barnes and I am Director of the Bureau of Pollution Control for the City of Atlanta. I am here today on behalf of the Water Environment Research Foundation in my role as Chairman of the Board of Directors to ask for your support of our request for funding at the level of \$2.5 million in the FY '94 budget.

The Research Foundation is an organization that is very important to my city and to its other Subscribers. The Foundation was organized in 1989 and has grown steadily to its current level of membership of more than 150 Subscribers. These Subscribers represent more than 60 million people and include municipal wastewater utilities, industry, consultants and equipment manufacturers. Over the past three years our Subscribers have invested approximately \$3 million in the Foundation. During this same period, an added investment of \$2.7 million has been made by the federal government.

These dollars have been committed to fund more than 33 specific research projects that have been identified and prioritized by the Foundation's Subscribers, in the areas of Human Health and Environmental Effects, Integrated Resource Management, Collection and Treatment Systems, and Residuals Management. These projects will provide important information that will directly benefit environmental protection and the communities that we serve. By combining the municipal/federal investment with dollar-for-dollar matches from other sources, the Foundation has leveraged its investments to fund more than \$11 million worth of active research.

I would like to provide the committee with a brief overview of the organization and operating policies of the Research Foundation to illustrate how research projects are identified and managed and how our funds are used.

The Research Foundation is a not for profit corporation that is governed by a Board of Directors representing the general makeup of its Subscribers. In addition, the Board has established a Research Council, composed of nationally recognized experts from the municipal, academic, consultant, industrial and regulatory areas, to develop and oversee the Foundation's Research Program. The Board of Directors and the Research Council are composed of volunteers who serve with no compensation from the Foundation. The day to day activities of the Foundation are carried out by a full time staff of 8 professionals. Approximately 84% percent of our annual revenues are expended for research and approximately 16% percent for administration.

A Five-Year Research and Development Plan is developed annually, with full input from the Research Council and Subscribers, to cover specific areas of concern that have been identified and prioritized. A list of the current research projects and areas proposed for 1994 research is attached.

I will focus my remaining remarks by giving you some general background on several of the key projects that are underway in the areas that were previously mentioned.

### RESIDUALS MANAGEMENT

The Foundation is concerned with both facilities which incinerate, and those which use a form of land disposal. Information derived from current and future studies will allow utilities more freedom in selecting the most suitable technologies for biosolids treatment and disposal, and will provide tools to promote public acceptance.

Our project on the Evaluation and Quantification of Biosolids Incinerator Hydrocarbon Emissions is looking at the extent to which incinerators represent a health risk. Recent health risk assessments are based upon total hydrocarbon measurements. This THC measurement is used for all organic compounds that might be emitted from a biosolids incinerator. However, cancer potency and risk factors vary, and are most often established on a compound by compound basis. Regulatory agencies have been forced to lump these compounds together forming a composite unit risk factor, while there is little data to verify the assumptions that underlie this grouping and the subsequent health risk assessments for biosolids incinerators.

The first phase of this project has been completed and the information that was obtained was extremely useful to EPA and the municipalities that utilize incineration, for the establishment of scientifically sound and acceptable criteria for the disposal of biosolids. The data provided by the Research Foundation will result in savings to municipalities of millions of dollars in fuel costs and will provide for an acceptable level of protection for human health and the environment.

In the area of land application we are conducting research that will Document Long-Term Experience of Biosolids Application Programs. This project will undertake the documentation of experiences at land application sites that have operated for more than ten years to provide the public and responsible officials with credible information on which to base policy decisions. This report will be available this year.

We are expanding our land application research through a cooperative project with the New York State Energy Resources Development Agency. This \$250,000 cooperative project will gather new data on the effects of thermal processing and natural elements on long term application of biosolids.

Again in the area of biosolids, the Foundation is participating in a project sponsored by the National Research Council which will study the Use of Treated Municipal Wastewater Effluent and Biosolids in the Production of Crops for Human Consumption.

Future biosolids research is addressing the Demonstration of Soil Remediation with Sewage Biosolids to Reduce Bioavailability of Metals. This will be of interest to municipalities and EPA in that it focuses on a beneficial use of wastewater biosolids and information on the

relative bioavailability to mediate soil-born metals. The results of this study could help to clarify the issue of whether a new and inexpensive resource is readily available for remediating urban soils contaminated with lead from auto exhausts and other sources.

### INTEGRATED RESOURCES MANAGEMENT

Integrated Resource Management is gaining popularity and looms on the horizon as a challenge to water quality professionals. Changes in current regulations are requiring utilities to look at the future responsibility for the entire watershed. The Foundation's Nonpoint Source research and Aquatic Ecological Risk research begins to put the watershed management puzzle together while providing information that will be of immediate use.

Federal NPS initiatives are forcing state governments to implement regulations before the resulting needs can be fully identified and researched. Many of the current point source regulations are based on dry weather standards. Because the loading of NPS primarily occurs during wet weather there is cause to question whether current standards should apply.

While there is no question that we are in support of reducing the environmental impact from nonpoint source pollution, there is a question as to the required level of treatment. By understanding the impact of NPS, it is possible that wet weather standards could be developed to fully protect the environment and at the same time reduce the costs associated with overly conservative controls.

One of the research projects underway looks at the Identification and Evaluation of Use-Attainability Methodologies for Aquatic Ecosystems. This research will provide a comprehensive and valid technical resource to conduct use-attainability analysis to accurately establish present uses and prediction of potential uses to develop the most appropriate management techniques to optimize the net environmental benefit. Also included will be a detailed discussion and support analysis of recommended methodologies and their applications.

We have also funded a project which Identifies Effective Sampling Protocols for Nonpoint Source Pollutants. The main premise for this research is that most monitoring systems are limited to a relatively small number of samples collected during storm events and lack continuous stream discharge measurements. This, in turn, produces inaccurate NPS load estimates and limits the development, calibration and testing of storm-loaded predicting models.

As one of the goals of the Research Foundation is to eliminate duplication of effort, this study will expand on data sets already under study and includes on-going sampling services provided by the U.S. Geological Survey. This research will determine the amount of suspended sediments, nutrients and pesticides transported by surface and subsurface waters draining from agricultural basins. The result will be the organization of sampling strategies for assessing the impact of nonpoint source pollutants in receiving streams and efficacy of

agricultural best management practices. A final report will be prepared representing a systematic evaluation of storm event sampling requirements to estimate pollutant loading.

Other projects will provide research dollars for studies in the Use of Riparian Buffer Zones and Constructed Wetlands in Water Quality Management Programs and also research on Particulate and Particulate-Pollutants Interaction in Water Bodies and Wetlands Receiving Point and Nonpoint Discharges.

#### HUMAN HEALTH AND ENVIRONMENTAL EFFECTS

Closely related to the study of NPS is that of Aquatic Ecological Risk. In this instance we look at the magnitude and probability of human activities and natural phenomena on the watershed's ecosystem.

Because all hazardous materials cannot be tested in-depth, risk assessment protocols should be able to screen substances for environmental risks using minimal testing and evaluation efforts. Such protocols should be capable of delineating high risk situations that require immediate action, from those that have a potential but ambiguous risk, and those which have negligible risk.

We are currently funding a project which will Develop, Test, Validate and Refine Protocols for Assessing Aquatic Ecological Risk. While a large number of risk assessment protocols have been proposed or applied, none of these are currently comprehensive and flexible enough to be directly applicable to water quality criteria, standards and NPDES permit limitations. As more risk-based regulations are imposed it becomes increasingly important for research of this type which will produce a comprehensive methodology for using Aquatic Ecological Risk assessments to derive both numerical and narrative quality criteria and standards.

The Research Foundation has started another project in this area which will study the Time-Scale Effects of Chemically Toxic Events in Freshwater and/or Marine Ecosystems. This study will address the need to assess the time-scale impacts associated with point and NPS toxicity for pollutant loadings in different aquatic ecosystems. Understanding this issue is important in developing toxics discharge regulations for Combined Sewer Overflows (CSOs) and other stormwater events.

As an extension to this research, the last area I want to mention is the Foundation's involvement in the Great Lakes Initiatives. The Water Environment Federation's work group in this area has approached the Research Foundation to consider playing a role in the need for scientifically sound water quality criteria. The Foundation is in the process of developing an independent research plan to improve the database and science used to establish water quality criteria. The Foundation would then solicit and accept donations from municipalities, consultants, and industry, to contract for independent research.

As you have heard, the Water Environment Research Foundation is addressing the needs and concerns of the cities and utility agencies that are faced with making major financial commitments that have a direct impact on the citizens they serve.

The municipal subscribers to the Foundation are supporting the Foundation through annual subscription rates that are based on \$250 per million gallons of daily average treated flow. The minimum rate is \$250 for the smallest facilities and it caps at \$75,000 for the largest facilities. To give you an idea, Atlanta is a 148 million gallon facility and our yearly subscription rate is \$37,000. Our elected officials have supported this investment because they realize that a return of many times this amount is obtained from the research work that is being done. For example, the amount of money Atlanta is saving on the incinerator hydrocarbon emissions study alone will pay our subscription rate for the next 10 years.

In addition to the financial contribution that is made annually by our Subscribers, many utilities are contributing direct support through the participation of staff members on the Board of Directors and the Research council. This includes Subscribers such as Erwin Odeal from the Northeast Ohio Regional Sewer District, Billy Turner from the Columbus Georgia Waterworks, Edward Wagner from the City of New York, Department of Environmental Protection, Walter Bishop from the Contra Costa California Water District and John Lampe from the East Bay Municipal Utility District in Oakland, California.

Federal Funding previously received by the Research Foundation includes \$1.5 million in FY '91, \$.5 million in FY '92 and \$.7 million in FY '93, bringing the total to \$2.7 million of Federal Funding. The EPA is actively participating with the Foundation in the identification of research projects and in the selection of projects for which the federal funds will be allocated.

Through it's collaborative funding efforts, the Research Foundation has made an admirable start in addressing some of the nation's most pressing water quality research needs, however, there is much more that still needs to be done.

When utility directors such as myself go in front of our elected officials and rate payers to request support and funding for state and federally mandated environmental programs, we must have confidence that the mandates are based on sound and documented scientific information. In our view, it is essential that the federal partnership with the Research Foundation be continued so that we and the citizens that we all serve will be able to confidently support the programs that are required to protect and enhance the environment.

I again urge for you to support of our request for funding at the level of \$2.5 million in the FY '94 budget.

I sincerely appreciate the opportunity to appear before you today and I would be pleased to answer any questions.

**STATEMENT OF  
JAMES R. BATCHELDER  
VICE PRESIDENT,  
ENVIRONMENTAL AFFAIRS AND TECHNICAL SERVICES,  
KOPPERS INDUSTRIES INC.  
ON BEHALF OF  
THE AMERICAN WOOD PRESERVERS INSTITUTE  
ON THE REAUTHORIZATION OF THE  
FEDERAL WATER POLLUTION CONTROL ACT  
BEFORE  
THE SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
MAY 12, 1993**

Mr. Chairman and members of the Subcommittee, thank you for the opportunity to present the views of the American Wood Preservers Institute (AWPI) on the Federal Water Pollution Control Act reauthorization.

I am James R. Batchelder, Vice President of Environmental Affairs and Technical Services for Koppers Industries Inc. Koppers Industries owns and operates 13 wood preserving plants in the United States. I am a past chairman of AWPI and remain active in that organization. I am familiar with the Clean Water Act and its regulations. I am accompanied today by Michael Charles, manager of regulatory affairs for AWPI, and John C. Chambers of McKenna & Cuneo, our legal counsel.

The Institute is the national trade association representing the wood-preserving industry. Its members include manufacturers of treated-wood products; registrants of wood-preserving pesticides regulated under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA); suppliers of raw materials and equipment; and providers of allied services (e.g., environmental engineering and consulting firms).

Our members employ creosote, pentachlorophenol, copper-based preservatives, and inorganic arsenic-chromium formulations in the preservation of wood for consumer goods and for such industrial uses as railway ties, utility poles, and marine piling.

My comments today primarily will address the wood-preserving industry's interest in maintaining the Domestic-sewage exclusion (DSE) and recommended improvements to the effluent limitations and pretreatment standards process. I wish to stress five important points.

**First, Congress should retain the domestic-sewage exclusion in Section 1004 of the Resource Conservation and Recovery Act (RCRA) to protect American industry's ability to continue to safely and efficiently discharge all wastewaters that have been pretreated to meet Clean Water Act and permit standards.**

A critical issue for the wood-preserving industry involves the retention of the domestic-sewage exclusion under Section 1004(27) of RCRA for industrial effluents that are discharged to publicly owned treatment works or POTWs.

Like many other industries, wood preservers produce wastewater that is listed as a hazardous waste under RCRA or that contains hazardous waste. Where discharged to a POTW, this water is subject to regulation under the Clean Water Act, which requires pre-treatment of the wastewater and which imposes rigid monitoring and discharge limitations on the generator of the wastewater.

AWPI opposes any ban on the discharge of wastewater to a treatment works that already is subject to permitting and pretreatment under the Clean Water Act and local authority.

Unlike most other wastes, wastewater cannot be effectively landfilled or incinerated,. It must eventually be released to the environment as a liquid or vapor.

Discharge to POTWs -- in full compliance with the Act's pre-treatment requirements -- assures that wastewaters are (i) properly and safely pre-treated by the generator, (ii) treated by the POTW, and (iii) discharged in accordance with a state or federal permit issued under the National Pollutant Discharge Elimination System (NPDES).

Additionally, under current federal rules<sup>1</sup>, generators already are required to notify POTWs in writing that their discharge contains hazardous waste and to list the hazardous constituents in it.

Let me emphasize this point: Discharge under the DSE does not avoid regulation; it simply transfers control of the discharge from RCRA to the Clean Water Act. The exclusion provides a cost-effective management alternative for industry and protects the environment.

Repeal of the domestic-sewage exclusion would eliminate an environmentally protective disposal outlet for industrial effluent meeting a Clean Water Act treatment standard.

---

<sup>1</sup> 40 CFR §403.12(p)(1).

As you may know, proposals in the last Congress would have placed wood-preserving wastewaters treated with the appropriate technology in the unusual position of being disposable at a RCRA Subtitle C facility, but barred from discharge to a POTW after being properly treated to allow for safe discharge. This would create an unnecessary conflict between the two laws, produce confusion among regulated industries, and provide no additional environmental benefit.

**Second, problems related to the DSE can and should be solved by proper implementation and enforcement of existing regulation of POTWs.**

POTWs are already required to have pretreatment programs that regulate industrial discharges to their systems, including those that are or contain hazardous waste. Congress should insist that EPA fully implement these requirements through enforcement and by providing help in developing standardized pretreatment standards.

NPDES permits for POTWs should properly account for connected industrial dischargers, as well as for specific local conditions. Thus, by meeting NPDES requirements and enforcing their own pretreatment requirements, POTWs will assure that industrial dischargers, including those taking advantage of the DSE, do not cause environmental harm or public hazard.

**Third, pretreatment standards and effluent limitation guidelines (ELGs) do not provide the timeliness or flexibility needed. A more streamlined, efficient process should be implemented.**

We believe that your consideration of problems with the existing system is important because the Federal facilities Compliance Act and previously proposed CWA legislation make use of the DSE dependent of the existence on-- and compliance with -- pretreatment standards. We have found the system of setting and updating pretreatment standards unworkable.

Pretreatment standards and effluent limitation guidelines (ELGs) must allow for flexibility in application relating to location specific situations and changing regulatory and technical conditions.

The standards and guidelines have been in effect for the wood-preserving industry since 1972 and they have not been substantially changed since then. When they were promulgated, they represented the then-current state of the art in wood-preserving wastewater treatment.

The effluent limitation guidelines prohibited discharge to surface waters. Similarly, the pretreatment standard for new sources (PSNS) also barred any discharge to POTWs. Nevertheless, the pretreatment standard for existing sources (PSES) allowed discharges while limiting levels of oil and grease, copper, chromium, and arsenic.

The no-discharge requirement was accomplished by means that generally included primary oil-water separation, collection of wastewater in soil-lined surface impoundments, and treatment or disposal by evaporation in lined surface impoundments, or by treatment or disposal by evaporation or spray application to land.

In 1980, bottom sediment sludge from the treatment of wastewaters from processes that use creosote and pentachlorophenol were listed as hazardous wastes under RCRA.

The U.S. Environmental Protection Agency (EPA) indicated that the accumulated sediment in surface impoundments was "storage" of a hazardous waste under RCRA. This made the continued use of surface impoundments impossible. Thus, many wood preservers closed their impoundments and installed treatment systems that discharged wastewater to spray irrigation fields because the effluent limitation guidelines prohibited direct discharges.

Then, in 1991, EPA added "process wastewater" to the list of hazardous wastes from wood-preserving operations. This meant that the irrigation fields would require a RCRA permit for land disposal. RCRA permitting is not required for a discharge to a POTW or in accordance with an NPDES permit, however.

Most wood preservers who employ oilborne preservatives, including most Koppers facilities, now discharge pretreated wastewater to POTWs. But some plants, including three Koppers plants, are not served by sewer systems. Consequently, discharge to a POTW is not an option.

Because the effluent limitation guidelines require "no discharge," NPDES permits cannot be obtained for surface discharge. Thus, due to RCRA and effluent limitation guidelines, there is now no viable option for discharge of wood-preserving wastewater where a POTW is not available, no matter how well the water is treated.

The guidelines need to allow individual permit writers the flexibility to consider variances to the ELGs where changing technology and regulations make their application impractical for specific situations.

In addition, the process for reviewing and updating existing pretreatment standards and effluent limitations needs to be made workable.

Due to changes in regulation and environmental standards, we in the wood-preserving industry have made substantial progress in our wastewater collection and treatment in the last 20 years.

But the pretreatment standards and effluent limitations have not changed to keep pace. They are now out of date and do not provide appropriate standards for either surface discharge or pretreatment. This means that they are generally of no use to permit writers.

Many within EPA may recognize this problem, but the Agency is too busy developing new standards and guidelines to properly consider updating the existing ones.

With new industries springing up every day, it is not practical to expect EPA to write and keep current standards for every industry. In many cases, permit writers must comply with basin plans, toxics criteria, and other local concerns to the point the standards are of no use at all.

They should be promulgated only to address specific and widely applicable national needs. They should be reviewed periodically, such as five years, at which time the need and appropriateness of the standards would have to be evaluated and reaffirmed.

**Fourth, the time limitation for appealing an ELG should be eliminated.**

The Clean Water Act and EPA regulations provide a method for dischargers to appeal effluent limitation guidelines based on "fundamentally different factors" than were considered in developing the guidelines. Nevertheless, these sections also require that a request for a variance based on fundamentally different factors be filed within 180 days of the date the effluent limitation was published.

No provision is made for factors that change after the effluent limitation has been promulgated. RCRA was substantially amended in 1984, land-disposal restrictions were imposed, and wood-preserving wastewater has been listed a hazardous waste. Moreover, the state of the art of wastewater treatment technology has changed radically. Yet the effluent limitations reflect none of these changes.

EPA should be allowed to consider fundamentally different factors when issuing permits, whenever they become different, rather than prohibited from such consideration. The time limitation for a variance based on fundamentally different factors should be rescinded.

**Finally, the Federal Facilities Compliance Act of 1992, Federally Owned Treatment Works modifications to the DSE unnecessarily restrict industrial discharges, but can be made workable.**

We understand that the language used in the Federal Facilities Compliance Act is being considered for incorporation into the Clean Water Act Reauthorization to restrict application of the DSE. This Act provided a new section 3023 to the Resource Conservation and Recovery Act (RCRA) covering Federally Owned Treatment Works (FOTWs) which provides an added interpretation for how the DSE should apply to FOTWs. In this context, the DSE was modified to say that solid or dissolved solid material in domestic sewage is not a solid waste if:

- 1) the waste water source is subject to and in compliance with Pretreatment Standards; or
- 2) for waste water for which no pretreatment standard has been written, EPA makes a schedule to make a Pretreatment Standard which would apply to the waste water source within 7 years, and provided that EPA actually does promulgate the Pretreatment Standard and the discharge complies with that standard when it become effective; or
- 3) for waste water without current or planned Pretreatment Standards, the waste water is not prohibited from land disposal because it has been treated to meet the land disposal restriction (LDR) limitation levels; or
- 4) the waste water is generated by a household or person generating less than 100 Kg/month.

The Act further states that it is unlawful to discharge hazardous waste to FOTWs.

If this language is applied to Publicly Owned Treatment Works (POTWs), the following would result:

Existing wood preserving plants currently subject to pretreatment standards could continue to discharge wood preserving process waste water, but any discharge exceeding the standards would be a RCRA violation, in addition to potential pretreatment permit and CWA violations.

Any new wood preserving plant could not discharge process waste water to a POTW because the Pretreatment Standard for new plants is "no discharge." This condition currently exists and would continue to give existing plants a competitive advantage.

Any facility with hazardous waste water not presently subject to pretreatment standards or land disposal restrictions would be prohibited from discharging to a POTW. Only after LDR limitations are achieved with pretreatment could the waste be discharged. The language requires that when a waste stream is newly listed, it would immediately be prohibited from discharge to POTWs. Only after LDRs are set could discharge be allowed.

Further unnecessarily complicating this scenario, the exemption would only apply if the waste water meets the LDR limits "because such material has been treated..." Thus, if the waste water met the limits without treatment, it could not be discharged.

Although we do not believe additional regulation of discharges under the DSE is justified, if the Congress believes it is necessary, Koppers and the AWPI would not oppose restricting the DSE by incorporation of the language used in the Federal Facilities Compliance Act as the best alternative, provided paragraph 3023 (a) (3) is corrected to read as follows:

**(3) such solid or dissolved material is not covered by paragraph (1) or (2) and is not prohibited from land disposal under subsection (d), (e), (f), or (g) of section 3004 because it is in compliance with all applicable treatment standards established pursuant to Section 3004(m); or**

AWPI and Koppers support responsible legislation and regulation. We encourage you, as you reauthorize the Clean Water Act, to consider our concerns. We also welcome any chance to work with you as the Act is considered by your committee.

Mr. Chairman, this concludes AWPI's prepared testimony. I will be happy to answer any questions.

## I. Introduction

The Chemical Manufacturers Association (CMA) is pleased to submit this written statement on reauthorization of the Clean Water Act (CWA). CMA is a nonprofit trade association whose member companies represent more than 90 percent of the productive capacity of basic industrial chemicals in the United States. CMA's members are directly and significantly affected by the requirements of the Clean Water Act.

CMA and many of its member companies were actively involved in the CWA reauthorization that led to Congress' passage of the Water Quality Act of 1987 (WQA). Since 1987, CMA has worked to help develop regulations to implement these amendments. Most of the regulations stemming from the 1987 amendments have been promulgated and CMA members are now implementing them at their facilities. Needless to say, there has not yet been an adequate opportunity to assess the positive impact on water quality as a result of full implementation of programs that Congress adopted in 1987.

Further, since 1987 Congress has passed three other pieces of legislation directly dealing with water quality issues -- the Great Lakes Critical Programs Act of 1990, the Coastal Zone Management Act Amendments of 1990, and the Oil Pollution Act of 1990. Implementation of these three programs is just beginning. EPA recently proposed guidance for the Great Lakes States that will produce consistent, minimum water quality controls for this region. The CZMA amendments, which provide broad coverage in 34 states, will effect controls on nonpoint sources of pollution in coastal waters, including those coastal waters of the Great Lake states, and adjacent shorelands of

these states. Regulations under the Oil Pollution Act, implementing the requirements for facility response plans to deal with worst case discharges of oil, have either been proposed or promulgated. Another piece of legislation enacted since 1987 that will also effect additional reductions in releases to all media, including water, is the Pollution Prevention Act of 1990. Implementation of new reporting requirements under this act is also just getting underway.

According to EPA, regulatory controls on industrial point sources have succeeded in achieving large reductions in pollutants discharged to waters of the United States. When the Clean Water Act was first enacted in 1972, industrial discharges were considered a major cause of water quality impairment. Two years ago when CMA testified before this committee, we quoted EPA's National Water Quality Inventory -- 1988 Report to Congress -- to the effect that less than 15 percent of the remaining water quality problems could be attributed to industrial discharges. In EPA's 1990 Report to Congress, the data is even better: less than 10 percent of the remaining water quality problems were attributed to industrial discharges.

While it would be wrong for industry to use these statistics to claim its work was done, CMA believes it is appropriate to cite these data to support our belief that the Clean Water Act controls on industrial discharges have been successful and will ensure continuing improvements to water quality. The trend revealed by these data do not suggest that more controls on industrial discharges are needed. Instead, they suggest that existing controls on industry are effecting continuing improvements. As Congress considers legislation to reauthorize the Act, therefore, it should ask itself three fundamental

questions. First, will additional regulation of industrial point sources produce significant reductions in risk to human health and the environment? Second, will additional regulation of industrial point sources produce environmental benefits worth the cost or will additional regulation disrupt the current regulatory scheme? Finally, can our nation's increasingly limited resources be better spent on other water quality and environmental problems where the risks are more significant?

Instead of layering more regulation on the industrial community for questionable environmental return, CMA urges Congress to focus its reauthorization efforts on the remaining significant water quality problems. It is our view that additional regulatory controls on industrial point source discharges at this time would produce little if any significant environmental benefit.

CMA would like to present its position in detail, covering: a description of what the regulated community has been doing to implement ongoing CWA programs; a discussion about pollution prevention in the context of CWA reauthorization, including both how the current act is already forcing this new mindset and what provisions in the existing CWA act as barriers to additional pollution prevention activities; and a general discussion of several other issues being mentioned for Congress' consideration in this reauthorization.

## II. Current CWA Industrial Point Source Programs

### A. Ongoing Effluent Guidelines and Water Quality Controls

The Clean Water Act provides for a combination of technology-based and water-quality-based controls on point source discharges.

Technology-based controls represent the level of pollutant removal, on an industry-by-industry basis, that the best technology is capable of achieving. Water quality standards are the pollutant levels that are necessary to protect the designated uses of the receiving waters, e.g., fishable/swimmable.

There are three increasingly stringent levels of technology-based controls for plants that discharge directly to U.S. waters (direct dischargers): Best Practicable Technology (BPT) controls for all pollutants; Best Conventional Technology (BCT) controls for conventional pollutants; and Best Available Technology (BAT) controls to specifically address toxic and nonconventional pollutants. Plants that discharge their wastewaters to publicly-owned treatment works (POTWs), i.e. indirect dischargers, are also subject to EPA promulgated technology-based pretreatment standards, which are generally comparable to the BAT limits for direct dischargers. EPA issues these technology standards on an industry-specific basis. Where industry-specific standards have not been developed, reductions in pollutant discharges are imposed on direct dischargers through permit limits that are based on the Best Professional Judgment (BPJ) of EPA and state regulatory officials. Controls on indirect dischargers are imposed through EPA's

general pretreatment regulations and limits developed by individual POTWs.

As technologies for treating wastewater discharges have improved through the years, the industry-specific technology-based controls similarly have developed in technical sophistication, resulting in more and more stringent standards. Revisions of existing effluent limitation guidelines are ongoing and reflect increasingly sophisticated technological means for reducing pollutants discharged. Industries without effluent guidelines are also being targeted for development of guidelines. Pursuant to a 1992 consent decree issued under Section 304(m) of the Clean Water Act, EPA is required to promulgate new and revised effluent guidelines for seven specific industry categories between 1993 and 1996; to conduct studies on 11 industry categories according to specific schedules between 1993 and 1997; and to promulgate 12 new or revised guidelines between 1997 and 2003.

Today, EPA has developed technology-based effluent guidelines for nearly 50 different industries. These regulations control the discharges of conventional pollutants at parts per million levels and the priority pollutants at increasingly low parts per billion levels.

Regulation of the chemical industry is a case in point. In 1987, EPA promulgated effluent limitation guidelines for the organic chemicals, plastics and synthetic fibers point source category (OCPSF --40 C.F.R. Part 414). These guidelines included discharge limits for conventional and nonconventional pollutants, and for more than 60 individual toxic pollutants for direct dischargers. These guidelines also imposed categorical pretreatment standards for more than 40 toxic

pollutants for indirect dischargers. This rule imposed more pollutants limits on the chemical industry -- by a wide margin -- than any other industry guidelines had done to date -- and these pollutant limits were at more stringent levels than any other industry guidelines to date.

In addition to compliance with technology-based standards, dischargers must also meet even more stringent water-quality-based standards where needed to meet designated uses of waters. Water quality standards are developed by the states for the protection of human health and aquatic life. They are based on chemical-specific water quality criteria (designed to protect aquatic life and human health) and the designated use of the receiving stream. These standards are incorporated into permit limits by wasteload allocations among dischargers along the same water segment. In recent years, EPA has begun developing guidance on sediment criteria, wildlife and biological criteria. Once these criteria are finalized, these too will be incorporated into states' water quality standards to protect sediment, wildlife and ecosystems and may lead to lower pollutant discharge limits.

Several other new developments in the water quality based program of the Act were added by the 1987 amendments to the Clean Water Act to address the problem of toxic hotspots. In Section 303(c)(2)(b) of the Act, Congress imposed a three year deadline on states to adopt water quality standards for toxic pollutants that interfered with the designated uses of the states' waters. By December 1992, according to EPA's assessment of states' standards, some 14 states had still not fulfilled their obligations under this section. As a result, relying on Section 303(c)(4) of the Act, EPA promulgated federal water quality

standards for toxic pollutants in those states (57 Fed. Reg. 60848, Dec. 22, 1992). This federal water quality rulemaking was unprecedented because up until now, water quality standard setting was the primary responsibility of the states. EPA's action is currently being challenged by several different parties on several different grounds. From Congress' perspective, however, EPA's action is significant because it should suggest that additional water quality controls are not necessary. All the states now have adequate water quality standards to address toxic hotspots in their states' waters. Because standards for toxics are now in place, in the years ahead, water quality concerns will likely drive the NPDES permitting process more than ever before. This will mean increasingly stringent permit limits where conditions in the receiving waters require it.

#### B. New Controls and Programs

In addition to pollutant-specific technology-based and water quality-based permit limits, permitting agencies have developed or are developing other tools to protect the aquatic environment from adverse effect and to address the impacts of complex effluents. These tools include: bioconcentration evaluations for ascertaining adequacy of controls on substances in effluents that may bioconcentrate; biomonitoring requirements for determining the toxicity of the effluent; and, where necessary, numerical toxicity limits in NPDES permits.

New programs that emerged from the 1987 amendments and more recent legislation have also produced a panoply of new requirements. Under Section 304(1) of the Act, individual control strategies are being

incorporated into NPDES permits of facilities that discharge to impaired waters specifically to address remaining toxics concerns. Under Section 402(p), the control of stormwater discharges is underway with requirements for general, group or individual permits. In 1990, in response to EPA's Domestic Sewage Study, new controls were added to the CWA's pretreatment program for indirect dischargers who discharge to POTWs. In particular, these regulations improve the control of hazardous wastes that are introduced into POTWs. Regional controls are now being proposed under the Great Lakes Initiative pursuant to the Great Lakes Critical Programs Act. These will drive discharge permit limits in the Great Lakes system lower than anywhere else in the country.

Overlaying all of these new and ongoing programs are enforcement provisions that were considerably strengthened during the 1987 amendments. Both civil and criminal penalties were increased and additional administrative penalty authority was provided. Enforcement of the Clean Water Act has increased since 1987 as a result of this new authority. In particular, administrative actions have increased significantly since 1987.

What all this activity suggests is that the development of pollutant discharge limits (technology-based, water quality based and toxicity based) under the CWA is an evolutionary, ongoing process. It will continue to occur in accordance with existing statutory mandates, even if Congress takes no further action to address improvements to water quality. Since the last reauthorization in 1987, industrial point source dischargers have been implementing and complying with many new, as well as ongoing, regulatory programs. Many of these new programs

were developed specifically to address the problems caused by toxic pollutants. Effluent guidelines for the chemical industry also focus largely on removal of toxic pollutants. The effects of all these programs on the environment will undoubtedly be positive, but because their implementation has not yet been completed, their full impact is still impossible to assess. CMA urges Congress to allow time for these programs to take effect before assessing the need for additional requirements.

### III. Pollution Prevention in the Clean Water Act

CMA supports the goals of pollution prevention and the hierarchy of environmental management practices described in the Pollution Prevention Act of 1990. Under this hierarchy, source reduction activities are the preferred method of preventing pollution, followed by recycling activities and finally, by treatment. It has been suggested that this pollution prevention hierarchy should be "introduced" into the Clean Water Act by supplementing the Act's existing emphasis on end of pipe treatment with source reduction or recycling/reuse requirements.

Before embarking to impose additional pollution prevention requirements in the Clean Water Act, CMA urges this Committee to first explore two questions with more deliberation. The first question is: does the Clean Water Act already force pollution prevention decisionmaking? The second question is, if Congress decides to add new pollution prevention authority to the Clean Water Act, what

barriers to pollution prevention exist in the Act that require removal in order to achieve additional pollution prevention?

**A. Consideration of Pollution Prevention Is Already Occurring Under the Clean Water Act.**

CHA believes that the answer to the first question is an absolute affirmative. The characterization of the CWA as solely an end-of-pipe treatment program is wrong. In our view, pollution prevention includes all environmental management practices that reduce the volume or toxicity of pollutants released to the environment or generated as wastes. These practices include the hierarchy of source reduction, recycle/reuse and treatment. Because of Clean Water Act requirements, the wastewater volumes of many industries have shown marked decreases over the years as facilities sought to come into compliance with applicable guidelines.

In addition, when facilities seek to comply with discharge limits, they do not look solely to end-of-pipe treatment to achieve the limits; they also look inside the manufacturing process to determine whether the limits could be met by making changes there. Along with technological feasibility, probably the two major determining factors in a facility's decision whether to treat at the end of the pipe or to reduce a pollutant at its source are maintenance of product quality and economics. These facts must be taken into account in considering the concept of pollution prevention during the CWA reauthorization debate.

Many of CHA's member companies use pollution prevention practices other than end-of-pipe treatment to meet the CWA's effluent guidelines for the organic chemicals, plastics, synthetic fibers point source

category. For example, DuPont invested over \$10 million in pollution prevention projects at its Deepwater, N.J. facility. These projects included a variety of recovery and waste generation reduction steps. Together with some treatment upgrades, these projects reduced about one million pounds per year of toxic pollutants from the feed to the wastewater treatment plant. Similarly, at its Belle, W.Va. plant, Dupont implemented ten source reduction programs in order to meet the effluent guideline limits for both conventional and toxic pollutants. These included such waste elimination steps as solvent substitution and product recycling. With treatment plant upgrades, the final result was a 50% reduction in total organic load to the wastewater treatment plant, including nearly complete elimination of three organic priority pollutants from DuPont's discharge.

There are many other examples similar to these. In addition, the water quality-based requirements of the Act that are becoming an increasingly significant portion of the CWA's regulatory program will also force companies to consider pollution prevention alternatives. Industry often cannot "just add treatment" to comply with these standards because these standards aren't based upon either treatment technology availability or economic achievability.

While these examples illustrate that the existing CWA's requirements are already forcing pollution prevention decisionmaking, they also illustrate the point that pollution prevention decisions are site specific and pollution prevention projects are nontrivial. Each of DuPont's projects had to be individually tailored in light of conditions at each plant. The lesson to be gleaned from these experiences should be familiar: just as EPA does not prescribe the

treatment technology that industry must use to comply with the CWA's effluent guidelines, any "requirements" for pollution prevention that Congress may consider should not specify the technologies that must be used. To do so would stifle innovation in development of new manufacturing processes and new products. It would put EPA in the inappropriate role of industrial decisionmaking. Related to this, it is CMA's view that any "requirements" for pollution prevention should not force any single type of pollution prevention practice over another for the same reason. Industry should be encouraged to employ source reduction before recycling and before treatment, but industry should not be required to employ any one of these practices over another. Pollution prevention should be driven by results, not by strict conformance to the hierarchy of environmental management practices. Site specific factors and cost effectiveness must be considered in any pollution prevention decisionmaking. Similarly, industry's pollution prevention progress should not be measured according to the type of environmental management practice that it employs, but rather according to the reductions it achieves in releases to the environment.

For these reasons, CMA supports voluntary, cross-media pollution prevention programs. Voluntary pollution prevention is already occurring as a result of reporting statutes like EPCRA and the Pollution Prevention Act and voluntary programs like EPA's 33-50 program and CMA's Responsible Care® program. CMA believes that the hierarchy of environmental management practices can be achieved in conjunction with existing environmental regulations including the Clean Water Act. Pollution prevention beyond what's already occurring under existing statutes should be voluntary to allow creative development of

the infinite variations in methods of achieving prevention of pollution. Pollution prevention should be encouraged, not mandated, both because source reduction and recycling opportunities are decidedly site specific decisions and because EPA has insufficient resources to examine the multitude of industrial manufacturing processes to judge whether source reduction/recycling practices are feasible in particular facility circumstances. Rather than attempting to "command and control" source reduction and recycling practices that industries are already examining, EPA's resources would be better spent focusing on the remaining significant sources of water quality impairment.

#### B. Barriers to Pollution Prevention

Under the existing single media approach to environmental protection, each statute contains its own peculiar set of requirements and procedures. Each statute brings differing degrees of flexibility. These differences raise the potential for serious conflict among these statutes in any serious attempt to layer cross-media pollution prevention requirements on top of each statute.

Under the Clean Water Act, the antibacksliding and antidegradation provisions are perhaps the most inflexible provisions in the Act. While the objective of these provisions is commendable -- to prevent backsliding from limits that had been achieved and to maintain existing water quality -- arguably these provisions can discourage pollution prevention. For example, for a facility to achieve a significant reduction in the amount of one pollutant that it discharges, it may be desirable to substitute a different material in the manufacturing process. Use of this material, however, may result in an insignificant

increase in the level of another pollutant in the facility's wastewater. If this slight increase will cause the facility to exceed its discharge limit for that pollutant, then the substitution cannot and will not be made, despite the environmental benefit that would result from the significant reduction in the pollutant from the discharge. The provision that prevents a facility from obtaining a less stringent permit limit is the antibacksliding provision at Section 402(o) of the Act. Another provision which EPA has interpreted so rigidly that it affords little flexibility in the requirements of the Act is the Fundamentally Different Factors (FDF) variance provision. EPA has granted so few FDFs over the years that it is not viewed as providing any real relief from the technology-based effluent limitations. The result can be, again, to discourage rather than encourage pollution prevention.

For example, in one of CMA's member company's facilities, a plant has installed two pollution prevention projects as part of the company's voluntary pollution prevention program. These have reduced the concentration in the plant's effluent of a pesticide active ingredient by 64 percent. This complex facility is subject to OCPSF, pesticide and inorganic chemical effluent limitations. The pesticide guidelines are currently under development at EPA and therefore the company is subject to Best Professional Judgement limitations for this category of pollutants. The company is currently evaluating a third pollution prevention project for that plant which, in addition to potentially reducing the concentration of the active ingredient in the effluent, is projected to also reduce total dissolved solids (TDS) and chloroform discharges from the plant by 3.5 million and 1000 pounds per

year respectively. However, EPA's proposed pesticide effluent guidelines would impose such low levels on this active ingredient that the company may NOT be able to install the pollution prevention project and ensure compliance with that level. The result will be no additional reductions in TDS and chloroform in exchange for a slight reduction in the discharge of the active ingredient.

In contrast to the other examples cited above that illustrate how effluent guidelines are forcing industry to seek pollution prevention alternatives to compliance, this example illustrates the rigidity of the current Clean Water Act requirements. While EPA might suggest that this company obtain a Fundamentally Different Factor variance so that it could obtain a variance from this one effluent limitation and so pursue this pollution prevention project, EPA has granted so few FDFs that this alternative is practically no alternative at all. The hurdles for obtaining an FDF have been set so high that it offers no real relief.

Barriers to pollution prevention like these are another reason CMA believes that pollution prevention should only be encouraged, not mandated. If Congress wants to encourage more pollution prevention, therefore, it should look for incentives for additional pollutant reductions AND it should look for ways to remove the barriers to pollution prevention that exist in each of the single media statutes.

#### 1. Incentives to Pollution Prevention

Some of the incentives to pollution prevention that Congress might consider during reauthorization of the Clean Water Act include market incentives such as tax credits, accelerated depreciation schedules, and

tradeable credits. Another type of incentive for pollution prevention might relate to the permitting process itself, such as streamlined permitting or streamlined monitoring requirements where pollution prevention projects are undertaken. Alternative compliance strategies also might be considered to allow facilities the time to implement innovative pollution prevention methods that result in greater protection of human health and the environment than could be achieved under the existing command and control regulatory regime.

Positive incentives such as these could help encourage pollution prevention beyond what's already occurring under existing laws. CMA believes positive incentives would achieve further reductions in wastes and releases to the environment more effectively than additional regulatory control measures.

Negative "incentives" such as effluent fees or taxes, however, would be inappropriate because they would apply across the board unfairly, without consideration of efforts a facility may have already made to reduce its discharges. Further, taxes or fees on discharges would raise the cost of U.S.-based production and harm the international competitiveness of U.S. manufacturing.

## 2. Removing Barriers to Pollution Prevention in Clean Water Act

There are many potential barriers to cross media pollution prevention in the Clean Water Act. Two of these mentioned above are the antibrackling and antidegradation provisions of the Act. EPA's restricted implementation of the Fundamentally Different Factor variance provision of the Act similarly stands in the way of innovative pollution prevention decisions. Although there are other variance

provisions in the Act, (e.g., Section 301(g)'s variance from technology based standards for five specific nonconventional pollutants if all applicable water quality standards can be met; Section 301(c)'s variance for economic hardship, applicable only to BAT limits for nonconventional pollutants; Section 301(k)'s variance allowing up to two additional years for compliance with effluent limitations for innovative technology that will result in greater effluent reduction than is required) few of them have provided enough relief from the requirements of the Act to actually encourage more pollution prevention.

On its face, the innovative technology variance provision (Section 301(k)) suggests an approach that may be applicable in the pollution prevention context. However, its additional two years compliance time is insufficient. Developing, testing and assuring compliance from innovative production processes or control techniques requires considerably more time than 2 years. Further, requiring there be a determination that the innovative system has the potential for industrywide application limits the usefulness of this provision considerably given the facility specific nature of pollution prevention techniques.

The inflexibility of compliance schedules under the Act is another key deterrent to industry to develop alternative pollution prevention means for meeting permit limits. But for the limited variances described above, compliance with BAT limits must be by March 31, 1989 or within three years of promulgation of an effluent guideline. Source reduction activities such as equipment or technology modifications, process modifications, redesign of products, and substitution of raw

materials or catalysts all involve a long payback on investment. Product quality is also a key factor in determining whether these types of pollution prevention projects are practical. In other words, it takes more time to undertake these types of practices because, at least in diverse industries like the chemical industry, they are likely to be very facility-specific and thus they have not been demonstrated (unlike treatment technology). Complex recycling also involves product quality considerations and takes much time to test and develop to standards that can assure compliance with permit limits. Driving all of these considerations are, of course, enforcement provisions under which dischargers are subject to strict liability for exceeding their permit limits.

In conclusion, while increasingly stringent permit limits are already forcing industry to look for methods other than end of pipe treatment to meet these limits, there are implicit in the Clean Water Act (as well as in other single-media environmental statutes) many restrictive provisions that discourage rather than encourage pollution prevention. If Congress is serious about adding pollution prevention authority to the Clean Water Act, it must seriously wrestle with the inherent inflexibilities in the Act that will stand in the way of real progress in further reductions of wastes and releases. Pollution prevention is a concept that CMA has embraced with open arms. However, the inherent command and control nature of the CWA (as well as the CAA and RCRA), the single media focus of each of these statutes, and the many differing peculiarities of each of these statutes, are all in conflict with what pollution prevention must be to be successful: flexible, facility-specific, and multi-media.

## IV. Toxic Use Reduction

The Clean Water Act has in large measure focused on improving the quality of surface water in the United States through the reduction of pollutants discharged to waters of the U.S. As discussed above, how facilities meet standards to achieve these reductions in discharges has been the decision of the individual facilities. Treatment technologies may have been the method of choice for reducing pollution over the last 15 years -- largely because they have been the most cost effective techniques for achieving reductions -- but industry has always been able to choose alternative methods or to develop new treatment technologies to meet CWA limits. This principle should be maintained in any amendments to the Clean Water Act so as not to stifle innovation and progress in developing methods for reducing pollutants in discharges.

In recent years, a new concept has been promoted -- termed toxic use reduction -- which in the context of the Clean Water Act, represents a radical departure from the basic thrust of that Act. As CMA understands it, the objective of advocates of toxic use reduction is to reduce, or remove from commerce entirely, a list of chemicals. Unlike the Clean Water Act, the endpoint of toxic use reduction (TUR) is not releases to the environment, but the use of chemicals generally. If incorporated into the Clean Water Act, toxic use reduction endpoints would change the CWA from a pollution prevention statute to a toxics use control statute. CMA believes this change in focus is inappropriate and unwarranted.

In the last Congress, a Clean Water Act bill was introduced in the Senate -- S. 1081 -- which would have changed the entire focus of the CWA from a pollution prevention statute to a toxic use reduction statute. The bill inserted the phrase "toxic use reduction" into several existing provisions of the Clean Water Act, authorizing at a minimum consideration of this concept. The most egregious forms of TUR in S. 1081 were found in three sections of the bill. The first one would have amended the effluent guidelines provisions of the Act to require EPA to require changes in industrial processes, raw materials and products to achieve TUR when setting standards for industry to meet. Another provision would have targeted for prohibition from discharges certain listed chemicals, certain other unidentified chemicals, and chemicals that met an arbitrarily established level of bioconcentration. This provision required EPA to equate its prohibitions with a determination of unreasonable risk of injury to health or environment pursuant to Section 6(a) of TSCA, which would in turn have likely resulted in outright bans on these chemicals. Finally a third provision would have authorized POTWs to prohibit specific products in their service area. CWA opposed these manifestations of toxic use reduction in S. 1081 on grounds that: 1) they would stifle innovation in pollution prevention technologies because industrial decisionmaking would be replaced by government decisionmaking as to manufacturing processes, products and raw materials to achieve toxic use reduction; 2) the basis for the discharge prohibitions was arbitrary; and 3) the product ban authority would be unmanageable because it would involve products that are typically marketed and distributed over wider territories than the service area of the POTW.

CMA supports pollution prevention and the continuous reduction of wastes and releases to the environment. CMA opposes, however, arbitrarily mandated chemical use reduction/elimination programs, as well as policies, goals, planning and reporting intended to lead to such programs. Arbitrarily mandating toxic chemical use reduction fails to account for several facts. First, that many regulated chemicals are essential raw materials in the manufacture of most every beneficial product we depend on and enjoy today. Second, that major progress is being made in pollution prevention and diverting resources from pollution prevention to an ill-defined exercise in use reduction could diminish or halt that progress. Third, TUR as defined by its proponents is not pollution prevention; it is an ultimate strategy to reduce the use of chemicals based on the overly simplistic and incorrect notion that use of toxic chemicals equates to unreasonable risk. Fourth, that direct or indirect use reduction pressures can affect the ability of U.S. companies to compete in a world market. And finally, that public disclosure of manufacturing process and chemical use information would seriously undermine protection of intellectual property.

The Clean Water Act is a pollution prevention statute. CMA urges this committee to resist the simplistic arguments in support of toxic use reduction during the debate on reauthorization of the Clean Water Act. Congress should neither mandate nor authorize toxic use reduction in the Clean Water Act. Congress should not enact amendments to the CWA that would have as their end point the reduction in use of toxic chemicals.

## V. Other Issues in Clean Water Act Resuthorization

### A. Watershed Approach

The concept of protecting water quality on a watershed basis is gaining broad support. Among others, Water Quality 2000 endorsed it in their 1992 report. In an attempt to better control all the sources of water quality impairment, several states and EPA regions have implemented pilot programs for watershed protection and planning. These programs typically entail definition of the problems of watersheds; obtaining adequate scientific and technical data for all point and nonpoint sources; obtaining adequate effects data; and developing management and funding of a process to control all sources of impairment in a watershed. Because this is a more comprehensive approach to water quality problems, watershed protection and planning is likely to be a key element of any CWA reauthorization bill.

CMA believes that a well-crafted program for comprehensive watershed planning can be an appropriate approach to water quality protection of our nation's waterways. To be successful, however, CMA believes that several principles should be key considerations in any new program. First, such a program must allow for a cooperative effort among the stakeholders in a watershed and encourage public participation. Second, the problems of the watershed must be clearly identified. Third, states should prioritize the needs of the watershed on a rational basis. Fourth, watershed protection should ensure a long-term phased approach based on sound scientific and technical information available at the time. Fifth, equity should be ensured in terms of funding sources, entities to be controlled, and the extent of

such controls. Finally, a watershed protection and planning program should be implementable through an appropriate balance of incentives and enforcement.

Further, CMA believes that a watershed planning approach should supplant existing requirements to some degree rather than merely overlay additional burden on the regulatory authorities and the currently regulated community. For example, watershed planning decisions should be allowed to supersede certain existing restrictions, such as the Clean Water Act's anti-backsliding provision.

#### **B. Funding Issues**

A great deal of attention has been paid recently to the question of funding for government programs, including environmental programs. CMA could possibly support permit fees as a source of revenue for administration of the NPDES program, if the fees are targeted to pay only for the cost of processing permit applications. Targeting permit fees for purposes other than the cost of processing permit applications is unacceptable, because it would be asking permittees to pay for more than their share of the water program.

In developing a permit fee structure, CMA urges Congress to ensure that fees are based on the complexity of the permit, bearing in mind that in many instances the wastewater flow is not a measure of the complexity of a permit.

In contrast, CMA opposes fees or taxes on industrial discharges and on industrial, commercial and consumer products. In particular, CMA opposes taxing industry in order to pay for municipal wastewater treatment and infrastructure needs and for nonpoint source control

programs. Such proposals unfairly target industry to pay for non-industrial pollution and fail to consider the impact of discharge fees on U.S. manufacturing and trade.

### C. Non-Point Source Pollution

Non-point source pollution has been consistently identified by both EPA and the environmental community as one of the most significant causes of water quality impairment today. The problem of nonpoint source pollution is a difficult one to solve primarily because the sources of contamination are as numerous as the uses of the land, e.g., agriculture, hydromodification, urban and suburban runoff, mining/oil drilling, silviculture, waste disposal, construction, etc. These sources differ in the degree to which they contribute to the problem. Sources that are a problem in one part of the country may not be a problem in other parts of the country. The solutions to nonpoint source pollution, therefore, lie in local land-use decisions -- an area in which the federal government plays a decidedly supportive role to state and local governments. Developing solutions will not be easy because traditional means of point source reduction, e.g., standard setting, may be inappropriate in the nonpoint context.

Federal authority already exists in Section 319 of the Clean Water Act, in Section 6217 of the Coastal Zone Management Act (CZMA) Amendments of 1990, in Sections 3 and 6 of the Federal Insecticide, Fungicide and Rodenticide Act and in the 1990 Farm bill to deal with different aspects of this problem. Many of these programs have only recently been initiated and in many of them the federal role consists

of grants and guidance to the states. Unfortunately, funding for both the CWA and CZMA programs has been scarce or nonexistent.

CMA supports a risk-based approach to determining the appropriate focus of CWA reauthorization issues. All recent data suggest that nonpoint source pollution is a significant source of water quality impairment. However, Congress should seek to understand the many different sources and the varying contributions of different pollutants before proposing an appropriate legislative response. Congress should ask, too, whether better application and funding of existing programs would be sufficient. Nonpoint source pollution will not be an easy issue to resolve and Congress should not expect, or seek, quick solutions.

#### D. Contaminated Sediments

Under the Clean Water Act, the discharges of pollutants are controlled by incorporation of effluent guidelines and water quality standards into NPDES permits. The Act, therefore, controls present discharge activities to protect the human health and aquatic environment. It does not address the remediation of problems that may have resulted from past discharge activities or past run-off from nonpoint sources.

EPA is currently poised to propose sediment quality criteria. These criteria could be used as guidance by the states in developing their water quality standards. While there are many unanswered questions about the methodologies for establishing these criteria and their appropriate uses, including the appropriateness of using them to derive permit limits, there is little question that the

preventive/protective nature of these criteria appropriately conforms with the objectives of the Clean Water Act.

Some suggestions have been made, however, that the Clean Water Act should also address remediation of existing contaminated sediment. CMA opposes any attempt to add remediation authority to the Clean Water Act. Creating a whole new remediation program under this Act when experts still don't agree on what is "clean" sediment and what is "contaminated" sediment; what are the risks associated with contaminated sediment, or what is the most environmentally protective manner for remedying these problems, simply makes no sense. Such a major shift in the thrust of the Clean Water Act would be ill-advised from economic, scientific and general policy perspectives.

CMA believes that adequate authority already exists to address remediation of contaminated sediment on a site specific basis (e.g. CERCLA). CMA believes that EPA's developing sediment strategy reflects that there are adequate authorities for dealing with this issue. Congress should not create an entirely new -- and likely extraordinarily expensive -- program under the Clean Water Act at a time of limited resources, when there is not yet consensus that this is a nationwide problem or what the appropriate remedies may be.

#### **E. Great Lakes**

In 1990, Congress passed the Great Lakes Critical Programs Act (GLCPA) amending Section 118 of the Clean Water Act. The goal of the GLCPA was to establish minimum water quality requirements for the eight states in the Great Lakes system and to fulfill the objectives of the Great Lakes Water Quality Agreement between the U.S. and Canada. On

April 16, 1993, EPA proposed guidance for the Great Lakes system to implement the GLCPA. This proposal establishes ambient water quality criteria for the protection of human health, aquatic life and wildlife as well as antidegradation policies and implementation procedures for the waters of the Great Lakes system.

The regional approach of the Great Lakes water quality guidance and many of the policies and procedures being proposed are precedential in nature. EPA has solicited comments on whether the new approaches used in the proposal should be adopted nationwide. From our perspective, some of the more problematic issues relate to the calculation of water quality criteria values on the basis of insufficient data (Tier II values); extraordinarily prescriptive antidegradation procedures that may well mean no increased production by industries located on the Great Lakes and hence produce a no-growth effect on the economy of the region; EPA's first-time use of "bioaccumulation factors" to derive criteria for a new class of chemicals of concern; and untested or scientifically unproven implementation procedures.

Congress needs to be aware of the issues being played out in the Great Lakes region as a result of the 1990 GLCPA. These issues require public comment, EPA consideration of these comments and implementation before Congress should even consider nationwide application. Because Congress found in 1990 that the Great Lakes posed unique water quality problems, the Great Lakes will be the testing ground for many new theories on water quality controls. The time is not ripe, however, for Congress to adopt these untested measures for the rest of the nation.

Therefore, it is CHA's view that Congress should not incorporate these proposed regulatory provisions in CWA reauthorization.

#### F. Pretreatment

In July 1991, EPA presented its Section 519 Pretreatment Report to Congress. This report found that publicly owned treatment works (POTWs) have made "tremendous progress" carrying out and enforcing national and local pretreatment standards and requirements. It noted that many POTWs have achieved "significant reductions" in toxic pollutant loadings to their treatment plants and subsequent reductions of toxics in their effluents and sewage sludges. The report found that additional work was necessary in three areas: more water quality criteria and standards; continued development of national technology-based standards; and strengthening of controls by POTWs over toxic discharges.

The year before the report was issued, EPA promulgated new regulations to improve the control of hazardous wastes that are introduced into POTWs. These regulations impose broad new prohibitions, notification requirements and permitting requirements to control discharges of hazardous waste to POTWs. Implementation of these new regulations is already leading to strengthening of controls by POTWs over toxic discharges.

In recent weeks, EPA promulgated sewage sludge standards and regulations that will indirectly lead to greater controls by POTWs of discharges of toxic pollutants into their treatment works.

These new requirements are responsive to EPA's call for additional work. Overlaying these new programs are long standing general

pretreatment requirements, categorical pretreatment standards for certain industries, including the chemical industry, and local limits established by POTWs. Between the existing and new program requirements, EPA has the tools in place it needs to maintain and improve its pretreatment program.

Despite this fact, there has been criticism of the domestic sewage exclusion (DSE) under RCRA and how it relates to the Clean Water Act's pretreatment program and POTW discharges. This criticism has been founded in a claim that the DSE is a "giant loophole" through which hazardous waste is being discharged to POTWs unregulated. Under the DSE, any mixture of domestic sewage and other wastes that passes through a sewer system to a POTW for treatment is not considered to be a solid or hazardous waste under RCRA. Industrial facilities that discharge hazardous wastewaters to sewers containing domestic sewage must meet pretreatment requirements under the CWA, rather than BDAT requirements under RCRA.

CMA believes that any proposals to eliminate the DSE are misguided because they ignore the panoply of controls under the Clean Water Act that ensure that wastes discharged to POTWs are adequately treated prior to discharge. Industries must comply with EPA's general and categorical pretreatment standards and any local limits established by the POTW before they can discharge to the POTW. EPA itself concluded in its 1986 Domestic Sewage Study that the DSE should be retained and that the Clean Water Act is the appropriate statute for regulating discharges of hazardous wastes to POTWs. This conclusion was not changed in EPA's Section 519 Report to Congress in 1991. Before Congress considers any changes to the DSE during reauthorization of

the Clean Water Act, it must be careful to consider some important principles. First, the Clean Water Act should not require redundant treatment of industrial wastestreams, as this would be contrary to Congress' intent in the CWA. Second, RCRA BDAT standards were never meant to be applied to these industrial wastestreams. Due to interferences that result in combined wastestreams, applying BDAT land-ban standards to discharges to POTWs could mean unachievable standards or disruptive segregation of wastestreams. Finally, Congress must understand the differences between RCRA and the CWA. These two regulatory regimes apply to different types of waste characteristics. RCRA regulates "solid waste" and "hazardous waste" while the Clean Water Act regulates the discharge of "pollutants." As a result of these differences, standards applied to wastes regulated under RCRA may not be applicable to pollutants regulated under the Clean Water Act. These differences must be considered and appropriately addressed if Congress considers changes to the DSE during reauthorization of the Clean Water Act.

Finally, while CMA agrees with EPA that the national pretreatment program is effective, much redundant treatment is now occurring by industry and municipal treatment works because of the unavailability of removal credits. Since sludge disposal regulations have been issued regulating certain pollutants, removal credits should be available for these pollutants. But there are many other pollutants for which POTWs maintain good treatment. CMA believes that removal credits should be available for all pollutants that are effectively treated by POTWs, not just those pollutants for which EPA publishes sludge standards. Congress should address the question of the availability of removal

credits in this reauthorization to alleviate the redundant treatment that is now occurring.

#### G. Water Quality

Since the 1987 amendments, EPA has been busily developing a variety of new tools for use by the states to protect ambient water quality for designated uses. These range from chemical-specific water quality criteria (aquatic life and human health), sediment criteria, and wildlife criteria, to effluent toxicity methods and biological criteria assessment methods. More and more, these tools are defining the water quality programs of the states.

Most recently, EPA promulgated the National Toxics Rule. This rule established water quality standards for toxic pollutants in 14 states that in EPA's estimation had not complied with the requirements of Section 303(c)(2)(b) of the Clean Water Act. Now all the states have water quality standards for toxic pollutants that meet the requirements of that provision of the Act. The comment period on that rule was a mere 30 days, but it was the first official notice and comment rulemaking provided on EPA water quality criteria. Up to now, EPA had issued these criteria only as guidance documents for the states.

CMA urges Congress to require that all water quality criteria, including sediment criteria, wildlife criteria, biocriteria, etc. that are used to develop state water quality standards and permit conditions, be subject to adequate notice and comment rulemaking and judicial review pursuant to the Administrative Procedures Act. Only through such an amendment can Congress be assured the criteria will be based on sound science and that EPA will be responsive to comments.

Such an amendment is also critical if EPA embarks on a new ecosystem or watershed approach in the next phase of water quality management.

CMA also believes that Congress should provide an explicit exception to the antibacksliding provision of the CWA (Section 402(o)) where a technology based or water quality based limit cannot be met and the water quality criterion has been raised as a result of additional or improved data. In addition, it should be clarified that the antibacksliding provision is not intended to preclude increased production and that higher limits may be allowed where such a limit does not impair the designated use of the waterbody and where necessary to accommodate such increased production.

Finally, with respect to aquatic biomonitoring techniques, CMA believes that such techniques can be useful in understanding the impact of a discharge on aquatic life. However, CMA also believes it is inappropriate to establish numerical toxicity limits in discharge permits prior to performing a series of sequential steps involving performance of an aquatic impact assessment and determination of the appropriateness of performing a toxicity reduction evaluation. The CWA should be amended to reflect this concept.

#### R. Enforcement

The Clean Water Act contains ample enforcement authority. The Act authorizes the imposition of significant civil and criminal penalties for violations of its mandates. For example, Section 309(d) provides for civil penalties up to \$25,000 for each and every day of violation. To put this into perspective, it is important to recall that most discharge permits contain both daily maximum and monthly average

discharge limits. Because the violation of a monthly average limit is considered to be a violation during each day of the month, a single exceedance of a monthly average limit during a 30-day month exposes a discharger to a civil penalty of \$750,000. The maximum monetary penalties for criminal offenses are even higher than the civil penalties, and prison terms may also be imposed for such criminal offenses. See CWA Section 309(c). Criminal enforcement has increased dramatically in the past few years. These civil and criminal penalties may be imposed by the government both for ongoing as well as past exceedances.

In addition to civil and criminal enforcement authority, EPA is also authorized by the 1987 amendments to the Act to impose administrative penalties. Class I administrative penalties up to \$25,000 may be imposed under Section 309(g)(2)(A) with only minimal procedural safeguards for the discharger, making the imposition of such penalties comparable to the issuance of (expensive) traffic citations. Administrative penalties up to \$125,000 are also authorized by CWA Section 309(g)(2)(B), with an opportunity for an administrative hearing. This administrative penalty authority is being used more and more frequently by EPA. Enforcement orders may also be issued by EPA under Section 309(a) of the Act.

In addition, Section 311 of the Act establishes an entirely separate enforcement scheme to address spills of oil or hazardous substances. Spills of hazardous substances may also be subject to enforcement actions under the Comprehensive Environmental Response, Compensation and Liability Act, commonly known as Superfund. Superfund authorizes the government to recover not only the costs of any

necessary clean-up action, but also natural resource damages and treble damages for non-compliance.

As a supplement to this extensive governmental enforcement authority, Section 505 of the Clean Water Act authorizes citizens to bring enforcement actions against dischargers who are alleged to be in violation of the Act. In interpreting Section 505, the Supreme Court correctly noted in the case of Gwaltney of Smithfield, Ltd. v. Chesapeake Bay Foundation, 484 U.S. 49 (Dec. 1, 1987) that "the citizen suit is meant to supplement rather than to supplant governmental action" (Id. at 60) and that the purpose of the citizen suit provision is "to abate pollution when the government cannot or will not command compliance." (Id. at 62). Thus, while citizen suits may be brought against dischargers where violations are ongoing, in order to provide a mechanism for bringing such dischargers into compliance, they may not be brought for purely punitive motives to address wholly past violations.

CMA believes that because the Clean Water Act includes more than ample enforcement authority -- both for governmental enforcement authorities and citizen groups -- it is not necessary for Congress to amend the Act to add enforcement authority. Additional authority would be counterproductive in many instances. For example, Senate proposals from the 102nd Congress to increase CWA enforcement authority for citizen groups and to add enforcement authority for natural resource damages resulting from a discharger's violation would have resulted in more litigation, for dubious environmental benefit. Further, neither provision is needed to address violations of the Act's requirements.

## VI. Conclusion

CHA would like to thank the Subcommittee for this opportunity to provide observations on a very important statute. Existing Clean Water Act programs have been successful in reducing pollutant discharges and promise more success in the future. Pollution prevention is already occurring. If Congress wants more pollution prevention to occur, Congress needs to consider ways to make the Act more flexible. Finally, CHA urges Congress in this reauthorization to focus its attention on significant remaining problems and on appropriate solutions that ensure continued improvements to our nation's water quality.

1950

STATEMENT

on

REAUTHORIZATION ISSUES UNDER THE CLEAN WATER ACT OF 1987

for submission to the

HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT

for the

U.S. CHAMBER OF COMMERCE

by

Frank H. Hackmann\*

May 12, 1993

The U.S. Chamber of Commerce appreciates this opportunity to offer its perspective on the Reauthorization of the Clean Water Act of 1987 (Act).

There has been great progress in cleaning the streams and rivers of the country over the last twenty years. Because of this progress, the Chamber believes that major revisions to the Act are not needed. This testimony will, however, encourage marginal, needed changes in keeping with the history of federal legislation and enforcement in this area.

An appropriate historical perspective is invaluable when addressing issues as fundamental to the environmental, social, and economic future of America as those addressed in the Act. The extension of federal regulation to maintaining clean water is generally considered to have begun with the nearly unanimous passage of the Federal Water Pollution Control Act of 1972, although the roots reach back to the 1899 Refuse Act.

---

\* Partner, Sonnenschein, Nath and Rosenthal, and former Chairman, U.S. Chamber of Commerce Water Quality Subcommittee.

(2)

The 1972 Act set forth some basic principles which remain the guiding lights today.

- Any discharge to the waters of the United States is unlawful unless expressly permitted (or otherwise exempted).
- Permits issued to dischargers shall state with detail the permissible discharge components and concentrations, with violators being subject to both civil and criminal prosecution, as well as citizen suits.
- All discharges are generally required to use a specified level of control technology, whether or not that technology is necessary to meet receiving water quality.
- Dischargers can also be made to provide tighter levels of treatment in order to meet applicable receiving water quality standards.
- There is a major federal funding rule to assist municipalities in discharging their obligations under the law, although the lack of federal funds is itself not a defense to noncompliance.
- Specified areas of concern, such as nonpoint source pollution and area-wide watershed issues, are dealt with in a somewhat different fashion — but are addressed in a manner that was acceptable to Congress.
- Different standards are needed for the so-called conventional pollutants and the so-called toxic pollutants, with appropriate standards for each.

(3)

- Water pollution control laws need to be coordinated with the remainder of the federal regulatory scheme on issues such as on-land sludge disposal, sludge incineration, etc.

In general, over the years the Chamber has supported these basic concepts, although it has disagreed, sometimes strongly, with specific items or amendments. Often this disagreement was over the means to reach the goals, rather than the goals themselves.

These principles are especially relevant to issues impacting small businesses and their compliance efforts, and should be used as a guide in developing further changes to the Clean Water Act. As much as possible, regulatory guidance should be clear and comprehensible, so that the regulated community understands what is expected, why it is expected, and how it can be done in the real-world context of a business operation.

### Progress

Overall, the Chamber believes the Clean Water Act has worked reasonably well, especially as compared to some other programs. While the Act is far from perfect, it does seem to be fairly well understood and well accepted in the business community. Because of improved measurements, such as the ability to detect parts-per-billion of contaminants in water, there is a misconception that water quality is deteriorating. More than 75 percent of the nation's lakes, rivers and streams meet strict water quality standards based on their intended use. As Congress begins the reauthorization process, it should not overlook the considerable improvements in water quality achieved under existing law. Many of the new water quality requirements under the 1987 amendments have just begun to take effect, while others are still being implemented.

(4)

**SELECTED SPECIFIC ISSUES WITHIN THE  
REAUTHORIZATION OF THE CLEAN WATER ACT**

The major concerns business and industry have about the Act reflect issues such as wetlands definition, extensive stormwater control, further implementation of water quality standards, and the apparent use in evaluating risks of placing one conservative assumption upon another resulting in significant overstatements of risks.

As noted, the Act clearly has made our waterways cleaner and our environment better. However, disruption or drastic changes in the basic framework of the statute would only cause further delays in the progress being made.

Toxic Control

A popular proposal in controlling the discharge of toxic substances is to simply ban their discharge. This concept is not wise public policy. While a "no discharge standard" may have superficial political appeal, it is often technologically or economically impractical or even unworkable, and even if complied with may not provide a net overall benefit. A more appropriate and realistic public policy will acknowledge the efficacy of treatment technologies and the relative effects of various contaminants when discharged into different media, and seek to minimize any negative environmental effects. This must be done without losing sight of other national goals, including economic factors.

Bans or restrictions on the use or production of materials without a determination of unreasonable risk to health and environment, consideration of the magnitude of exposure, societal benefits and economic consequences, are contrary to the Pollution Prevention Act of 1990. Industry innovations, voluntary efforts and market-based incentives are more effective ways to attain environmental protection and making progress in finding optimal solutions for reducing discharges to our nation's waters.

(5)

### Sound Science

The Chamber supports the use of credible science and economic considerations in setting, revising, and implementing discharge permits and related standards.

Occasionally, the EPA will determine that a different technology standard or permit limits should apply when a permit is renewed. If what otherwise appears to be a "weaker" standard is nonetheless based on sound science and applicable regulations, sound public policy is not served by refusing to acknowledge the new facts, situations, standards, and regulations.

A National Pollutant Discharge Elimination System (NPDES) permit should be able to be modified upward, just as it can now be modified downward. There is no reason to be forever shackled to past understanding, errors, or good-faith misjudgments in issuing and reviewing permits.

### Pollution Prevention

While the Chamber strongly endorses the overall concept of pollution prevention and waste minimization as integral parts of industrial operations, it is opposed to specific statutory mandates. The reason is that our past experience with a variety of environmental laws has shown the difficulty of translating specific numerical statutory goals into reality at the level of an operating. Clearly the statutes should encourage the EPA and industry to move forward in efforts to make sensible, further reductions in pollution. However, the costs, both economic and social, associated with such decisions cannot and should not be ignored by Congress. Industry innovation, voluntary efforts and market-based incentives are more effective ways to attain environmental improvements and protection than is legislative prescription.

### Removal Credits

The Chamber supports the continued use of removal credits for chemicals with categorical pretreatment standards consistent with the current legal framework regulating a municipality's use and operation of its sewage system. We recognize there is a significant potential problem related to sewage sludge disposal; there is an interrelationship between sewage sludge disposal regulations and removal credits regarding toxic material levels. However, it is not necessarily more advantageous to force users away from heavy reliance on large, central publicly owned treatment works for their treatment needs. Increasing the number of small pretreatment facilities, particularly at smaller industries, in an effort to meet unreasonably stringent sewage sludge disposal regulations may not represent the best overall environmental outcome. For example, multiplying the number of regulatory sources of concerns could strain the enforcement mechanism. Thus, while we understand the tension between the removal credit and sewage sludge disposal issues, we caution against setting sewage sludge standard so stringent that many types of common and historically acceptable industrial dischargers would face difficulty with continued sewer use while providing a traditional level of pretreatment.

### Wetlands

The Chamber supports the goal of "no net loss" of the nation's remaining wetlands because they provide essential ecological functions such as water purification, wildlife habitat, flood control, and food production. However, wetlands should be designated as such only if they display the three traditional indicators: saturation, hydric soils, and hydrophytic vegetation. Wetlands also should be classified according to their value or function. Owners of property who are adversely affected by the designation of wetlands should be compensated. The Chamber also supports mitigation banking, as a market-based solution, to help achieve the goal of "no net loss" of our true wetlands.

Compliance Should Be Made Easier, Not Harder

One major concern of the Chamber is that many portions of the EPA programs, laws and regulations are nearly incomprehensible to the practicing professionals, and even more so to the small businessman or small manufacturer where the bulk of America's jobs, and job growth, reside. In addition, regulations under the different statutory authorities are not coordinated, creating conflict and duplication. A number of the so-called toxic and nonconventional pollutants are ubiquitous materials found nearly everywhere in our society. Therefore, further regulations of these materials will vastly increase the number of regulated indirect users, diffuse the enforcement ease with which significant problems can be identified and handled, and create the potential for less, not more, environmental protection.

Government should not make it unnecessarily difficult for the regulated community to do what is desired. For example, further pretreatment controls and the removal of the domestic sewage exemption, will have three major adverse consequences with no corresponding environmental benefit:

- Proliferation of small on-site "pretreatment" plants, each of which would be added to the NPDES permit system, at least in some fashion.
- A corresponding increase in the universe of hazardous waste generators, because any on-site treatment residuals or users affected by loss of the "Domestic Sewage Exemption" who would therefore become subject to the RCRA system.
- Dilution of enforcement effort by converting centralized treatment plants which can be assessed and monitored relatively efficiently,

(8)

into a larger and much harder-to-track universe of regulated sources.

### Summary

The Chamber believes that the basic structure of the Clean Water Act is working well, and that no radical changes are necessary or appropriate. Progress has been made in cleaning up and managing our water resources, and we do not dispute that more needs to be done to solve the remaining problems. To meet these challenges in a cost-effective and equitable way, Congress should consider the following criteria as part of any reauthorization effort:

- sound science and economic considerations as the basis for discharge limits and cleanup priorities;
- equitable and flexible regulations, where needed, for all sources;
- recognition, within state and local water-quality standard determinations, of the need for economic growth; and
- limitation of permit-application costs, monitoring requirements, and paperwork burdens.

The Chamber looks forward to working with committee staff as Congress deliberates the reauthorization of the Clean Water Act. A consistent approach, with a view toward pursuing a broad public policy designed to further a variety of national goals, both environmental and economic, will greatly contribute to the nation's ability to compete effectively in the domestic and international marketplace while making continued improvements in our water resources.

Washington, D.C. 20036

Testimony Before the Subcommittee on Public Works and the Environment  
U.S. House of Representatives

12 May 1993

\*The author is a Resident Scholar at the American Enterprise Institute and an Adjunct Research Fellow, John F. Kennedy School of Government, Harvard University. I would like to thank Marilyn Arnold, Dan Dudek, Scott Farrow, Barry Korb, Mark Luttner, and Zach Willey for helpful discussions. The views in this testimony reflect those of the author and do not necessarily reflect those of the institutions or individuals with which he is affiliated.

Improving Water Resource Management in the United States:  
Suggestions for Reauthorizing the Clean Water Act\*

Robert W. Hahn

1. Introduction

Thank you for inviting me to testify.

The purpose of my presentation is to persuade you that there is an alternative to traditional water quality regulation that is, as the commercial says, "less filling and tastes great." We now have the know-how to achieve improved levels of water quality at lower cost to the public, provided that you are willing to embark on a new approach to regulating water.

I have spent the last ten years trying to develop and implement more effective approaches for resource and environmental management throughout the world. A central focus of my recent work has been on the development of economic approaches for improving water quality and water management. I attach an op-ed from the New York Times that illustrates the kind of market-based approaches that I would like to see encouraged in the reauthorization of the Clean Water Act. It is a proposal to reduce phosphorus loads to the Everglades through introduction of a market in transferable restoration credits. The proposal is very similar in structure to the 1990 Clean Air Act provisions for cutting sulfur dioxide emissions by 10 million tons. The idea is to give industry greater flexibility in achieving ambitious environmental goals, thus saving money and, in some cases, jobs.

I would like to begin my presentation with a quotation from a great, and now defunct, economist. Joan Robinson once asked: "Why is there litter in the public park, but no litter in my back garden?" The answer, of course, lies with incentives -- each of us has a direct incentive to keep our backyard clean. And while each of us would like to see the park kept clean, we would prefer that other people do it while we are out on the beach getting a sun tan.

The same problem arises in managing U.S. water resources, the subject of my remarks today. Because we collectively own most of our major water bodies, none of us has an incentive to take care of these resources the way we would take care of our own home. The problem for Congress is, thus, to change the incentive structure so that individual consumers, governments, and businesses have a direct stake in taking better care of our precious water resources.

There are basically two approaches to changing the incentive structure to achieve better management of water resources. The first is to sell off major public waterways, including rivers, lakes and streams. Putting these assets in private hands has the potential to improve their use provided property rights for both water

quality and quantity are well-defined and enforceable. In this case, the new owners of these assets would have a very strong incentive to treat these water resources just like they treat their own backyard. That is, they would have an incentive to keep the water body clean and allow people to use the water body only if they paid a price that reflects the value of the resource.

Privatizing water resources could also start a political firestorm, if not a revolution. Thus, I will not advocate it here today.

Instead, I will focus on a second approach to improving the management of resources -- the introduction of "economic" approaches for improving the public management of water resources. Within the economic approach, there are two fundamental issues that need to be addressed -- the first is the identification of appropriate goals for water quality and water use; the second is to choose appropriate methods for achieving goals.

The choice of goals for water quality should depend, among other things, on the economic benefits associated with consuming or using the water resource as well as the economic costs of providing that resource. The benefits include preservation of species habitat, recreational uses such as fishing, swimming and boating, commercial uses, the ability to use the resource as a drinking water supply, and the satisfaction that comes from knowing waterways are clean.

## 2. Introducing Cost-Benefit Analysis

In conventional cost-benefit analysis, standards are intended to be set so that the incremental benefit from cleaning up the water just equals the incremental cost. Admittedly, these concepts are difficult to quantify, particularly on the benefit side. Nonetheless, it is absolutely imperative that efforts be made to quantify these concepts if clean water policy is to be developed in a way that is likely to lead to improvements in our standard of living.

The U.S. Environment Protection Agency (EPA) has not devoted significant resources to developing analyses that suggest where regulatory efforts are best focused under the Clean Water Act. The most comprehensive analysis of the benefits and costs of current plans to achieve the objectives of the Clean Water Act has been performed by Lyon and Farrow (1993). These authors argue that in many current implementation plans, the incremental costs of improving water quality exceed the incremental benefits. This means that many of the standards and regulatory methods that EPA has promulgated to date may be wasteful in the sense that they actually lower our average standard of living. At the same time, there may be specific instances of heavily polluted and/or heavily used water bodies where significant improvements in water quality are well worth the cost.

The preliminary results by these authors and results from earlier studies suggest that more attention needs to be given to doing cost-benefit analysis so that Congress can be certain we are focusing on the right water problems in the right water bodies.

Recommendation 1: EPA should commission a state-of-the-art cost-benefit analysis of the current Clean Water Act by scientists and social scientists so that the political debate on Clean Water Act reauthorization can be better informed. This analysis should attempt to point out where standards could benefit from tightening and where standards could benefit from being relaxed.

The analysis also should identify key areas of uncertainty in the estimation of benefits so that decision makers can make more informed decisions about appropriate standards. At present, relatively little is known about the dose-response function for many water contaminants or how people value clean water that they, themselves, may not use.

Recommendation 2: EPA should develop a database that permits a more refined assessment of the benefits and costs of the Clean Water Act.

EPA should be required to submit a report to Congress every two years that addresses the benefits and costs of controlling different pollutants in different waterways.

The second recommendation is similar to a provision in the 1990 Clean Air Act Amendments, which calls for a cost-benefit analysis of selected statutes in the Act. Without such information, Congress will not be in a position to make informed decisions about the economic consequences of their proposed statutes.

### 3. An Overview of Economic Incentives

Once a standard has been chosen, the question arises as to what is the least costly way of achieving that standard. One way is to prescribe a technology that each company in an industry must use. This is sometimes referred to as "command-and-control" regulation. Command-and-control regulation has been criticized by economists because it does not leave businesses and individuals with much choice in how they achieve an environmental target. For example, a law may require that a power plant use a scrubber to reduce air pollution, regardless of whether another technology or group of technologies might be more effective in achieving the same level of air quality.

Economists have argued that many pollution problems can be addressed

more effectively through the introduction of economic incentives. The idea behind using economic incentives is to save resources while achieving a particular environmental goal. For example, in 1990, the Congress adopted an economic incentive approach for limiting acid rain that could save society as much as \$1 billion annually when compared to a conventional command-and-control approach that required the largest polluters to install scrubbers.

There are many different kinds of economic incentive approaches. They include the use of subsidies, taxes, deposit-refund schemes, marketable permits, and the removal of institutional barriers that lead to price distortions. In the interest of brevity, I would like to focus on charges (taxes) and marketable permits.

Charge systems impose a fee or tax on pollution. For example, a chemical manufacturer would be charged for every unit of pollutant that it discharged into a river. Several European nations, including France, the Netherlands, and West Germany currently use water pollution charge systems.

Pollution charges, by themselves, do not restrict the amount of pollutants that may be emitted; rather, they tax emissions. Such fees ensure that a firm will internalize the previously external pollution costs and be forced to perform a profit and loss calculation in order to respond efficiently to the fee. A firm has many options. It might decide that it is in its interest to pay the fee, completely eliminate the discharge, or partially reduce the emission.

The advantage of the fee system is that all businesses face the same incentive to limit pollution at the margin. A firm will control pollution up to the point where the marginal cost of control just equals the fee. The result is that the total costs of pollution control are minimized, when compared with other methods of allocating the pollution control burden across businesses. Pollution charges, like other market-based mechanisms, also provide ongoing incentives for businesses to develop and adopt newer, better pollution control technologies.

One problem with emission charge systems is that governments do not know in advance what level of cleanup will result from any given charge. This problem stems from a lack of knowledge about how businesses will respond to a given level of taxation. Governments do not have the information to determine either an individual firm's pollution control costs or the distribution of costs across businesses. This inability to specify a target level of pollution that will be achieved does not, however, alter the reality that charges have the potential to achieve emission reductions at substantially lower cost than command-and-control regulation.

### Marketable Permit Systems

Marketable or tradeable permits can achieve the same cost-minimizing allocation of the pollution control burden as a charge scheme, while also avoiding the problem of uncertain responses by businesses. Under a tradeable permit system, the allowable overall level of pollution is established and then allotted to businesses and government entities in the form of permits. A business that keeps its emission levels below the allotted level may sell or lease its surplus permits to others.

As with a charge system, the marginal cost of control is identical across businesses and thus the total cost of control is minimized for any given level of total pollution control. In the case of local water pollution control, for example, this approach could be substantially more efficient than current regulatory methods, both because its inherent flexibility takes advantage of differences in control costs, and because it allows individual businesses to decide where and how to make desired reductions in loadings.

In the event that overall loading targets are viewed as too strict, the government may choose to increase the supply of permits. Likewise, in order to reduce allowable emissions, regulators could take the opposite stance and reduce the supply of permits.

Permit systems have been used primarily in the United States. Examples include: the Environmental Protection Agency's Emissions Trading Program for air; the nationwide lead phasedown in gasoline, which allowed fuel refiners to trade reductions in lead content; and the gradual phase out of chlorofluorocarbons in the U.S., where businesses are allowed to trade the right to produce or import limited quantities of these chemicals. In addition, several western states have implemented water quantity trading in limited forms. Some states also are considering water environmental credit trading programs to achieve least-cost approaches for controlling discharges from farms and municipal wastewater treatment plants.

#### 4. Encouraging the Use of Economic Instruments for Better Water Management

Congress could encourage EPA to implement both fee systems and marketable permit approaches. Because I believe fees are likely to encounter more political resistance, I believe Congress should promote more widespread use of marketable permits for improving water resource management.

The subsequent recommendations highlight the potential for encouraging greater use of marketable permits.

Recommendation 3: EPA should be required to implement marketable permits as the tool of choice for improving water quality, or justify in writing why it has not chosen this alternative.

The point of this recommendation is to encourage EPA to rely more heavily on market-based approaches for improving water quality rather than the command-and-control approach used for the last twenty years.

Recommendation 4: Congress should encourage EPA and the states to implement trading of environmental credits between point sources where technology-based requirements do not lead to the attainment of water quality goals (i.e., in "water quality limited" areas).

Recommendation 5: Congress should encourage EPA to allow for trading between dischargers whose effluent is then treated at a sewage treatment plant.

The point to point source trading between sources, such as municipal treatment plants and industrial sources, has the potential to save money and stimulate environmental innovation. So, too, does trading between dischargers whose effluent is treated at sewage treatment plants.

Recommendation 6: Congress should encourage trading with non-point sources, including trading between point and non-point sources and trading among non-point sources.

It is becoming increasingly apparent that many problems with water quality arise because non-point sources, such as agricultural runoff, are typically unregulated or minimally regulated. For example, over 18,000 water bodies will not attain water standards even if all point sources were to meet their technical requirements. While EPA has acknowledged non-point sources are a major problem, there have been few advances in regulation over the last twenty years.

There appears to be a great potential for achieving cost savings if non-point sources can be brought into the system. One way to bring them into the system is for EPA to develop guidelines for trading with non-point sources. Even if non-point sources remain largely unregulated, heavily regulated point sources should have the ability to trade with non-point sources provided they can show that water quality will improve as a result of the trade.

The technical challenges of regulating non-point sources are large, but surmountable. For example, I have proposed a transferable restoration credit system for the Everglades in South Florida that allows phosphorus to be measured at specified pump stations in the Everglades Agricultural Area. Where monitoring can only be done at great cost, then experts may need to use best practical judgment along with trading ratios to assure that water quality would improve. For example, in an application of this concept to the Hawkesbury-Nepean River system in Sydney, Australia, I am working with the government to establish trading rules for

phosphorus reductions for farmers. These reductions would reduce the occurrence of blue green algae blooms in the river system.

It is important to note that the technical challenges of regulating non-point sources are not unique to a market-based approach, but apply to all regulatory systems including command-and-control. If monitoring costs of actual loadings are too high, then other alternatives may be appropriate. For example, in the case of phosphorus use on farms, it may be preferable to impose a tax on inputs, such as fertilizer, basing the tax on expected harm to the water body.

A key advantage of introducing trading with non-point sources is that it provides environmental benefits while lowering the overall cost of regulation. If regulation of these sources remains largely voluntary, a market-based approach provides a positive incentive for these sources to participate in limiting their water pollution.

The concept of trading can be expanded to wetlands.

Recommendation 7: Congress should encourage EPA to develop and implement rules for trading among different kinds of wetlands.

The idea is to encourage the preservation of wetland functions while promoting economic growth. Because artificial wetlands can be constructed, there is scope for trading among wetlands. Establishing the rules for trading will be a challenge. EPA should be instructed to provide guidance on this issue in a timely manner, explicitly recognizing that different wetlands serve different functions. The practice of building or maintaining wetlands in exchange for specific forms of development has been tried successfully in Florida with the construction of Disney World. I propose to expand on that idea, allowing individuals greater flexibility in managing wetlands while preserving the environmental integrity of the wetland system.

Under current law, regulated entities would be required to meet technology-based requirements. This command-and-control regulation should be supplanted by market-oriented regulation that focuses on the environmental performance of the water body in question.

Recommendation 8: Congress should encourage EPA and the states to establish total maximum loads for all non-attainment water bodies.

Recommendation 9: For those areas where a load-based water quality standard is defined, Congress should permit the states to implement a trading system that does not require businesses to meet a specific technology-forcing requirement, provided that it can be shown that trading leads to a comparable or better outcome in terms of water quality.

The focus on environmental outcomes is likely to lead to better environmental quality at lower cost. Where there are damage thresholds associated with specific sites, some command-and-control regulation may be necessary to set the maximum ceilings on loads from a specific site or a cluster of sites. Nonetheless, the goal of regulation should be to provide the maximum improvement in environmental quality per dollar spent. This goal is best achieved through making greater use of market-based approaches for preserving and enhancing water quality.

While most, if not all, of the preceding recommendations could be implemented under the existing Clean Water Act, explicit Congressional support for marketable permits will spur their use.

Recommendation 10: Congress should insert language in the new Clean Water Act that demonstrates its commitment to the widespread use of marketable permits for improving the quality and economic value of the nation's water resources.

Congress should make it clear that it is primarily concerned with making necessary improvements in water quality in a timely manner. The precise method of achieving those environmental improvements should be left to business and government entities responsible for making the reductions needed to meet those goals.

##### 5. Whither Water Regulation?

A fundamental concern for the 1990s will be integrating water quality and quantity concerns. My testimony has focused primarily on quality issues, but the two issues are inextricably linked. Just as quality can be improved through the introduction of markets, so, too, can water quantity. Moreover, markets for water quantity may also improve water quality by encouraging non-point sources of pollution to conserve water. While water quantity issues generally are subject to state law, the federal government could help by endorsing the use of water markets and allowing the transfer of water contracts for federal reclamation water supply projects.

We have the technical know-how to implement economic instruments for improved water quality and allocation. The question is whether we have the political will. I am optimistic that such changes will occur. My only question is whether Washington will lead the charge or follow. The reauthorization of the Clean Water Act provides you with a unique opportunity to lead that charge. I hope you take advantage of that opportunity to benefit the health and welfare of the American people.

Thank you.

1968

TESTIMONY OF DUANE MARSHALL,  
UNION CAMP CORPORATION  
ON BEHALF OF THE  
AMERICAN FOREST AND PAPER ASSOCIATION  
May 12, 1993

Mr. Chairman and members of the Subcommittee, my name is Duane Marshall, I am Director of Environmental Affairs for the Union Camp Corporation. I am testifying today on behalf of the American Forest and Paper Association (AFPA), the national trade association of the U.S. forest products, pulp and paper industry.

INTRODUCTION

Before addressing the Clean Water reauthorization issues, I would like to give you a brief snapshot of the important role that the U.S. forest and paper industry plays in sustaining the U.S. economy.

Nationwide, our industry accounts for 7 percent of all U.S. manufacturing output. AFPA's member firms directly employ 1.6 million workers in the growing of trees, the manufacture of forest and paper products, and the recovery and recycling of paper products. Collectively, the industry injects \$43.5 billion into local economies through wages and salaries, and ranks among the top ten employers in 46 of the 50 states.

The forest products, pulp and paper industry has been an active participant in the development and implementation of the nation's clean water laws.

Unlike many industries, we are regulated for both point and nonpoint discharges. So our interest in this reauthorization is substantial.

CLEAN WATER ACT ISSUES

Mr. Chairman, AFPA believes the Clean Water Act has been a true success story--one that has resulted in real improvements in our nation's water quality. The reasons for its success are simple:

1. In past reauthorizations, Congress has avoided micro-managing the implementation of the Act and resisted writing into the law overly-prescriptive requirements.
2. The statute gives EPA the broad authority and flexibility it needs to address virtually all water quality concerns.
3. The Act is based on a strong Federal-State relationship which results in effective implementation of its requirements.

If there is one message we would like the Subcommittee to hear this morning it is this: The Clean Water Act works--it is not broken. EPA has the authority it needs to solve most of our nation's remaining water quality concerns. We urge you to avoid adopting highly prescriptive requirements as they likely are unnecessary and duplicative.

As you review the many proposals to change the law, ask yourself this question: "Does EPA currently have the authority to carry out this activity?"

POINT SOURCE DISCHARGES/WATER QUALITY

The pulp and paper, or point source, side of the industry estimates that, since 1972, it has invested more than \$5 billion in capital spending to comply with federal and state clean water requirements.

This represents just a portion of the industry's overall investment in pollution abatement. For the years 1989, 1990, and 1991, total pollution abatement expenditures for the pulp and paper industry exceeded \$1 billion per year, of which 40-50 percent was for water quality improvements. This is a substantial amount of resources dedicated to environmental protection, whether viewed as an absolute number or as a percentage of total industry capital expenditures. Recent trends indicate that 20 percent of all total future industry capital expenditures will go to pollution abatement efforts.

What water quality improvements have we gotten for these investments? Well, we've reduced water usage in the manufacture of pulp and paper substantially. In the period 1975-1988, the industry's water use and effluent flows per unit of production were reduced by approximately 30 percent; in 1988, it required 70 percent less water to make a ton of paper than it did in 1959. Since 1975, the amount of conventional pollutants -- BOD and total suspended solids -- discharged from pulp and paper mills has been reduced by as much as 75 percent per unit of production.

Substantial reductions have also occurred with regard to toxic pollutants. For example, the industry has spent more than \$1 billion in process changes in a voluntary pollution prevention effort to reduce dioxin, an unintended byproduct of chlorine bleached pulp and paper manufacturing. Dioxin releases from pulp and paper mills have been reduced by more than 90 percent since 1985, and over 90 percent of the mills are already at or below effluent concentrations that can be measured by EPA's newest proposed method. As a result of this investment, the cumulative amount of dioxin associated with the pulp and paper industry is less than one percent of total estimated annual releases into the environment -- less than many other manmade sources, and even less than natural sources. And we continue to make further reductions.

The industry expects to spend an additional several billion dollars in order to fully implement the yet-to-be-promulgated requirements of the 1987 amendments, the Great Lakes Initiative and the new coastal nonpoint program.

The significant water quality improvements achieved with regard to point source discharges over the last twenty years can be attributed to two programs: the promulgation of effluent guidelines by EPA; and the implementation of water quality standards by the states.

Over the last twenty years, EPA has developed a comprehensive process that produces well-documented and usually carefully considered, technology-based effluent limitations guidelines. EPA is currently in the process of developing new effluent guidelines for pulp and paper mills which will include the installation of stringent Best Available Technology (BAT). EPA has been developing this very complex proposal through a public process for several years, with input from the industry, from environmental groups, and others that will be effected. These regulations will be finalized by 1995 with compliance required within three years or less. With this in mind, we strongly urge the Subcommittee to avoid additional amendments that would disrupt this ongoing public process.

With respect to the water quality standards program, AFPA supports the basic policy which provides states the flexibility to designate the use of a particular water body and to adopt criteria the state believes appropriate for each use. Where appropriate, water quality standards should be upgraded to address additional pollutants or new information -- so long as the criteria documents for those standards are based on sound science and are peer-reviewed.

We believe it would be appropriate to place more emphasis on EPA research to determine the effects of chemicals on various uses and in different settings. On the other hand, imposing uniform water quality criteria on all uses and in all circumstances such as EPA essentially has done in its National Toxics Rule - effectively eliminates the essential state role in designating uses, and should be avoided.

Early in these hearings, Chairman Mineta rightfully noted that our ability to detect pollutants has sometimes overtaken our ability to assess their true impacts and to develop additional control technologies. In fact, we can now detect to near zero levels, and zero keeps expanding from parts per million, to parts per billion, to parts per trillion, to parts per quadrillion, and so on.

To require a zero discharge of some pollutants, as some have proposed -- even after best available technology is installed and operating, and water quality standards are being met -- simply does not make scientific or economic sense:

Such a severe requirement, presumably proposed to squeeze out that last marginal percentage of pollutants, would cost industrial dischargers billions of dollars and in some cases could result in process or plant shutdowns and lost jobs. Wouldn't those dollars be better invested in capital improvements that create jobs, or be better spent on investments which can yield tangible environmental benefits? Reductions of discharges beyond what would otherwise be required by EPA and the states under effluent guidelines and water quality standards are unwise and unnecessary.

Mr. Chairman, as I mentioned earlier, we have spent over a billion dollars to reduce the trace amounts of dioxin in our discharge to below detection levels. Our concern is that, because a zero discharge requirement would necessitate wholesale changes in the direction of environmental controls we've undertaken, much of that unprecedented voluntary investment would become obsolete.

NONPOINT SOURCES

Unlike many other landowners, our industry has been implementing nonpoint source Best Management Practices (BMPs) for a number of years.

Since passage of the 1972 CWA Act, all states with significant forest management activities have either passed forest practice laws or developed BMPs, approved by EPA to minimize the impact of timber harvesting on water quality.

Consequently, EPA has repeatedly found that forest management activities contribute relatively little to water quality impairment. According to EPA, forestry contributes, on average, only six percent of the loadings attributed to nonpoint source pollution. Beyond this "quantity" issue, there is also the issue of "quality" -- and runoff from the forests has been demonstrated to be much cleaner than that from many other types of land use activity.

It has been estimated that approximately one-half of water pollution comes from nonpoint sources. If we are to achieve water quality improvements, then it is appropriate to consider additional approaches in this area.

But, we ask you to move forward with extreme caution in any nonpoint legislation, to consider what approaches are working well now, and to avoid a Federal regulatory approach.

First, we urge you to recognize the highly successful efforts already being made by those now implementing BMPs, particularly in silvicultural management.

Second, BMPs are, and should continue to be, developed on the basis of state specific characteristics. AFPA generally supports the approach taken by the National Governor's Association (NGA) and the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), which calls for a state-based, "bottom-up" approach in developing and implementing BMPs. Section 319 of the current law provides the best framework for addressing this state-based approach.

Third, any nonpoint source program should avoid prescriptive land-use planning. Implementing BMPs is one thing, but telling private landowners when, where and how to harvest timber is inappropriate and unnecessary.

Finally, any new program should include all nonpoint sources. Identifying a small, select group of "easy targets" will not result in measurable water quality improvements and will only place a disproportionate burden on those covered in the program.

### WATERSHED PLANNING

Watershed analysis and management concepts can provide useful tools for addressing regional and site specific water quality problems. As the Subcommittee is aware, not only does substantial authority already exist in the Clean Water Act to implement watershed planning approaches, but activity is occurring on a local level in nearly every part of the country.

For this reason, we urge the Subcommittee to undertake an extensive review of this authority, as well as a review of the watershed management activities already underway, to learn what has and has not been effective in the field.

Rather than embark on a major nationwide "shotgun" initiative, it may be more useful to apply watershed planning concepts utilizing a "rifle shot" approach in some highly impaired areas, perhaps on a pilot-project basis.

AFPA is also concerned about the potential misuse of watershed approaches as a means of imposing federal land-use restrictions on private landowners. If watershed planning were used to address objectives other than impacting water quality impairment, such as restricting legitimate timber harvesting activities, or controlling residential or commercial development, manufacturers, small businesses, private landowners, and their communities could be severely impacted.

Watershed planning should not be used to impede legitimate private sector activities that are themselves in full compliance with federal, state, and local water quality laws.

### WETLANDS

As the subcommittee considers amendments to Section 404, we would like to point out that forestry represents a compatible economic activity in woodlands that can protect and enhance woodlands functions and values. The 1988 National Wetlands Policy Forum Report, sponsored by the Conservation Foundation with an array of participating stakeholders, including major environmental groups, recognized the compatibility concept and concluded that the silvicultural exemption under Section 404 should be retained.

The industry strongly believes that non-regulatory approaches, including market-based incentives, will encourage landowners to maintain wetlands in forest cover. Market-based approaches, including mitigation banking, and modification to the tax code provides opportunities to restore, enhance and create wetlands.

AFPA believes that for a forested area to be classified as a water of the United States subject to permitting requirements under the Clean Water Act, all three wetland criteria (hydric soils, hydrophytic vegetation, hydrology) must be present and

fully documented. In addition, the burden and responsibility of proof must be placed on the federal government, based on the preponderance of the evidence, that the site meets all three wetland criteria.

Congress should recognize that the imposition of regulatory requirements can result in the significant loss of economic value resulting in a taking of private property. In the event that private property rights are taken, just compensation for the fair market value of interests in lands should be provided.

#### GREAT LAKES INITIATIVE

As you know, the Great Lakes Critical Programs Act was enacted in 1990 in the final days of the Congressional session. That law calls for consistent water quality standards to be developed for the Great Lakes System. Recently, EPA issued its proposed guidance for those water quality standards.

AFPA is actively involved in the Great Lakes Initiative (GLI) process. Throughout the deliberations, we expressed significant concerns over the quality of science being used to support the water quality guidance, the fast pace in which the process was moving, and the substantial economic impacts likely to occur in Great Lakes communities. Our views have been shared by others, including many local officials whose communities will be seriously effected.

We understand that the Great Lakes model may be under consideration for other areas of the country -- such as the Gulf Coast -- and we would like to work with you to assure that adequate scientific review and lead time, as well as credible economic assessments, are provided to assure the development of sound programs.

#### FEES

We are aware that Congressman Gerry Studds intends to introduce a bill that seeks to raise something on the order of \$4 billion in new fees on industry and agriculture to pay for municipal wastewater treatment.

We strongly oppose this proposal. The approach unfairly penalizes dischargers who meet permit limits and comply with water quality standards because it requires them to pay for the construction of POTWs -- many of which are probably not even located on the same water body, or even in the same state.

We would, in effect, pay twice -- once for the cost of installing our own pollution control equipment and again for the entire nation's municipal wastewater treatment facilities which create their own water quality problems.

Previously we submitted a statement for the hearing in the Merchant Marine and Fisheries Committee which details our concerns with this proposal, and we would request that this statement be made part of the record for these hearings.

#### CONCLUSION

In conclusion, Mr. Chairman, AFPA appreciates this opportunity to share its views with the Subcommittee on these issues. AFPA has a strong interest in the development of Clean Water Act amendments. We look forward to working with you to develop sound policies that recognize existing authorities in the Act, and that address remaining water quality problems in the most efficient and least disruptive manner.

**TESTIMONY OF THE NATIONAL ASSOCIATION  
OF METAL FINISHERS REGARDING  
REAUTHORIZATION OF THE CLEAN WATER ACT  
BEFORE THE WATER RESOURCES AND ENVIRONMENT SUBCOMMITTEE  
HOUSE PUBLIC WORKS AND  
TRANSPORTATION COMMITTEE**

MAY 12, 1993

**INTRODUCTION**

The National Association of Metal Finishers (NAMF) represents the interests of over 800 member companies in the Surface Finishing industry. NAMF members provide electroplating and other surface finishing techniques for a variety of industries including, medical, automotive, aerospace, defense and general industry. Surface finishing is accomplished as a service performed on customer owned parts, "job-shops", and in "captive shops", surface finishing operations integrated within larger manufacturing operations. Either way, these operations impart an array of characteristics to finished parts, industrial components and products. Primary characteristics are corrosion and wear resistance. Without this protection, our society would find it necessary to replace items such as automobiles, other consumer and industrial goods with much more frequency. This fact results in an intrinsic environmental benefit to society provided by the activities of the Surface Finishing industry. Industry processes reduce the need for basic metals and other resources through increased product longevity.

NAMF appreciates the opportunity to submit this testimony on behalf of its primarily small business member regarding the prospective reauthorization of the Clean Water Act. NAMF believes that reauthorization should address the current

1

Chicago  
Washington

recognized, largely unregulated contributors to water quality problems including urban and agricultural "non-point sources" of pollution. The Congress should consider only provisions that seek to effectively minimize these contributions to pollutant loadings. NAMF suggests that Congress should not impose more and more stringent requirements on industries that are already heavily regulated by the Clean Water Act. Compliance by regulated industries such as NAMF's members has resulted in a significant improvement in the quality of the Nation's waters. Data collected by EPA, which the environmental community does not dispute, demonstrates that non-point sources of pollution, which have just begun to be regulated by the Clean Water Act, are responsible for 75 percent of the remaining water quality problems in lakes and 65 percent of the remaining problems in rivers.<sup>1</sup> It should be obvious from the EPA data that very little water quality improvement will result from any further, incremental reductions in pollutant discharges by point sources, simply because point sources are no longer a significant cause of water quality impairment. Incremental is the key descriptive term here. Reduction by industrial and other point-source dischargers of the last remaining traces of pollutants below current regulatory requirements which exceed or approach naturally occurring background levels will be prohibitively expensive to all - industrial facilities, communities and Publicly Owned Treatment Works (POTWs).

Congress should therefore recognize the significant, continuing achievements that industrial dischargers have made to date and focus its legislative efforts where remaining problems lay.

---

<sup>1</sup>. Impairment of surface waters from all sources may well be considerably lower than indicated by the lists required under CWA Section 304(1). Many of the 304(1) indications of water quality impairment were based on water quality criteria for metals which are scientifically invalid (please see additional comments in this testimony).

COMMENTS ON SPECIFIC ELEMENTS OF CLEAN WATER ACT POLICYThe Effluent Guidelines Program - Continuous Progress

NAMF has become a significant contributor to the progress currently being made in the Effluent Guidelines Program, which along with Pretreatment Programs, sets discharge standards for the majority of industrial discharges. The program currently includes National Effluent Limitations and Standards for 50 Industrial Categories set since 1972. The prospect for continuous progress in the effluent guidelines program is contained in the current EPA Effluent Guidelines Plan which sets forth the following schedule for reviews of existing standards and development new categories:

- \* 9 ongoing regulations (listed in 1990 plan) to be finalized 1993-96;
- \* 12 additional regulations, final 1996-99  
Waste Treatment Phase 2; Industrial Launderers  
Transportation Equipment Cleaning; Metal Products &  
Machinery<sup>2</sup>; Eight Additional Categories;
- \* 11 pre-regulatory studies over 6 years.

NAMF serves as a participating member of the judicially mandated EPA Effluent Guidelines Taskforce. The primary charge of the task force is to make recommendations to the EPA on how the effluent guidelines development process can be further improved and expedited and the above schedule effectively implemented. NAMF, representing both its members' interest and those of general small business industrial facilities, is working with other task force members including POTWs, environmental and community groups, states and EPA staff to review and recommend the best methods for gathering data, promoting pollution

---

<sup>2</sup>. EPA estimates that the Metal Products & Machinery category alone will regulate 855,000 industrial sites (57 Fed. Reg. 41001).

prevention, setting environmentally protective and economically achievable discharge standards. This collaborative process, bringing together all interested parties, is an example of how effective environmental policy can and should be made in successful, on-going, established regulatory programs. The collaborative approach is especially important in programs and policy which deal with, again, incremental progress in existing standards and already regulated industrial point source categories.

Consistency in standards, regulatory definitions and the general expectations of the regulated community as well as regulators (communities, POTWs, states) is essential for continued progress. The perceived need for and call for this consistency is a chorus from the regulated community, and particularly strong from local control authorities and POTWs that have meshed effluent guidelines limitations with their own locally imposed limits, water quality criteria based limits and beneficial sludge use requirements.

#### Establishment of Discharge Limits - Pollution Prevention

Congress decided in 1972 that EPA should not mandate how dischargers should reduce the level of pollutants in their discharges. While EPA was directed by the 1972 amendments to consider "process changes," along with other enumerated factors, when it promulgated discharge limits, the Agency was not permitted to require the adoption of particular process changes or the use of particular treatment equipment to achieve compliance with such limits. Rather, the decision how to come into compliance with effluent limitations was left to individual facilities. This regulatory approach was designed to foster and encourage dischargers to develop innovative approaches to come into compliance with standards. The process has worked well, although there is currently debate regarding the inhibiting effect of the "Technology Development Documents" used to support the limitations set in effluent standards because these documents inherently result in de facto specification of technologies.

There is neither a need nor a justification for altering the basis for effluent guidelines now, except perhaps to provide industry with pollution prevention incentives and flexibility.

Again, NAMF has played a constructive role in the debate about the appropriate role for pollution prevention in effluent guidelines standards. The Association participated for the past 18 months in the Industrial Pollution Prevention Project (IP3) Focus Group formed under the aegis of the EPA's National Advisory Council on Environmental Policy and Technology. This appointed group of leading industry, environmental group, POTW, consulting engineers and EPA officials struggled with the question of how pollution prevention could be fostered in the effluent guideline process but failed to reach full consensus on the appropriate method of doing so. Industry and others maintained that pollution prevention should be implemented with clear distinctions drawn between it and end-of-pipe control technologies. Pollution prevention policies in Clean Water Act programs should not look to past command and control approaches as a model but should be fitted securely in the multi-media, flexible, cooperative, incentive based approaches that appear to show the greatest promise for enhanced environmental progress and industrial competitiveness.

American industry, including the Surface Finishing industry, is extraordinarily diverse. There are literally tens of thousands of different processes, many of which are highly proprietary or simply unique due to the customer mix they serve, and just as importantly, completely different based on how individual facilities have tailored their specific processes in order to achieve general environmental protection and discharge limitations. EPA is simply not in the position to mandate pollution prevention measures including process changes or materials substitution, without wreaking havoc on the competitiveness of American industry. Accordingly, NAMF urges Congress to consider incentives and flexible approaches to pollution prevention as the primary, recommended tools for all

types of pollution prevention from source reduction to off-site return of materials into the stream of commerce.

Multi-media approaches to environmental control are now held to be the most promising development in environmental policy. The Surface Finishing industry is a compelling example of how pollution prevention and multi-media concerns are linked. The metals which are the primary constituent in Surface Finishing industry discharges are only toxic in concentrated amounts or volumes. In fact they are naturally occurring and ubiquitous earth elements. Unlike organic chemicals, they can not be destroyed through treatment or oxidation. While metals from plating operations can effectively be removed from waste water, the application of treatment technology to remove the metals from the water concentrates them in sludge or other semi-solid forms. There they can be appropriately managed or ideally, returned to either the plating process or sent off-site for reclamation and reuse. A variety of pollution prevention techniques are routinely used to insure that metals can be returned to process or are processed in a pure enough form to facilitate reclamation off-site. Virtually every one, single or in combination, are engineering techniques specific to the individual facility or production line. The appropriateness of any incremental water effluent discharge limitations for the Surface Finishing industry should include considerations of how current reclamation and solid metals generation reduction activities can reduce overall, multi-media releases to the environment but not mandate techniques.

The Domestic Sewage Exclusion Is An Important Part of Overall Environmental Strategy

The Resource Conservation and Recovery Act (RCRA) excludes from the definition of "solid waste" any mixture of wastes and domestic sewage that passes through a sewer system to a POTW for treatment. As a result of this "domestic sewage exclusion" (DSE), most treated, Clean Water Act regulated industrial wastes

that are discharged to POTWs are not considered to be solid or hazardous wastes under RCRA.

Pursuant to RCRA, EPA several years ago conducted a study of hazardous wastes discharged to POTWs. That study concluded that the DSE should be retained but that additional controls should be imposed on dischargers to POTWs. Those controls were promulgated in 1990. Having directed the Agency to study whether the DSE should be retained, and having made a study and recommendation which indicates that it should be retained, Congress should either call for review of those findings or retain the DSE.

The DSE should also be considered in the light of current prohibitions against "pass-through" interference for pollutants discharged by POTW system users, implementation and compliance with stringent water quality standards and the regulatory uncertainty (CWA & RCRA) for both industry and POTWs that would result from elimination or modification of the DSE.

Water Quality Standards - Good Science Should Be the Standard

Prior to the 1972 Clean Water Act, the primary mechanism for controlling water pollution was water quality standards developed by the states. In 1972, Congress decided to establish a nationwide, technology-based program of water pollution control as well (effluent guidelines), but Congress left with the states the primary responsibility for developing and implementing water quality standards, with EPA oversight. EPA was to "develop and publish...after consultation with appropriate Federal and State agencies and other interested persons...criteria for water quality accurately reflecting the latest scientific knowledge...on the effects of pollutants", CWA Section 304 (a) (1). 33 U.S.C. § 1314 (a) (1).

NAMF wishes to bring the issue of the scientific validity of current water quality criteria standards to the attention of the Subcommittee with the emphatic suggestion that Congress must compel EPA to revamp its development, consideration and adoption procedures for water quality criteria and perhaps other Clean

Water Act standards. The current informal "guidance" process subject only to requirements noted in-part above must be altered to insure that the "latest scientific knowledge" is in fact considered in these criteria through open peer review, public comment, and promulgation of these highly technical criteria. As often happens with "guidance" procedures or documents, federal water quality criteria and their applications methodologies adopted to date have become de facto standards on which many state programs are based. This unintended result (federal criteria were intended to assist states in developing their own standards) is often exacerbated because EPA Regional Offices discourage or all but refuse to accept alternative standards developed by states and because state resources for development of state specific criteria have been limited.

NAMF members are naturally concerned about metals water quality criteria and standards, and Congress has continually heard testimony from industry, municipalities and POTWs pointing out the extreme nature of metals water quality criteria and the prospective costs to control metals to below background levels as established in federal criteria and guidance documents that recommend or sanction the use of the "total recoverable metals" applications methodology.

In 1987 Congress adopted additional language at CWA Section 303(c)(2)(B). 33 U.S.C. § 1313(c)(2)(B) which required that states adopt numerical water quality criteria. EPA recently used provisions of this section as the purported basis for the promulgation of its "National Toxics Rule" ("NTR") (57 Fed. Reg. 60848 December 22, 1992) which imposed federal water quality criteria on 14 states.

In 1991 and 1992 NAMF used the Administrative Procedures Act proposal and promulgation process for the NTR to comment in part on the validity of the scientific basis for the metals criteria documents and guidance on which the NTR and many state water quality criteria standards, programs and permit limitations are based. NAMF provided comments to the EPA, including scientific

assessments and documents from within the Agency, that clearly indicated the metal criteria applications methodology used, recommended or sanctioned for use by EPA, the "total recoverable metals" measurement method, has been proven to be flawed, and that it measures amounts of metals that have not been shown to have a toxic effect on aquatic organisms.

Our on-going challenge to the scientific basis of EPA's current water quality criteria and applications methodology for metals illustrates that Congress must address the increasingly complex scientific basis for water quality regulation and the EPA's procedures for developing and implementing these basic provisions of the Clean Water Act. Congress must not allow EPA to use a "guidance" process coupled with the fog of scientific complexity to set standards which once in place result in environmentally unnecessary, extremely costly control measures, that are held inviolate by those who might choose to ignore the progress of environmental science.

#### CONCLUSION

NAMF wishes to again thank the Subcommittee for this opportunity to provide testimony. The information contained here indicates that the Surface Finishing industry has and continues to make a contribution to sound Clean Water Act and general environmental policy. Our industry has borne a tremendous burden in meeting a variety of environmental statutes. NAMF members understand that exceeding, not just complying with environmental regulations is the current and expected standard. Our members are only rankled when environmental requirements are unsupported by science, based on flawed logic or appeals to emotion. We hope that the Congress will use the reauthorization of the Clean Water Act as an opportunity to address new environmental challenges and the specific, limited deficiencies in existing law that require amendment.

1985

1986

TESTIMONY

OF

WILLIAM B. SCHATZ  
General Counsel

Northeast Ohio Regional Sewer District  
Cleveland, Ohio

BEFORE

THE

HOUSE PUBLIC WORKS & TRANSPORTATION COMMITTEE,

SUB-COMMITTEE ON WATER RESOURCES AND ENVIRONMENT

May 12, 1993

Mr. Chairman and members of the Committee, I appreciate the opportunity to present testimony to you today. My name is William B. Schatz, and I am the General Counsel of the Northeast Ohio Regional Sewer District. Our wastewater treatment agency collects and treats the wastewater for the residents and industries of the City of Cleveland and 48 other communities in the northeast Ohio area. We were created by an Order of the Cuyahoga County Common Pleas Court in 1972. Since that time, the District has spent over \$1 billion on construction projects to upgrade and improve water quality in the greater Cleveland area. One of the results of these efforts has been the tremendous improvement of water quality in Lake Erie and the Cuyahoga River.

The District owns and operates three major facilities within its service area. The Westerly Wastewater Treatment Plant, which is on the Lake Erie shoreline west of Cleveland, was rehabilitated and converted to a physical chemical treatment process commencing in 1974. The District's overall expenditure exceeded \$120 million for the upgrade of this 50 million gallon per day facility. Much of the facility was financed in part by the use of USEPA construction grant funds.

The process selected by the District was one which was touted by USEPA during the late 1960s and early 1970s as the technology of the future, particularly for facilities which treated high concentrations of industrial wastes. Rather than utilize conventional biological treatment, the process relied on removal of the solids through sand filters and carbon adsorption. During the course of construction, a number of problems were encountered both with the various phases of the

process and with certain equipment.

Through the early and mid 1980s, the District diligently dealt with construction and equipment problems and committed to the successful operation of the facility. After spending additional funds to change components of the system and process in 1989, a study of the facility was undertaken to ascertain if the process would work. The study concluded that the process was fundamentally flawed and would not enable the District to meet its NPDES permit limits for the Westerly treatment works. The District then decided to abandon and remove portions of the plant related to the physical chemical process and install a conventional biological facility with aeration and trickling filters.

A consulting engineer was retained by the District. After two years of design effort, construction commenced with a contract for site preparation. Three new contracts were let this year to upgrade the facility, and construction is now underway to convert the plant into a biological treatment operation. The cost of the actual conversion to a biological process is approximately \$35 million, although with engineering and other costs incurred by the District, the overall cost will be somewhat higher.

In addition, USEPA has brought an enforcement case against the District because the plant does not meet its effluent limits. The District has asserted a defense in this litigation with USEPA, claiming that it relied on the technology then touted and urged upon the District by USEPA. Also, auditors of the Office of the Inspector General during the construction grant close-out audit have set aside those portions of

the total cost funded with USEPA construction grants that are related to the flawed technology. This set aside means that the funds might be declared as eligible after the plant has been converted to a biological process and then meets its permit limits.

I appear before you today to request your assistance in obtaining recognition of this problem, and acknowledging the need for an authorization of an amount not less than \$35 million to assist the District in the reconstruction of this facility. This request is made with the caveat that there should be some fundamental fairness in the manner in which the users of the District's system are treated when they rely on representations made by the Federal government.

The rationale is that the District did rely on technology at this facility that was recommended and approved by USEPA. Without exception, other facilities constructed using this technology have all been converted to another process or otherwise rehabilitated. Several have received assistance through additional USEPA construction grants, which are, however, no longer available to our District. Arguably, had this facility been funded at the time when innovative or alternative construction grant funding was available, the facility would have qualified for such funding. Thus, the result of the failure of the process would provide that USEPA participate with funding at a level of 100% to rebuild the flawed technological portion of the treatment works.

The Westerly Wastewater Treatment Plant was the largest application of the physical chemical treatment technology in this country, and of course the largest facility which was unable to meet permit limits. The

Page 4

District spent several years and millions of dollars of its own additional funds to try to make this facility achieve its permit requirements. Now, the District must not only face the burden of the reconstruction of this facility, but must defend the lawsuit brought by USEPA. While we recognize that funding of specific projects in today's legislative environment is difficult because there are fewer discretionary funds available, we believe that this situation is so unique that it cries for the relief we request. We also seek through legislation an acknowledgement that the District's problem of permit noncompliance is not of its making, and given the fact that USEPA participated in the selection of and urged the flawed process, no civil penalties should be assessed against the District.

In closing, I again would like to thank the Chairman and members of the Committee for your time. I would be pleased to provide any additional information for your consideration. I once more urge that the citizens of northeast Ohio receive the fair treatment to which they are entitled caused by this mistake, and that they not have to shoulder alone the burden of the cost of the change.

1991

AMERICAN TEXTILE MANUFACTURERS INSTITUTE

1801 K Street, N.W. Suite 900 Washington, D.C. 20006-1301 TEL 202 862-0500 FAX 202 862-0570

Written Testimony of the  
AMERICAN TEXTILE MANUFACTURERS INSTITUTE  
before the  
HOUSE PUBLIC WORKS  
SUBCOMMITTEE ON WATER RESOURCES and ENVIRONMENT  
regarding  
REAUTHORIZATION OF THE CLEAN WATER ACT  
presented by  
JEFFREY SILLIMAN, ScD (Milliken & Company)  
CHAIR, ATMI WATER SUBCOMMITTEE

May 12, 1993

Gentlemen, thank you for soliciting the advice of the American Textile Manufacturers Institute specifically and those of us in the industrial community regulated by the Clean Water Act in general. My name is Dr. Jeffrey Silliman, and I manage environmental affairs for Milliken & Company, headquartered in Spartanburg, South Carolina. I, like those with me today, feel we can speak to the front-line successes and failures of the Act, and appreciate the opportunity to testify today. Given that textile facilities are in located in many small to medium-size communities, such as your own Mr. Chairman, I'm sure you will be able to relate to many of my comments.

For the most part, I would like to elaborate on several points my fellow panelists already have brought up -- specifically:

- **Don't rewrite the Clean Water Act.** Simply reauthorize it and make whatever minor revisions necessary. EPA already has numerous responsibilities from the 1987 reauthorization on which to act. Moreover, it has plenty of existing authority on which to act to protect the nation's waterways and the health and environment of the general public.

In addition, it should be noted that EPA's Office of Water faces significant funding cuts and staff reductions in the upcoming fiscal year and need not be hindered with new responsibilities. With fewer new responsibilities, EPA's Office of Water could focus instead on developing criteria and guidance documents based on *sound* science that are respected by the environmental and regulated communities alike and that are less likely to be challenged in court.

ATMI Testimony  
 J. Silliman  
 Page 2 of 7

- *Refrain from requiring EPA to issue water-quality criteria on arbitrary schedules, that are generally applied and not scientifically justified across-the-board.*

*A case in point:* In regulating metals, EPA has issued water-quality criteria that apply to all metals that are present in a stream regardless of form, whether or not they are bioavailable or toxic. As a result, one textile company has spent upwards of \$300,000 and four years demonstrating to the State of South Carolina that the metal in textile dyestuffs, in this case copper, is not bioavailable nor toxic and therefore the state environmental agency should not use EPA's stringent criteria for copper in developing discharge permit limits for the form of copper present in this facility's effluent.

Because the metals exists, however, in all likelihood, the company will see a metal limit in the fraction of a part per million range in its permit that will require treatment costing hundreds of thousands of dollars annually but will have minimal, if any, environmental benefit because the copper chemically is not bioavailable to harm human health or the environment.

- *Because of the prevalence of facilities impacted by EPA's water-quality criteria for metals and the excessive costs incurred by municipalities and industries nationwide for treating metals to these low limits, Congress should require EPA to undertake its desired scientific review of its metals criteria within the next 12 months and act upon its findings within the next 24 months.*

Corroding pipes, naturally-occurring metals, and the commercial use of various products containing metals – from copper to chromium, mercury to manganese, and zinc to lead – are present in the municipal and industrial discharges to our nation's waterways. There's not a member of this Subcommittee that doesn't have a constituent interest here – be it a metal-finisher in Steubenville, Ohio; a computer manufacturer in San Jose, California; a photo-finisher in Utica, New York; a dentist in Beckley, West Virginia; a textile plant in Toccoa, Georgia, or a municipal wastewater plant in New York City.

But, while not all forms of metals are toxic or present a danger to human health and the environment, EPA does not distinguish between those that are and those that aren't, and, through guidances, encourages the adoption of overly-stringent permit limits for metals by state permit writers requiring enormous capital to meet – even when the metals present no documented danger. Such is the case with metals found in textile discharges emanating from textile dyes.

## ATMI Testimony

J. Silliman

Page 3 of 7

In January, ATMI participated in an EPA metals workshop where experts reviewed the Agency's controversial metals criteria and discussed the textile industry's predicament in particular. The experts recommended to EPA, and the Agency has concurred, that more research is needed, but due to funding cuts, may never be initiated or, if so, in the far-distant future -- as businesses and cities go bankrupt trying to comply.

To mitigate any further costs from its controversial metals criteria, Congress should mandate that EPA undertake and act on their proposed metals studies in the near, rather than long, term. U.S. competitiveness and municipal solvency is at stake.

- *The nation's ability to detect pollutants in the parts per million, per billion and now per trillion level is overwhelming our ability to pay for the protection of human health and the environment to these same levels.* Therefore, Congress should mandate realistic risk assessments and corresponding cost-benefit analyses, and, with EPA's expertise and assistance, prioritize the risks to human health and the environment that are addressed by existing federal environmental statutes. This may be an overwhelming, if somewhat undefined task. Still, if Congress fails to act, EPA forever will be pursuing to eliminate parts per million, per billion, per trillion and so on of a substance that poses relatively minimal risk in one situation while overlooking, or more appropriately underfunding, the elimination of, perhaps, the same substance, in another situation where it poses a relatively more serious and widespread risk. This is a costly chase that few industries or communities have funding to pursue. Risk assessments accompanied by cost-benefit analyses are needed.

*A case in point:* Presently, the general public can drink water with more copper content than textile companies are permitted to discharge in their wastewater. In setting these respective standards, is EPA saying fish are more important than humans? Which risk is greater? Where should the limited funds of federal, state and local governments be allocated?

- *Require EPA to use the rule-making process, and specifically the Advanced Notice of Proposed Rule-making (ANPRM), to notify the regulated community that it is investigating and preparing a rule or guidance, particularly the latter, that might affect them and that they can come to the Agency prior to anything ever being written and demonstrate why the guidance would not apply to them or how the EPA's approach to implementation might be flawed.*

ATMI Testimony  
 J. Silliman  
 Page 4 of 7

Presently, public notification is required for the proposal and issuance of only rules, not guidances, and even then by the time something is in writing, it is difficult to alter EPA's position. Requiring an ANPRM for every proposed rule and guidance would reverse the Agency's tendency to regulate first, de-regulate later, and save the regulated community and EPA much time, effort and money in correcting its overly-conservative assumptions and past mistakes.

- *Allow industrial facilities that can demonstrate to EPA that they have, in EPA's terms, "no potential for stormwater contamination" to exit the stormwater permitting system and be managed under urban stormwater management plans.* This would minimize paper shuffling at both EPA and affected facilities. And, it would allow the Agency to focus on the truly "bad actors," where stormwater contamination presents real problems and allow affected facilities to focus on complying with other pressing environmental mandates.

*A case in point:* Many textile companies not only manufacture fabric, but also cut and sew their fabric products into apparel. These "cut-n-sew" operations use minimal, if any, chemicals and have minimal potential for stormwater contamination, but by virtue of being manufacturing operations where industrial activity takes place, are subject to the stormwater permitting requirements. If no potential for contamination exists, then common sense dictates that these facilities and others should be exempt from the permit requirements and should be managed under larger urban stormwater management programs. Moreover, we fear that stormwater permits could become the domino triggering other requirements, just as we have seen SARA, Section 313 reports become.

- *Federal pretreatment standards are redundant and unnecessary.* For the most part, POTWs already impose local discharge standards on industrial dischargers across the nation. These standards prevent discharge of any substance or substances that could interrupt or overwhelm the treatment system or that could pass through a cause a compliance problem with the POTW's permit. Development of federal pretreatment standards would be redundant and a waste of the EPA Office of Water's limited financial resources.
- *Instead, invest in POTW construction and operator education.* Rather than impose redundant treatment, industrial dischargers and localities would be better served with construction of POTW systems accompanied by funds to ensure the proper education and training of POTW operators. To this end, Congress should require that for every dollar loaned from the State Revolving Fund, X percent should go toward annual operator training to ensure comprehension and proper use of EPA's criteria and guidance documents -- annual because of the constant issuance of new or revised EPA criteria and guidances being adopted by states.

## ATMI Testimony

J. Silliman

Page 5 of 7

In the textile industry's experience, particular in rural and mid-sized communities, all too many POTW operators lack the proper education to understand and apply EPA's mandates as they are adopted and implemented by states -- for instance, EPA's water-quality criteria. This results in sometimes total misapplication of EPA criteria, inefficient POTW operation, costly, but unnecessary treatment, and need I forget, costly and protracted permit renewals for both permittees and local and state agencies. I speak from experience. Nearly 70 percent of textile dischargers are indirect dischargers through POTWs in mid- and small size communities.

*A case in point:* One textile company in North Carolina was told by their local POTW to reduce their discharge of copper and zinc to the level of several parts per million. Yet, the POTW was adding copper sulfate to their system to inhibit algae growth and zinc sulfate to inhibit corrosion -- both at levels that made the plant's in-coming water exceed the very water-quality limits for zinc and copper that they were imposing on the plant. The operators did not recognize the substances were being used nor did they comprehend how to properly adjust the metals limits of dischargers using their system to accommodate for their use. As a result, they were wreaking havoc and imposing overly-stringent limits on everybody including themselves.

- *Retain the Domestic Sewage Exclusion.* If the federal government doesn't know how to safely and cost-effectively handle hazardous waste at Superfund sites, it better not consider repealing the domestic sewage exclusion. EPA and the regulated community can show that the exclusion, which allows textile companies to discharge trace hazardous wastes to POTWs for treatment, has provided for the proper treatment and safe discharge of these wastes, minimal though they may be. Were it otherwise, companies could not afford, nor in many urban localities could space be found, for equivalent treatment. And, given the low detection levels that categorize a waste as hazardous, the potential for improper treatment, storage and disposal of hazardous waste would be greatly expanded.
- *Retain mixing zones in order to accurately assess the true impact of discharges on a water body and to allow nature to act on its innate capacity to assimilate.* In many instances, for example, with textile effluent from a weaving mill, nature has as innate capacity to assimilate and handle the discharge from the facility. In fact, biological wastewater treatment systems -- the type most frequently found within the textile industry -- are modeled after nature itself. To determine whether or not a discharge impacts a water body, however, industry and municipalities -- more the latter -- need mixing zones. Without them, we must rest on generalizations from tests run in controlled laboratory settings. Only through the use of mixing zones can industries and municipalities accurately assess the true impacts and address them. For many years, EPA has supported the use of mixing zones to further its holistic approach to water management.

## ATMI Testimony

J. Silliman

Page 6 of 7

- *Refrain from arbitrary chemical bans or mandated reductions.* The regulated community has shown that it safely can handle and dispose of numerous substances that Congress or EPA might ban – several of which, by the way, are naturally-occurring that you can't ban, but from experience, EPA and states will mandate industries and communities to treat and control. Instead, Congress should acknowledge the past, present and on-going success of related environmental and safety statutes, and let them continue to work, and refrain from equating use with risk. If it does, it sets a dangerous precedent.
  
- *Where fees are required – for effluent guideline development, permits or discharges, require the input of the regulated community as to how the funds are to be used and an accounting of how the funds actually are used. In the case of fees assessed by POTWs, industrial and residential surcharges should be increased at approximately the same rate and be apportioned to reflect the existing use of the system.* Finally, the fees that are generated from NPDES permit holders, directly or indirectly, should be appropriated solely for point-source programs.
  
- *Recognize the context – the environment, if you will – in which efforts to comply with environmental mandates are being made.* To those of us trying to comply with federal environmental requirements, we are grappling not just with Clean Water Act mandates, but also RCRA, Subtitle C, SARA, Section 313, Oil Pollution Act, and others, all simultaneously. In today's economic environment, it's easier to say, "get it done" than it is to do – particularly when the problem exists at the several parts per billion or trillion level.
  
- *Moreover, recognize industry's efforts to date to minimize pollution and assist EPA in enhancing our environment.* The success of Clean Water Act in cleaning up the nation's waterways can be, to great deal, attributed to industry's joint efforts in developing and complying with EPA's effluent guidelines and in jointly constructing – and in many cases, helping POTW managers operate – the POTWs in our communities. EPA recognizes this, we hope you do as well.
  
- *"Amtext".* A lot has been said here and in the White House about converting military research and development for industrial purposes. I'm here to say that the American textile industry has listened and is making it come true. Last month an agreement between the U.S. Department of Energy and the American textile industry was signed that will open up DOE's labs to textile chemists, plant engineers, and environmental managers for up to \$15 million in cooperative research. The environment is one of five areas selected for research, in this instance, focused on waste minimization through technologies that facilitate reuse and recycling and, more importantly, by fundamental manufacturing process changes.

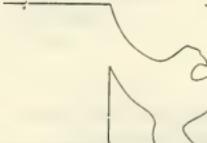

ATMI Testimony

J. Silliman

Page 7 of 7

In closing let me put my statements in context and state for the record that the American Textile Manufacturers Institute is the national trade association representing nearly 75 percent of domestic textile manufacturers located in approximately 30 states. The domestic textile industry is the *largest manufacturing sector of non-durable goods in the United States and contributes more than \$53 billion to America's gross domestic product* -- an amount larger than that produced by the automotive, petroleum refining and primary metals sectors. The industry consists of more than *26,000 companies* representing over 2 million jobs or *12 percent of the American workforce*. Textiles are manufactured into electronic components, medical devices, auto parts, home and office furnishings, and, of course, apparel. Presently, the domestic textile industry faces an unprecedented threat from foreign imports, many from countries that have few, if any, environmental concerns or mandates.

Gentlemen, I thank you for your attention and will be happy to entertain any questions.

**ORAL TESTIMONY**

**NATIONAL ENVIRONMENTAL DEVELOPMENT ASSOCIATION**

**CLEAN WATER PROJECT**

**MAY 12, 1993**

**INTRODUCTION**

Good morning. I am John Stein, and I am the Director of Strategic Environmental Initiatives for the Anheuser-Busch Companies. This morning, I am pleased to offer the views of the National Environmental Development Association's Clean Water Project on issues concerning the reauthorization of the Clean Water Act. My statement is meant to summarize and highlight the key points of NEDA's views. I would ask that our complete written statement be entered into the record.

In my testimony today, I plan to discuss briefly four significant issues in the reauthorization of the Clean Water Act -- market based approaches, toxic use reduction, toxic pollution control and enforcement.

**MARKET-BASED APPROACHES**

Market-based approaches to environmental protection can improve the quality of the nation's water resources while ensuring that the goal is reached in the most cost effective manner. In particular, provisions for the trading of effluents in individual watersheds should be explicitly added to the Clean Water Act.

A tradable permit system should allow companies to use trading to meet BAT requirements and pretreatment agreements.

In all situations, the antibacksliding provisions of the Clean Water Act should be clarified to permit trading.

Oral Testimony  
NEDA Clean Water Project  
Page 2

#### **TOXIC USE REDUCTION**

With respect to toxic use reduction, the NEDA Clean Water Project believes that Congress should not grant regulatory agencies the authority to make decisions that legitimately belong to the private sector.

A recent legislative proposal would have given EPA authority to make decisions regarding production in the guise of protecting water quality. Placing such authority in the hands of regulators would have serious implications for the growth and competitiveness of the U.S. economy.

Current law provides sufficient authority to establish standards. These should be continued along with market-based approaches for innovation and flexibility.

#### **TOXIC POLLUTION CONTROL**

Likewise in toxic pollution control, the NEDA Water Project believes that Congress should not summarily prohibit the use or release of substances without carefully considering the consequences.

Recent proposals to prohibit the discharge of certain chemicals do not consider the implications of such bans. Such decisions should consider the economic consequences to consumers as well as producers and the technical feasibility of achieving "zero discharge," along with the environmental effects of such restrictions.

#### **ENFORCEMENT**

In enforcement, we agree with a unanimous Supreme Court decision that citizens should not be given the right to sue for violations of the Clean Water Act that occurred entirely in the past. This authority would eliminate the distinction between citizen and government action to punish past transgressions.

Individual citizens are not bound by the government's need to pursue many public policy objectives, and are not held accountable by the general public, as is the government.

Granting citizens this right is entirely punitive. It will not improve present compliance or deter future violations.

The NEDA Water Project also believes that natural resource damages should not be made a part of Clean Water Act enforcement. Environmental remediation is already provided for under other laws.

I would now be happy to answer any questions.

Recycled Paper

Mr. Chairman, members of the Committee: I am Jeff Wennberg, Mayor of Rutland, Vermont and vice chair of the National League of Cities Energy, Environment and Natural Resources Committee. I am here today to testify on behalf of NLC and the 16,000 cities and towns across the nation we represent on the critical municipal issues confronting you in reauthorizing the Clean Water Act.

We are pleased to see both Congress and the Administration reevaluate the Clean Water Act with a view to addressing some of the problems the nation's cities and towns confront in implementation of the statute. Our principal concern is that existing federal requirements are simply overwhelming our ability to comply with the law. Our members are making it absolutely clear that the trend of unfunded mandates must change. There must be a careful evaluation of what resources can reasonably be made available and an honest determination of what the best and most effective use of those resources ought to be.

We note that the reconciliation instructions are clear that there will be less federal assistance available, not more, irrespective of any level of authorization. We believe, therefore, that we have a common responsibility to manage with what we have -- and to assure that no additional responsibilities and liabilities are imposed upon us until we have resolved what is already before us.

We also believe you, as individuals and as members of Congress, must take responsibility for prioritizing federal goals and objectives. Both as members of this committee in dealing with issues over which you have jurisdiction, and, as members of the House of Representatives in voting on issues outside of this committee's jurisdiction the nation's resources at every level of government, the relative risk of what we are asked to fix, and the costs measured against the benefits must be assessed and evaluated as part of every decision made on Capitol Hill.

We are also concerned when we hear of increasing federal interest in imposing federal fees as a revenue raising measure. We regard user fees as our source of revenue and would oppose efforts to encroach on our already limited ability to fund Clean Water Act mandates.

From the perspective of municipalities, a Clean Water Act reauthorization must address the following issues:

- A clarification of Congressional intent and revisions of the stormwater management program;
- Requirements for combined sewer overflows;
- Clarification of federal wetlands policies; and
- A continuing federal financial commitment to municipalities to assist in implementation of Clean Water Act requirements.

**STORMWATER**

While more often than not it is senseless to codify specific and detailed requirements for implementation of programs, in the stormwater area it is increasingly apparent that Congress has little choice. The separate stormwater management requirements in the 1987 Clean Water Act amendments occupy less than one page of the law and to us seemed fairly straight forward -- implement best management practices (BMPs) to the maximum extent practicable (MEP). Yet EPA has managed to write hundreds of pages of regulations and require costly application procedures which to municipalities seem to go far beyond this standard.

The same is true for CSOs. The law encourages the use of alternative technologies, but past regulations and guidance generally do not actively promote innovation at the local level.

While admittedly it is easier to administer and enforce programs that have uniform requirements for every municipality -- the "one size fits all" paradigm -- here is very clearly a case where innovation and flexibility ought to take precedence. We could even get better pollution controls for less cost.

● **STORMWATER MANAGEMENT PROGRAM** -- Last year this committee took the initiative to ensure a two year delay in the application of the stormwater management program to the nation's smaller communities. It is an initiative we applaud and for which we are truly grateful. But, we also hope you recognize that that action was merely a stopgap placeholder and the whole issue of managing urban stormwater run-off for all cities must be revisited. In our view, this program very clearly is "broken" and in desperate need of revision.

As I'm told, a representative of the National Association of Flood and Stormwater Management Agencies (NAFSMA) suggested to this subcommittee during the last Congress that if the federal government were paying for the separate storm sewer management program you would certainly look more carefully at the cost/benefit ratios. We cannot overemphasize our concurrence with these sentiments.

We have seen cost estimates for implementation of this program that range from \$1.2 billion in annual operation and maintenance costs for relatively straight forward and simple best management practices (street sweeping, prevention of illegal hook-ups, "no littering" and "pooper scooper" ordinances, vacant lot clean-up, etc.) to \$542 billion for major structural controls to remove nutrients, microorganisms, floatables, and metals. We have seen estimates for potential capital costs ranging from \$147 million to \$407 billion. Please note that if municipalities are required to implement the most sophisticated stormwater management program, we are talking about close to \$1 trillion -- or translated into terms we can all understand, \$11,000 per person, per year! This is \$500 per year more than the average Rutlander makes -

- before taxes.

We have also heard some denigrate these cost estimates as "over-inflated." But we have yet to see realistic cost estimates from EPA, an agency that estimated preparation of an application for a stormwater run-off permit would cost between \$35,000 and \$75,000. The reality, based on the experiences of cities over 100,000 population, is that the average cost of a permit application has been closer to \$1 million. And for \$1 million all a city has done is apply for a permit; not a penny has gone to prevent or abate pollution anywhere.

The committee should be assured that many of the nation's larger cities, those over 100,000 population, are struggling to justify these expenditures to their citizens. Many of these cities have, or had, CSOs as well as separate stormsewer systems. First they asked their citizens to finance sewer separation and now they must ask these same citizens to face new taxes to finance the results of that separation.

The fundamental questions Congress must ask is whether stormwater runoff is really that serious a problem that controlling it merits expenditures of this magnitude. We believe that the NURP study, conducted before the widespread impact of implementation of secondary treatment was evaluated, is out of date and does not adequately define the problem.

And secondly, Congress must assess whether controlling urban runoff is a priority concern, and if so, what mandate will be lifted or cancelled to assure that the necessary resources are available -- at any level of government -- to finance a stormwater management program.

Having said this, we do not deny that stormwater runoff contributes some pollution to the nation's rivers and streams. We are not calling for repeal of the stormwater management provisions. But, we believe -- at least for the foreseeable future -- a simplified, flexible and financially feasible stormwater management program would allow for orderly and cost effective development of both information and program design and make more sense than what we face now.

Our bottom line is a legislative prohibition on requirements for end-of-pipe standards or water quality based limits as now applied to other point sources. It is untenable for the federal government to hold municipalities responsible to accomplish what no one knows how to do at a price that, in our current economy, is absolutely unaffordable. If the NPDES program cannot be amended to accommodate a lesser standard, than a new stormwater management program outside of the NPDES program should be added to the Clean Water Act.

● **COMBINED SEWER OVERFLOWS** -- EPA has recently completed a guidance document for implementation of a CSO strategy. I would like to request inclusion in the record

-4-

of NLC's joint comments with the CSO Partnership. I also would like to reiterate one of NLC's concerns about implementation of a CSO strategy particularly as it affects more than half of the municipalities with CSOs -- those with populations of less than 5,000. These communities do not have the significant resources that would be required for studies and facility construction. And, we believe construction of facilities is not necessarily the most environmentally appropriate strategy for addressing pollution from combined sewers. We would prefer to see a mandated option for the use of alternative and innovative solution at least for small system CSOs.

If I may quote from the comments:

*Experience with utilization of ponds and wetlands designed and managed for wastewater treatment and water quality enhancement suggests that such alternative technologies offer the prospect for effective CSO storage and/or treatment at reduced capital and operating costs. Depending on local conditions, such approaches may also provide habitat enhancement, storage of storm flows and gradual release for low flow augmentation and preservation of open space with aesthetic and recreational value. In addition, such approaches may avoid adverse impacts on shoreline habitat and recreational uses resulting from construction of conventional storage and treatment facilities.*

#### WETLANDS

NLC acknowledges that wetlands are among the most productive of all natural landscapes. At the same time, the needs of the nation's growing population for housing, transportation and other infrastructure requires that we accommodate physical growth and development in our communities. But most of all, we need consistent policy setting the parameters for what we can and cannot do.

NLC believes sound public policy requires recognition of the values of economic and physical development as well as environmental protection. We support a classification system which recognizes that not all wetlands are of equal ecological function and value. Our criteria essentially are:

- to allow development where individual wetlands perform relatively marginal or insignificant ecological functions;
- to prevent development where wetlands are of the highest ecological value and irreplaceable;
- to require compensatory mitigation in areas where wetlands are very limited and losses would result in a serious reduction of wetlands function;
- to exempt areas where wetlands are abundant or the dominant land type and where proposed development would not result in substantial loss to overall

wetlands function and value from compensatory mitigation.

#### FUNDING

NLC has recently examined and developed new policy addressing what the nation's local elected officials believe are the most appropriate and effective means to re-establish the federal-state-local partnership in financing national goals and objectives in attaining and maintaining the national commitment to clean water. With respect to funding I will highlight three major areas of concern to our country's cities and towns: loans; grants; and project eligibility.

● **LOANS** -- While the National League of Cities continues to support the State Revolving Loan Fund (SRF), we do so with reservation. The loan program, in our opinion, is only one of several appropriate mechanisms for non-municipal financial participation in funding national environmental mandates.

We believe:

- First, a loan program should be a supplement to, not a substitute for, grant assistance.
- Second, we are also increasingly concerned about earmarks for purposes other than IMPLEMENTATION of Clean Water Act mandates.
- Third, repayable loans from federal resources generally mean that federal assistance goes to those least in need and with the best credit rating. The least goes to those with the greater needs.
- And finally, federal assistance comes with "strings," such as Davis-Bacon prevailing wage requirements, that make loans from private sources without those "strings" less expensive and more attractive.

Loans -- at least as currently devised -- are not a viable funding mechanism for many communities. A loan, by its very nature, requires repayment. For some communities, repayment is beyond their fiscal capacity. And, we believe it important to note, the inability to repay loans is neither unique nor exclusive to small communities. Many of the nation's large and medium sized cities face severe financial constraints, declining revenue bases, middle class outmigration, and increased federal intrusion in determinations about local financing priorities through costly, and in many cases, ill-conceived, mandatory requirements.

Municipalities face increasingly onerous and burdensome unfunded mandates from both the federal and state level. We are rapidly approaching -- if not already at - critical overload.

Conservatively, Clean Water Act mandates alone -- for wastewater treatment (\$110 billion), for CSOs (\$200 billion), and for stormwater management (estimated at a minimum \$1.1 billion for operation and maintenance of least cost best

-6-

management practices) -- represent in excess of \$300 billion.

We also face daunting, unfunded federal mandates for Safe Drinking Water Act requirements; RCRA mandates for solid waste disposal facilities; Superfund liability; Americans with Disabilities Act requirements; Fair Labor Standards Act costs, etc., etc., etc. One simple truth is environmental protection happens at the local level. The only place these mandated programs actually come together is when they land on my desk -- or show up in my constituents water bills.

We believe the current committee system makes it difficult for members of Congress to appreciate the "big picture" facing other levels of government. By way of example, you deal with Clean Water; Energy and Commerce has jurisdiction over drinking water and RCRA; Judiciary has ADA; Education and Labor does the Fair Labor Standards Act. One-by-one these legislative proposals may not look onerous. The cumulative impact at the local level, where we must address all of these concerns -- and usually by yesterday -- has brought us to our knees.

While it is not really within your purview, the states, by and large, are no different. Mandates imposed on the states by the federal government more often than not get passed on to us at the local level. And in the event there is something requirement Congress or the federal agencies have not thought of, you may rest assured, the states have or will. And that gets passed on too -- not to me as the Mayor, but to my citizens, my taxpayers, your constituents.

And, it does not end with the Congress. Some states take full advantage of the unrestricted license allowed under federal law to further enlarge these mandates. For example, it EPA desires to tighten regulations on the recycling of sewage sludge (Sec. 503), they can do so only if the more stringent standards are "necessary to protect public health and the environment. States, however, are not bound by this standard and may impose regulations based upon purely political considerations or even whim.

If the federal government expects us to continue to comply with federal requirements it must either:

- provide adequate financial assistance for all of these programs,
- a mechanism for prioritizing requirements to allow a rational approach to the tasks at hand, or
- the flexibility to address what are truly the problems at the local level.

A further exacerbation of the problem is what we heard recently from EPA -- that the SRF would be used to restore funding for a state program (the 104[b] program) proposed to be cut by OMB in the FY 1994 budget. The states already get 4 percent off the top in non-repayable grants for the costs of administration; Indian tribes get funds off the top of the SRF in non-repayable grants for compliance with

CWA mandates; now EPA is proposing to further diminish the SRF with yet another set-aside.

For municipalities, faced with the lion's share of the \$300 billion in implementation costs, there are only repayable loans. If we continue to see erosions and intrusions into the SRF for yet more set-asides, there will be less and less available even to borrow.

- **GRANTS** -- NLC believes that without grant assistance as part of the federal commitment to help meet the nation's environmental objectives, it is unlikely that municipalities will be able to comply with these mandates.

The previous administration recognized -- albeit in limited scope -- that the only way to attain the national commitment to secondary treatment (in the six coastal cities -- Seattle, Los Angeles, San Diego, Boston, New York and Baltimore), was by providing grants to expedite the process. There is little likelihood that cities, confronted with the magnitude of costs, will ever have the resources to complete even secondary treatment without grant assistance.

NLC policy in fact, calls on Congress to restore grant funding to assist municipalities in meeting the nation's clean water goals and objectives. Cities should be eligible for grant or loan funds or any combination of loans or grants. The use of loans and/or grants should be tailored to the specific needs and capacity of each municipal applicant for federal assistance. We also believe funding allocations to municipalities should take into account not only a municipality's ability to finance projects, but also prior local efforts to address the problem. We do, however, support prohibiting the use of grant funds to repay loans from the SRF.

- **GRANTS TO SMALL COMMUNITIES** -- Let me also add, that while we appreciate efforts to target grant funding to small communities, NLC does not believe population size is the sole determinant of need. Some of my colleagues preside over small communities where there is significant (and enviable) affluence. Others preside over large cities where significant proportions (in some case more than 50%) of the population are on some form of financial assistance. We believe economic distress, ability to pay and the community's track record of success in water pollution control should be elements of any grant formula.

In Rutland, for example, we will double our water and sewer rates in six years. The 1993 increase was 18.3%. We estimate that 90% of these new dollars are a direct result of state, Clean Water Act and Safe Drinking Water Act mandates. These increases do not include spending on stormwater treatment or the preponderance of CSO mandates.

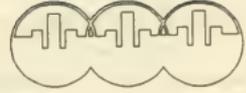

- **PROJECT ELIGIBILITY** -- NLC specifically supports expanding the activities eligible for

federal financial assistance under the Clean Water Act. We were pleased to see Administration support for this expansion in their proposed FY 1994 budget as well. We believe such funding should be available for all Clean Water Act mandates. We are most concerned that in addition to funding for compliance with secondary treatment, funds be made available to assist municipalities in addressing problems associated with CSOs and separate storm sewer management programs.

#### OTHER ISSUES

While these are our top priority issues, there are clearly others about which we have concerns. If I may, I would also like to submit NLC's *National Municipal Policy* on Clean Water issues for the record. It details our position on issues not specifically address in the testimony. In addition, our steering committee will be meeting tomorrow to review our current policy on watershed management with a view to enhancing our current position on this concern.

1993 National Municipal Policy**

## **2.05 Water Quality And Supply**

### **A. Problem**

It is becoming increasingly apparent that no section of the country is immune to the problems associated with both natural and man-made water pollutants. Urban stormwater and construction runoff have long been recognized as major contributors to water quality problems, and in many older cities, the existing sewer system with deteriorating pipes may be one of the main causes of water pollution. The growing concern over the introduction of toxic chemicals and pesticides into the environment and their impact on the ground water have added a new dimension to existing problems.

New treatment plants are generating mountains of sludge to be disposed of, and serious questions about land application practices encouraged by federal legislation are being raised as the concern over heavy metals, organic chemicals, and pathogenic organisms grows.

There is increasing evidence of organic contaminants, viruses, and other disease-causing organisms in our nation's public water supplies.

Expanding industrial activity has resulted in the discharge of a wide variety of synthetic organic chemicals into the rivers from which a large number of cities draw their drinking water. In spite of increasingly stringent controls on water pollution, small amounts of these chemicals have still been widely detected in the treated drinking water of many cities. Several of these synthetic organic chemicals are known as possible carcinogens, although the exact extent of the public health hazard posed by quantities of those chemicals present in cities' drinking water is not fully known.

The limited availability of water in all parts of the country also appears to be a growing and difficult problem.

Individual cities and in some cases entire regional water basins are feeling the constraints of limited water supplies. In some places, constraints have become true shortages. New reservoirs or diversion projects can no longer be solely relied upon to solve the problem. The number of possible sites, the environmental disturbances, the financial costs, and the absolute supply of water severely limit these structural solutions. Nor can greater amounts of groundwater be relied upon. In some locales, ground water mining has led to exhaustion of supplies, diminished stream flow, and land subsidence, and salt water intrusion.

Water has not traditionally been subject to price-determined allocation. Instead, it has been distributed according to a complex mix of state laws, federal regulations and charges, and local rates. It is a haphazard system at best, one which nearly defies rational evaluation. For many projects federal funding and water rates are such that taxpayers subsidize projects, the benefits of which go disproportionately to a limited number of agricultural and industrial uses.

### **B. Goals**

The basic principle for dealing with water pollution must be that no one has the right to pollute—that pollution continues because of technological limits, not because of any inherent right to use the nation's waterways for the purpose of disposing of wastes. However, the impracticability of immediately eliminating all pollution also must be recognized. A reasonable relationship of economic and social costs and benefits should be a necessary precondition toward achieving a nonpollution goal. The ability of municipalities to comply with any clean water program must be recognized as contingent upon adequate funds for building treatment facilities. In addition, any clean water goal must be applied on a uniform, national basis to prevent movement of industry in search of loosely enforced standards.

The nation's drinking water should be as safe as is technologically feasible at reasonable cost. Most Americans receive their drinking water from public water systems owned and operated by local governments. It is thus imperative for the continued health and welfare of the nation that local governments have the financial resources

and technical expertise needed to provide adequate and safe drinking water to their citizens.

### C. Clean Water Act Policies

#### 1. Federal Funding

Federal participation in the financing of projects mandated by the Clean Water Act is critical to the ultimate achievement of national water quality goals. The federal government must continue and expand its partnership with states and localities in the funding of Clean Water Act mandates. Federal contributions to the financing of water pollution control needs must be both substantial and a reliable long-term source of capital.

##### a. State Revolving Loan Fund

NLC continues to support the state revolving loan program (SRF) as a supplement to, not a substitute for, a grants program. The federal government should authorize an annual appropriation of funds which would be distributed to the states according to a specified formula. The states should then establish their own revolving loan programs for the distribution of loans, loan subsidies, or bond subsidies to localities for meeting Clean Water Act mandates. Such a supplementary program would help leverage federal funds, reduce annual local debt payments, and provide localities with added flexibility in structuring their Clean Water Act financing plans. Congress should prohibit states from using the interest on SRF loans to local governments to meet state matching requirements.

##### b. Grants

It is estimated that the nation's cities and towns face over \$200 billion in unfunded Clean Water Act mandates to comply with secondary treatment requirements and separation of combined sewer overflows. These cost estimates do not include implementation of separate stormwater management or wetlands protection or mitigation programs.

NLC calls on Congress to restore grant funding to assist municipalities in progressing toward meeting the nation's clean water goals and objectives. Without such assistance it is unlikely that municipalities will be able to comply with federal clean water mandates.

##### c. Use of Funds

Federal funding for Clean Water Act purposes should be available to meet all Clean Water Act mandates imposed on municipalities including construction of wastewater treatment plants, interceptors and major appurtenances, infiltration/inflow correction, major sewer rehabilitations, repair, upgrading, collector sewers, combined sewer overflows, separate stormwater management programs and wetlands mitigation projects.

Cities should be eligible for grant or loan funds or any combination of loans and grants to meet their water pollution control needs. Under no circumstances should any community be permitted to use grant funds for repayment of loans granted under the Clean Water Act.

The use of loans and/or grants should be tailored to the specific needs and capacity of each municipal applicant for federal financial assistance. Allocations of funds to municipalities should take into consideration a community's ability to pay and past local efforts to address the problem.

##### d. Sources of Funding

The federal government should redirect non-domestic spending priorities to assure adequate resources to meet Clean Water Act mandates. Congress should allocate a portion of these

redirected resources to a fund dedicated to implementation of water quality requirements.

Under no circumstances should the federal government look to traditional local sources of revenues (e.g., a federal tax on water and sewer user charges, a federal tax on industrial dischargers to POTWs) to fund increased federal participation in financing Clean Water Act mandates.

e. **Tax Code**

Congress should remove current restrictions on the availability of federal tax incentives for private financing of wastewater treatment facility needs, since such financing arrangements may reduce capital costs and expedite project construction, upgrading, repair, rehabilitation, etc.

2. **Compliance**

To enable municipal compliance with federal secondary treatment requirements, Congress should restore adequate grant funding and assure full funding of the SRF. Additionally, state governments should provide increased assistance for construction of wastewater treatment facilities and localities should collect sufficient revenues through assessment of user fees to help pay for the needed construction.

3. **Local Financing**

Local governments should have the choice between the ad valorem property tax, metered user charges, and any other mechanism for recouping construction and operating costs. Federally mandated sewer user charges should be deductible from federal income tax.

4. **Level of Treatment**

The statutory requirement of "secondary treatment" should be defined as a desired level of water quality and not restricted to any one particular process. This desired treatment level required of municipalities should be defined to prevent expenditures for unnecessary and expensive facilities. Moreover, the least expensive solution should be favored, such as low flow augmentation, when such a solution is the most economically efficient solution.

5. **Needs Survey**

Cities should cooperate with their states and the EPA to develop an accurate and equitable needs estimate for the annual survey required by the Act. EPA must assure that project priority lists submitted by states give highest priority to projects in areas of greatest need, and assure the highest return in the amount of pollution controlled for each dollar of federal assistance expended. Attention should also be given to problems of small, rural communities.

6. **Areawide Planning**

Where wastewater treatment planning is on an areawide basis, local elected officials must have primary responsibility. Management agencies should be designated in response to the desires of local elected officials, and should assure a fair voice for each participating government on a one-man, one-vote, or weighted vote basis. Preference should be given to existing planning and management agencies where they have demonstrated expertise and capability. Each city should be designated a management agency, if so desired. River basins should continue to be basic units for the development and administration of water resources. River basins should be developed to assure the maximum benefits possible in both water supply and recreation to the communities they serve.

Areawide water quality management programs required under Section 208 must be assured adequate federal funding for implementation and continued planning and management. Funds must be made available for adequate technical assistance to aid in the transition from planning to actual implementation of plans.

7. **Discharge Analysis**

Any extensions of the deadline for compliance with secondary treatment standards should allow adequate time

for individual analysis of current discharge practices. The analysis should focus on all relevant environmental effects including air quality, land use and energy efficiency. When evidence indicates that the technique utilized does not significantly degrade the environment, the facility should be exempted from additional treatment. The practice should continue to be monitored and if an unfavorable change is noted, additional treatment should be required.

### 8. *Desalinization and Recycling*

Government policies should encourage expanded use of desalinization processes and recycling of wastewater along with recovery of sludge and other resources material.

### 9. *Beneficial Use of Sludge*

Federal regulations on the management of municipal sewage sludge should encourage its beneficial reuse. Reasonably anticipated adverse effects associated with potential sewage sludge exposure and local geographical and climatic conditions must be considered in the safe disposal of sludge. If site specific consideration can be shown by reasonable risk assessment analysis to be environmentally sound, then the management practice should be permitted.

### 10. *Sedimentation and Silting*

Sedimentation and silting of lakes, creeks, estuaries, or other streams must be checked and avoided in all future planning. Whenever such silting and erosion has already occurred, research should be continued to find ways of correcting this condition, within an ecologically sound framework.

### 11. *Research*

EPA should support research on problems growing out of the management of wastewater treatment facilities such as combined sewer overflows, land application of treatment effluent and sludges, and source reduction.

Innovative and alternative technologies have not been used to their fullest potential. Therefore, federal research, development, and public education of these technologies should expand, but not at the expense of research on management and operational issues.

Source reduction technologies and programs are prohibitively expensive for individual municipalities to develop. For example, to enable municipalities to reduce levels of metals and other toxic pollutants from non-industrial sources, EPA should undertake research to identify products introduced by small business and residential generators and suggest control programs for reducing these pollutants.

### 12. *Pretreatment*

EPA should establish national categorical pretreatment standards only for those industries that it has classified as major polluters and only for those classes of toxic pollutants which are known to be widespread and which may be causing human health and aquatic life problems. EPA should be required to publish, by date specific, a listing of categories for which action will be required.

Local governments should be allowed to devise methods to satisfy national standards that not only assure protection of water quality but which are also cost effective under the conditions of their particular jurisdiction. Therefore, as an alternative to federally mandated implementation of the national categorical pretreatment standards, Congress should authorize states to approve local pollutant elimination programs.

To qualify for the alternative local program, a Publicly Owned Treatment Works (POTW) should be required to demonstrate to an authorized state agency that: 1) the POTW is in compliance with the requirements of its permit under the National Pollutant Discharge Elimination System (NPDES); 2) it has developed and implemented a local pollutant elimination program that in the aggregate is equivalent to implementation of the national categorical pretreatment standards; and 3) it is maintaining a local monitoring and reporting program which is adequate to disclose the quality of the receiving waters.

### 13. *State Water Quality Standards*

The current Clean Water Act requires states to designate how each water body is to be used within its

jurisdiction and to develop standards for attaining that use. Under no circumstances should a state be allowed to downgrade or revise its water quality standards where the designated uses have already been attained. However, a state may revise its water quality standard if it can demonstrate that: 1) the existing designated use is unattainable because of irretrievable man-induced conditions; or 2) attainment of the designated use would result in substantial and widespread adverse economic and social impact.

Where the water quality of a stream exceeds the level necessary to maintain a designated use, a state should have the option to allow lower water quality for that stream because of necessary and justifiable economic or social development for which there is no feasible alternative. In no case should the degradation of water quality interfere with or become injurious to existing instream use. Before a state exercises such an option, it should be required to hold public hearings and coordinate with all affected governmental agencies.

#### 14. *Toxicity Testing*

NLC supports the use of Whole Effluent Toxicity Testing (WETT) for the assessment of the potential toxicity of wastewater discharges; however, legislation should be adopted to prohibit the use of such tests as "pass/fail" NPDES permit conditions imposing strict liability on POTWs.

#### 15. *Common Law*

No municipality injured by a willful or negligent violation of federal or state law should be deprived of a remedy if one exists under the federal Water Pollution Control Act and other appropriate laws. However, EPA must be made a party where the defendant can demonstrate it has acted in good faith.

#### 16. *Pollution Prevention*

In addition to treatment policies, the federal government should develop, advocate, and institute pollution prevention measures. Prevention strategies are more effective in keeping toxics out of wastewater and far less costly than end-of-pipe technologies. Products containing chemical levels which constitute a significant percentage of the total loading should be restricted as to their composition and/or use.

#### 17. *Separate Storm Sewer Requirements*

NLC continues to support a more simplified and flexible approach to management of municipal stormwater run-off which would allow for orderly and cost effective development of both information and program design than that which exists under current EPA regulations.

Congress should amend the Clean Water Act to regulate urban stormwater run-off under a newly-enacted provision of the Act separate from the NPDES program. Such regulations should require implementation of Best Management Practices (BMPs) to the Maximum Extent Practicable (MEP) with a legislative prohibition on requirements for end-of-the-pipe treatment. Management of run-off from municipal industrial facilities should be incorporated as part of a system- or jurisdiction-wide stormwater management program. Municipal compliance with stormwater management requirements should be based on implementation of site-specific Best Management Practices required in the permit.

#### 18. *Combined Sewer Overflow (CSO)*

In establishing CSO guidelines, the federal government should use a technology-based approach determined on a case-by-case basis using best professional judgement weighing costs and benefits. The cost-benefit analysis should carefully consider the cost of CSO control, the intermittent and dilute nature of CSO discharges, the extremely large rate of the discharges, and the often remote locations of CSO outfalls against measurable benefits.

In controlling pollution from combined sewer overflows, EPA should develop a risk-based policy which implements controls and establishes implementation schedules based on the severity and/or frequency of pollution caused by overflows.

Technology-based requirements should not be assumed to involve end-of-the-pipe technology such as retention followed by conventional wastewater treatment. The technology-based requirements should provide for a wide variety of control techniques such as infiltration/inflow control, street sweeping, and conveyance away from sensitive environmental areas. Partial or total sewer separation should be phased in over time.

Municipalities shall be deemed in compliance once control plans and implementation schedules are in place, assuming the controls are appropriate and the schedule for implementation is maintained.

EPA should establish a "wet weather task force" of state and local government representatives to develop realistic water quality standards taking varying climatic and hydrogeological conditions into account.

Funding allocations should take into consideration a community's ability to pay and past local efforts to address the problem.

#### *19. Non-Point Pollution*

Congress and the Administration should proceed as expeditiously as possible through expanded research and development, technical and managerial assistance, and funding to aid the efforts of local and state governments in the control of non-point sources of water pollution.

Congress should authorize a new supplemental grant program for the funding of non-point source pollution abatement.

### MEMORANDUM

TO: US EPA Assistant Administrator for Water  
US EPA Assistant Administrator for Enforcement

FROM: The CSO Partnership  
National League of Cities

DATE: March 19, 1993

RE: Comments on EPA Draft CSO Control Policy

---

These comments are submitted jointly by the CSO Partnership and the National League of Cities. We thank the US EPA for the opportunity to comment on this Draft CSO Control Policy.

#### INTRODUCTION

As communities with combined sewer systems have recognized for some time, discharges of combined sewage, or CSOs, into our nations' waters represent a significant source of pollution that must be controlled if we are to meet the national goals of restoring our nations' waters. The CSO Partnership was formed to promote solutions and funding for this problem through a true **partnership** among the communities, states and the federal government. The **Draft Combined Sewer Overflow Control Policy**, developed by the US Environmental Protection Agency, dated December 18, 1992, represents a significant step forward by resolving issues and providing a sound format that will promote cooperation and the implementation of real solutions.

The CSO Partnership and the League believe that this Policy represents a workable compromise among the competing concerns of improving water quality through CSO control and recognizing the very real costs to communities and ratepayers that are associated with controlling and treating large volumes of combined sewage. As the Partnership and the League understand the Policy, planning for long term control of CSO discharges to meet Clean Water Act requirements will recognize the need to schedule construction and implementation of long term programs consistent with communities' ability to fund the programs. This recognition that programs will be implemented only in a manner consistent with communities' ability to afford the programs represents a significant change from the past, when it was perceived that there was little concern about how projects would be -- or whether they could be -- financed.

The CSO Partnership and the League want to note several components of the Policy that are particularly good:

Telephone: (804) 780-5200

Facsimile: (804) 649-9661

1. Recognition of financial considerations: EPA states early in the document that it "recognizes that the financial considerations are a major factor affecting the implementation of CSO controls" [page 7]. Thus, the Policy contemplates that implementation of long term control plans will take into consideration the community's ability to fund required projects. EPA has said that it is ultimately "each permittee" that is responsible for aggressively pursuing financial arrangements for the implementation of CSO controls. While we agree with that statement, it is only with the help and support of EPA and other interested parties that funding for these projects can be appropriately prioritized and made available. The recognition that without funding strategies no programs can be implemented is a significant step forward in ending the many years of little action on CSO control.
2. Long term planning based on knowledge of the sewer system: The Policy recognizes that development of environmentally sound and cost effective programs for CSO control depends on having good data and an understanding of how each specific system works. The approach of characterizing the system and developing a range of alternatives for review is sound. In addition, the CSO Partnership and the League support the early review of sensitive areas and the use of cost/benefit analysis in developing control programs. Overall, the Policy prescribes a rational and sensible approach to long term planning.
3. The co-equal nature of the "Presumption" and "Demonstration" approaches: The Policy allows a community to use the approach which is most suitable to its situation. While, as discussed later, the language in the Policy must be sharpened to make clear this equality, this flexibility and recognition of the site-specific nature of CSO problems will enhance the ability of communities to plan cost-effective and environmentally sound programs.
4. The recognition of the need for appropriate state water quality standards: The Policy encourages state and federal regulators to meet with communities planning CSO control programs to review and coordinate development of water quality standards to better reflect wet weather events. The Policy recognizes the need to be realistic about conditions during wet weather events and to more carefully define designated uses based on genuine recreational and other opportunities.
5. Prohibition of dry weather overflows: The CSO Partnership and the League recognize dry weather overflows (DWOs) of untreated and undiluted sanitary sewage from combined sewer systems as one of the most significant pollution problems in our waters today. The Partnership and the League support EPA's strong position on elimination of DWOs.

6. Maximizing treatment at the POTW: The Policy recognizes that it makes little sense to prohibit communities from using primary treatment capacity already available in the system. The provisions for a "generic bypass" will improve the level of treatment received by combined sewage flows and will foster environmentally sound decisions about where and how to discharge from combined sewer systems.

In addition to these general comments on the Policy and the positive step forward that it represents, the CSO Partnership and the League have specific comments on several sections of the Policy and has proposed language changes at several points. A copy of the Policy, with redlining and strikeout, is included with these language changes.

## **POLICY AS REGULATION**

The Policy states it is guidance only. However, as is well understood by the regulated community, unless carefully worded this guidance could be applied as regulation by permit writers. To assist in alleviating this potential problem, we have suggested replacing definitive key words and phrases throughout the document with language that appropriately conveys the discretionary nature of this guidance document.

## **STATE STRATEGIES**

EPA has recognized in the Policy [page 3] that the State strategies developed in conjunction with its 1989 CSO Strategy must be revised. The State CSO strategies are intended to provide a greater level of detail and site specific guidance to the affected cities and municipalities. The Partnership and the League recommend that the existing state strategies be revised after finalization of the policy on a schedule similar to that for the development of the strategies in 1989-1990. The initial guidance and direction for strategy review and update must come from either the national or regional levels of EPA. We suggest the schedule to reduce the period of uncertainty under which states and permittees must work and because it is the state policies that will initiate and provide more area-specific guidance for WQS revisions and ongoing CSO planning efforts. The Partnership and the League also recommend that the state strategies be reviewed and updated on the same triennial schedule as is currently required for each state's existing Water Quality Standards.

## **PREVIOUSLY COMPLETED CSO CONTROL PLANS AND PROGRAMS**

The provision at Section I.C.2. [page 4] for programs being implemented at the time of Policy adoption requires that existing programs be modified to comply with the sensitive area and fixed-date schedule requirement in the Policy. These requirements are likely to be unworkable where programs are being implemented and may be unfair to communities that already have begun the difficult task of CSO control. Requiring these localities to

modify already agreed to programs will penalize those localities that have taken the lead in CSO control by imposing upon them the expense and delay of modifying projects under design and/or construction. Aside from fairness, the proposed reviews are unworkable because many plans are now being implemented pursuant to consent orders or decrees that can not be modified without the agreement of all parties. Cities will be understandably reluctant to agree to modify orders negotiated in good faith in reliance on then existing federal and state guidance and policy when changes to the program cause additional delay and expense for already costly programs. The CSO Partnership and the League have proposed changes to the language in the Policy that it believes provide a more workable provision.

It is important that any CSO plan be designed to meet water quality standards including programs already completed or in the planning stage. However, few CSO programs will be able to demonstrate compliance with water quality standards unless the policies of "III - Coordination with State Water Quality Standards" are implemented as a part of the review of these existing programs. This can be addressed at least in part by requiring a WQS review as a part of the plan evaluation for large CSO service areas.

#### **SMALL SYSTEMS CONSIDERATIONS**

The National League of Cities has information that the median population served by combined sewer systems is approximately 5,000. While we recognize that Policy has provided some relief for small systems, we are concerned that these very small cities will face heavy burdens for both studies and facility construction.

The National League of Cities and the Partnership believe that some relief from these burdens might come from a better recognition of the opportunities offered by alternative technologies. The Clean Water Act contains a number of provisions encouraging the use of alternative technologies. Section 201(f) of the Act specifically encourages treatment options incorporating open space and recreational considerations. Experience with utilization of ponds and wetlands designed and managed for wastewater treatment and water quality enhancement suggests that such alternative technologies offer the prospect of effective CSO storage and/or treatment at reduced capital and operating costs. Depending on local conditions, such approaches may also provide habitat enhancement, storage of storm flows and gradual release for low flow augmentation and preservation of open space with aesthetic and recreational value. In addition, such approaches may avoid adverse impacts on shoreline habitat and recreational uses resulting from construction of conventional storage and treatment facilities. Language should be added to Section II.C.3 of the Policy which encourages permittees to consider and permitting authorities to approve innovative and alternative technologies as appropriate for CSO control. EPA should prepare separate guidance and case studies regarding utilization of alternative and innovative technologies for CSO control.

**FUNDING**

The CSO Partnership and the League recognize that EPA cannot make compliance with the Clean Water Act and NPDES permit requirements contingent on grant funding. While, as noted above, the Partnership is encouraged by EPA's recognition of the importance of financial considerations, we do suggest that EPA acknowledge the need for grant funding for CSO control. We have proposed language changes in Section I.E to include this point.

**NINE MINIMUM CONTROLS**

The CSO Partnership and the League support the implementation of the "Nine Minimum Controls" in the first phase of the long term CSO Control Plan. In some cases, however, we do not agree with specific actions listed in Attachment 1 to the Policy (which we understand were intended to provide examples of how these controls might be implemented or documented). The guidance must be carefully developed. The attachment to the Policy, while it contains some interesting ideas, does not have the guidance that is needed. For example:

1. Installation of inflatable dams, computer flow controls, bar screens, or booms: These projects may be appropriate at some locations as part of a long range plan. However, they are not generally short term or temporary measures that we believe EPA had intended as part of the nine minimum controls. Computer flow control, for example, is not simply installing a PC on the Chief Operator's desk. It is a system which requires sensors, communications, telemetry, customized software, automatic actuators, and flow control hardware. If such a system is installed without proper support, improper operation could actually exacerbate an overflow and cause severe upstream flooding problems.
2. Promote water conservation: Conservation, as a general principal, is desirable. However, in communities that draw their water from large, dependable surface sources, the significance of water conservation is minimal. In the context of CSOs, the base flow (which is the only component that would be affected by water use conservation) is generally a small fraction of the total discharge. Therefore, the decrease of the "sanitary" component would not likely affect the threshold level of a combined sewer discharge.
3. Revisions to existing pretreatment programs: The CSO Partnership believes innovative pretreatment programs can be an important part of CSO control programs. However, to the extent that such components of the controls are intended to limit industrial and commercial sanitary discharges during wet weather (for discharges in CSO tributary systems), it is not practical as part of the nine minimum

controls. There is an implication in this suggestion that industries located in combined sewer areas might be required to either shut down a plant (idling its workers) during rain or install more stringent levels of pretreatment than would otherwise be required for an indirect discharger under 40 CFR Part 403. Guidance in the pretreatment program contemplated separate base standards [403.5] for discharges to each POTW in a community with two or more treatment plants. However, in most cases, the National Categorical Standards have been more stringent and/or the community has chosen to use the more stringent POTW based standard for all dischargers. When such increased levels of pretreatment would only be needed during certain rain events, however, we do not think that it is realistic to expect affected communities to implement more stringent discharge standards for industries in CSO areas by 1997.

The Policy should be issued without Attachment 1, and the Agency should concentrate on finishing the guidance document that is being drafted to explain these controls.

#### **FIXED-DATE COMPLIANCE SCHEDULES**

In Section II.C of the Policy [page 13], EPA states that the long term CSO control program should include a "fixed-date project implementation schedule (which may be phased)." The meaning of a "fixed-date" schedule juxtaposed with the acknowledgment that implementation schedule "may be phased" could cause confusion in the implementation of the Policy. The CSO Partnership recognizes the need to provide certainty that the requirements of the Clean Water Act vis-a-vis CSO discharges will be met. The Partnership believes that this certainty can be maintained by appropriately requiring construction or implementation of later phases of the long term control program follow completion of earlier phases. Such an approach is more realistic in that often the scope of and need for later phases of CSO control programs will be determined after the effectiveness of initial phases has been assessed. This interpretation is consistent with the language in the Policy, but the Policy would be more clear if the words "fixed date" were omitted from this paragraph.

The interpretation of this particular requirement is critical to the central theme of this Policy -- that communities must be able to implement these long term control programs. A long-term, i.e., greater than 5-10 year, schedule with specific implementation dates which is incorporated into an enforceable administrative or judicial order can make it more costly or even impossible for a community to finance the earlier phases of the project. This is because when rating agencies review a community's ability to repay a particular bond issue, these agencies look at the total likely indebtedness of the community. It is this review that determines what the bond rating will be, or whether the community can issue the debt at all.

If a community is under an enforceable order to undertake specific construction projects on specific dates, the cost of these projects, including the debt financing, will be incorporated into the calculation of risk for the present bond issue, increasing the level of risk, and therefore the financing costs, of the present issue. In the extreme, the bond rating agencies could decide that the construction program is beyond the means of the community and therefore rate its present issue as highly risky, effectively preventing the community from borrowing money -- and possibly delaying implementation of the program. By contrast, if the obligation includes a requirement to schedule additional phases or projects following completion of earlier projects, the cost of these later projects does not directly impact the rating of the earlier bond issues. In many communities sewerage projects compete with schools, police, fire and other community needs for capital dollars, and the inclusion of long term schedules with specific construction dates may affect many more projects than just CSO control.

### SENSITIVE AREAS

The CSO Partnership and the League support the goals of the provision in the Policy that suggests "sensitive areas" should receive special consideration. However, we believe that the language implementing this principle at Section II.C.2.b. [page 17] is confusing. The language reads as requiring that overflows to sensitive areas be eliminated or relocated "wherever physically and economically achievable." This language does not seem to set forth a standard that is either clear or consistent with the structure of the WQS. As the Policy makes clear, the focus of control programs must be to comply with WQS. To a large extent, the areas defined as "sensitive" by the Policy are identified in WQS, often through designated uses. Thus, the process of reviewing areas where CSOs discharge and planning control programs that will meet WQS are likely to lead the appropriate level of control for these areas because of their designated uses. Attempting to adding a "special" level of review, particularly one which is so ill-defined, will complicate, rather than improve, the decision-making process for selecting controls for these areas.

Further, the assumption that any discharge to a sensitive area has an adverse impact is false. As with other CSO discharges, these must be considered in light of the conditions in the receiving water, the impact of CSO discharges, and the impacts of other sources of pollution. The provision as drafted does not allow these considerations and could cause CSOs cities to delay or forego addressing serious CSO problems in areas which do not carry a label of "sensitive." It is appropriate, however, to eliminate or relocate overflows where it is cost effective, and we suggest the sensitive area provision be revised to reflect this. The attached copy of the Policy shows these language changes.

**DEMONSTRATION APPROACH**

While the "presumption" and "demonstration" approaches in Section C.3. are described as alternatives, the CSO Partnership and the League are concerned that the Policy could be interpreted to impose an enormous, perhaps insurmountable, burden in satisfying the demonstration alternative. If this were the case, the result would be that the criteria in the presumption approach will effectively become minimum national standards, a result that we do not believe is intended by EPA. The problem is the language that requires the permittee to demonstrate that the controls are "clearly" adequate to meet water quality standards. Wet weather discharges such as CSOs involve highly complex issues relating to water quality standards compliance that are not easily resolved through traditional data analysis and modeling. The cost of sophisticated analytical techniques is high enough that few cities will have the resources to produce documentation that will "clearly" be accepted as having met this standard. To make the two approaches true alternatives, we suggest that more realistic standards demonstration language be included.

Section C.B.ii. as worded could be misinterpreted to mean that if WQS violations are not due to natural background conditions that CSO must be eliminated. It is our understanding that the intention of this paragraph is that the CSO controls must be adequate to meet WQS in the absence of background conditions. We suggest the paragraph be modified to reflect this.

Further, we question the appropriateness of including the requirement in the demonstration approach [Section C.3.b.iii.] that the permittee show that the selected controls will provide the "maximum pollution reduction benefits reasonably attainable." If the permittee has complied with the 9 minimum controls and met WQS, imposing additional control requirements that have little additional environmental benefit is control for the sake of control. It is appropriate, however, to indicate that the controls be cost effective and operated to provide the maximum pollution reduction benefits reasonably attainable.

The attached redlined version of the Policy contains changes to the language to incorporate the above points.

**PRESUMPTIVE APPROACH**

The presumptive approach included in the Policy is acceptable and compatible with progress toward controlling CSOs only if it is an equal alternative to the demonstration approach and not in any way a minimum requirement. This equal treatment approach is violated in Section IV.B.2.h. on page 39 which requires application of the presumptive controls if monitoring data indicate a plan does not meet WQS. There is no basis for requiring the presumptive controls as a matter of policy.

The text of the Policy states "aggregate national data suggest that incremental pollution control benefits at this level of control (4 overflows per year) are substantial compared to incremental costs for most CSO systems." The actual number of 4 overflows per year was not, as the text suggests, based on analysis of national data. However, it is our understanding that such an analysis is available to EPA, and we recommend that it be used to establish the target level of control. Based on discussions with US EPA staff, the required presumptive level would be reduced to 8-12 overflows per year if available technical analysis were used. An analysis of data developed for US EPA indicates that 8-12 overflows per year are equivalent to 73 to 67 percent capture by volume. It should be noted that 4 overflows per year is equivalent to approximately 80 percent capture not 85 percent capture.

In lieu of revising the number of overflows in the presumptive approach, EPA may strike the statement on page 20 that states the criteria were selected on incremental pollution control benefits and revise the basis to a non-technical policy based decision that may be modified on a case by case basis. However, it would be preferable to revise the figures to reflect actual data as suggested above. Our attached redlined Policy includes the preferred revisions.

The National League of Cities and the Partnership are also aware that some states have developed state standards for CSO control programs. For example, Illinois has found that there is evidence of a "first flush" and has developed regulations for CSO control around this concept. We suggest that the US EPA consider adding a fourth subsection to the "Presumption Approach" which supports state-developed criteria to be used in this approach.

Finally, we remain concerned about the requirement that "all flows" captured as specified in the presumption approach must receive minimum treatment equivalent to primary clarification. There are circumstances where flow through systems, such as, swirl concentrators, provide acceptable treatment for combined sewage at a comparatively low price. However, these systems have different performance levels over ranges of flows, and it is not clear how the term "all flows" will be interpreted. We would leave the WEF Manual of Practice as the standard but would make a minor language change shown in the attached redlined version to eliminate the word "all."

## **IMPLEMENTATION SCHEDULES**

The CSO Partnership and the League commented above on EPA's recognition that a community's financial resources must be considered in developing a schedule for its CSO control program. The Partnership and the League have two additional comments on Section II.c.7. First, guidance developed on financial capability should be based upon the cost of community-financed commitments, including all Clean Water Act programs. Second, included in the list of factors to be considered as part of a community's financial capability

is "ix. Other viable funding mechanisms and sources of financing." The Policy does not explain what these other items might be, and we are not aware of any sources of funding not included in the list. Unless at least one example is provided, this item should be removed from the list so as not to create the incorrect impression that CSO cities have additional funding options.

#### **WATER QUALITY STANDARDS**

The Partnership and the League have already commented on the Policy's recognition of the need for water quality standards that appropriately recognize wet weather conditions as one of the most important aspects of the Policy. We believe that the issue is important enough that the language in Section III.A [page 29] suggesting coordination among the state and federal regulators and the community developing a CSO control program should be strengthened. Changes are included in attached redlined version of the Policy.

#### **REOPENER CLAUSE**

The NPDES permit requirements spelled out in the Policy include a reopener clause in Section IV.B.2.h. This clause allows an NPDES authority to reopen a permit upon a determination that CSO controls which have been implemented fail to meet WQS. The CSO Partnership and the League believe that the last sentence of this paragraph, which requires use of the "presumption" approach in planning additional controls if the "demonstration" approach was used previously, is inconsistent with EPA's intent in establishing the two approaches as co-equal and likely to cause disruptions to what is otherwise a rational and systematic approach of achieving the most cost effective programs by adding to and expanding CSO controls. The ultimate goal of the Policy is, as required by the Clean Water Act, that operators of combined sewer systems meet WQS. Up until this point in the Policy, EPA has established a program that maintains that requirement but allows NPDES permittees flexibility to ensure that the programs designed to meet the requirements will make the best use of scarce resources.

Estimating the impacts of CSO discharges and the effects of controlling those discharges is a complex, difficult and imprecise task. It is highly unlikely that any community will precisely predict the impacts of completing CSO control programs. In some cases, the result will be much better than predicted, but in others, they will not achieve the planned improvements. This is true whether the program is planned using the "presumption approach" or using the "demonstration" approach. In imposing the requirement that if an initial program does not achieve the required result on the first try it must immediately go to a national standard, EPA is effectively eliminating an opportunity for flexibility that it has so carefully set out. The two approaches have been set forth as equally valid, and this part should be consistent with that principle. The attached redlined Policy includes the necessary change.

**CONCLUSION**

The CSO Partnership and the National League of Cities commend EPA for addressing the issues associated with CSO control in a straightforward, reasonable and realistic manner. EPA has presented a sensible and workable policy. The Partnership and the League look forward to implementing the Policy and moving forward with real CSO control.

ADDITIONS TO THE RECORD

---

**AMERICAN PUBLIC WORKS ASSOCIATION**

1301 Pennsylvania Avenue, NW, Suite 501, Washington, DC 20004 (202)393-2792, Fax 202/737-9153

**STATEMENT FOR THE RECORD**

by **Gordon R. Garner**

**American Public Works Association**

regarding

**Clean Water Act Reauthorization**

given to the

**House Subcommittee on Water Resources**

**May 11, 1993**

This statement for the Record is being submitted by Gordon R. Garner, Executive Director of the Louisville/Jefferson County Metropolitan Sewer District, Louisville Kentucky and a member of the American Public Works Association (APWA). It is in Mr. Garners' capacity as President of APWA's Institute for Water Resources that this statement is being provided today.

The American Public Works Association is a nonprofit educational and professional association that is an outgrowth of the American Society of Municipal Engineers which was established in 1894. APWA is headquartered in Kansas City, Missouri, with a governmental affairs office in Washington, D.C. The purpose of the Association is to assist public works agencies in fulfilling their responsibilities and to enable people involved in this field to work together to improve their professional practice, thereby serving the best interests of the tax-paying public. Membership is comprised principally of local officials, by also includes strong representation from the federal and state levels of government. Educators and representatives of the private sector are also counted among our over 27,000 members. APWA defines public works very broadly as, "the physical structures and facilities developed or acquired by public agencies to house governmental functions and

provide water, waste disposal, power, transportation, and similar services to facilitate the achievement of common social and economic objectives." Both the membership and the interests of APWA reflect the breadth of that definition. The training and focus of our members, and hence our Association, are in the technical disciplines underlying the various aspects of public works engineering and administration.

To foster professional development among public works personnel. APWA has established a number institutes which focus on the following fields of activities: administrative management, buildings and grounds, equipment services, municipal engineering, transportation, solid wastes and water resources. The institutes exist to promote high standards of competence in each of these areas. They conduct surveys and studies, and collaborate with APWA's Education and Research Foundations in presenting training programs and conducting research projects. APWA's Institute for Water Resources focuses on the development and protection of water resources, management of water supply and distribution systems, wastewater collection, treatment and disposal, drainage and flood control, and other programs involving the use of water for the generation of power, irrigation, and recreation.

Our Association, on a whole, believes that amendments to the Clean Water Act are necessary to address increases in knowledge of pollution and recognition of new environmental problems since the last amendments to the Act were passed in 1987, to address certain technical matters, and to continue the federal commitment to provide resources to address water pollution. The Association has prepared a position paper that is provided for the record that recommends Congressional action in certain areas of clean water legislation. Before getting into the details, let me set the stage by stating that over the years the American Public Works Association members have become increasingly aware of their role as being good stewards of the environment. In 1991, the Association adopted a comprehensive policy on the environment which recognizes, among other things, the need for sustainable development. A copy of this policy is provided for the record. Our members clearly find

themselves on the cutting edge of environmental protection in their day-to-day work and take their work seriously. Nevertheless, many of our members also frequently find themselves engaged in activity for the public good for which a Sec 404 permit is required. The need to get a project accomplished to better serve the needs of the taxpaying public may therefore run headlong into the need to preserve wetlands. The wetlands issue has been a contentious issue for several years now, and this is the first aspect of the Clean Water Act that I would like to cover.

### Wetlands

This program cries out for reform. In recent years, the 404 program has been "clarified" by such documents as the Federal Manual for Identifying and Delineating Jurisdictional Wetlands and various Memoranda of Agreement (MOA's) between the regulatory agencies. Although these documents have been somewhat helpful in determining what constitutes a wetland and what measures should be instituted to compensate for destruction of wetlands, they have had the practical effect in the minds of many to make it exceedingly difficult to secure a permit in a timely fashion, if at all. Moreover, when permits are granted, mitigation is being required with increasing frequency. In addition, although it is clearly recognized that wetlands make an invaluable contribution to the aquatic ecosystem, it is not at all clear that all wetlands, of themselves, are invaluable. Therein lies a problem which requires national attention and which we hope the Congress will seriously address during this session. Toward this end, our association urges that Congress, when addressing Sec 404 of the Clean Water Act, recognize that wetlands in general make an invaluable contribution to the quality of life and well being of the country. In addition, we also urge that Congress recognize that public works infrastructure projects based on sound engineering and economic decisions contribute to the quality of life and well being of this country as well. A balance between these two often competing interests must be struck.

One way that we believe this can be accomplished is by passing legislation that requires a three tiered classification system for wetlands. Such a system would consider the relative importance of wetlands e.g. invaluable wetlands, significant wetlands and low value wetlands. A system for regulating and managing wetlands can then be established that would allow development in low value wetlands without compensatory mitigation, allow development in significant wetlands with compensatory mitigation, and would generally preclude development in invaluable wetlands unless there is a compelling public interest reason and only after all feasible and practicable compensatory mitigation is provided. A copy of APWA's position paper on wetlands which elaborates on this position is being provided herewith for the record.

#### Stormwater and CSO's

The stormwater permitting process is a new program that is becoming a tremendous burden to municipalities which are being threatened with unrealistic numerical effluent limitations for stormwater discharges. Because stormwater systems are not treatment systems, imposition of specific effluent limitations is not practical and cannot be cost effective in most cases. APWA supports a change in approach to these permits to use quality management programs or best management practices as the primary means to achieve water quality standards before any treatment alternatives are required. EPA must then develop water quality standards appropriate for stormwater and CSO's that are reasonable and achievable. It must also be recognized that the effectiveness of technologies to abate the impact of combined sewer overflows (CSO's) is uncertain as is local government authority and capability to institute controls of toxic pollutants from stormwater run-off and from domestic sources. The association believes that such efforts would be better advanced through demonstration projects and abatement plans by municipalities. These projects should be allowed some flexibility to evaluate available

means of abating the impact of pollutants from these sources. In accomplishing this, recognition must be given to the site specific nature of CSO controls.

#### Financing

Available resources to improve our water resources are limited. Federal, state, and local governmental funds are inadequate for many existing programs and are not readily available to institute new programs. Consideration must be given to the costs and benefits at all governmental levels of any new initiatives to insure that they can be and should be supported by public money and staffing resources. Additional improvements should therefore be required and undertaken only if they can be economically justified, i.e. the benefits derived exceed the costs of implementation. Moreover, it should be recognized that communities are unable to undertake stormwater and CSO controls beyond the limits of their financial resources. Officials and professional at all levels are currently unable to effectively meet the demands of the current Act, and their ability to undertake additional programs is questionable. The ability of these people to obtain funds to institute such programs given the current economic climate is also uncertain. APWA also feels very strongly that if the federal government is going to mandate national standards then it should pay for its mandates. State and local governments can no longer afford legislative initiatives from Washington that tells them what to do while leaving the responsibility to these governments for finding the necessary funds.

#### Research

The APWA has also established policy regarding research and development. It has found that increased research and development to solve the environmentally related problems of local governments is a pressing national need and supports programs to stimulate research and development to meet this need. APWA also

supports authorization and funding of the National Academy of Sciences to evaluate research and development programs and to explore the feasibility of expanding the environmental research programs to provide authoritative information to policy-making officials on environmental issues and to more effectively respond to the environmental research needs of state and local governments. Such an effort would permit more informed judgments in establishing policy and in writing legislation such as future amendments to the Clean Water Act.

The American Public Works Association appreciates this opportunity to provide our views on Clean Water Act reauthorization. We stand ready to assist in any way possible.

## AMERICAN PUBLIC WORKS ASSOCIATION

APWA Position Paper**CLEAN WATER ACT***Approved by the IWR Executive Council on August 30, 1992**Approved by the Panel on Policy Review on March 8, 1993**Approved by the Executive Committee of the Board of Directors on March 8, 1993*Position

Amendments to the Clean Water Act are necessary to address increases in knowledge of pollution and recognition of new environmental problems since the last amendments to the Act in 1987, to address certain technical matters, and to continue the federal commitment to provide resources to address water pollution.

Available resources are limited. Federal, state, and local governmental funds are inadequate for many existing programs and are not readily available to institute new programs. Consideration must be given to the costs and benefits at all governmental levels of any new initiatives to insure that they can be and should be supported by public money and staffing resources. Additional improvements should therefore be required and undertaken only if they can be economically justified, i.e. the benefits derived exceed the costs of implementation.

Officials and professionals at all levels are currently unable to effectively meet the demands of the current Act, and their ability to undertake additional programs is questionable. The ability of these people to obtain funds to institute such programs given the current economic climate is also uncertain. The effectiveness of technologies to abate the impact of combined sewer overflows (CSO's) is uncertain as is local government authority and capability to institute controls of toxic pollutants from stormwater run-off and from domestic sources. Such efforts would be better advanced through demonstration projects and abatement plans by municipalities. These projects should be allowed some flexibility to evaluate available means of abating the impact of pollutants from these sources.

Wetlands protection is very important to clean water. Although the Senate in the 102nd Congress did not wish to address wetlands, as part of reauthorization, APWA believes the issue must be addressed. APWA previously has developed a resolution with regard to this matter and asks that the wetland program be changed as part of reauthorization in accordance with this resolution. Briefly, the position taken by APWA is that although wetlands make a valuable contribution to the quality of life, so too do sound public works

infrastructure projects. Therefore, a balance must be achieved between wetlands protection and infrastructure development. APWA has also taken the position that all wetlands are not of equal importance and that this should be recognized in the development and administration of the Sec. 404 program.

The APWA policy on CSO's specifies that in addressing this issue, recognition must be given to the site-specific nature of CSO controls. Moreover, it should also be recognized that communities are unable to undertake CSO controls beyond the limits of their financial resources.

The APWA resolution on Environmental Policy espouses principles that relate to any environmental law or action. These include a stipulation for sustainable development, pollution prevention, recognition of the need for sustainable energy sources, prioritization of resources, education and enhanced research and development.

The APWA has also established policy regarding research and development. It has found that increased research and development to solve the environmentally related problems of local government is a pressing national need and supports programs to stimulate research and development to meet this need. APWA also has supported authorization and funding of the National Academy of Sciences to evaluate research and development programs and to explore the feasibility of expanding the environmental research program to provide authoritative information to policy-making officials on environmental issues and to more effectively respond to the environmental research needs of state and local governments.

The stormwater permitting process is a new program that is becoming a tremendous burden to municipalities which are being threatened with unrealistic numerical effluent limitations for stormwater discharges. Because stormwater systems are not treatment systems, imposition of specific limitations is not practical and cannot be cost effective in most cases. APWA supports a change in approach to these permits to use quality management programs or best management practices as the primary means to achieve water quality standards before any treatment alternatives are required. EPA must then develop water quality standards appropriate for CSO's and stormwater that are reasonable and achievable. This approach is being discussed in greater detail by the National Association of Flood and Stormwater Management Agencies. APWA also feels very strongly that if the federal government is going to mandate national standards then it should pay for its mandates. State and local governments can no longer afford legislative initiatives from Washington that tells them what to do while leaving the responsibility to these governments for finding the necessary funds.

The APWA is aware that an analysis of proposed amendments to the Clean Water Act is also being conducted by the Water Environment Federation and

urges that all parties working toward reauthorization of the Act carefully consider the comments of this group of environmental professionals.

#### Issue

The 103rd Congress will be considering amendments to the Clean Water Act sometime within the next two years. Most recently amended in 1987, this law is the foundation for federal, state and local efforts to insure ground and surface water quality. Both the costs and benefits of the existing law have been enormous. The amendments as presented in legislation introduced in the 102nd Congress (S.1081) and expected in the 103rd Congress would greatly expand the responsibilities and obligations of federal, state, and local governments.

#### Rationale

The membership of the American Public Works Association is largely responsible for the administration of water pollution control and industrial permitting programs and seeks to insure the development of the best laws and regulations to reasonably address water quality objectives.

## AMERICAN PUBLIC WORKS ASSOCIATION

1301 Pennsylvania Avenue, NW, Suite 501, Washington, DC 20004 (202)393-2792, Fax 202/737-9153

### APWA Policy Statement

#### ENVIRONMENTAL POLICY

Approved by the Task Force on  
Environmental Policy on August 9, 1991  
Approved by the APWA Board of Directors on August 25, 1991

### Policy

The American Public Works Association supports an environmental policy embodied in the following six (6) principles and their supporting position statements:

**PRINCIPLE #1:** One of the highest goals of all environmentally concerned citizens and governmental entities must be to develop long-term environmental strategies for sustainable development. Sustainable development is defined as growth or development that, through the use of appropriate technologies, policies and programs, satisfies existing needs without compromising our environment, or the ability of future generations to adapt to evolving environmental and development needs. Environmental and socioeconomic concerns need not be in conflict, but are intertwined. They should result in long-term environmental and economic progress for a healthier and more stable world that recognizes the need to protect and enhance irreplaceable ecosystems.

**PRINCIPLE #2:** Pollution prevention, including source reduction and all forms of recycling and reuse, provides a framework for solving and avoiding environmental problems with efficiency and innovative technology. Pollution prevention should be emphasized as the front line of environmental defense, thus decreasing our reliance on the more traditional disposal and pollution treatment methodologies.

**PRINCIPLE #3:** Federal governments in cooperation with state/provincial, regional and local governments, the private sector and the public, must develop a sound and effective comprehensive energy policy which recognizes the goal of maintaining and improving the quality of the environment, emphasizing the use of sustainable energy sources, energy efficiency and conservation.

**PRINCIPLE #4:** Due to limited availability of resources, environmental protection efforts and remedies of past practices,

should be prioritized on the basis of opportunities for the greatest risk reduction.

PRINCIPLE #5: Promote a spirit of environmental stewardship through education, communication and coordination. This should be done by emphasizing the early coordination and continuous involvement of federal, state/provincial, regional and local governments, private businesses, interest groups, communities and interested individuals.

PRINCIPLE #6: There must be a strong commitment to the enhancement of research and development activities that evaluate the environmental risks and benefits of public works policies and programs.

#### Issue

In the United States, according to EPA, there has been a thirteen million ton increase in the amount of waste generated annually between 1986 and 1989. Also, environmental resources, including clean air, land and water are under increasing pressure from energy related and non-energy related developments. To assist in compliance and clean-up, during the past twenty years Congress has passed an impressive array of environmental laws, each adding stricter and more costly requirements. Still, a comprehensive, global, ecological perspective needs to be taken in solving our problems. This would include public education, communication and close coordination of all levels of government. It also includes a renewed commitment to environmental R&D. Finally, long-term environmental strategies must provide for sustainable development if a healthier and more stable world is to thrive.

#### Rationale

Members of the American Public Works Association (APWA), public agency and individual members, alike, have responsibility and concern for the protection, enhancement and sustainability of the environment while simultaneously providing the total spectrum of public works services and facilities that form the physical structure of our nation and communities. In addition, federal, state/provincial, regional and local governments are continually reshaping environmental policies and priorities to balance economic growth and public works development. Such governments should benefit from the advice and counsel of public works professionals. To assist the membership in discharging their duties, the foregoing environmental policies and principles have been developed which provide guidance for APWA and its membership.

**AMERICAN PUBLIC WORKS ASSOCIATION**

1301 Pennsylvania Avenue, NW, Suite 501, Washington, DC 20004 (202)393-2792, Fax 202/737-9153

APWA Position Paper**WETLANDS PROTECTION**

Approved by the Executive Committee of the  
Institute for Water Resources on February 23, 1991  
Approved by the APWA Board of Directors on March 19, 1991

Position

The American Public Works Association believes that although wetlands make a valuable contribution to the quality of life and well being of the country, public works infrastructure projects, based on sound engineering and ecological and economic decisions, also contribute significantly to the nation's quality of life and economic well being. A balance must therefore be struck between wetlands preservation and infrastructure development. Since all wetlands are not of equal value, APWA believes a three-tiered classification system is needed to classify wetlands for which Sec. 404 permits are being sought. This system should consider the relative importance of wetlands, e.g. low value wetlands, significant wetlands, and invaluable wetlands. APWA further believes that in administering the Sec. 404 program, a system for regulating and managing wetlands developed around this classification system is required which will: (1) allow development in low value wetlands without compensatory mitigation; (2) allow essential infrastructure development in significant wetlands with compensatory mitigation; and (3) generally preclude infrastructure development in invaluable wetlands unless there are compelling public interest reasons and all feasible and practicable compensatory mitigation is provided.

Issue

The Congress of the United States in Sec. 404 of the Clean Water Act established what has become a wetlands protection program by vesting responsibility with the Secretary of the Army through the Chief of Engineers for controlling discharge of dredge or fill material into waters of the United States. The ensuing permit process often does not allow for timely decisions by the Federal Government in approval or denial of permits, thereby contributing to schedule delays and resulting in additional project costs. Moreover, denial of Sec. 404 permits may result from the failure to strike the proper balance between infrastructure development and wetlands protection.

Rationale

American Public Works Association members are involved in activities for the public good, which may often run headlong into the need to protect and preserve the environment, particularly wetlands. A classification system for classifying wetlands must be developed which will allow for the more effective administration of the Sec. 404 program and a better balancing of infrastructure development with the need to preserve wetlands. Without such a system, meritorious infrastructure development projects will continue to be delayed and in some cases denied.

## Testimony

Clean Water Act Reauthorization  
U.S. House of Representatives  
Committee on Public Works and Transportation  
Subcommittee on Water Resources and Environment

by  
Ralph H. Brooks  
Vice President, Water Management  
Tennessee Valley Authority  
Knoxville, Tennessee

May 12, 1993

TVA is pleased to be able to share its views on a watershed approach to improving water quality. TVA is a regional agency. Its area covers 201 counties located in seven states. At the heart of this region is the Tennessee River watershed itself.

TVA has 60 years of experience building and operating dams on the Tennessee River system. There are 39 dams. They are operated for navigation, flood control, electric power, recreation, mosquito abatement--and water quality--purposes. The Tennessee River watershed is perhaps the most comprehensively regulated watershed in the United States.

With this much control over the watershed, many Valley citizens believe TVA should address water pollution problems. Since we have no regulatory authority over what people put into the water, we have developed an alternative approach that has been successfully applied to several watersheds within the system. We work with state and federal agencies, landowners, interest groups and the general public in a forum of cooperative problem solving to identify water pollution problems and find voluntary solutions.

TVA believes the approach taken by the Congress to address nonpoint pollution in the Clean Water Act should recognize some key principles borne out by our experience with water quality improvement efforts in the Tennessee Valley. These principles are:

By using established best management practices (BMPs), large amounts of nonpoint source pollution can be reduced at relatively low cost. There is no reason to further delay actual implementation of BMPs to reduce nonpoint source pollution. We have the technical knowledge. It does not require exotic new equipment. Most pollution can be controlled from most parcels of land with a few, simple practices.

TVA's objective has been to try to capture this large environmental benefit by demonstrating to landowners how much environmental return can be achieved for their community--and perhaps some economic benefit for themselves as well--by taking these low cost actions. When other Federal programs have been available to reimburse part of this cost, we have worked with the landowners to qualify them for these programs.

Many nonpoint source pollution problems can be corrected through voluntary, cooperative agreements. A partnership of landowners, business and industry, state regulatory and resource management agencies, federal agencies, and community leaders can be an effective coalition for change. Such partnerships are efficient because no new bureaucracy must be created to implement regulations, and adversarial actions and litigation are avoided. The solutions have staying power because they are based on an understanding of the causes of pollution problems and the benefits of corrective actions.

Incentive programs are a key element to successful partnership arrangements. TVA and other federal agencies have entered into cost-share agreements with landowners to implement best management practices; landowners bear a portion of the cost and agree to implement and incorporate these practices into their operations. Landowners frequently see the benefits both to themselves and to their communities by adopting BMPs. In the agricultural nonpoint source sector, TVA has found that generally well over half and, in some cases, as many as 90 percent of landowners participate in partnerships and incentive programs.

Limited resources have to be targeted toward priority problems within the watershed The foundation for effective targeting is understanding the condition of water resources through water quality and ecological monitoring and assessments. In the agricultural nonpoint source sector, for example, we have found that only half the farms are implicated in pollution problems in any given watershed. A problem-oriented approach to the assessment of water quality data helps determine the members to a partnership (i.e., who is affected or implicated by the problem) and the size of the watershed area addressed by each partnership. By using this type of data to target resources, funding agencies can realize maximum benefit at least cost.

Pro-active communications, public relations, and educational programs are all key to the partnership approach. Landowners contributing to nonpoint source problems are more likely to participate if they understand--in simple terms--what the problem is, how their activities contribute to the problem, how the solution works, and what benefits will be achieved. Having decided to participate, landowners help community leaders and government agencies find more efficient solutions to the problems.

There are some problems that require further research before either a partnership or a regulatory approach can succeed. We need research to identify cost-effective wastewater treatment methods for the 1100 communities of 5000 people or less in the Tennessee Valley who cannot afford conventional sewage treatment. We also need additional evaluation of the eight lakes and three streams that are posted with fish consumption advisories due to chemical contamination. Some of these advisories have been in effect for almost a decade. We are no closer today to understanding what it will take to get contamination reduced to a safe level than when the advisories were first made.

We have come to these conclusions from our decades of experience dealing with water resources and water quality issues on the Tennessee River and its tributaries. Our more recent experience with two specific programs is illustrative and instructive. The two programs are the Bear Creek Floatway project and the Land and Water 201 Program.

The river below Bear Creek Dam in Alabama flows through a beautiful gorge and offers whitewater rapids that attract rafters and canoeists from a wide area. But in 1984 the floatway was closed to recreational use because of high fecal coliform concentrations. Aerial photographs and targeted monitoring showed that the main problem was lack of adequate animal waste management on many small farms.

The Bear Creek Floatway was cleaned up by a cooperative effort. The Alabama Department of Environmental Management worked to upgrade treatment levels for point source discharges. TVA provided expertise in monitoring water quality, analyzing aerial photos, and targeting priority nonpoint sources for cleanup. The Soil Conservation Service provided expertise in working with livestock operators to design and install waste management facilities. The Agricultural Stabilization and Conservation Service provided expertise in developing contracts with the operators and arranging for payment of cost-share monies. The Bear Creek Floatway Advisory Committee provided guidance for educating the operators and inspecting installed systems. And, finally, landowner participation ensured that the pollution sources would be cleaned and maintained.

Agencies and local farmers halted nonpoint source pollution from livestock operations and reopened the recreational floatway. The landowners and recreationists benefited--and it also eliminated a source of pollution that affected the Tennessee River.

These results were obtained by installing 140 animal waste management systems on 50 farms. The systems included limiting livestock access to streams, providing alternative watering sources, treating wastewater effluent and polluted runoff, and land application of waste. Some systems involved innovative technologies, like constructed wetlands, and one solution to control releases from runoff treatment basins was patented.

The total cost for the systems was \$1.2 million with just over 20 percent paid by participating farmers. The remaining cost-share funding was provided by TVA under a special Congressional appropriation. The project removed waste equivalent to raw sewage from 15,000 people from the floatway at a cost of less than one-fifth the cost for treating a comparable amount of domestic waste. When completed in 1990, this project demonstrated that the watershed approach could effectively restore degraded water quality at a reasonable cost.

The Land and Water 201 Program was established in 1984 as a cooperative effort among the seven Valley states, the U.S. Department of Agriculture, the U.S. Environmental Protection Agency, and the Tennessee Valley Authority. It is based on the premise that many agencies working together can more quickly and effectively solve complex resource management problems. The purpose of the program is to serve as a national demonstration in improving water quality, reducing soil erosion, and increasing rural income.

A long-range plan developed for the 201-county region identifies \$6 billion of total resource management needs. Over half of these needs will be met by the year 2000 through existing programs. An economic analysis indicates that at least \$3 of benefits will be derived for each \$1 of expenditure. Since 1984, many projects in the region, like the Bear Creek Floatway Project, have benefited by the coordination and joint participation achieved through the Land and Water 201 Program.

TVA has now adopted this watershed management approach for all of its water quality efforts. All of these programs were recently combined into a single program, given new focus, and strengthened. We call it our Clean Water Initiative. Its goal is to help the Tennessee River system become the cleanest, most productive commercial river system in the Nation by the year 2000.

We use comprehensive water quality monitoring, novel public communication methods, River Action Teams, and cost-sharing partnerships.

Monitoring -- For years TVA has conducted a water quality monitoring program. We think it is the most comprehensive monitoring program in the Nation. TVA scientists now monitor conditions at key locations on most of the 35 reservoirs in the Tennessee River system and on major streams. They run over 8,000 tests annually on fish, water, and sediment samples.

Our monitoring program combines conventional water quality monitoring and ecological monitoring. We keep tabs on a broad range of physical and chemical variables in sediments, fish, and water. And we monitor the organisms that live in the water because these organisms can provide clues to help identify low levels of pollution or intermittent pollution episodes that otherwise might not be detected.

Communication -- Another part of the Clean Water Initiative is the RiverPulse river performance report. RiverPulse is a milestone because it presents, for the first time, complex technical information about TVA reservoirs in an easy-to-understand format. Based on monitoring results, RiverPulse gave answers to the three most common questions asked by TVA river system users: Where is it safe to swim? Are the fish safe to eat? Are the conditions adequate for aquatic life?

RiverPulse is an important part of our public communications effort because it helps people who are interested in water quality set river cleanup goals and track progress toward meeting them. If we want river system users and the public to get involved in river cleanup, we must make sure that they know what the problems are.

River Action Teams -- On January 20, 1993, TVA announced plans and locations for River Action Teams designed to facilitate solving the concerns identified by our monitoring. A River Action Team is a group of about six TVA experts in environmental science and engineering, aquatic biology, and other disciplines. Their job is to work in a watershed with government agencies, interest groups, landowners, and the general public to protect the ecological integrity and appropriate human uses of Valley water resources. They assess the status of water resources, identify the root causes of problems, and develop and help implement projects that resolve these problems. Projects focus not only on pollution cleanup where uses are impaired, but also on protection and restoration of aquatic habitat.

The River Action Teams we expect to create will be formed around watershed areas of about 2,000 to 4,000 square miles. These areas are large enough to allow watershed, reservoir, and tailwater interactions to be captured, yet not too large to be addressed by a small team.

TVA believes it has a cooperative problem-solving approach that will work anywhere. Our program emphasizes water quality monitoring, public communication, River Action Teams, targeting of problems, and cost sharing.

River cleanup is important. TVA's experiences indicate that cooperative problem solving at the watershed level is the best approach. It provides an opportunity for development of low-cost, site-specific solutions. Innovative methods can be tried that take advantage of local conditions. Local cost sharing ensures careful management of funds.

## Charles J. Chvala

### State Senator

TESTIMONY OF CHARLES J. CHVALA,  
 SENATOR, 16TH DISTRICT, WISCONSIN,  
 BEFORE THE HOUSE WATER RESOURCES  
 AND ENVIRONMENT SUBCOMMITTEE  
 MAY 12, 1993

MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE:

I WANT TO THANK YOU FOR THE OPPORTUNITY TO DISCUSS NONPOINT SOURCE POLLUTION, A CRUCIAL ENVIRONMENTAL ISSUE WHICH IS TRULY THE LAST FRONTIER OF SURFACE WATER PROTECTION.

CLEARLY, REDUCTION OF NONPOINT SOURCE POLLUTION MUST BE A KEY COMPONENT OF THE RE-AUTHORIZED CLEAN WATER ACT. WITH THE RECENT OUTBREAK OF CRYPTOSPORIDIUM IN MILWAUKEE'S WATER SUPPLY AND A SMALLER OUTBREAK IN NEARBY SHEBOYGAN, THE NEED TO ELIMINATE THIS PERVERSIVE AND PERNICIOUS TYPE OF POLLUTION FROM OUR SURFACE WATER COULD NOT BE ILLUSTRATED MORE DRAMATICALLY.

IT IS HARD TO BELIEVE IN THIS ERA OF ADVANCED TECHNOLOGY AND ENVIRONMENTAL ENLIGHTENMENT THAT MORE THAN 800,000 PEOPLE IN A MAJOR METROPOLITAN AREA OF THE UNITED STATES WERE FORCED TO BOIL WATER BEFORE DRINKING IT AS THOUGH THEY WERE LIVING IN A MEDIEVAL WORLD. YET MILWAUKEEANS WERE FORCED TO LEARN FIRSTHAND THE EFFECTS OF NONPOINT SOURCE POLLUTION.

FORTUNATELY, NONPOINT SOURCE POLLUTION CAN BE REDUCED INEXPENSIVELY, OFTEN WITH SIMPLE CHANGE IN MANAGEMENT TECHNIQUES. BUT WHATEVER THE COST, WISCONSIN SHOULD NOT BECOME AN ISLAND IMPOSING GREATER COSTS ON ITS FARMERS AND BUILDERS WHILE OTHER STATES IGNORE THE THREAT OF NONPOINT SOURCE POLLUTION. WISCONSIN AND OTHER STATES SHOULD NOT BE PUNISHED FOR ACTING RESPONSIBLY TO PROTECT OUR WATER QUALITY.

FEDERAL ACTION IS NECESSARY TO ASSURE CONSISTENCY AND PROVIDE THE DIRECTIONS TO CLEAN UP THIS LITTLE-KNOWN BUT DANGEROUS THREAT TO OUR ENVIRONMENT. WE SPEND BILLIONS OF DOLLARS EVERY YEAR TO ASSURE THAT MUNICIPAL SEWERAGE SYSTEMS, INDUSTRIAL DISCHARGERS AND OTHER POINT SOURCES OF POLLUTION ARE REDUCED AND ELIMINATED. BUT WE HAVE IGNORED THE POLLUTION THREAT JUST UPSTREAM - THE MISMANAGED CONSTRUCTION SITE OR A GROUP OF FARM ANIMALS THAT POLLUTE THE WATERWAY.

-1-

WE HAVE SIMPLY WAITED TOO LONG TO TAKE ACTION. WHILE FOCUSING OUR ATTENTION ON CONTROLLING INDUSTRIAL WASTE, WE HAVE NEGLECTED THE PROBLEM OF NONPOINT SOURCE POLLUTION. IN WISCONSIN ALONE, NONPOINT SOURCE POLLUTION ACCOUNTS FOR 65% OF THE POLLUTION IN OUR WATERWAYS. AS A RESULT, THE STATE DEPARTMENT OF NATURAL RESOURCES ESTIMATES THAT 40% OF OUR STATES CREEKS AND RIVERS AND 93% OF OUR LAKES HAVE BEEN DEGRADED OR THREATENED BY POLLUTANTS FROM RUNOFF.

I CHAIRED A SPECIAL LEGISLATIVE COUNCIL SPECIAL COMMITTEE ON NONPOINT SOURCE POLLUTION IN WISCONSIN WHICH EVENTUALLY CREATED THE NONPOINT SOURCE POLLUTION BILL THAT WAS PASSED BY THE LEGISLATURE. THE GROUP INCLUDED FARMERS, BUILDERS, ENVIRONMENTALISTS AND REPRESENTATIVES OF CITIES AS WELL AS DEMOCRATIC AND REPUBLICAN LEGISLATORS. WE HEARD TESTIMONY FROM HUNDREDS OF PEOPLE, AND AFTER MUCH AGONIZING DEBATE WE CRAFTED WHAT WE BELIEVED TO BE A CONSENSUS, COMPREHENSIVE NONPOINT SOURCE POLLUTION BILL.

IT HAS LONG BEEN KNOWN THAT NONPOINT SOURCE POLLUTION FROM STORM RUNOFF, CONSTRUCTION SITES, ROADS AND FARMS HAS RESULTED IN THE DEGRADATION OR DESTRUCTION OF WATERWAYS AND HABITATS. TROUT FISHERMEN AND OTHER SPORTSMEN HAVE LONG COMPLAINED OF THE EFFECTS OF RUNOFF ON STREAMS.

DRAMATICALLY IMPROVING THE WATER QUALITY IN OUR LAKES AND STREAMS WAS THE IMPETUS FOR THE NONPOINT SOURCE LEGISLATION WE PASSED IN WISCONSIN LAST YEAR. WE SAW THE PROBLEM IN WISCONSIN, AND WE TOOK ACTION TO CORRECT IT. THE BILL I AUTHORED, KNOWN AS SB 281, ESTABLISHED SEVERAL NEW CONTROLS TO HELP REDUCE NONPOINT SOURCE POLLUTION IN WISCONSIN'S WATERWAYS.

THE BILL CONTAINED SEVERAL PROVISIONS, INCLUDING:

- \* A STATEWIDE CONSTRUCTION SITE EROSION CONTROL PROGRAM PAID FOR WITH BUILDER PERMIT FEES.

- \* REFORM OF THE STATE'S PRIORITY WATERSHED PROGRAM AND CREATION OF INCENTIVES FOR FARMERS AND OTHERS TO IMPLEMENT BEST MANAGEMENT PRACTICES VOLUNTARILY.

- \* CREATION OF A "BAD ACTOR" PROVISION IN STATE LAW WHICH ALLOWED THE STATE DEPARTMENT OF NATURAL RESOURCES TO FORCE PARTICIPATION IN BEST MANAGEMENT PRACTICES PROGRAMS IF WATER QUALITY IN A PRIORITY WATERSHED IS NOT SUFFICIENT TO MEET WATER QUALITY GOALS.

- \* GRANTING OF AUTHORITY TO THE STATE DEPARTMENT OF AGRICULTURE TO ORDER DRAINAGE DISTRICTS TO CORRECT POOR MAINTENANCE OF DITCHES.

FINALLY, THE BILL DIRECTED THE STATE DEPARTMENT OF AGRICULTURE TO CREATE A MODEL LIVESTOCK EXCLUSION ORDINANCE TO LIMIT UNCONTROLLED ACCESS OF ANIMALS TO LAKES AND STREAMS. UNFORTUNATELY, GOV. TOMMY THOMPSON VETOED MANY KEY PORTIONS OF THIS BILL.

IT IS MY HOPE THAT THE GOVERNOR WILL RECONSIDER AND SIGN LEGISLATION I WILL RE-INTRODUCE THIS YEAR, ESPECIALLY IN THE WAKE OF MILWAUKEE'S WATER CRISIS. THE BILL'S PROVISIONS, IF ADOPTED, COULD HELP PREVENT SIMILAR CRISES IN MILWAUKEE AND OTHER CITIES IN WISCONSIN.

MANY PEOPLE HAVE VIEWED THE PROBLEM AS ONE LIMITED TO RURAL AREAS AND A SITUATION WHICH HAS NO DIRECT EFFECT ON CITIES AND THEIR RESIDENTS.

THAT WAS BEFORE MILWAUKEE'S WATER CRISIS.

MILWAUKEEANS LEARNED FIRSTHAND ALONG WITH THE REST OF THE COUNTRY THAT WE CANNOT ALWAYS ADEQUATELY PROTECT PEOPLE FROM ENVIRONMENTAL HAZARDS CAUSED BY RUNOFF FROM FARM FIELDS, BARN YARDS, COUNTRY ROADS AND CITY STREETS, AND CONSTRUCTION SITES. MANY OF THEM FOUND OUT THROUGH A PAINFUL ILLNESS THAT POLLUTION IN OUR WATERWAYS IS MORE THAN JUST AN ABSTRACTION.

IN THAT WAY, NONPOINT SOURCE POLLUTION HAS LITERALLY BECOME A GUT-LEVEL ENVIRONMENTAL ISSUE IN WISCONSIN.

ALTHOUGH THE EXACT CAUSE OF THE OUTBREAK MAY NEVER BE KNOWN - AFTER ALL, ONE OF THE PROBLEMS WITH NONPOINT SOURCE POLLUTION IS THAT YOU CAN'T PINPOINT THE SOURCE - IT IS DIFFICULT TO DENY THAT RUNOFF OF ANIMAL WASTE INTO THE MILWAUKEE RIVER WATERSHED MAY HAVE BEEN A CULPRIT IN MILWAUKEE'S WATER CRISIS.

ACCORDING TO WISCONSIN'S DEPARTMENT OF NATURAL RESOURCES, VIRTUALLY ANY ANIMAL FOUND IN A WATERSHED CAN BE CONSIDERED A POTENTIAL CARRIER OF CRYPTOSPORIDIUM. CATTLE ARE HIGHLY LIKELY HOSTS OF THE ORGANISM AND, WITH THE NUMBER OF FARMS IN THE MILWAUKEE RIVER WATERSHED, IT IS NOT DIFFICULT TO CONCEIVE OF A SITUATION WHERE THE ORGANISM WAS INTRODUCED TO LAKE MICHIGAN - SOURCE OF MILWAUKEE'S DRINKING WATER - THROUGH THE RIVERS AND STREAMS THAT EMPTY INTO THE LAKE.

BUT CRYPTOSPORIDIUM IS ONLY THE MOST OBVIOUS THREAT. SOIL EROSION, ROAD SALT, FERTILIZER, PESTICIDES AND OTHER CONTAMINANTS ARE INTRODUCED INTO OUR WATERWAYS.

ONLY THROUGH PREVENTION, DISINFECTION AND FILTRATION CAN WE PREVENT THESE AGENTS FROM REACHING THE TAPS OF OUR HOMES AND BUSINESSES. BUT I WOULD ARGUE THAT THE MOST IMPORTANT FACTOR IN THIS EQUATION IS PREVENTION.

IF WE KEEP POLLUTANTS OUT OF SURFACE WATER, NOT ONLY WILL WE HAVE HEALTHIER LAKES AND STREAMS, NOT ONLY WILL WE HAVE HEALTHIER LAKES AND STREAMS, BUT FAILURE TO PROPERLY FILTER AND DISINFECT OUR DRINKING WATER WILL NOT RESULT IN SUCH DISASTROUS CONSEQUENCES AS HAPPENED IN MILWAUKEE.

ANOTHER WISCONSIN NATIVE, THE PRE-EMINENT NATURALIST ALDO LEOPOLD, CHALLENGED HUMANITY TO DEVELOP A "LAND ETHIC." LEOPOLD SAID THAT WE ABUSE LAND BECAUSE WE REGARD IT AS A COMMODITY THAT BELONGS TO US, RATHER THAN AS A COMMUNITY TO WHICH WE BELONG.

MOST FARMERS AND OTHER LAND OWNERS ARE EXCELLENT STEWARDS OF THE LAND. BUT TO QUOTE LEOPOLD, "WHEN WE SEE LAND AS A COMMUNITY TO WHICH WE BELONG, WE MAY BEGIN TO USE IT WITH LOVE AND RESPECT." MOST LAND OWNERS RESPECT THE LAND. BUT IT IS CLEAR WE MUST NOT ALLOW THE BAD ACTORS TO CONTINUE TO POLLUTE.

WE ARE BEGINNING TO SEE THE HUMAN TOLL OF OUR FAILURE TO BE GOOD STEWARDS OF THE LAND. OUR NEED TO PROTECT OUR WATERSHEDS IS NO LONGER THE RESULT OF SOME ROMANTIC ENVIRONMENTAL AESTHETIC. RATHER, IT IS NOW A MATTER OF PRESERVING HUMAN HEALTH.

WITH GOV. THOMPSON'S VETO OF KEY PORTIONS OF WISCONSIN'S NONPOINT BILL, THE NEED FOR A FEDERAL LAW THAT REDUCES THE FLOW OF NONPOINT SOURCE POLLUTION HAS NEVER BEEN MORE EVIDENT. OUR NATION SHOULD ACCEPT ALSO LEOPOLD'S CHALLENGE TO BE BETTER STEWARDS OF THE LAND. CONGRESS MUST SEE TO IT THAT OUR STATES DO NO LESS.

IT MAKES NO SENSE TO INVEST BILLIONS OF DOLLARS TO CLEAN OUR LAKES AND STREAMS WHEN SEVERE DEGRADATION OCCURS JUST UPSTREAM.

THIS IS WHY THIS LAST FRONTIER MUST BE CONQUERED.

WITHOUT FEDERAL LEGISLATION, OTHER CITIES MAY FIND THEMSELVES IN THE SAME SITUATION AS MILWAUKEE. WE CANNOT AFFORD THAT RISK.

THOSE WHO QUESTION WHETHER SUCH FEDERAL LEGISLATION IS REQUIRED NEED SIMPLY TO ASK ANY OF THE THOUSANDS OF RESIDENTS IN MILWAUKEE COUNTY WHO WERE STRICKEN DURING THE WATER CRISIS. THEY WOULD BE HAPPY TO DISPEL THEIR DOUBTS.

I WOULD BE PLEASED TO ANSWER ANY QUESTIONS YOU HAVE ABOUT THIS ISSUE. THANK YOU AGAIN FOR THIS OPPORTUNITY. I HOPE MY TESTIMONY HAS BEEN HELPFUL IN DETERMINING THE NEED FOR FEDERAL NONPOINT SOURCE POLLUTION GUIDELINES.

Milwaukee Journal  
6/1/52

## A runoff of responsibility <sup>nd</sup> <sub>5/6/52</sub>

**E**VERY NOW and then, Tommy Thompson forgets that he is governor of Wisconsin and behaves as if he were governor of Elroy. He did just that the other day in gutting a pioneering bill to curb runoff pollution. Shame on Thompson. His parochialism stands to hurt taxpayers, the environment and his own reputation as an innovator.

With his trusty veto pen, the governor quietly excised key provisions of a bill that provided new carrots and sticks for stemming non-point pollution — runoff from farms, construction sites and city streets. Such runoff chokes fish-spawning beds, spurs weed and algae growth and contaminates ground water, causing billions of dollars in damage each year.

With just about everyone agreed on the need for cleanup, state Sen. Charles Chvala (D-Madison) spent two years working with a fragile coalition of farmers, environmentalists, builders and others on language that all could live with. The result was hailed as a national model.

Enter Thompson. His shortsighted vetoes knocked out the legislation's teeth, including a provision permitting the state to crack down on landowners who persistently refuse to practice soil conservation in the most polluted watersheds; \$71 million in state bonding authority, one of two principal funding mechanisms for cleanup; and incentives for the voluntary fencing of stream banks, to stem pollution from cows.

The governor also nixed county controls over erosion from one- and two-family homes and Department of Natural Resources oversight of commercial building sites; both jobs now fall to the Department of Industry, Labor and Human Relations, which has never shown much zeal for erosion control and now, thanks to Thompson, lacks enough funds to train inspectors.

What could have prompted such ill-considered moves? In his veto message, the governor said landowners were already committed to water quality. Some are, but he ignored the bad actors who have degraded about 40% of the state's rivers and streams and 75% of its lakes.

The catalyst for these vetoes seems to have been an alliance of uncooperative farmers and a few GOP lawmakers who willfully distorted the stream-bank fencing provision — it was *never* mandatory, though arguably it should have been — and played to Thompson's rural roots.

What now? A veto override is unlikely, but it ought to be tried. Meantime, counties and cities aren't precluded from enacting their own erosion controls for subdivisions and commercial sites; some already have done so, and more ought to, pronto. And the DNR should exercise what remaining power it has to stem runoff.

**T**HIS STUFF is killing our waterways and robbing from taxpayers' pocketbooks. May a future governor be enlightened enough to stop protecting sacred cows.

Gov. TOMMY THOMPSON

OUR OPINION

# Water: A non-point issue

Let's make one thing perfectly clear: The cryptosporidium protozoa that sent thousands of Milwaukeeans running for the Pepto-Bismol in the past week did not originate at Gov. Tommy Thompson's desk.

But the horrid epidemic of intestinal flu that has practically shut down Wisconsin's largest city is a perfect example of the very real dangers of non-point pollution. And while the non-point pollution bill that sailed through the Legislature last year only to be gutted by Thompson's veto pen probably could not have forestalled this spring's cryptosporidium outbreak, it might have prevented such plagues in the future.

It has been about two weeks since Milwaukee-area doctors and pharmacists first noticed that a disproportionate number of city residents were suffering the same nasty symptoms common to tourists in undeveloped foreign countries. It has been a week since public health officials identified the culprit as cryptosporidium, a microscopic parasite common to farm animals, and ordered city residents to boil all drinking water.

Officials theorize that animal dung washed into the Milwaukee River was carried in a "pollution plume" out into Lake Michigan, from whence Milwaukee draws its drinking water. Combine heavy spring rains with some type of failure in Milwaukee's water purification system and presto! You've got the Beer City two-step. Meanwhile, thousands of city dwellers who never gave the slightest thought to the problems of rural run-off are now arguing the issue over glasses of chilled Perrier.

Rural run-off is non-point pollution. So are the leaves and grass clippings and lawn fertilizer that run into Madison lakes and turn them into algae chowder by the Fourth of July. So is the dirt that washes off construction sites. Altogether, two-thirds of

all water pollution in Wisconsin is non-point pollution — that is, pollution that cannot be traced directly to a smoke stack or open sewage pipe.

Any number of steps can be taken to reduce the amount of rural run-off polluting the state's surface waters, says state Sen. Charles Chvala, D-Madison, author of last year's landmark non-point bill. That bill, which was supported by a broad coalition of farmers, construction industry officials, environmentalists and lawmakers from both parties, tried to encourage voluntary cooperation by promoting low-cost techniques like pasture rotation and conservation tillage methods. But the bill also contained teeth that would have allowed the Department of Natural Resources to force compliance from farmers who otherwise refuse to recognize the error of their ways — teeth that Thompson pulled.

Noting that several of the state's 130 worst watershed areas are located in the Milwaukee River basin, Chvala vowed this week to reintroduce those portions of the bill that Thompson vetoed last year. If Thompson needs an abject lesson in why he should support such a move, he should head east on I-94. There are a few thousand people at the end of the road who would be happy to explain it to him.

And lest Madison water customers become too complacent because our water is drawn from deep wells rather than surface water, remember that this city is surrounded by several hundred farms whose wells are polluted with pesticides and herbicides that have leached through the soil into the ground water. The saga of Milwaukee's water woes must teach us all that clean water is something none of us can take for granted.

## EDITORIALS

Janesville Gazette  
11/14/91

## Non-point pollution needs state attention

Over the past two decades, Wisconsin has made tremendous strides in fighting water pollution.

One estimate says industries and local government have managed to reduce pollutants, which starve water-borne plants and animals of essential oxygen, by 90 percent. Wisconsin was the first state to comply with federal water-quality standards. This state has been honored across the nation for its achievements.

This type of pollution, which typically comes out of the end of a pipe or some other clearly identifiable place, is called "point source pollution." The other key type of water pollution, non-point, washes off of farmland or roads and eventually into streams and rivers. This state's track record in curbing non-point pollution hasn't been as good.

A bill that just passed the Senate, however, makes a commendable yet realistic effort to improve. The bill faces Assembly action early next year. It should be passed.

The plan introduced by Sen. Charles Chvala, D-Madison, would:

- Direct the state Department of Natural Resources to begin work by 2000 in 130 watersheds around the state where pollution is worst. The state would likely identify the worst problem areas and offer landowners who volunteer to participate in cleanup efforts up to 70 percent cost sharing.
- Allow the DNR to require "bad actors" to enroll in the program after a sign-up and grace period. As a penalty, however, these participants would not be eligible for major grants or loan subsidies.
- Establish uniform, statewide controls on runoff from construction sites. Counties also would be required to adopt ordinances by July 1, 1993, that would keep farm animals out of streams and set new restrictions on drainage districts. The state Department of Agriculture, Trade and Consumer Protection would develop a model ordinance that local governments could adopt to encourage farmers to keep the state's 5 million farm animals out of waterways.

Funding for these efforts would come largely from a \$7.50 title transfer fee on used cars, which often leak oil and other fluids and have poor emission controls. That can result in toxic chemicals getting into the air and eventually finding their way into water. It's estimated the fee will raise \$10 million a year.

Why is it important for Wisconsin to get serious about non-point pollution?

For starters, clean water is key to keeping this state an attractive place to live and to visit. Many Wisconsinites take every opportunity they can to go fishing. Many visitors make fishing a key component of their weekend trips or vacations in the state.

If pollution chokes our fish population, it will have a tangible impact on quality of life and tourism income.

Pollution is already starting to take its toll. The Nature Conservancy recently reported that fish and other aquatic animals throughout North America are disappearing at a much faster rate than land animals.

"The loss of these species is a warning to us," Chvala said. "These species are our 'aquatic canary in the mine' - a warning to humans that the ecosystem we need to live is threatened."

Chvala recently called this the most important piece of environmental legislation the Legislature would consider this year.

He's right. This bill is that important to the long-term health of Wisconsin's environment.

With the Senate's approval, the bill is halfway there.

Chvala

## Let the lessons be clear as water

**M**ILWAUKEE'S water crisis may be over, but the malady lingers on. And we don't mean just the Dash-to-the-Bathroom Blues. Until city and rural folks alike get serious about keeping junk out of everyone's drinking-water sources, the threat of a repeat will remain. Maybe Milwaukee can help point the way to better prevention strategies nationwide.

The culprit here was Cryptosporidium, a tiny parasite found in animal wastes. How it got into the water supply is still a mystery. But at least one suspected culprit is upstream farmland runoff. Manure flushed into the Milwaukee River can eventually make its way into Lake Michigan, the source of the Milwaukee area's drinking water. A temporary change in purification techniques at the Howard Ave. treatment plant might have made it easier for the parasite to escape filtration.

How to prevent a recurrence? All levels of government, along with individual citizens, have roles to play. When the federal Clean Water Act comes up for reauthorization later this year, Milwaukee's crisis should impel Congress to improve safeguards for drinking water nationwide.

The Wisconsin Legislature, meanwhile, must crack down hard on landowners who fail to control runoff, and Gov. Tommy Thompson dare not stand in the way again. Whatever the ultimate cause of Milwaukee's crisis, his veto of tough enforcement provisions in

an erosion-control measure last year was indefensible.

Mayor John Norquist is on the right track in calling for stronger local standards for drinking-water purity and regular tests for Cryptosporidium. If water that meets state and federal regulations is making people sick, the rules clearly are inadequate.

The city also needs to explore moving the pipe that

draws water from the lake. Although that would be expensive — perhaps \$20 million — such an investment might help put a safer distance between pollution discharges and the water withdrawn for drinking. Federal help could ease the cost burden.

**Until city and rural folks alike get serious about keeping junk out of everyone's drinking-water sources, the threat of a repeat will remain.**

As Norquist himself acknowledges, the water utility must take customer complaints more seriously than it did when this crisis was in the making. There's also a need for better communication between local health officials and advocates for AIDS patients, who, unbeknown to the city, were apparently some of the first to suffer effects of the contamination.

Finally, everyone needs to be more respectful of the vast reservoir at Milwaukee's doorstep. Everything dumped onto lawns and streets — fertilizers, pesticides, pet droppings, oil and other chemicals — has the potential to wind up in Lake Michigan, the source of the community's drinking water. There's no guarantee that even the most sophisticated purification techniques will remove every last poison and pathogen. Better to keep them out of the lake in the first place.

# Let Milwaukee water ills be a lesson

"Water, everywhere and not a drop to drink." Things were just about that bad during the recent water contamination episode in Milwaukee.

Too often it takes a dramatic incident such as this one to focus public attention on the fact that even an abundant resource like water is vulnerable.

Whether caused by runoff of animal wastes from barns and pastures, or sewer overflow, somehow a dangerous parasite got past the water purification system and into the drinking water, causing many people to suffer a very unpleasant illness.

Polluted runoff (cattle waste, farm pesticide, fertilizer, mine and construction site waste) is called non-point pollution. This pollution often runs into streams, lakes and even seeps into groundwater.

Within the last few years, non-point pollution has been recognized as a serious threat to drinking water, and efforts are being made to correct it.

Some chemicals have already been banned from farm use. And an excellent bill introduced by Sen. Charles Chvala, D-Madison, was passed by the Legislature

More development scattered around the countryside brings to mind the worst nightmares of sprawl: The land lost to new housing sites and roadways leading to them would diminish still further our open spaces, wild lands and wetlands that make Wisconsin a wonderful place to live and a tourists' paradise.

• • •

A serious accident such as happened in Milwaukee should act as a warning to us to act with all possible speed to plug the loopholes in our water protection system, to increase safeguards where needed, and certainly not to weaken in any way, shape or form the protective rules already in place.

Sen. Chvala will reintroduce his runoff control bill.

The Legislature should pass it and the governor should sign it. DILHR should strengthen the septic system code, thereby living up to its duty to protect the public health.

We should accept no less from our public officials.

*Frankie Locke is active in the local Audubon Society and writes an occasional column on environmental issues for The Capital Times.*

septic systems to meet code of fluent standards. Experts in the field are unable to predict the long-range effects of the current rates of pollution from septic on groundwater quality.

Nevertheless the Department of Industry, Labor and Human Relations is actually planning to weaken the already inadequate rules controlling septic systems. This action would not only increase rates of pollution, but would open up 20 to 40 percent more land in the state to development and subsequent groundwater contamination.

Another source of groundwater pollution comes from septic systems used in rural, unsewered areas. While less obvious, this source of pollution is increasing, and could become much worse.

There is documented evidence of the deteriorating quality of Wisconsin's groundwater, and of widespread failure of existing

last year.

That bill would have gone a long way toward protecting our water. Unfortunately it was vetoed by Gov. Thompson when he vetoed most of the runoff control and enforcement provisions.

## **CLEAN WATER ACT REAUTHORIZATION**

### **Summary of Testimony of CH2M HILL, INC.**

Thank you for this opportunity to present testimony on the reauthorization of the Clean Water Act (CWA). CH2M HILL, INC., one in the family of companies of CH2M HILL COMPANIES, LTD., provides planning, engineering design, operation, and construction management services to help clients apply technology, safeguard the environment, and develop infrastructure. Our professional staff includes specialists in environmental engineering, waste management, water management, transportation, energy, industrial facilities, and a broad spectrum of infrastructure systems. Meeting water and wastewater challenges is a cornerstone of our practice.

From our experience working to achieve the objectives of the CWA, we believe that reauthorization of the Act should be one of the highest priorities of this Congress. Expedient reauthorization will allow the regulated community to move forward in addressing water quality problems. Although we have recommendations about specific provisions of the CWA, our fundamental assertion is that the CWA must be reauthorized soon so that efforts to protect the integrity of our Nation's water can proceed.

Funding is a critical issue. We endorse proposals to increase funding levels for clean water programs to \$5 to 6 billion a year. In addition, we recommend that State Revolving Funds (SRF) be made available for a range of projects, to be expended wherever they produce the most benefit in terms of water quality improvement.

On the basis of our experience in helping the public meet CWA goals, we offer the following recommendations.

#### **1. Endorse a Comprehensive Watershed Management Approach.**

- The CWA should endorse the watershed management approach being developed and recommended by agencies and groups such as the U.S. Environmental Protection Agency, the Association of Metropolitan Sewerage Agencies, and the National Research Council.
- Antibalancing requirements should be eliminated in favor of water-quality-based permit requirements that take full advantage of a watershed management approach.
- The watershed management approach should be extended to interconnected water bodies, including the surface water and groundwater interface.

## **2. Use Wetlands for Enhancing Water Quality.**

- This issue need not be a barrier to CWA reauthorization.
- The CWA should be amended to specifically encourage the construction of wetlands for water treatment and allow the development of natural wetlands for wastewater recycling.
- The CWA should clarify the potential to use constructed wetlands for mitigation of 404 wetland alterations.

## **3. Prioritize Environmental Actions on the Basis of Risk.**

- The CWA should be modified to prescribe an integrated approach to watershed management, such as that presented by the National Research Council, in which prioritization of risk is implicit.
- Risks and uncertainties should be recognized and incorporated into the decision-making process if the objective is to find the optimal and most cost-effective combination of environmental actions.

## **4. Set Site-Specific and Condition-Specific Standards for Water Quality.**

- Site-specific and condition-specific water quality standards should be permitted and encouraged by the CWA.
- In cases where effluent in an ephemeral stream has created a habitat, the CWA should require regulatory agencies to develop site-specific and use-attainability standards.
- The CWA should not mandate upgraded treatment capabilities nor the development of standards based solely on chemical parameters.
- The CWA should not be interpreted as requiring implementation of end-of-pipe standards if the discharge "passes" water body assessments and whole-effluent toxicity tests but fails chemical-specific tests.

## **5. Use Research and Development to Find Cost-Effective Means for Improving Water Quality.**

- Additional research and development of water treatment techniques and technologies should be funded through the CWA and the appropriations process.

- Federal grants and waivers that permit some improvement in conditions without requiring prohibitively expensive treatment to meet all standards should be implemented for rural communities.

## **6. Resolve Conflicts Between the CWA and the Resource Conservation and Recovery Act (RCRA).**

- Congress should permanently resolve the jurisdictional gap between the CWA and RCRA by amending the CWA so that indirect dischargers of hazardous wastewater are explicitly subject to management and control solely under the CWA.
- Congress should fashion a reasonable solution to the conflict between RCRA land disposal restrictions and the provisions of the CWA by recognizing the primacy of the CWA regulations.

## **7. Eliminate Impediments to Cleanup of Contaminated Sites.**

- Congress should consider at least two statutory initiatives during CWA reauthorization to facilitate the cleanup of contaminated sites currently regulated under RCRA and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA):
  - Authorize the EPA to develop regulations and effluent limits under Sections 307(b) and 402 that will allow expedited permitting of sites undergoing remediation; and
  - Encourage states and municipalities to incorporate provisions into their publicly owned treatment works (POTW) programs to facilitate permitting of treated wastewater from remediation sites.

## **Conclusion**

We at CH2M HILL, INC., and many others who support the objectives of the Clean Water Act, believe that the Act is generally working well to achieve defined and important goals. We urge Congress to examine the issues that we have raised and our recommendations, and to proceed reasonably and expeditiously to reauthorize this important statute with appropriate improvements. Thank you for this opportunity to provide our comments.

**CLEAN WATER ACT REAUTHORIZATION****Testimony of CH2M HILL, INC.****Introduction**

Thank you for this opportunity to present testimony on the reauthorization of the Clean Water Act (CWA). CH2M HILL, INC., one in the family of companies of CH2M HILL COMPANIES, LTD., provides planning, engineering design, operation, and construction management services to help clients apply technology, safeguard the environment, and develop infrastructure. Our professional staff includes specialists in environmental engineering, waste management, water management, transportation, energy, industrial facilities, and a broad spectrum of infrastructure systems.

The CH2M part of the firm's name is derived from the names of the founders of the company—Holly Cornell, James Howland, T. Burke Hayes, and Fred Merryfield. CH2M was established in 1946, in Corvallis, Oregon. In 1971, CH2M merged with Clair A. Hill & Associates, a surveying, photogrammetry, water resources, and structural engineering firm based in California. CH2M HILL now comprises more than 5,000 men and women and serves clients from more than 70 locations in 27 states and on 5 continents. The company has received national recognition for engineering excellence and innovative designs.

Since the earliest days of the firm, CH2M HILL has met the needs of municipalities and industries for water and wastewater treatment and water resources management. Our services on more than 5,000 projects in this area have ranged from preliminary studies and design for conventional treatment plants to the intricacies of the world's most advanced wastewater treatment systems and regional water management programs. CH2M HILL's involvement in high-technology wastewater treatment began in the 1960s with the development of the first advanced wastewater treatment facility in North America—the Lake Tahoe Advanced Wastewater Treatment Plant in California. Subsequent projects, such as the Upper Occoquan Water Reclamation Plant in Virginia, have afforded the opportunity for continued pioneering and advancements in wastewater treatment. Recently, CH2M HILL has made significant contributions on hazardous waste and transportation projects. However, meeting water and wastewater challenges remains a cornerstone of our practice.

### **General Observations on the Clean Water Act**

From our experience working to achieve the objectives of the CWA, we believe that reauthorization of the Act should be one of the highest priorities of this Congress. Expedient reauthorization will allow the regulated community to move forward in addressing water quality problems. Uncertainty about potential statutory and regulatory changes has caused some communities and companies to postpone needed improvements in their water quality programs and systems. Although we have recommendations about specific provisions in the CWA, our fundamental assertion is that the CWA **must** be

reauthorized soon so that efforts to protect the integrity of our Nation's water can proceed.

Funding is a critical issue. Members of environmental groups, water quality practitioners, and the regulated community present a united front in their support of increased Federal funding to enable states and localities to meet water quality needs. The U.S. Environmental Protection Agency (EPA), in its *1988 Needs Survey*, concluded that compliance with the CWA would require spending \$83.5 billion for wastewater treatment during the next 15 years. The U.S. General Accounting Office reported in 1991 that states believed that the true costs were much higher because the survey included only projects that were already designed and planned. Also, it omitted projects addressing nonpoint-source pollution control or protection of estuaries. Calculations based on the EPA's *1990 Needs Survey* put a price tag of \$110 billion on total unmet needs.

The Association of Metropolitan Sewerage Agencies (AMSA), in its report, *The Cost of Clean*, verifies the significance of the added cost to rate payers. The American Public Works Association (APWA) recently commented that municipalities will be required to spend in the range of \$1 billion to \$542 billion annually to implement best management practices in response to the National Pollutant Discharge Elimination System (NPDES) stormwater program. Many water quality professionals with whom we have worked believe that these figures are just starting points, and that doubling or tripling those numbers may yield a more realistic assessment of the cost.

By all accounting, it is clear that current Federal spending is too low. EPA's FY 1994 budget request for the CWA's State Revolving Fund (SRF) program is only \$1.2 billion, down from \$2.55 billion in FY 1993. If the Administration's budget request is honored, the Section 319 nonpoint-source pollution grants program, an area where many believe significant gains can be made in improving water quality across the board, would receive \$80 million in FY 1994. Although that is a hefty increase from the \$50 million appropriated for FY 1993, it still falls far short of the estimated funding required to address the problem. We endorse proposals to dramatically increase funding levels for clean water programs to \$5 to 6 billion a year. Also, although SRF funds have historically targeted point-source programs, we recommend that funds be made available for a range of projects, to be expended wherever they produce the most benefit in terms of water quality improvement. In addition to point sources, SRF-funded programs should address combined-sewer overflow, storm water, and nonpoint sources.

### **Specific Issues and Recommendations**

On the basis of our experience in helping the public meet CWA goals, we believe that there are several specific issues that Congress should address during reauthorization of the Act. The remaining sections of this testimony provide specific comments on these issues:

- Watershed management
- Use of wetlands for enhancing water quality
- Risk-based prioritization of environmental actions

- Setting of site-specific and condition-specific standards
- Research and development for cost-effective means of improving water quality
- Resolution of conflicts with the Resource Conservation and Recovery Act
- Impediments to cleanup of contaminated sites.

## **Watershed Management**

### *Summary of the Issue*

Most water quality professionals now recognize that few significant gains in meeting desired water quality standards can be achieved by focusing only on point-source controls. The full range of control options should be considered. This is particularly true for advanced levels of nutrient control and for removal of metals and organic compounds, where a less-expensive reduction in pollutant loading from a remote source would reduce the Total Maximum Daily Loading (TMDL) to a receiving water at a lower regional cost than a traditional end-of-pipe solution.

An integrated approach to watershed planning and management leads to identification and implementation of cost-effective solutions. Watershed planning integrates land-use management, an understanding of fate and transport of pollutants, and setting of water quality standards for receiving waters on a watershed basis. When watershed planning is combined with the regional economics of pollutant management, it results in a lower overall cost for achieving environmental goals. Watershed planning and management, by

broadening the focus beyond expensive end-of-pipe controls, also provide local governments and industries with needed flexibility in meeting receiving water quality goals.

The National Research Council, in its report *Management of Urban Wastewater in Coastal Areas*, presents an integrated approach to watershed management.

### ***Applications of Watershed Planning and Management***

The case studies presented here demonstrate that watershed management and planning can provide cost-effective solutions to water quality problems.

**A Cooperative Approach in California.** California wastewater agencies working through Tri-TAC and the California Association of Sanitation Agencies (CASA) have developed a coordinated watershed management approach. This is largely the result of recent water quality evaluations and permitting studies conducted in San Francisco Bay and in the Sacramento River Watershed. Most of the agencies involved are also implementing extensive new waste minimization and expanded pretreatment programs for upstream discharges. Where feasible, some discharges are being reduced through water reclamation programs. Yet despite these measures, many or most of the publicly owned treatment works (POTWs) are finding that they will be unable to meet current water quality standards for several metals. Even if industrial discharges were eliminated completely, these standards could not be met. Additional forms of treatment, such as reverse osmosis, would provide little benefit and would often be counterproductive because they would affect other media and produce additional waste streams, such as

brine and sludge. Significant overall improvements can only be achieved by considering all pollutant sources, including urban and agricultural runoff and mine drainage.

**The Example of the City of Santa Rosa.** In another area of California, the City of Santa Rosa has also demonstrated the importance of watershed management. For most of the year, Santa Rosa reclaims and recycles its treated wastewater through agricultural and urban irrigation. Through Santa Rosa's planning processes, it has become apparent that effective management of non-point source pollution (primarily from agriculture) is the most significant way to meet water quality criteria. Even complete removal of nutrients from the POTW discharge would not provide a measurable improvement in water quality, and the receiving stream would remain on the non-attainment list. The City is currently investigating several unconventional options for wastewater management projects, including treatment of animal waste and use of wetlands. The City is also conducting a CWA Sec. 205(j) basinwide assessment to determine the combined effects of urban stormwater, agricultural runoff, and POTW discharges on water quality.

**Federal Paper and Water Quality Modeling.** The Federal Paper Board Company, on North Carolina's Cape Fear River, has the most stringent organic matter requirements for its effluent of any pulp and paper mill in the Southeast. When Federal Paper found it impossible to fully comply with NPDES permit requirements at one of its mills, it negotiated a consent order with the state. In part, the consent order allowed Federal Paper to initiate investigations, conduct studies, and develop a revised water quality model to use in renegotiating permit limits. Federal Paper's studies proved that using

conventional technologies for processing, wastewater treatment, and effluent disposal would not achieve the permit limits. Further, biological investigations suggested that wastewater discharges were not impairing the river's aquatic habitat. The modeling demonstrated that seasonal fluctuations in the river flow were a key variable in determining appropriate waste-load allocations. Federal Paper's knowledge of the river's sensitivity to seasonal organic matter loadings enabled the company to develop a plan to store and seasonally release effluent to fully protect the environment without cutting production or closing the plant.

### *Specific Recommendations to Facilitate Watershed Planning and Management*

Although these good results can be achieved under the present CWA, several steps could be taken to facilitate wider use of cost-effective watershed management. Our first recommendation is that the CWA endorse the watershed management approach being developed and recommended by agencies and groups such as the EPA, AMSA, and the National Research Council in its report on coastal wastewater management. Water users should be given the opportunity to come together voluntarily to negotiate, rather than having to deal with prescriptive solutions that increasingly are inadequate or extremely expensive for improving water quality near the point of discharge. Federal and state governments should serve as facilitators to help interested parties get together to establish priorities and set standards for water quality improvements.

Second, we recommend that antibacksliding requirements be eliminated in favor of water-quality-based permit requirements that take full advantage of a watershed management approach. Antibacksliding is a technology-driven requirement to prevent industries and municipalities from removing treatment technologies that have already been implemented. In some cases, these requirements mandate systems that are no longer cost-effective.

Our final recommendation is that the watershed management approach be extended to interconnected water bodies, including the surface water and groundwater interface where, for example, pollution control could alleviate the effect of inflow from streams that are nutrient limited. This interconnection is in evidence in central Nebraska, where high nitrogen loads from excess fertilizer application are affecting water quality in the Platte River near the point of discharge from Grand Island's treatment plant. Greater use of CWA Sec. 319(i) authority, under which EPA can provide grants to States to protect groundwater from nonpoint-source pollution, would be helpful here. Significant clarification is needed in the CWA if the advantages of regional approaches to water quality management are to be realized.

## **Use of Wetlands for Enhancing Water Quality**

### ***Summary of the Issue***

The debate over reauthorizing the CWA has repeatedly run into one of the most controversial environmental questions of our time: How do we protect, restore, or replace

valuable wetlands while fostering vital economic growth and development? A regrettable feature of the debate over this issue is that some fundamental engineering and scientific facts are being obscured. The facts include the following:

- Degraded wetlands **can** be restored
- Existing wetlands **can** be protected and enhanced
- Viable, valuable wetlands **can** be constructed.

Constructed wetlands are being used throughout the world for water quality treatment. Engineered natural wetlands are also being used to provide water quality treatment in many areas of the U.S. Because of their existing biological characteristics and land forms, engineered natural wetlands can sometimes provide effluent management at a lower cost than constructed wetlands. Also, in some cases, the environmental value of natural wetlands may be restored or enhanced by their use for wastewater treatment.

When carefully engineered and operated, constructed wetlands can provide consistent, cost-effective, water quality treatment while providing important ancillary benefits to society. Wetlands can be used singly or in combination with other wastewater treatment technologies to treat a broad variety of effluents including municipal, industrial, agricultural, and non-point runoff. The quality of the final discharge from these wetlands can be as consistent as that from conventional treatment systems, yet capital and energy expenditures are frequently much lower. In addition, society benefits twice, from cost-

effective treatment and from an increase in greenspace, wildlife habitat, and public recreation potential.

### *Applications of Wetland Technology*

There have been several notable successes in applying wetland treatment technologies. These include: (1) Carolina Bays, South Carolina; (2) Incline Village, Nevada; (3) Santa Rosa, California; (4) Fort Deposit Alabama; and (5) West Jackson County, Mississippi.

**Water Quality Improvements in South Carolina.** One example of a wetland system that has been successful in improving water quality is the Carolina Bays Project in South Carolina, which won the American Consulting Engineers Council's highest honor, the Grand Conceptor Award. The project incorporates about 700 acres of natural wetlands into a low-energy, municipal wastewater treatment system. The wetlands provide consistent treatment as well as habitat for rare and endangered species such as the Venus fly-trap and the black bear. The project received considerable support and interest from EPA Region IV in Atlanta. Similar natural wetland projects are ongoing in Conway and Hilton Head, South Carolina and in Pasco County, Florida.

**A Pioneer Project in Incline Village.** The largest and oldest constructed wetland treatment project is in Incline Village, Nevada, where 385 acres of marshes were constructed in 1984. Building on an existing, mineralized, warm-water wetland near Minden, Nevada, the Incline Village General Improvement District developed a system

that renovates wastewater and benefits wildlife using natural processes. A 20-mile pipeline carries treated effluent from the treatment plant to the Wetlands Enhancement Facility. Constructed wetland cells, berms, a flood dike, and a distribution ditch are the main components of the system. Eight constructed wetland cells are the primary disposal area for treated effluent. There is no surface discharge from the wetland disposal area because of evaporative water losses. Each wetland cell has a deep center channel that discourages emergent vegetation growth and provides a landing area for waterfowl. Islands within the channels serve as nesting sites.

**An Experiment in Santa Rosa.** Santa Rosa, California, is the site of a 10-acre demonstration wetland, currently in its fifth year of operation, which provides final polishing of highly renovated municipal wastewater and rural runoff water. At Santa Rosa, constructed wetlands are only one component of a watershed protection program that integrates wastewater treatment and reuse with nonpoint source pollution control and environmental enhancement.

**A Winner in Fort Deposit.** Fort Deposit, Alabama, is a small rural town that could not comply with increasingly stringent water-quality-based effluent limits. As part of the CWA Sec. 201 Facilities Planning process, constructed wetlands were recommended to the town to meet these new permit limitations. A 15-acre wetland was constructed in 1990 and has provided consistent treatment since that time. This project won the Alabama Wildlife Federation's Governor's Conservation Achievement Award in 1991,

the Alabama Engineering Excellence Award in 1991, and the American Consulting Engineers Council Grand Award in 1992. These accolades are indicative of the overwhelming approval of engineers and the public for this type of project.

**Improving Wetlands in West Jackson County.** The West Jackson County, Mississippi, constructed wetland treatment system includes 56 acres of man-made marshes. It is part of an overall land treatment system covering 415 acres that uses facultative lagoon treatment followed by land treatment and disposal during dry periods, and uses constructed wetlands during wet periods. A large part of this project is built within the boundaries of a National Wildlife Refuge that protects an endangered subspecies of the sandhill crane. The presence of natural wetlands on the site of the proposed constructed wetlands created a problem during the design and permitting process. These natural wetlands were wet pine woods that had recently been included as waters of the U.S. by the adoption of the 1989 Wetlands Delineation manual. A Section 404 wetlands permit allowed replacement of this wet pine forest by the constructed wetland treatment system, which was considered a significant environmental enhancement.

### ***Specific Recommendations for Encouraging the Use of Wetlands for Water Quality Enhancement***

The CWA should be amended to specifically encourage the construction of wetlands for water quality treatment and to allow the development of natural wetlands for wastewater recycling. This would be consistent with the general national consensus concerning

reducing the net loss of wetland habitat. Also, the CWA should clarify the potential to use constructed water quality treatment wetlands for mitigation of 404 wetland alterations.

## **Risk-Based Prioritization of Environmental Actions**

### *Summary of the Issue*

Water quality standards are becoming increasingly stringent. These standards are, in many cases, based on inferred toxicological and public health risks determined by laboratory tests on animals and other living organisms. The cost of meeting these standards is often prohibitive when dischargers are limited to solutions involving direct impacts at the point of discharge, the "end of the pipe." Significant cost savings and desired water quality goals can both be achieved if a risk-based approach is incorporated into permitting and planning decisions.

Many factors are considered in the development of proposed environmental actions. These factors cannot always be clearly defined and are subject to variation. In using the risk-based approach, decision makers understand the effect of this variability and the need for alternative solutions. For example, changing hydrologic conditions or pollutant concentrations that could be discharged affect the potential for or risk of exceeding an established numeric effluent limit. Understanding the risks associated with alternative technical solutions can enable decision makers and regulators to determine an optimal combination of environmental actions to meet the desired goals.

### *Applications of Risk-Based Prioritization*

**Cleaning Up Boston Harbor.** Risks were effectively prioritized by the Massachusetts Water Resources Authority (MWRA) in its combined-sewer overflow (CSO) project at Boston Harbor. The overflow of untreated stormwater and sewage from CSO has been a significant source of pollution sources in Boston Harbor. In preparing its facility plan, the MWRA used the risk-based approach for defining levels of control and allowing a specific number of wet-weather discharges when designated beneficial uses are achieved. By identifying the contribution of CSO to water quality problems in the harbor, MWRA was able to identify a mix of management strategies that could most effectively control this pollutant source. A variety of technologies were proposed, ranging from best management practices to near-surface and deep-tunnel storage and treatment. The mix of CSO control strategies was developed with a cost savings to local citizens of billions of dollars. Forecasts of costs and income levels were used to determine the affordability of the recommended program. The MWRA considered the risks associated with compliance and with diverting funding from other programs. Available funds were prioritized according to the greatest environmental benefits produced.

**Exploring Alternatives in Portland.** The City of Portland, Oregon, is developing a long-term management program to reduce CSO from their combined-sewer system which serves about 70 percent of the city's population. In dry weather, sewage flows to the Columbia Boulevard Treatment Plant for treatment. In wet weather, however, sewage overflows into the Willamette River and the Columbia Slough. The city has been

working for more than two years to evaluate the sewer system, determine the frequency and duration of the overflows, estimate the effects of CSO on water quality, and find solutions. Analysis of hydrologic uncertainty was used to select the storm conditions under which the control program would be expected to operate, and the range of management strategies for achieving these goals.

As part of its evaluation, the city has considered a range of alternative solutions. The level of control specified in a draft CSO policy issued in January 1993 by the EPA was used as a benchmark to allow comparison with other levels of control, including a Stipulation and Final Order (SFO) agreed to by the city and the State of Oregon in 1991. Alternative solutions have been analyzed to identify the facilities involved, resulting improvements in water quality, and costs. By comparing the costs and benefits of potential solutions in advance, the city will be able to choose the cost-effective solution that best meets its needs and its water quality goals.

### *Specific Recommendations for Risk-Based Prioritization*

Once again, we recommend that the CWA be modified to prescribe an integrated approach to watershed management such as that presented by the National Research Council. Prioritization of risks is an inherent part of that approach.

## Setting of Site-Specific and Condition-Specific Standards

### *Summary of the Issue*

In recent guidance, the EPA has begun to recognize the need for modification in the "one effluent limit fits all" strategies of the past. Setting different effluent limits and total maximum daily loads (TMDLs) for dry weather and wet weather conditions is permitted under current EPA guidance, but resource and other constraints have prevented maximum effective use of this tool. Further, in some regions of the country, aquatic habitats have been created primarily as a result of effluent discharges. These ephemeral streams support aquatic communities that otherwise would not exist. Enforcing effluent limits designed for completely different environments makes little sense in these areas.

### *The Need for Site-Specific and Condition-Specific Standards*

In Grand Island, Nebraska, a wastewater treatment plant discharges treated effluent into an ephemeral stream, Wood River. Because of this effluent, the downstream area has developed an aquatic environment that supports a variety of species. Recently, the river was inadvertently classified as a receiving water by the state, making it subject to discharge standards. Elevated levels of nutrients (ammonia and nitrogen) were found in the stream. Two options were available for meeting discharge standards: divert the effluent flow to the Platte River, which would destroy the downstream habitat; or upgrading the plant to add nitrification/denitrification capabilities. The most cost-

effective solution at Grand Island was to upgrade the plant. This solution also benefitted the environment, so it was a win-win situation. However, had the cost of diverting the effluent been lower, the choice would have been less clear, and achieving an inappropriate water quality standard could have resulted in the loss of the aquatic environment in the ephemeral stream.

### *Specific Recommendations for Setting Site-Specific and Condition-Specific Standards*

Site-specific and condition-specific water quality standards should be permitted and encouraged by the CWA. In cases such as that at Grand Island, where effluent in an ephemeral stream has created a habitat, the CWA should require regulatory agencies to develop site-specific and use-attainability standards. The CWA should not mandate upgraded treatment capabilities nor the development of standards based solely on chemical parameters.

In addition, the CWA should not be interpreted as requiring a discharge to pass the three tests currently used to determine the need for water-quality-based limits. If the discharge passes Whole Effluent Toxicity (WET) testing and the receiving water body complies with established water quality standards, then chemical testing should be regarded as inappropriate and unnecessary.

## **Research and Development for Cost-Effective Means of Improving Water Quality**

### *Summary of the Issue*

The difficulties in meeting wastewater and drinking water needs of rural communities have been widely reported. Rural areas, to a greater degree than their urban or suburban counterparts, have a compelling need for low-cost means to improve water quality. In the absence of beneficial economies of scale, loan programs are often not a viable option for meeting these needs. Additional research and development of water treatment techniques and technologies should be funded through the CWA and the appropriations process.

### *The Alaskan Experience*

Residents of rural Alaska face many challenges in developing adequate systems for water and wastewater treatment. At least three deaths reported in the last several months are due to an hepatitis outbreak that is a direct consequence of antiquated and inadequate sanitation systems in approximately 200 Alaska communities. About 180 water and wastewater systems do not even have qualified operators on site. Many villages have no running water or flush toilets. The "honey bucket" is a way of life for far too many Native people. Hepatitis A rates in Alaska are among the highest in the nation. Two

separate epidemics of hepatitis now ravage Alaska, with more than 300 cases reported in recent months.

### ***Specific Recommendations for Research and Development***

Federal grants and waivers that permit some improvement in conditions without requiring prohibitively expensive treatment to meet all standards would be appropriate in Alaska and other communities similarly situated. One approach would be a 50 percent Federal match for projects that would bring water and wastewater up to a minimum standard, with the state funding the remaining 50 percent of construction costs and taking responsibility for operation and maintenance of the projects.

### **Resolution of Conflicts with the Resource Conservation and Recovery Act (RCRA)**

A long-standing debate between the CWA and RCRA, and the emergence of a second major conflict area in late 1992 between the CWA and RCRA, warrant special attention by Congress during the reauthorization of the CWA. These conflicts have led to numerous court challenges to EPA's administrative interpretations and have caused substantial regulatory uncertainty for most industrial dischargers.

### *The Domestic Sewage Exclusion (DSE)*

**Summary of the Issue.** The first major area of lingering inter-statutory debate is RCRA's DSE and its effect on the management of potentially hazardous wastewater originating from industrial sources that discharge into POTWs. Under the EPA's interpretation of RCRA Section 1004(27), wastewater originating from indirect dischargers that would otherwise be considered hazardous waste is excluded from RCRA Subtitle C jurisdiction as soon as dilution with domestic sewage occurs.

Studies completed by EPA in the mid-1980s under RCRA Section 3018 indicate that some 3.2 billion gallons of industrial wastewater containing hazardous constituents (potentially regulated under RCRA Subtitle C) are discharged daily to POTWs through the DSE. The EPA regulates these discharges under the pretreatment regulations promulgated pursuant to CWA Section 307(b). Conclusions presented in the studies suggested that the jurisdictional gap between RCRA and the CWA resulted (in part) in deficiencies in the Federal pretreatment standards and in weaknesses in local program implementation and enforcement. In light of EPA's findings, in July 1990 major revisions were made to strengthen the pretreatment program.

**Specific Recommendations.** We recommend that Congress permanently resolve the lingering jurisdictional gap by amending the CWA so that indirect dischargers of hazardous wastewater are explicitly subject to management and control solely under the

CWA. Solid waste, such as treatment residuals, would continue to be regulated under RCRA Subtitle C or D, as appropriate.

### *Land Disposal Restrictions and Surface Impoundment Units*

**Summary of the Issue.** The most recent statutory conflict between RCRA and the CWA resulted from a decision by the U.S. Court of Appeals in *Chemical Waste Management, Inc. et al v. EPA*.<sup>1</sup> The court applied RCRA Section 3004(d) hazardous waste land disposal restrictions (LDRs) to centralized industrial wastewater treatment facilities managing wastewaters in surface impoundment units. The effluent from those facilities has been regulated under CWA Section 307(b) or Section 402 permits, whereas surface impoundments are defined under RCRA Section 3004(k) as land disposal units. The court found that the RCRA LDR required that affected wastewaters be treated to a "minimize threat" standard before being managed in CWA surface impoundment treatment units. The long-term consequences of this decision on several thousand affected industrial wastewater treatment facilities, though still uncertain, are likely to be significant.

In emergency rulemaking signed by Administrator Browner on May 10, 1993, EPA cited RCRA's Section 1006<sup>2</sup> and asserted that sufficient rulemaking authority exists under the

---

<sup>1</sup> 976 F.2d 2 (D.C. Cir. 1992)

<sup>2</sup> "The Administrator shall integrate all provisions of this Act for purposes of administration and enforcement and shall avoid duplication, to the maximum extent practicable, with the appropriate provisions of . . . the Federal Water Pollution Control

CWA to effectively implement the court's mandate in the short term. EPA indicates, however, that considerable rulemaking will be necessary in the next several years to fully comply with the Court's mandate. It is expected that a number of petitioners will file suit throughout the rulemaking process.

A key issue is RCRA's underlying mandate that hazardous wastewater be treated to best demonstrated available technology (BDAT) standards when managed in surface impoundment units. That mandate conflicts with long-established effluent-limit guidelines and treatment standards established under CWA Sections 307(b) and 402. BDAT standards have largely been established without consideration of wastewater complexity, make-up, and source. CWA effluent limits were developed for specific industrial source categories in consideration of reasonable engineering control technology. Almost without exception on a constituent-by-constituent basis, RCRA's BDAT standards are more restrictive than the CWA's effluent limits. This results in confusion and in potential misuse of resources.

**Specific Recommendations.** We recommend that Congress fashion a reasonable solution to the conflict between RCRA LDRs and the provisions of the CWA by recognizing the primacy of the CWA regulation.

---

Act." 42 U.S.C. 6905(b), RCRA Sec. 1006(b).

## **Impediments to Cleanup of Contaminated Sites**

### ***Summary of the Issue***

Thousands of contaminated sites across America are presently undergoing cleanup under the Comprehensive Environmental Response, Compensation, and Liability Act (Superfund), RCRA, and state programs. At many sites, cleanup will generate millions of gallons of wastewater from activities such as remediation of contaminated groundwater and from conventional chemical or biological wastewater treatment. The treated wastewater will ultimately require some form of post-treatment management such as indirect and direct discharge to waters of the U.S., or disposal at permitted RCRA Subtitle C or D facilities.

Many states and municipalities restrict or prohibit the acceptance of treated effluents from remediation activities into their POTWs, even though the effluents do not differ significantly from other effluents treated at the plants, and are frequently treated to a higher standard than the effluents from industrial dischargers permitted under Section 307(b). In these situations, these effluents must be managed at great expense at permitted RCRA Subtitle C facilities, with little or no tangible environmental benefit.

### *Specific Recommendations*

We believe that Congress should consider at least two statutory initiatives during CWA reauthorization to aid in facilitating the cleanup of contaminated sites:

- Authorize EPA to develop regulations and effluent limits under Sections 307(b) and 402 that will allow expedited permitting of sites undergoing remediation; and
- Encourage states and municipalities to incorporate provisions into their POTW programs to facilitate permitting of treated wastewater originating from remediation sites.

### **Conclusion**

We at CH2M HILL, and many others who support the objectives of the CWA, believe that the Act is generally working well to achieve defined and important goals. We urge Congress to examine the issues that we have raised and to proceed reasonably and expeditiously to reauthorize this important statute with appropriate improvements. Thank you for this opportunity to provide our comments.

Ingrid B. Sheldon  
Mayor

## CITY OF ANN ARBOR, MICHIGAN

100 N. Fifth Avenue, P.O. Box 8847, Ann Arbor, Michigan 48107

Phone (313) 994-2786 FAX (313) 994-4954

May 19, 1993

The Honorable Douglas Applegate  
Chairman  
Subcommittee on Water Resources and Environment  
U.S. House of Representatives  
Washington, D.C. 20515

SUBJECT: Reauthorization of the Clean Water Act

Dear Chairman Applegate:

I was recently informed by Congressman William D. Ford that the House Public Works and Transportation Committee is holding a series of hearings on the reauthorization of the Clean Water Act. According to Congressman Ford, it is anticipated that this law is actually going to be rewritten in the coming months. The City of Ann Arbor has various concerns regarding changes to the Clean Water Act which could impact upon the City's ability to continue protecting human health and the environment by providing efficient sewage treatment and stormwater management. These concerns are presented in the following paragraphs.

Amendments to the Clean Water Act which promulgate more stringent effluent standards will require sewage treatment plants to either modify existing equipment or install additional treatment processes in order to meet the new standards. To implement these changes,

The Honorable Douglas Applegate  
May 19, 1993  
Page 2

sewage treatment plants will require significant capital outlays and will incur higher operating costs. Congress should be reminded that, as with the original Clean Water Act, federal and state funding sources must be made available to municipalities to provide the financial assistance necessary to comply with more stringent discharge standards. Therefore, it is recommended that the committee renew the funding authorization for the state revolving fund loan program and consider increases recommended by President Clinton. Further, the committee should strive to simplify the process and requirements by which the state revolving funds are made available.

The City of Ann Arbor is committed to the protection of human health and the environment. At the same time, we are sensitive to the fiscal responsibility which our voting constituency has entrusted to us. Any adjustments to the Clean Water Act which lower discharge standards should be based upon sound scientific principles. Clear definitions of perceived problems are needed in order to develop the best solutions and to determine, in the future, whether the solutions are effective. Therefore, thorough human health risk assessments and environmental fate analyses of pollutants should be conducted to determine the level of increased removals required. Relative risks, relative benefits and cost analyses need to be performed before more stringent discharge limits are decided upon. Decreases in effluent concentrations

The Honorable Douglas Applegate  
May 19, 1993  
Page 3

which result in little or no perceivable improvements to the environment at an increasingly higher cost to the ratepayer must be avoided.

For example, USEPA Region 5 has recently tried to prevent changes to the mass loading requirements for a local community's sewage treatment plant in Coldwater, Michigan. Because the facility was increasing its flow to the plant's design capacity, and by maintaining the same mass loading requirement, USEPA Region 5 was in effect lowering the effluent concentrations at which the plant could discharge. The justification for this action was not based on the ability of the receiving stream to safely assimilate this discharge into the environment. The reason cited was that the plant had displayed the ability to treat wastewater to the lower concentrations based on its past performance.

However, USEPA Region 5 did not recognize that the improved performance occurred at flows below the design flow, and the efficiency of any sewage treatment plant will inevitably be greater at less than design flows. Additionally, water quality standards are expressed as acceptable concentration levels. As long as these concentrations are maintained, the water quality of the receiving stream will not be compromised, even at higher flows and consequently higher mass loadings.

The Honorable Douglas Applegate  
May 19, 1993  
Page 4

By restricting the sewage treatment plant, USEPA Region 5 is also preventing this community from providing wastewater treatment to a larger service population. When the local government and ratepayers contributed to the construction of this treatment plant, they did so with the understanding that it would be designed to accommodate expansion within their community. The net result is that an arbitrary decision not based on sound scientific principles, may lead to little or no improvement to the environment at the ratepayers' expense.

After Coldwater, the question we face is which municipally owned sewage treatment works in our region will be the next "target" of USEPA?

The trend toward lowering discharge standards must be a carefully considered path. It is not practical or prudent to pursue a policy of restricting the discharge of all pollutants at any concentration (i.e., zero discharge). Laboratories are continuously improving test methods and equipment. The result of these improvements is that more chemicals are being detected at significantly lower concentrations. Consequently, chemicals may be detected in the laboratory at concentrations which pose no or extremely low risk to human health or the environment. Because of the significant capital and operating costs to remove an

The Honorable Douglas Applegate  
May 19, 1993  
Page 5

incremental amount of a chemical, we cannot afford to take an approach of managing the environment based on treatment to achieve ever decreasing detectable concentrations of chemicals.

The major focus of both federal and state environmental laws has been directed primarily at regulating point source discharges. Because point source discharges are easier to identify and monitor, management of these facilities is a much easier task to address than management of non-point source discharges. However, a number of studies have indicated that non-point source discharges are contributing a significant amount of pollutants to the environment. All sources associated with water quality impairment should be considered by the committee. Overall, recognition needs to be given to the multi-media (ground, air and water) and regional nature of environmental issues. The recent Milwaukee water system problem and the growing levels of mercury in remote lakes show the relationship and need to address issues regionally.

As guardians of the public trust, we are responsible for protecting human health and the environment within the constraints of available funding for this purpose. Consequently, the focus of environmental regulations should be directed toward efficiently achieving the greatest benefit to the environment, while at the same time carefully considering the costs associated with the quantified benefits gained. The committee is requested to adopt

The Honorable Douglas Applegate  
May 19, 1993  
Page 6

the "Watershed Management" concept in the drafting revisions to the Clean Water Act as a mechanism to balance the point and non-point source controls needed to achieve the goals of the act and to insure that the most effective approaches to pollution controls are implemented. Environmental laws which impose stricter standards on point source discharges while ignoring non-point source discharges are not fiscally responsible; they are components of a policy which invests more of the ratepayers' money toward gaining less of a benefit to the environment. The committee should consider all major sources of pollution, in a holistic systems approach, the costs to abate these sources, and not overly regulate point source discharges.

With regard to the Huron River and Ann Arbor, the storm water permitting under the Clean Water Act has been less than optimal. By using population as the only selection criterion, the USEPA singled out Ann Arbor as the only community in the Huron River Watershed to regulate. This has resulted in the majority of the land area within the Huron River basin having little or no effective controls on runoff.

Ann Arbor and its storm water facilities are nearly fully developed. There are relatively few remaining opportunities within Ann Arbor to effect new development or construction of new storm water facilities. The growth opportunities remain in the townships

The Honorable Douglas Applegate  
May 19, 1993  
Page 7

and communities surrounding the City of Ann Arbor and within the Huron River watershed. These are the communities where stormwater regulations need to apply. These are the areas where much of the stormwater facilities are still developing. Areas where changes can be made to design practices/standards that will effect water quality at a relatively lower cost. Dollars spent at the design phase of stormwater systems in developing areas can have a larger impact on water quality than dollars spent on retro-fitting existing systems in highly developed areas.

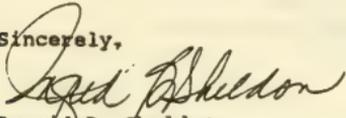

Ann Arbor has a well run Storm Water Utility that has spent to date \$550,000 to meet the challenges presented by the Clean Water Act. We look forward to working with the other communities in our watershed basin as they too become regulated through a "Watershed Management" approach and urge Congress to implement the program for communities under 100,000 as soon as possible.

Finally, the committee should recognize the unique federally mandated programs working in the Great Lakes region ,i.e. the Great Lakes Initiative, Lakewide Management Plans, etc. and should give this consideration and credit to their drafting of Clean Water Act revisions. Particularly, again, the need for financial assistance to complement such programs.

The Honorable Douglas Applegate  
May 19, 1993

The City of Ann Arbor will continue to protect human health and the environment by complying with all environmental laws. It is our hope that Congress will address and incorporate our concerns expressed in this letter when drafting revisions to the Clean Water Act. We believe that in doing so, Congress will be responsibly investing the taxpayers' and ratepayers' monies to achieve the highest degree of pollution control necessary in an environmentally responsive and cost effective manner.

Sincerely,

Ingrid B. Sheldon  
Mayor  
City of Ann Arbor, Michigan

The Honorable Sherwood L. Boehlert  
Ranking Minority Member  
Subcommittee on Water Resources & Environment  
Committee on Public Works and Transportation  
U.S. House of Representatives  
Washington, D.C. 20515

Dear Congressmen Applegate and Boehlert:

The enclosed statement is being submitted for the Clean Water hearing record by the Edison Electric Institute. On behalf of our member companies, we appreciate this opportunity to express our position on the Reauthorization of the Federal Water Pollution Control Act.

We look forward to working with your Subcommittee in this legislative effort, and will be pleased to clarify our position or answer any questions you may have concerning our statement.

Sincerely,

A handwritten signature in cursive script that reads "Walker F. Nolan".

EXECUTIVE SUMMARY

The Edison Electric Institute (EEI) believes that **most of the Clean Water Act's current programs are fundamentally sound and should not be substantially changed.** The U.S. Environmental Protection Agency (EPA), states, and regulated parties have made huge strides in reducing pollution under the Act's current provisions during the past 20 years. The nation also has invested tremendous resources in achieving these solid results. Given the complexity of the Act, and the solid progress being made toward implementing its provisions, EEI encourages Congress to provide the regulated community and the regulatory agencies the stability of settled law to continue implementing the Act, without major changes.

EEI strongly supports retention of the thermal water quality and effluent limitation provisions of the Act set out in sections 316(a) and 303(g). Furthermore, EEI strongly supports continued availability of mixing zones for thermal discharges, without inappropriate statutory constraints. These features of the Act have served the nation well for more than 20 years, allowing electric utilities to discharge heat in an environmentally-sound and cost-effective manner. In fact, the concept of allowing a company to show that an alternative, site-specific limit will protect the environment as well as or better than a universal water quality standard or effluent limit set by EPA or a state should more broadly be applied in the Act.

Congress could improve implementation of the Act by clarifying that **dischargers are responsible only for their own additions of pollutants to a water body**, not for pollutants added by other dischargers or attributable to natural causes. EPA argues that it can set technology-based effluent limitations based on "gross" concentrations of contaminants in water, rather than the "net" contribution added by a particular facility, except in very limited circumstances. But requiring dischargers to take responsibility for contaminants they have not added to water is inequitable and is not in keeping with the intent of the Act to control discharges into the nation's waterways.

Congress also might improve implementation of the Act by requiring **EPA and the states to use reliable test methods and data in setting water quality standards, technology-based effluent guidelines, permit limits derived from those standards and guidelines, and other Clean Water Act**

**requirements.** EPA and the states should be required to validate analytic and test methods, through response to public comment and careful peer review, before issuing regulations based on those methods. Furthermore, standards, guidelines, permit limits, and other requirements imposed on regulated industries should be based on sound analyses and sufficient, good-quality data. For example, EEI has substantial questions about the accuracy and precision of some of the new "whole effluent toxicity" and biological test methods EPA is requiring states to adopt.

**EEI is very concerned about proposals in the 102d Congress to expand the reach of section 401 of the Act,** which allows states to review federally licensed projects to ensure that the projects will meet applicable Clean Water Act requirements. Such projects already are heavily regulated through the licensing process, which triggers not only section 401 review, but also reviews under a host of other federal laws, including statutes aimed at protecting environmental quality, federal lands, fish and wildlife, endangered species, and historic artifacts. Section 401 already fully addresses water quality concerns and should not be expanded.

Steps could be taken to **streamline the Act's permitting programs.** For example, Congress might reduce or eliminate the administrative burden under section 404 for human activities that have little or no impact on wetlands, such as construction, operation, and maintenance of utility transmission and distribution lines. EEI encourages Congress to authorize the concept of mitigation banking, to promote creation of new wetlands and restoration of degraded wetlands.

To the extent possible, Congress should **continue to encourage cooperative management of the nation's water quality,** providing incentives for regulated parties to work with EPA and the states in achieving the Act's goals, rather than penalties and fines. The Act's penalty and enforcement provisions are already too harsh in many respects and should not be increased or broadened.

These and a number of other issues -- antidegradation, pollution prevention, zero discharge, contaminated sediments, and watershed management -- are discussed in more detail in the following comments. EEI would be happy to elaborate any of its recommendations, upon request.

STATEMENT

The Edison Electric Institute (EEI) is the association of investor-owned electric companies. Its members generate approximately 78 percent of all the electricity in the United States and service 76 percent of all ultimate-use customers in the nation.

EEI's members recognize the importance of clean water. Along with other sectors of society, electric utilities rely heavily on the nation's water resources for a variety of purposes. First, water is essential to the production of electricity both as a coolant, removing heat produced by the process of generating electricity from fossil and nuclear fuels, and in the production of steam to run turbine-generators. In addition, water is used in electric utility plants for day-to-day operations, such as cleaning and waste treatment processes. Electric utilities also rely on surface water and groundwater as sources of drinking water for their employees and visitors. Finally, water is the very source of power at hydroelectric projects across the nation, providing not only clean, renewable energy, but also recreation, navigation, flood protection, irrigation, and fish and wildlife habitat.

The nation's electric utilities take their stewardship of this resource quite seriously. Electric utility companies have demonstrated leadership in safeguarding water quality in and around their projects. They comply with a host of regulations under the current Clean Water Act, including water quality standards and steam-electric technology standards. Furthermore, the companies have been leaders in developing and protecting fish and wildlife habitat, including wetlands, and in providing their communities such water-dependent benefits as boating, fishing, and swimming. The nation's electric utilities are proud of this stewardship and look forward to continuing to work with Congress, the U.S. Environmental Protection Agency (EPA), and state and local governments in managing this valuable resource.

1. GENERAL COMMENTS ON REAUTHORIZATION

EEI's principal comment about the Clean Water Act (CWA or the Act) is that the Act is fundamentally sound. In particular, the Act's provisions for overseeing point source discharges and federally-permitted activities are largely in place, comprehensive, and working well. While improvements certainly can be made in these programs at the margin -- we suggest a few below -- there is no need to make substantial changes in the Act's basic provisions. Furthermore, there is real value in having stability in the law, especially when the cost of complying with a statute is as substantial as it is here. EPA, the states, and the regulated community need to be able to continue working to achieve the Act's current goals without substantial changes in the targets toward which they are aiming. For these reasons, EEI encourages Congress to reauthorize the Act without

substantial revision of the Act's current programs, recognizing the environmental success story the Act already represents.

Instead of adding new layers of requirements to programs already in place in the Act, EEI encourages Congress to help streamline the regulatory process and to reduce the Act's complexity wherever possible. One simple change that would cut a key regulatory burden in half would be to allow EPA and the states, in appropriate circumstances, to issue National Pollutant Discharge Elimination System (NPDES) permits for up to 10-year periods instead of five years. Another change would be to reduce the administrative burden of complying with section 404, especially for human activities that have little or no impact on wetlands. Congress might also encourage EPA and the states to look for ways to improve administration of the Act.

EEI would welcome better recognition of the need for cooperation among all parties with a share in managing the nation's water resources. Rather than imposing increasingly stringent statutory restrictions and enforcement provisions on regulated industries such as the electric utility industry, EEI encourages Congress to recognize that industry, state and local government, and EPA are partners, all working together to safeguard water quality. The Act should provide incentives to promote cooperation and to invite wise management of our water resources, rather than mandates and penalties, to the maximum extent possible.

The remaining sections of this statement contain more detailed comments on primary areas of concern to our industry, specifically:

- thermal discharges
- water quality standards
- antidegradation
- net-gross issue
- NPDES permits
- section 401 certification
- pollution prevention, zero discharge
- contaminated sediments
- watershed management
- wetlands
- compliance and enforcement

Each section is organized into three parts: (1) "background" remarks, describing relevant statutory and regulatory provisions; (2) an "impacts" section, describing the effects of those provisions on electric utilities and the environment; and (3) "EEI recommendations" for maintaining positive aspects of and improving the Act.

## 2. THERMAL DISCHARGES

### A. BACKGROUND

Power plants typically draw cooling water from a water body and circulate it through condensers to absorb heat generated during power production. In many cases, this water is then discharged back to the water body, a process known as once-through cooling. If the Act did not allow otherwise, NPDES permit writers would typically impose generic thermal effluent limits on the discharge of this cooling water.

However, since the Act was passed in 1972, CWA sections 316(a) and 303(g) (33 U.S.C. §§ 1326(a) and 1313(g)) have allowed departure, in appropriate circumstances, from both technology- and water quality-based generic effluent limitations otherwise applicable to thermal discharges. These provisions recognize that local aquatic and biological conditions may warrant less stringent thermal criteria than those set on a statewide or national basis. Specifically, under these provisions of the Act, if a discharger can demonstrate that an alternative thermal limit will assure protection and propagation of a balanced indigenous population of shellfish, fish, and wildlife in and on the receiving water body, the regulator may grant an adjustment of the effluent limitation.

In addition, because heat dissipates rapidly to the environment, is a naturally-occurring phenomenon, and does not bioaccumulate, many state water quality standards include thermal mixing zones. These are specified areas where temperatures may exceed limits otherwise required by the standards. For example, thermal mixing zones may be allowed in oceans, large lakes, and large rivers with substantial flow if the zones will not affect shellfish beds, spawning areas, and anadromous fish passage. EPA allows states to establish reasonable mixing zones for thermal discharges, recognizing that these zones do not cause adverse effects to the overall water body.

### B. IMPACTS

For more than 20 years, relying on sections 316(a) and 303(g) and on reasonable use of mixing zones, regulators working with the nation's electric utilities have been able to select the best means of managing thermal discharges at power plants to ensure protection of the environment. As a result, many plants are now meeting appropriate standards protective of the aquatic environment without having to rely on expensive technology that otherwise could have been universally and unnecessarily required.

Most utilities have studied thermal discharges at their power plants and have found the effects of the discharges to be minor. Indeed, thermal discharges can be beneficial, helping to sustain populations of fish and other wildlife, such as the Florida manatee, that benefit from warm water. As the following comments by eminent fishery biologist Charles C. Coutant substantiate, Congress made a wise decision more than 20 years ago in enacting section 316(a):

Unlike many ... pollutants, thermal discharges are non-toxic, non-persistent and non-accumulative. Additionally, because heat dissipates rapidly, any effects are geographically limited. Experience gained during 20 years of applying section 316(a) to the discharges of many power stations has significantly improved our understanding of the ecological effects of thermal discharges. [Studies of these discharges] have enhanced the electric utility industry's ability to manage this potential pollutant in a manner that is least detrimental, and often beneficial, to the ecosystem and its use by human society. ... [R]epealing § 316(a) would be ill-advised.<sup>1/</sup>

Absent section 316(a)/ 303(g) alternative thermal limits and mixing zones, many utilities would have to install cooling towers or take other costly measures that are not needed to protect the environment in order to meet generic thermal permit limits. Although cooling towers and other such measures can reduce the quantity of heat and rate of cooling water discharged to a water body, they also can have a number of social, environmental, and economic disadvantages that may outweigh their benefits at particular sites, especially in retrofitting existing plants.

According to a study prepared by Stone & Webster Engineering Corporation for EEI in 1992, the cost of replacing the nation's existing once-through cooling systems with cooling towers would be on the order of \$41 billion.<sup>2/</sup> At individual facilities, capital costs alone would be about \$250 million for a typical nuclear plant and about \$39 million for a moderate-size coal-fired plant. In addition, retrofitting an existing plant with cooling towers can reduce the plant's performance, in part because some of the energy produced by the plant must be used to pump cooling water to the towers and back to the unit. This energy loss must be made up. Nationwide, it could be on the order of 9000 megawatts. Also, operation and maintenance costs will tend to go up for converted plants.<sup>3/</sup>

Requiring electric utilities to spend large sums of money to replace current once-through cooling systems and to scramble to make up corresponding energy losses, in order to meet uniform temperature requirements not tailored to protection of the local

<sup>3/</sup> *Id.*, pp. 27-43.

environment, would not be a wise use of limited societal resources. These costs would end up being borne by electric utility customers to no good end.

In addition, replacing existing once-through cooling systems with cooling towers can produce environmental effects. Cooling towers consume more water than once-through cooling systems because they rely on evaporation as a cooling mechanism. For a typical natural-draft tower, more than 1 million gallons of water evaporate and must be made up every day. Furthermore, in some instances, conversion of the once-through cooling systems can locally increase siltation, salt drift, fogging, and icing. Also, cooling towers require land that may not be available, especially at existing power plants in urban areas.<sup>4/</sup> For these reasons, it may be impracticable to retrofit many existing power plants with cooling towers.

The U.S. Department of Energy also has examined the potential effects of deleting section 316(a), and has reached similar conclusions about the potential economic and environmental effects.<sup>5/</sup> In the agency's view, "Considering the extremely high costs, very minimal benefits, and expected environmental impacts if the Section 316(a) variance were eliminated, little justification has been found for deleting Section 316(a) from the CWA."<sup>6/</sup>

EPA also has studied section 316(a), focusing on environmental effects and EPA's own administration of the provision.<sup>7/</sup> Although EPA has identified a variety of improvements that it intends to make in administering the section, the agency has concluded that, for the majority of facilities studied with section 316(a) limits, "impacts from thermal effluent have not been found to be large and/or permanent."<sup>8/</sup> The agency also believes that "the Section 316(a) variance is a useful tool when appropriately and consistently applied."<sup>9/</sup>

### C. EEI RECOMMENDATION

**Alternative limits for thermal discharges should remain available to facilities which can demonstrate that such limits are protective of a water body's aquatic life. Also, EPA and the states should continue to be able to use mixing zones in their water quality standards and effluent limitations.**

Where a permittee can demonstrate that an alternative thermal limit is sufficient to protect a balanced, indigenous population of shellfish, fish, and wildlife, as existing section 316(a) currently provides, regulators should continue to be able to rely on that alternative limit. These alternative limits should also continue to satisfy the water quality standard provisions of the Act, as CWA section 303(g) now specifies. Furthermore, EPA and the states should remain free to use mixing zones for thermal discharges appropriate to the nature of these discharges, without inappropriate size or locational constraints.

### 3. WATER QUALITY STANDARDS

#### A. BACKGROUND

The Clean Water Act requires states to set water quality standards (WQS) to support beneficial uses of their rivers and streams. The states must designate beneficial uses for each water body, and they must develop numeric or narrative criteria necessary to attain and maintain those uses. The numeric criteria typically specify the concentration of particular pollutants that must be met instream, while the narrative criteria describe instream water quality conditions that must be met (for example, "no toxic pollutants in toxic amounts"). The Act provides that, whenever technology-based effluent limitations will not ensure attainment of applicable WQS, more stringent water quality-based limitations must be imposed in NPDES permits issued under the Act.

The Act gives EPA responsibility for overseeing state WQS programs to ensure consistency with the Act's provisions. EPA must review and approve or disapprove state-adopted WQS, and the agency must adopt appropriate WQS where a state fails to do so. The Act also requires EPA to develop pollutant-specific guidance to assist states in setting WQS. Due to limited time and resources, states often adopt EPA's guidance criteria in full, even though those criteria typically are driven by extremely sensitive organisms that are not indigenous to a particular state's waters and are developed using laboratory water that does not reflect local stream conditions.

At EPA's behest, some states have begun using "whole effluent toxicity" (WET) testing to set numeric criteria and to implement narrative criteria. WET testing involves exposing aquatic organisms to an effluent to determine whether, and at what concentration or concentrations, undesirable toxic effects will occur. EPA also recommends that states use biological surveys as a separate method for setting and

implementing criteria. This essentially involves taking field measurements of the types and numbers of resident organisms at a location likely to be affected by an effluent discharge and comparing those measurements to standard indices that the state has determined reflect attainment of applicable designated uses.

#### B. IMPACTS

As state WQS programs mature, electric utilities are being subjected to an increasing number of water quality-based discharge permit limits. In many cases those limits are significantly more stringent than necessary to achieve designated uses. The methods for deriving the criteria and the effluent limits are extremely conservative. Also, the water quality criteria often are based on species not found in receiving water bodies to which a specific utility discharges, and the species on which the criteria are based often are more sensitive to a given discharge than the resident species.

In addition, some standards are based on insufficient information or questionable analytic methods. The water quality criteria on which discharge limits are based often are not supported with sufficient scientific data. The accuracy and reliability of many of EPA's analytic methods, such as WET testing and biological field surveys, have not received adequate peer-review and validation for use in the regulatory and enforcement context. Also, it can be difficult or impossible to attribute the results of a particular biological field survey to any particular discharger, especially if multiple dischargers and nonpoint sources are present.

A case in point is EPA's WQS guidance criterion for copper, a metal frequently found in minute concentrations in water discharged by coal-burning power plants. The criterion is based on data for only the most sensitive aquatic species for which data were available to EPA. Yet, pressured by lack of time and resources, states are broadly adopting the criterion without regard to whether those species or species of like sensitivity are even present within the state or in a given water body. As a result, utilities may have to install costly treatment systems or cease discharges to protect species that do not exist anywhere near their facilities.

Complying with unnecessarily stringent water quality-based limits can have effects on other environmental media. In many cases, removing pollutants from aqueous waste streams produces solid wastes or air emissions that can create cross-media environmental concerns. Furthermore, compliance with overly stringent water quality-based permit limits and conditions can be extremely expensive in terms of capital, operation, and maintenance costs. Such expenditures should not be required when not needed to protect the resource.

### C. EEl RECOMMENDATIONS

**States should continue to have primary authority for setting and implementing appropriate water quality standards. EPA's role should be limited to providing guidance and overseeing state activities.**

EEl believes that WQS should be protective of human health and aquatic life, but should not be more restrictive than necessary to protect the realistic uses of a particular state's waters. States should continue to be primarily responsible for setting WQS, which should reflect the specific water body and aquatic life being protected. States should be required to tailor their WQS to reflect resident species in the specific water body being regulated, and to reflect water body-specific physical and chemical characteristics, rather than adopting EPA criteria across-the-board. In addition, states should continue to be able to set water quality-based permit limitations based on reasonably-sized, site-specific mixing zones, in particular for thermal discharges.

States also should be required: (1) not to set standards more stringent than the lowest concentration that can be measured reliably by approved test methods, and (2) to account for the unique characteristics of the particular pollutant being regulated. For example, a relatively large percentage of the metals a power plant may discharge are biologically unavailable and, hence, non-toxic to aquatic life. This should clearly be recognized in regulating discharges of those metals.

**Adequate research, studies, and validation of test methods should precede regulation based on those methods.**

EEl believes that water quality-based permit limitations are justified under the CWA only when reliable data demonstrate that technology-based limits are inadequate to protect water quality. However, many of the test methods currently being used to set WQS and to determine whether technology-based limits suffice are not scientifically accurate or sufficiently peer-reviewed.

EEl urges that the scientific and implementation problems with these tests be resolved before EPA and the states rely on them. Specifically, biological monitoring and assessment techniques, such as WET testing and biocriteria, should be relied on in the regulatory and enforcement process only after the scientific and implementation problems in their application are resolved. All such test methods should be subject to thorough performance scrutiny and peer review, should be fully and properly validated under CWA section 304(h), and should be adopted under Part 136 of EPA's regulations before being promoted for widespread adoption by state and federal regulatory agencies.

Furthermore, while EEI supports the concept of using instream surveys to assess receiving water quality, the information obtained thereby should be weighed along with all other available evidence (including chemical-specific and WET tests) in making regulatory decisions.

**The regulated community should have adequate opportunity to participate fully in all aspects of the development of water quality standards, including development of guidance documents and test methods.**

The CWA should promote cooperation among federal and state authorities and the regulated community. The regulated community and the public should have an adequate opportunity to comment on all proposed WQS, policy statements, guidance documents, and test methods, many of which are not currently made available for public comment before they are used in the regulatory process. Also, EPA and the states should fully address the concerns and issues raised in those comments.

**Confirmation of test results is necessary before regulatory and enforcement decisions are made.**

Due to variability in all test results, a single test failure should not be the sole basis for regulatory or enforcement decisions. The CWA should ensure that dischargers are given the opportunity to conduct confirmatory testing of analytic test results, as a matter of right, before permitting and enforcement decisions are made. Furthermore, the variability in test results should be reflected in NPDES permits. These issues are discussed in more detail in the compliance and enforcement section (section 12) below.

#### 4. ANTIDegradation

##### A. BACKGROUND

The CWA authorizes EPA to develop "antidegradation" policies. Even before the Act was amended in 1987 to include that specific authorization, EPA already had promulgated an antidegradation policy, which is set out at 40 C.F.R. Part 131. The policy requires each state, as part of its WQS, to adopt an antidegradation policy that: (1) fully protects existing water body uses, (2) prohibits degradation of waters where water quality exceeds levels necessary to protect "fishable/swimmable" uses, unless a discharger can show that lowering water quality is necessary to accommodate important economic or social development, and (3) prohibits lowering water quality in "outstanding National resource waters" (ONRWs), such as waters of national and state parks and wildlife refuges, and waters of exceptional recreational or ecological significance. At the same time, EPA has properly acknowledged that state antidegradation policies also must be consistent with CWA § 316(a) and must not preclude use of modified thermal permit limits under that section.

## B. IMPACTS

As interpreted by several EPA Regional Offices, EPA's antidegradation policy can result in permit limits more stringent than necessary to meet applicable WQS. Also, on its face, the policy can be applied to any increase in pollutant discharge, no matter how *de minimis* its impact on water quality. As a result, the policy may prevent utilities from increasing discharges from existing sources or discharging from new sources, even if the discharges would not violate any applicable WQS or pose significant environmental concerns. To this extent, the policy can unnecessarily restrict the development of new or expanded power facilities, posing a concern about utilities being able to meet the nation's energy needs. Antidegradation policies also can act as a major disincentive to voluntary improvement in effluent quality via pollution prevention techniques or use of innovative wastewater treatment technology.

## C. EEl RECOMMENDATIONS

**States should retain flexibility to manage water quality as socially or economically justified.**

EEl supports a policy that protects water quality in a manner that is flexible enough to allow states to permit new or increased uses of their water resources that are socially or economically justified yet comply with applicable WQS. EEl supports application of antidegradation policies in a manner that allows changes in effluent quality or quantity where it can be demonstrated that such changes meet applicable water quality standards and have little or no impact on designated uses.

**The states are best equipped to designate uses and define high quality waters and outstanding national resource waters (ONRWs).**

EEl believes that states are in the best position to obtain accurate site-specific information for use in designating uses for water bodies and defining state "high quality" waters and ONRWs. At the same time, EEl believes that states must justify those decisions with scientifically valid data.

## 5. NET-GROSS ISSUE

### A. BACKGROUND

Typically, a point source discharger will take water from a water body, use it in a water-dependent process that may add contaminants to the water, treat the water to remove many of the contaminants, and then return the treated water to the original water body. Some or all of the contaminants added during the process may also be

found in the water body from which the water was withdrawn, either due to natural causes or having been added by other point or nonpoint sources upstream.

In enacting the Clean Water Act in 1972 and amending it in subsequent years, Congress has focused attention on reducing and controlling "discharges of pollutants," which section 502 of the Act defines as the *addition* of pollutants to a water body by a point source. The Act's provisions on technology-based effluent limitations (section 301), water quality-based effluent limitations (section 303), new source performance standards (section 306), pretreatment standards (section 307), water quality certification (section 401), NPDES permits (section 402), and dredge-and-fill permits (section 404) all focus on such discharges.<sup>10/</sup> Thus, the Act is aimed at controlling net concentrations of pollutants that are being added to a water body, not gross concentrations of contaminants some of which were in the water body in the first place.

However, EPA asserts that it has authority to set technology-based effluent limitations based on gross concentrations of pollutants in a discharge, ignoring concentrations in the original water body. Although EPA does allow use of net-based limitations as an exception in some cases, this exception is available only under very limited circumstances. See 40 C.F.R. § 122.45(g). Furthermore, EPA has not explicitly made this exception available for water-quality-based limits. Although industry groups have tried to challenge EPA's net-gross regulations in the U.S. courts of appeals, the courts have refused to consider the legality of the rules until after EPA has applied them in a specific case.

#### B. IMPACTS

By setting effluent limitations based on gross concentrations of pollutants in a discharge, EPA is requiring dischargers to remove not only pollutants they have added to their waste streams, but also contaminants present in water because of natural causes or contributed by other point or nonpoint sources. At the same time, EPA and the states are reducing permissible concentrations of many pollutants to extremely low levels. These developments can produce effluent limitations that are inappropriately stringent and prohibitively expensive to meet. While removing a particular pollutant from a discharge to very low levels may be physically possible, the lower the level, the more expensive and technically difficult such removal will be. At very low levels, costs can soar exponentially, often with little or no benefit to the environment. To exacerbate this situation by requiring companies to spend enormous sums of money and resources to reduce concentrations of contaminants in their discharges below background levels is inequitable.

---

<sup>10/</sup> Section 401 focuses on "discharges," which section 502 of the Act defines as "discharges of pollutants." Section 404 focuses on "discharges of dredge and fill material," but section 502 defines "pollutant" as including dredge spoil.

### C. EEI RECOMMENDATION

**Congress should clarify that EPA and the states must take background levels of contaminants into account when setting permit limits, so that dischargers are held accountable only for their net additions of pollutants to a water body.**

Although the Act already strongly suggests that Congress intended EPA and the states to set limits based on net discharges of pollutants, EPA has asserted a different view. Clarifying this point would bring fairness and rationality back to the Act. If a particular substance is found in a water body naturally, or is being added to the water body by upstream users, the downstream discharger should not bear the burden of removing quantities of the substance the downstream discharger did not add.

## 6. NPDES PERMITS

### A. BACKGROUND

Section 402 of the Act authorizes EPA and the states to issue permits for discharges of pollutants if the discharges meet a host of requirements set out in the Act. The discharges must meet technology-based effluent limitations, water quality-based limitations, new source performance standards, pretreatment standards, monitoring and inspection requirements, and ocean discharge criteria, as applicable. States can issue permits only if EPA has approved their permit programs, which also must meet a number of criteria. Section 402(b) limits the permits to five years in duration.

### B. IMPACTS

The permit issuance or reissuance process can easily take as much as two years, during which time the discharger who has applied for a permit must submit substantial information about the proposed or existing discharge to EPA or the state agency issuing the permit. The resulting permit can be quite complex, often containing 25 pages of standard terms and conditions in addition to specific requirements for each waste stream at the facility. Yet a scant three years later, the process must begin again. This imposes a substantial drain on limited EPA, state, community, and business resources.

### C. EEI RECOMMENDATION

**EEI encourages Congress to allow permit writers to issue permits under section 402 for periods up to 10 years, in appropriate circumstances.**

This simple change would substantially reduce the regulatory burden that point source dischargers -- including electric utilities, other businesses, and municipalities -- now face under section 402. This change also would reduce the administrative burden that

EPA and the states face. According to EPA, there are more than 62,000 NPDES permits,<sup>11</sup> so the potential relief here is substantial. Furthermore, this change poses no threat to human health or the environment. Permit writers would use professional judgment to determine whether a permit term longer than five years is appropriate, case by case. In many cases, NPDES standards are set stringently enough that having them apply for 10 years would not pose an environmental threat.

In fact, allowing dischargers to work with their permits for 10 years instead of five could improve permit compliance and achievement of the Act's goals. Ten-year permits would allow companies to invest in better waste treatment technology, some of which (such as reverse osmosis technology) is quite expensive and time consuming to install. Also, being able to work with given technology for more than three to five years before new technology must be added would allow companies to gain operational experience with their waste treatment systems, improving prospects for ongoing compliance with their permits.

## 7. SECTION 401 CERTIFICATION

### A. BACKGROUND

Under section 401 of the CWA, states have the opportunity to ensure that projects being licensed by federal agencies meet applicable Clean Water Act requirements. An applicant for a federal license or permit for any activity that may result in a discharge to navigable waters must obtain a certification from the state in which the discharge will originate that the discharge will comply with applicable water quality standards, effluent limitations, and other such requirements. Under section 401(d), the provisions of the certification become conditions of the federal license.

### B. IMPACTS

Electric utilities are affected by section 401 in a variety of contexts. Hydropower projects licensed by the Federal Energy Regulatory Commission (FERC), nuclear power plants licensed by the Nuclear Regulatory Commission, and dredge-and-fill activities permitted by the Army Corps of Engineers all trigger 401 certification. Yet all of these activities are heavily regulated by the federal agencies that license or permit them.

For example, when FERC licenses or relicenses a hydropower project, the agency is required by law to consider a number of factors – the need for energy from the project, the project's positive and negative impacts on recreation and the environment,

---

<sup>11</sup> *Report to Congress on Clean Water Act Enforcement Mechanisms*, U.S. Environmental Protection Agency, March 1992, p. 2.

the project's effect on navigation and flood control, project economics, and so forth. FERC solicits comments from numerous interested participants, including state and federal agencies dealing with issues such as water quality, fish and wildlife, historic preservation, and land management. FERC then carefully considers the input received from every one of these agencies, as well as comments from Indian tribes, project proponents, and the public. It issues licenses aimed at providing maximum public benefits, seeking to reconcile the various comments to the extent possible.

The FERC licensing process ensures a careful, balanced approach to accommodating numerous state, federal, and public concerns. Indeed, the Federal Power Act (FPA) gives states special opportunities to participate in the licensing process. Under section 10(a) of the FPA, states may prepare comprehensive plans for improving or developing their waterways, taking into account a variety of specified public uses, and FERC will specifically consider those plans in licensing projects. Furthermore, under section 10(j) of the FPA, state and federal fish and wildlife agencies may propose specific recommendations for protecting fish and wildlife, and FERC must give special deference to those recommendations.

FERC has interpreted section 401 as being independent of this comprehensive licensing process. As a result, FERC does not screen state agency 401 conditions but merely adds them to project licenses, regardless of whether the conditions relate to water quality and even if the conditions conflict with the FERC license conditions. In recent years, some state water quality agencies have sought to impose conditions through their 401 certifications that FERC might not have deemed appropriate, consistent with the overall project license, or necessary to protect water quality or the environment. Indeed, some agencies have attempted to impose non-water quality conditions dealing with issues such as recreation and navigation in their 401 certifications. Such conditions can threaten a project's viability, preventing environmentally and economically sound projects from being licensed.

### C. EEI RECOMMENDATION

**Congress should not expand section 401, nor should Congress add another layer of regulation of federally-licensed projects to the Clean Water Act. If anything, Congress should clarify that states are authorized under section 401 to address only water quality issues, not to supplant the federal licensing and permitting process.**

States already have ample authority under section 401 of the existing Act to ensure that federally-licensed projects will meet applicable water quality requirements. If states have *non*-water quality concerns about such projects, those concerns should not be addressed in the Clean Water Act. Instead, states should avail themselves of the generous opportunities to raise such concerns in the licensing process.

For the same reasons, Congress should take care in expanding other provisions of the Act, such as the Act's nonpoint source provisions, that might affect federally-licensed projects. If expanded too broadly, such provisions could add another layer of regulation to such projects, which already are heavily regulated under the federal licensing process. Again, water quality concerns about such projects are fully addressed through section 401. To add new CWA regulations aimed at non-water quality issues would be inappropriate and counterproductive.

In the hydropower context, expanding section 401 or adding another layer of regulation would erode the federal government's ability to authorize environmentally sound projects. Such expansions of the Act would merely exacerbate the problem of state water quality agencies second guessing FERC on *non-water quality* grounds. In turn, this could threaten the viability of hydropower projects, giving the water quality agencies control over power generation, fish and wildlife, recreation, navigation, irrigation, and flood control. The FERC licensing process has served the country well by allowing responsible development of hydropower projects for decades. Congress should not now erode that process at the expense of one of the nation's cleanest, most dependable, renewable sources of energy.

## 8. POLLUTION PREVENTION, ZERO DISCHARGE

### A. BACKGROUND

The Clean Water Act requires EPA to establish effluent guidelines that identify methods for eliminating discharges of pollutants. The Act also requires EPA to establish effluent limitation guidelines that eliminate discharges where technologically and economically achievable for a class or category of sources. Independently, the Pollution Prevention Act of 1990 (PPA) (42 U.S.C. §§ 13101-13109) requires EPA to develop and implement a strategy for voluntary pollution prevention by the business community. This law recognizes options for reducing threats to human health and the environment, including, in order of preference, source prevention or reduction, recycling, treatment, and disposal or discharge.

Under the PPA, EPA must encourage use of source reduction measures through guidance documents, information sharing, state grant funding, training programs, technical assistance to the business community, an annual award program, and measurable goals. The act defines "source reduction" to include changes in equipment and processes that reduce the amounts of pollutants in a waste stream and thereby reduce hazards to public health and the environment. The law emphasizes the use of incentives, flexible programs, and innovative, cost-effective technology to achieve its goals.

As a first step toward implementing the PPA, EPA has developed a national pollution prevention strategy, 56 Fed. Reg. 7849 (Feb. 26, 1991) that sets two goals for pollution prevention: (1) reducing risks to human health and the environment, and (2) enabling industry to implement cost-effective measures to minimize waste generation and to reduce compliance and disposal costs. EPA's strategy rejects the idea of "zero discharge" (i.e., eliminating discharges to a receiving water altogether). EPA recognizes that wastes that cannot feasibly be prevented or recycled should be treated in accordance with the CWA and residues from treatment should be disposed of safely.

#### B. IMPACTS

Utilities have found that different pollution prevention and recycling programs, tailored to their individual situations, offer the best way to reduce the amount of waste they must manage. Those programs use a wide range of techniques, including best management practices, chemical substitution, equipment changes, reformulated processes, recycling, and improved operations. Due to the various power generating and related processes used at different types of power plants, flexibility to try different techniques has figured significantly in the success of these programs. For this reason, a mandatory pollution prevention program would be extremely undesirable. Such a program could impose inflexible requirements, forcing utilities to take action (1) whose cost is not commensurate with the environmental benefits and (2) that does not fit the company's individual circumstances.

#### C. EEl RECOMMENDATIONS

**Pollution prevention programs should continue to be voluntary, flexible, and driven by appropriate incentives. The Pollution Prevention Act of 1990 is the correct approach.**

EEl supports a policy of voluntary pollution prevention actions by industry, and endorses the overall approach to this issue taken in the Pollution Prevention Act of 1990. EEl does not believe that any further legislation is needed to promote industry initiatives. The Pollution Prevention Act fully encourages industry to adopt innovative and cost-effective pollution reduction measures. The Act's most positive aspects are the flexibility it allows utilities to adopt measures that conform to the particular processes at their power plants and the appropriate incentives it provides for those efforts.

**Pollution prevention programs should recognize and account for the cross-media effects of any specific type of source reduction.**

Accordingly, EEl supports implementation of EPA's national strategy within the confines of the CWA's existing statutory and regulatory scheme. EPA also should aim for national consistency on this and other key points by providing guidance to states for developing strategies and technical assistance programs. State and local governments

implementing pollution prevention programs should coordinate closely with affected industrial and commercial entities, which are in the best position to understand and evaluate the implications of any source reduction for their operations, including cross-media transfer.

**Pollution prevention programs should focus on reducing pollution to levels that do not adversely affect human health or aquatic organisms in the receiving water.**

EPA's national strategy recognizes that pollution prevention does not mandate zero discharge and acknowledges that after cost-effective pollution prevention and recycling efforts, a discharge may contain a *de minimis* amount of pollutants as long as treatment and discharge comply with applicable CWA requirements. If a discharger achieves that level, then EPA's pollution prevention goals are attained despite the presence of pollutants, many of which are naturally present in the environment.

**Congress should not mandate zero discharges of contaminants.**

Zero discharge limits rarely, if ever, will be justified by reference to tangible water quality or other environmental benefits. Also, mandating them for a particular contaminant or class of contaminants can prevent EPA, states, and the regulated community from identifying *de minimis* concentrations of the contaminants that may pose essentially no harm to human health or the environment. If the contaminants are found in nature, requiring zero discharge is especially unlikely to make sense.

Furthermore, achieving a zero discharge objective can be tremendously expensive, not only to the specific discharger faced with such a requirement, but also to society if such requirements are broadly applied. Removing the last increments of a contaminant from a discharge also can be virtually impossible. Few, if any, physical or chemical treatment processes can achieve this goal.

Zero discharge limits also present insurmountable compliance monitoring and enforcement problems. Analytic test methods are not capable of measuring down to absolute zero. Furthermore, to force industrial dischargers to monitor for discharges at the lower limits of detection -- where measurements are inevitably inaccurate -- can expose them to inappropriate enforcement action and penalties, as discussed further in the compliance and enforcement section (section 12) of this statement.

## 9. CONTAMINATED SEDIMENTS

### A. BACKGROUND

Water pollution regulation traditionally has focused on protecting the quality of water in the water column. Recently, however, EPA has begun to focus on the potential impacts of pollutants that might collect in sediments. Contaminated sediments are a source of concern to EPA because they may be consumed directly by organisms and be passed up the food chain, or because they may release contaminants into the water column where adverse effects to resident organisms may occur. EPA believes that it already has authority to regulate contaminated sediments and to encourage states to adopt sediment quality criteria as part of their WQS. EPA currently is developing methodologies for deriving sediment criteria for a specific group of organic chemicals and metals, and also is developing a standardized sediment chronic-toxicity test.

### B. IMPACTS

To the extent sediment regulations require utilities to remove additional amounts of contaminants from their discharges, this will affect their operations and will affect other environmental media. For instance, virtually all existing waste water treatment systems that might be used to meet sediment quality-based permit limits produce solid waste that must be removed and disposed of. Similarly, requiring removal of contaminated sediments already in place would generate solid wastes which, even if treated to minimize their volume, ultimately would have to be disposed of. Furthermore, disturbing existing sediments, whether for treatment or disposal, can have more negative impacts on the environment than leaving them in place.

EEl recognizes the need for attention to sediment contamination in certain polluted "hot spots" across the country. However, EPA already has authority under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) to address problems at such locations. Beyond this, EPA is still in the process of developing the analytic methods and environmental criteria necessary to gauge *whether* sediment contamination in general poses an environmental threat. Yet even without having these basic tools in place, EPA is actively encouraging permit writers to establish controls to address sediment contamination. To compensate for the lack of sound scientific data, permit writers may impose unnecessarily conservative restrictions, and there is no way to tell whether the resulting regulations and permit conditions are warranted or proper.

EEl also believes that utilities should not be required to take responsibility for sediment quality problems caused by others. EPA is still in the process of grappling with the technical issues involved in identifying point and nonpoint sources of pollutants responsible for sediment contamination and allocating responsibility among those sources. Failure adequately to address these issues could lead EPA to require industrial facilities

to shoulder more than their fair share of the regulatory burden. EEI would oppose this as unfair and inequitable to the nation's utilities and, ultimately, to consumers of electricity.

### C. EEI RECOMMENDATIONS

**EPA should be required to conduct further research into sediment quality issues, including test methods, before implementing a new regulatory program. Sediment criteria, test methods, and remediation technology relied on by EPA must be scientifically and technically sound.**

To begin with, basic questions about the need for a new sediment regulatory program, and the wisdom of tampering with existing sediments, need to be answered before EPA and the states launch new sediment control initiatives. As to sediments that may already be contaminated, the wisest course of action may be to leave such sediments in place rather than requiring them to be treated or removed.

In addition, significant research is necessary to develop scientifically defensible sediment quality criteria and testing methods. Sediment criteria should address those factors which, on a case-by-case basis, can affect the transport and toxicity of contaminants in sediments, such as salinity, dissolved oxygen content, and pH. Any guidance or WQS criteria that failed to account for such factors would lack proper scientific basis. Also, at a minimum, any remediation required must be based on proven, sound techniques and should account for the water quality and other environmental effects of the remediation itself. EPA should focus on species indicators based on sediment quality, such as the Shannon-Weaver index.

**Ultimately, states should have the authority to prevent and control contamination of sediments as necessary and appropriate to protect public health and the environment at reasonable cost.**

If a sediment regulatory program is needed, the states -- which are best able to take account of the wide variations in aquatic and geographic variables affecting sediment conditions within their waters -- should have primary responsibility for the regulation of contaminated sediments, with guidance and oversight from EPA.

**The Clean Water Act should ensure that dischargers have the right to perform confirmatory testing before expensive, burdensome sediment control requirements are imposed.**

Due to the variability of test results associated with the sediment toxicity testing procedures EPA is now developing, the CWA should ensure that dischargers have the opportunity to conduct confirmatory testing, as a matter of right, in response to any positive test results before control or remediation requirements are imposed.

Furthermore, the tests must not be used at levels beyond their capability to measure accurately.

**The Clean Water Act should ensure that regulators identify sources of sediment contamination with reasonable certainty, and equitably allocate responsibility for the contamination based on sound data, before imposing corresponding sediment controls.**

Contamination of sediments generally will develop over long periods of time and may result from many pollutant sources, both point and nonpoint. The Clean Water Act should ensure that EPA and the states conduct research sufficient to determine the various point and nonpoint sources of sediment contamination, and regulators should be required to justify any sediment-related permit limits by establishing a direct causal link between the discharger and the contamination. Moreover, the Act should ensure that once such a link has been established, responsibility for controlling or remediating contamination is allocated on a reasonable and equitable basis. Out of fairness, point sources should not be required to address contamination attributable to natural causes.

**The Clean Water Act should require regulators to consider all water quality and non-water quality-related environmental impacts in assessing contaminated sediment remediation options.**

To begin with, sediment remediation should continue to be addressed under remedial statutes such as Superfund rather than the Clean Water Act, focusing on those cases where the need for remediation to protect human health or the environment has been demonstrated. In addition, before requiring any form of remediation, regulators should be required to perform a risk analysis to determine whether leaving the sediments in place is the best course of action, and whether the benefits of remediation outweigh the costs. Because removing or otherwise remediating contaminated sediment can affect both water quality (for example, by increasing turbidity or resuspending pollutants) and other environmental media (for example, by increasing solid waste disposal needs), the Act should ensure that regulators identify and balance these effects against the water quality benefits of requiring remediation. Only proven, cost-effective remediation techniques should be required. Finally, responses should be flexible and tailored appropriately to each specific situation.

## 10. WATERSHED MANAGEMENT

### A. BACKGROUND

The concept of "watershed management" is being discussed on the Hill in the context of reauthorizing the Act. Just what the concept means, however, and how it may be incorporated into new legislation are unclear. The "watershed" for a particular water body, be it a stream, lake, or estuary, is the area that ultimately drains into that water

body. For a small "prairie pothole," this may be the surrounding fields. For the Mississippi River, it is half of the continental United States, including all of the land area that supports tributaries of the river.

The Act already contains several provisions that promote management of water quality by focusing on watersheds. These include the nonpoint source management program under section 319, the areawide waste treatment management program under section 208, the Chesapeake Bay program under section 117, and the Great Lakes program under section 118. Each of these sections encourages EPA and the states to identify sources of pollution contributing to a particular water body or water bodies and to set priorities for managing the pollution from those sources.

#### B. IMPACTS

The impacts of using watershed management as an approach to implementing the Clean Water Act are hard to predict, not knowing the specifics of what might be proposed. However, the concept raises a number of questions: What is the relevant watershed for planning purposes -- the land area supporting the *tributary* to a larger river, or the land area supporting the larger river? How will planning for smaller watersheds nested within larger watersheds be coordinated? What are the implications for point sources, which are already heavily regulated, of being linked together with nonpoint sources in a given watershed? Will the substantial reductions in pollutant loadings already achieved by point sources be fully recognized and credited? Will trading of pollutant allowances be considered between point and nonpoint sources, and how will such a program work? How will interstate watersheds be managed? How will inter-basin issues be addressed? How will the concept of watershed management interact with existing CWA requirements, and how can we avoid disrupting the progress already made under the existing Act? How will local land use requirements fit into a watershed management program?

#### C. EEL RECOMMENDATION

**Any watershed management requirements that might be added to the Clean Water Act should be carefully thought out before being proposed in legislation.**

On the one hand, watershed management may offer a way for states to organize their management of the myriad sources of pollution, both point and nonpoint sources, within their borders. But watersheds do not stop at state borders, and using the concept even within a given state raises the many questions posed above. Care needs to be taken to ensure that point sources that already are heavily regulated under the Act are not expected to shoulder an even greater share of the burden for achieving state water quality goals. The utility industry stands ready to participate in development and implementation of watershed programs that make good sense.

## 11. WETLANDS

### A. BACKGROUND

The primary program for managing the effect of human activities on wetlands under the Clean Water Act is the dredge-and-fill permit program set out in section 404 of the Act. Under that provision, EPA and the U.S. Army Corps of Engineers share responsibility for evaluating proposals to dispose of dredged or fill material in the nation's waterways, including wetlands. The Corps has primary authority for evaluating applications and issuing or denying permits under section 404. It has developed a number of "nationwide permits" for activities that it has determined have minimal impact on the nation's waterways. EPA has veto authority over Corps decisions, and the two agencies work closely together in developing guidance on such issues as how to identify a wetland and what mitigation is required for impacts caused by dredge and fill activities.

### B. IMPACTS

Obtaining an individual permit under section 404 can be a lengthy and arduous process. For example, the process of getting state and federal permits for a simple transmission line siting can require years, multiple studies, and several iterations. In such a setting, it helps to have fairly fixed ground rules. Yet even the definition of a wetland or a jurisdictional discharge, and the scope and interpretation of the nationwide permits, change over time. Also, the permitting process is not always applied consistently, either from case to case or in different regions of the country. This adds uncertainty that complicates complying with section 404 and imposes unequal burdens on the regulated community.

Electric utilities are no strangers to wetland issues. Because they rely so heavily on water for the production of energy, including the need for cooling water, these companies often must locate their facilities near water. As a result, the companies have learned how to site transmission and distribution power lines and other utility facilities in wetland areas with minimal if any impact on the wetlands. The nation's electric utilities are proud of their careful stewardship of the nation's wetlands and the wetland benefits the companies have been able to provide in their communities. They take their role in protecting this resource quite seriously.

### C. EEL RECOMMENDATIONS

**In reauthorizing the Act, Congress should reduce or eliminate administrative burdens for human activities that have little or no impact on wetlands, including transmission and distribution line siting, operation, and maintenance.**

On a tour at one of our member company's facilities last fall, congressional staff were able to see firsthand that locating, operating, and maintaining power lines in

wetland areas can be done with little or no impact. By using minimal impact towers and careful construction, operation, and maintenance techniques, including amphibious equipment, electric utilities have established long runs through such areas without disturbing the local ecology or hydrology. Indeed, with large sections of their service territories surrounded by or close to water and wetlands, many companies have no practical choice but to locate such facilities in wetlands.

In addition, because of the importance of maintaining electric service to the many families and businesses utilities serve, electric utilities need quick and effective access to their facilities, both for ongoing maintenance and to repair the facilities after storms or other natural disasters. Again, such activities generally have little or no impact on the wetlands.

**Furthermore, Congress should require permit writers under section 404 to take into account limitations imposed on permit applicants by other federal and state siting and licensing processes.**

In siting their facilities, including transmission and distribution lines, electric utilities generally must undergo extensive federal and state siting approval or licensing processes. If federal lands are involved, the federal land management agency's approval may be required. In most if not all states, the state public utility commission's approval will be required, and that approval typically is based on extensive public involvement and consideration of environmental factors. Furthermore, under federal and state law, other agencies may be involved, such as the state's water resources board and coastal zone management agency.

By the time all of these agencies and the public have finished reviewing and approving a facility, a section 404 permit applicant's siting options usually will be legally and practically constrained. The applicant may not *have* any practicable alternatives to a proposed site or route. Permit writers under section 404 should recognize this in determining whether the proposed site is acceptable under the practicable alternatives test and in determining appropriate permit conditions.

**To encourage companies to create and restore wetlands, such created or restored wetlands should not be subject to section 404 jurisdiction unless, at a company's option, the company seeks and is given "mitigation bank" credit for a particular wetland. Congress should authorize EPA and the states to establish mitigation banks whereby companies can obtain such credits for later sale or exchange.**

Section 404 actually discourages companies from establishing new wetlands and restoring wetlands lost through prior human activity and natural processes. Once a company establishes such wetlands, it risks having to obtain a section 404 permit in order to engage in activities involving those wetlands. As a result, companies hesitate to take positive steps that otherwise would augment the nation's wetland resources. To help

solve this problem, Congress should exempt from 404 jurisdiction wetlands that a party has created or restored until the party seeks credit for those wetlands in a mitigation bank or similar arrangement.

EEl supports the concept of mitigation banking, whereby companies would get credits for wetlands and other habitats they have created or restored and would be able to exchange credits if necessary in order to conduct activities that otherwise might be constrained under the Act. By encouraging landowners to develop new wetlands in particular, such a program could help the nation meet its goal of stemming the loss of wetlands without unnecessarily impeding continued economic growth and development.

## 12. COMPLIANCE AND ENFORCEMENT

### A. BACKGROUND

To begin with, the news about compliance with the Clean Water Act is good. As then EPA Administrator William K. Reilly noted in testimony to the Public Works Committee two years ago, EPA and the states have "implemented discharge standards for over 50 industrial categories, typically reducing pollutant loadings by 90%."<sup>12/</sup> More than \$75 billion has been spent in federal, state, and local funds to construct municipal sewage treatment works, 82 percent of which now meet secondary treatment standards. As a nation, we now invest on the order of \$41 billion per year in water quality, resulting in marked progress towards fishable, swimmable waters.<sup>13/</sup> These achievements are in large part the result of hard work by EPA, the states, and the regulated community to clean up the nation's waters.

Dischargers report their compliance to EPA and the states by submitting self-monitoring reports in accordance with their NPDES permits. Any single violation of a permit limit or condition is considered a violation of the CWA, regardless of fault or intent, and the violation may result in enforcement action. The 1987 CWA Amendments markedly increased EPA's enforcement authority, including a substantial expansion of EPA's administrative enforcement powers.

The Act now imposes harsh sanctions for violations of its provisions. Section 309 authorizes civil and criminal penalties as high as \$100,000 per day plus imprisonment up to six years, and administrative penalties up to \$125,000 per violation. At least one

---

<sup>12/</sup> *Testimony of William K. Reilly, Administrator, U.S. Environmental Protection Agency before the Committee on Public Works and Transportation, U.S House of Representatives, March 20, 1991, pp. 1-5.*

<sup>13/</sup> *Id.*

federal district court has interpreted a single violation of an average monthly limit as 30 separate violations, and none of the other federal courts has yet taken a position to the contrary. *Chesapeake Bay Foundation, Inc. v. Gwaltney of Smithfield, Inc.*, 611 F. Supp. 1542, 1555-56 (E.D. Va. 1985)).

Where neither EPA nor a state has taken enforcement action in response to a potential violation, citizens are authorized to "step into the shoes" of the government by filing suit under section 505 of the Act. However, plaintiffs in such cases must first notify EPA, states, and potential violators and give them an opportunity to act. The U.S. Supreme Court has reviewed the Act's citizen suit provision and determined that citizens are not authorized to file suit based exclusively on past violations that have been remedied. *Gwaltney v. Chesapeake Bay Foundation*, 484 U.S. 49 (1987). The Court viewed this constraint as the most logical reading of section 505, which the Court interpreted as allowing citizen suits to supplement, not supplant, EPA and state enforcement authority under the Act.

Not only are the Act's enforcement provisions ample, but they also are being used aggressively. According to EPA, 12 percent of the penalty cases the agency brought in fiscal year 1991 were under the Act, among the highest share for any of the statutes EPA implements. These enforcement actions resulted in more than \$26.6 million in judicial and administrative penalties.<sup>14/</sup>

## B. IMPACTS

The CWA requires utilities to achieve compliance with their NPDES permits 100 percent of the time. Yet for a number of reasons outside the control of permittees, that level of compliance can be difficult or impossible to achieve. To begin with, EPA sets water quality standards and technology-based requirements under the Act at very stringent levels. In many cases, WQS are at or near the limits of detection for a given contaminant, and technology requirements push the envelope of what a given industry can accomplish. Also, no technology can operate as designed and intended 100 percent of the time, even if it includes some margin for error. Even companies that are properly operating and maintaining their treatment systems at all times may occasionally exceed their permit limits.

In addition, compliance monitoring introduces an element of uncertainty. A company can find itself in apparent violation of its permit but not actually be in violation because of erroneous or misleading test results. Regulators have been known to set permit limitations for substances at levels below the level at which analytic test methods

---

<sup>14/</sup> *Enforcement Accomplishments Report for Fiscal Year 1991*, U.S. Environmental Protection Agency, April 1992, Appendix entitled "FY 1991 National Penalty Report," p. 7.

can measure reliably. At such levels, a test result may be wrong because the test is being used beyond its limits. In addition, laboratories can err in determining test results, producing "false positives." As a consequence, companies can face substantial risk of liability when in fact they actually are in compliance with their permit.

### C. EEI RECOMMENDATIONS

**CWA provisions concerning enforcement and compliance are more than adequate and should not be broadened.**

Recent EPA enforcement statistics show that the enforcement provisions of the CWA already are more than adequate to achieve and maintain permittee compliance with the CWA.<sup>15/</sup> Indeed, as interpreted and applied by some courts and regulators, they may go too far. Under the rationale of the above-referenced district court *Gwalney* decision, for instance, a discharger could face \$750,000 or more for violation of a single monthly average permit limit, 611 F. Supp. at 1555. As permit limits become stricter and the number of permit conditions increase, expanding the scope of enforcement provisions and limiting prosecutorial discretion would serve more to discourage companies who are doing their best to comply with their permits than it would to increase compliance. Such actions also would increase the risk that permittees would face enforcement actions for minor technical infractions or misleading test results.

In addition, EPA and the states need flexibility to apply their enforcement authority based on the circumstances of each individual case. One of the CWA reauthorization bills introduced last year would have precluded issuance of an NPDES permit to any permittee with two or more permits out-of-compliance. But again, especially for companies with multiple facilities, and given the stringency of modern NPDES permits, this would have seriously upset implementation of the Act and the regulated community's ability to continue operating their facilities. In the case of electric utilities, this poses substantial potential national energy concerns.

Rather than developing new and ever more burdensome enforcement tools, Congress should encourage improved communication and cooperation between federal and state regulators and the regulated industries. Then, with a better understanding of the compliance issues faced by the dischargers they are regulating, state agencies in particular can use the extensive information and enforcement tools at their disposal fairly and effectively to ensure compliance with the Act's complex permit limits and requirements.

---

<sup>15/</sup> See, for example, EPA's March 1992 *Report to Congress on Clean Water Act Enforcement Mechanisms* and EPA's *Enforcement Accomplishments Report for FY 1991*.

**Imposing additional burdens on dischargers to monitor or report compliance is unjustified.**

The CWA currently requires extensive self-reporting for dischargers. Discharge monitoring reports (DMRs) require permittees to report the degree of their compliance with applicable permit limitations and conditions. DMRs become a part of the public record, allowing regulatory authorities and interested citizens an opportunity to gauge the permittee's compliance. Furthermore, permitting authorities are free to inspect facilities to verify the accuracy of self-monitoring information. Any additional self-evaluation requirements or reporting requirements would only add to the already heavy administrative burden to which utilities are subjected. Such additional requirements are not warranted.

**Citizen suits should continue to be restricted to ongoing violations, and such suits should not be allowed when EPA or a state has decided not to seek civil or criminal sanctions as a matter of prosecutorial discretion.**

EPA and the states should be given full "prosecutorial discretion" not to cite a company that is striving to comply with its permit limits in good faith, and citizen suits should not be allowed in such cases even for current violations. If EPA or a state believes that a permittee is fully cooperative and is acting in good faith to eliminate its compliance problems, EPA and the state should have the option not to impose sanctions on that permittee. Citizen groups should not be able to circumvent that determination by seeking civil penalties. Citizen suits in such a setting undercut efforts by EPA and the states to work with permittees toward compliance. The suits reduce the ability of the regulatory agencies to provide positive incentives for compliance.

Furthermore, the CWA should not allow citizens to bring suits for wholly past violations. Once a permittee has solved its compliance problems, no good purpose will be served by allowing citizen suits that merely penalize the permittee's past violations. Such suits would not be an incentive to achieve compliance, because the permittees already would be in compliance when the actions were brought. Nor would the suits be a significant deterrent against future violations, because permittees already will be subject to civil penalties and imprisonment for any new violations they might commit.

#### CONCLUSION

In summary, EEI encourages Congress to preserve the principal existing provisions of the Clean Water Act. The Act should encourage EPA and the states to work together with regulated industries to achieve the nation's water quality goals, supporting research and information sharing and using incentives wherever possible. Congress should direct EPA and the states to base regulatory requirements on sound science and data, with full participation by permittees and the public and with adequate peer review. Furthermore,

those regulatory requirements should focus on areas of greatest risk, producing benefits that equal or exceed their costs. EEI and its members stand ready to cooperate fully in these endeavors.

Food Industry Environmental Council • 1764 Old Meadow Lane, Ste. 350 • McLean, VA 22102

May 12, 1993

The Honorable Douglas Applegate  
Chairman, Subcommittee on Water  
Resources and Environment  
Committee on Public Works and Transportation  
United States House of Representatives  
E370-A Rayburn House Office Building  
Washington, D.C. 20515

Dear Mr. Chairman:

On behalf of the members of the Food Industry Environmental Council (FIEC), we appreciate the opportunity to provide input for your consideration as the Subcommittee on Water Resources and Environment addresses reauthorization of the Clean Water Act (CWA). We respectfully request that this submission be included in the record pertaining to the recently concluded Subcommittee hearings on this issue.

Overview

FIEC is comprised of national food manufacturing and processing trade associations and individual companies. Together, the Council represents approximately 15,000 companies which employ more than 1.4 million people and are responsible for approximately \$121 billion of sales annually. FIEC has been formed to support sound, effective environmental policies and to coordinate the activities of its members, particularly as these activities relate to reauthorization of the CWA.

FIEC's objective is to serve as a resource to Congress to provide any necessary data regarding the processes used in the manufacture and delivery of food as related to CWA considerations. In addition, FIEC will evaluate any proposed legislative amendments to determine their potential impact on the continued safety and availability of the nation's food supply. Therefore, we hope that our comments will serve as the first step in a continuing dialogue during your deliberations of CWA reauthorization.

FIEC supports Congressional efforts to ensure that this nation's waters are clean and protected. It is essential to the companies represented by this Council that a continuous supply of clean water be available for use in food processing. It also should be recognized that the food processing industry has invested millions of dollars in pollution control technology to protect our waters, and along with other industries, has improved water quality significantly. For example, the loadings of conventional and toxic

The Honorable Douglas Applegate  
May 12, 1993  
Page 2.

pollutants to surface waters have been reduced by over 90 percent since the implementation of the National Pollutant Discharge Elimination System (NPDES) permitting program and the National Pretreatment Program. Progress will continue to be made under existing law.

FIEC's primary message as you begin considering reauthorization of the CWA is that, overall, the Act is working quite well. Perhaps some fine-tuning may be appropriate, but a wholesale rewrite of the legislation is neither warranted nor desirable.

#### Legislative Goals

It is a goal of the Council to ensure that there is an adequate supply of clean water for use in providing consumers with safe and nutritious processed food at reasonable prices. As you evaluate various proposed amendments to the Act, we urge you to consider the following guiding principles:

- o Based on sound scientific data, any proposed amendment should improve water quality significantly, fairly, flexibly, and cost effectively.
- o Any proposed amendment should not affect food safety adversely or contradict current food safety regulations.
- o Any proposed amendment should not contribute to the need for an increase in the price of the food supply.
- o Any proposed amendment should not cause a loss of jobs.

FIEC believes all amendments should be evaluated against these principles.

The Council believes that any proposed changes to current regulations should be based on a risk-based approach that is grounded on sound and appropriate scientific analysis. Only those amendments which ensure cost-effective and efficient solutions to any problems presented, or not addressed, by the current regulations should be adopted. This fine-tuned approach must recognize and evaluate industry specific needs. For example, any wholesale prohibition of certain chemicals for all industries would not be desirable. This is certainly the case with some disinfectants, which may be dispensable in some industries, but which are essential to food processors for ensuring the safety of the food supply by maintaining a contaminant-free workplace. In fact, regulations promulgated by the Food and Drug Administration (FDA) and the U.S. Department of Agriculture (USDA) stipulate that certain chemicals can and should be used in food plants for sanitation and other purposes.

The Honorable Douglas Applegate  
 May 12, 1993  
 Page 3.

In addition, any revisions to the CWA should be consistent with other environmental programs and should not create cross-media environmental problems. The solution to water pollution problems for example, should not create new solid waste or air emission problems.

#### Legislative Suggestions

FIEC recognizes that, while this country has made substantial progress toward improvement of water quality, more can and should be done to accomplish the goals of the CWA. Specifically, legislative proposals should embody provisions to ensure adequate funding of ongoing programs, particularly the National Pretreatment Program, the Non-point Source Pollution Program, and Control of Combined Sewer Overflows. Adequate funding of these programs would provide continued cost-effective improvements in water quality.

Moreover, a major revamping and revision of the CWA presently is not needed and would be counterproductive to the continued progress being made under the existing program. Dramatic changes to the Act are not needed particularly since most of the proposed changes, if adopted, would result in significantly increased regulation, spending, administrative burdens, and costs without achieving significant public health benefits and enhanced environmental quality.

Based on FIEC's review of several proposals put forth during the last session of Congress, we offer the following specific comments on provisions that might be under consideration by the Subcommittee:

- o Conventional Pollutants. The current technology controls on conventional pollutants are adequate and should be retained. Additional restrictions on conventional pollutants would not be cost-effective and would not result in any significant improvement in water quality. Accordingly, the current effluent guidelines for conventional pollutants should not be modified. The Council also recommends that ammonia and chlorine be retained as non-conventional pollutants contrary to some suggestions that these two chemicals should be added to the list of toxic pollutants. The weight of scientific evidence does not support the inclusion of these chemicals on the toxic pollutant list. Inclusion of ammonia and chlorine on the toxic pollutant list would add substantial cost to industries and municipalities, without associated environmental benefits.
- o Water Quality Standards. Water quality standards should reflect efficient resource allocations on a site-specific basis and should result from a consideration of the costs and benefits of associated controls. It is necessary to recognize that the goal of fishable and swimmable waters, as contained in the original Act, may be unrealistic for all waters and would result in an inefficient allocation of resources.

The Honorable Douglas Applegate

May 12, 1993

Page 4.

- o Water Quality Monitoring. Water quality monitoring requirements, while important, should focus on generating useful and not excessive data and should be industry-specific.
- o Pretreatment. There have been some suggestions that indirect dischargers should be required to meet the same effluent levels imposed on direct dischargers, and that indirect dischargers should receive NPDES permits. The Council suggests that this requirement would increase the financial, technical, and administrative burdens on both industry and the regulators, with no significant improvement in POTW performance. The Council encourages Congress to fund adequately the National Pretreatment Program and allow adequate time for it to be effective before enacting any additional, and perhaps unnecessary requirements.
- o Permit Fees. Permit fees should be reasonable and fair. The Council urges Congress to consider an equitable funding mechanism. Since water quality permit programs benefit the public as a whole, funding these programs should not burden unduly any one segment. Therefore, the Council urges that public funds generally be used to finance federal and state water quality programs.
- o Toxics Use. During the last session of Congress, mandatory toxics use reduction was contemplated, including required changes in production processes, products, or raw materials that would eliminate the use of toxic substances. FIEC believes Congress should reject any such proposal. Toxics use reduction should be voluntary and should not be micro-managed by EPA. Individual companies, not EPA, should determine what production processes will be used in their facilities taking into account many factors, such as product quality, safety and other resource conservation and environmental pollution concerns. EPA is not in a position to make those decisions for the thousands of facilities subject to effluent guidelines, nor should any government agency be given such responsibility. Companies are keenly aware of the multimedia impacts in the cost of environmental planning decisions and already consider these issues in their plans. Legislation including these mandates simply is not needed.

The Honorable Douglas Applegate  
May 12, 1993  
Page 5

- o Audit Programs. The Council urges Congress to encourage the use of audit programs which would avoid the threat of public disclosure and prosecution for efforts to correct identified problems.

Conclusion

FIEC suggests that Congress should be guided by the fact that substantial progress has and continues to be made in improving water quality. Any proposed changes to the current CWA programs should be evaluated thoroughly using cost-benefit analyses to assess their efficacy and to determine if they are necessary. Changes that have the potential to affect adversely food safety and supply of this nation's processed foods should be rejected.

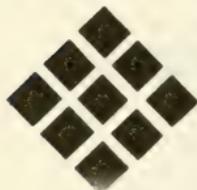

The Council appreciates the opportunity to provide these comments and looks forward to with you and other Subcommittee members during the reauthorization process.

**ACWA**

ASSOCIATION OF  
CALIFORNIA  
WATER AGENCIES

*a non-profit corporation  
since 1910*

**Testimony Submitted by Stephen K. Hall  
Executive Director  
Association of California Water Agencies**

**on  
The 1993 Reauthorization of  
the Federal Water Pollution Control Act  
before**

**The Committee on Public Works and Transportation  
U.S. House of Representatives**

---

I would like to thank the Chairman and the Members of the Public Works and Transportation Committee for allowing the Association of California Water Agencies (ACWA) an opportunity to comment on the reauthorization of the Federal Water Pollution Control Act, more commonly referred to as the Clean Water Act (CWA). As you may know, ACWA is a non-profit association of California's public water agencies. It is the largest single-state coalition of water purveyors in the United States. ACWA represents more than 400 agencies which together are responsible for delivering 90 percent of California's domestic and agricultural water.

ACWA believes that there are five issues which the Committee should consider as it begins the process of reauthorizing CWA. They are as follows:

*1. States' rights must be preserved.*

As federal law increasingly impinges on traditional water rights and state laws, it is important to reaffirm that the Clean Water Act (CWA) does not give the federal government authority to allocate water. CWA must not impede state water allocation systems when the need arises to modify stream flows.

HALL OF THE STATES  
444 N. CAPITOL ST., N.W.  
SUITE 326 NORTH  
WASHINGTON, D.C. 20001-1512  
(202) 434-4760  
FAX - (202) 434-4763

*Testimony of Stephen K. Hall, Association of California Water Agencies*2. *Protection of drinking water supplies should be a goal of the Act.*

The CWA explicitly protects fish, shellfish, wildlife, and water for recreation. It should also address public health needs through the protection of drinking water supplies.

3. *Creative, economically feasible solutions to non-point source pollution should be examined.*

Non-point source pollution from agricultural drainage is currently exempted from CWA permits under section 402 (l) (1). Although the CWA has significantly increased water quality by reducing industrial pollution, non-point source contamination remains a significant water quality issue. Voluntary state-sponsored best management practices standards should be set to address non-point source pollution.

4. *The Act should promote the use of reclaimed water.*

The reclamation and reuse of water in arid regions of the West is an effective way of enhancing available water resources. Regulations governing water quality have created impediments to the use of reclaimed water. CWA should facilitate, not frustrate, the use of reclaimed water.

5. *The wetlands provisions of the Act have failed and should be modified.*

The national wetlands policy governed by section 404 of the CWA has not worked in California. Both the state's wetlands and its public interest projects have suffered under the current system. Section 404 must be substantially altered.

I would now like to go into greater detail on each of these points.

*States' Rights*

For the last twenty years, CWA has protected our nation's waterways from the discharge of harmful pollutants. Now there is increasing interest in expanding the Act's scope to protect the physical and biological integrity of America's surface waters. The desire to protect aquatic ecosystems through the use of CWA is a laudable goal. It is also a dramatic departure from the current implementation of the Act. Such a departure could have a significant impact on California's water allocation system.

To the economies of California and the rest of the arid West water is lifeblood. Over the last century and a half, a complex amalgamation of overlapping water rights, state laws and interstate compacts have been woven into a water allocation system. It is on this system that California's population and economy has grown and now depends. As

*Testimony of Stephen K. Hall, Association of California Water Agencies*

incomprehensible as this system seems, it represents the only rational system for allocating water within the state.

The allocation of water by its very definition requires water rights holders to divert water, and in turn the process of diversion invariably impacts on the ecological "integrity" of natural waterways. If CWA authorizes the Environmental Protection Agency (EPA) to protect the physical and biological integrity of streams, it will substantially shift the control of water allocation from the state to the federal government. Such a shift would threaten the integrity of California's water allocation system and could have dire consequences for the state's economy. It could also have unintended negative environmental impacts.

ACWA believes that neither the CWA nor any of its amendments should supersede, abrogate, or impair state water allocation systems and water rights. Under section 101 (g) of CWA the regulation of water rights is specifically reserved to the states. Section 101 (g) should apply to all existing and new or altered programs resulting from the reauthorization of CWA. States must have the primary responsibility and prerogative for allocating, determining, and administering rights to quantities of water. Water rights asserted by federal agencies and Indian tribes should be claimed in the appropriate state water forum under the provisions of the McCarran Amendment. No federal agency should utilize any provision or program of the CWA to allocate or reallocate quantities of water. Finally, no provision of the CWA should be used to prohibit or limit the development of water allotted to a state under interstate compacts or equitable apportionment cases.

ACWA and its members are committed to protecting California's aquatic ecosystems. ACWA's member agencies spend billions of dollars annually to ensure that the water they discharge into California's rivers and streams is clean. California's public water agencies, however, cannot sanction a federal statute which has the potential to prevent them from delivering reliable and affordable water to their customers.

**Protection of Drinking Water Supplies**

Currently, CWA protects water for the needs of fish, shellfish, wildlife and human recreation. This standard has been used with great success to protect wildlife and recreational opportunities associated with our nation's waterways. Surface water, though, is not only an important ecological and recreational commodity, it also serves as a primary source of drinking water. The Association therefore encourages the Committee to consider adding the protection of public drinking water supplies to the requirements of sections 101 (a) (2), 304 (a) (2) (B) and 305 (b) (1) of the Act. CWA should further ensure that the protection of public drinking water supplies takes precedence over recreational activities where the two are in conflict.

*Testimony of Stephen K. Hall, Association of California Water Agencies*

### **Watershed Management**

The concept of watershed management has been in place in many states including California for some time. Although improvements to the states' systems can be made, ACWA believes that fundamentally the state, and not the EPA, should manage watersheds within its boundaries.

One important aspect of watershed management is the control of non-point source pollution. Although point source pollution has been dramatically reduced by the enforcement of CWA, non-point source runoff continues to be a significant source of contamination. ACWA believes that individual states should adopt economically feasible, voluntary best management practices to reduce non-point source pollution. The Act should require states, in cooperation with the agricultural community, to develop technically and economically feasible, voluntary best management practice standards to reduce agricultural runoff. The cost of such initiatives should be shared among the beneficiaries of the program including the federal, state and local governments.

### **Water Reclamation (Recycling)**

In the arid West, water recycling can boost available water supplies for economic and environmental uses. Unfortunately, the lack of flexibility under CWA requires reclamation projects to meet the Act's stringent "fishable and swimmable" standard. It is often impossible for reclamation projects to economically meet this standard, preventing what would otherwise have been economically and environmental sound projects from going forward.

ACWA supports amending section 101 of CWA to include a policy statement supporting the use of reclaimed water. The statement should also make it clear that water bodies created through the use of reclaimed water need not meet the stringent CWA criteria of "fishable and swimmable." Water quality standards for such aquatic environments should be based on the unique nature of the individual reclamation project and not presume a final use objective.

### **Wetlands**

Section 404 of CWA has become one of the Act's most controversial measures. By all accounts, section 404 is not working. The process which is intended to preserve our nation's wetlands has turned into a bureaucratic quagmire, aggravating landowners and frustrating vital public works projects while seemingly providing few of the environmental benefits for which the language was drafted.

*Testimony of Stephen K. Hall, Association of California Water Agencies*

ACWA supports amending section 404 to include the following provisions.

1. A regional approach to wetlands preservation should be established. Regional master plans for wetlands should be developed to identify existing wetlands. An assessment should be made of their relative biological value and whether they were created naturally or artificially. Future wetlands mitigation sites should also be identified.

Wetlands types and needs vary tremendously from one region to the next. Developing a regional master plan would not only end much of the confusion landowners and public works project planners face when determining which areas are protected under the Act, but it would also aid state and local long-term land use planning efforts.

2. States, such as California, should be given incentives to assume the administration of the 404 permitting process since they are more familiar with their regional needs. States also should retain their authority over land use planning. In the last decade, section 404 has been used as a federal land use planning tool, a tool that should rightly reside with the state and not the federal government.

3. The 404 permitting process must be streamlined. A scoping process for potential project applicants should be developed which would allow them to meet with all the federal agencies involved in the 404 permitting process to address potential problems before an application is submitted. Further, new 404 permits should not be required every time standard maintenance is performed on an existing project. The process also should allow maintenance requirements to be considered in the initial project application, forestalling the need for additional permits unless the circumstances change significantly.

An expedited permitting process should also be developed for projects which fit within the criteria outlined in the new regional master plans. Deadlines should be established for the permitting process and periodic progress reviews should be conducted to prevent permits from bogging down. An effective dispute resolution mechanism should be established to resolve differences between the varying federal agencies and between the federal agencies and the applicant.

4. The application of the 404 permitting process must be more uniform and fair. The Act should require EPA vetoes to be based on evidence presented in the administrative record. EPA should also provide feasible alternatives when a project is rejected. Training and coordination of personnel for both the Army Corps of Engineers and the EPA is needed. The permitting process should also give consideration to a project's social importance.

5. The current single-minded emphasis curtailing dredge and fill operations should be reexamined. Dredge and fill operations are not the only type of projects which impact wetlands, and yet these projects have to bear the brunt of mitigation requirements. CWA should encourage EPA and the Army Corps to develop a more balanced and broad-based view of wetlands preservation.

*Testimony of Stephen K. Hall, Association of California Water Agencies*

6. Finally, 404 permitting requirements for incidentally created artificial wetlands associated with water treatment and delivery systems should be eliminated. Section 404 was developed to preserve existing natural wetlands which are an integral part of our country's ecological systems. Incidentally created man-made wetlands are clearly not part of our natural heritage, and should not be protected by the CWA.

I would again like to express my thanks to the Chairman and the other members of the Public Works Committee for considering ACWA's comments on the reauthorization of CWA. The Association believes that with the notable exception of section 404, CWA has worked fairly well. Over the last twenty years the Act has helped to markedly improve the quality of many of our nation's rivers, streams and lakes. More needs to be done, but Congress should proceed cautiously as it attempts to improve on one of our country's more successful environmental laws.

Dear Mr. Chairman:

Please find attached a statement of the IAFWA for the record on the hearings held on reauthorization of the Clean Water Act by your subcommittee in April and May. The Association appreciates the opportunity to comment on this very important issue, and would be pleased to answer any questions you may have regarding our statement.

As your subcommittee progresses in its deliberations over wetlands and reauthorization of Section 404, in particular, the Association would appreciate the opportunity to appear before your subcommittee to share with you our interests and concerns. I would thus appreciate it if you would give the Association serious consideration as a panel member for any future hearings on bills or other topics relating to wetlands.

Thank you for allowing the Association to share our thoughts on this important issue with you.

Sincerely,

R. Max Peterson  
Executive Vice President

cc: Honorable Sherwood L. Boehlert, Ranking Member

STATEMENT SUBMITTED TO THE  
HOUSE SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
ON WETLANDS CONSERVATION

by R. Max Peterson, Executive Vice President  
International Association of Fish and Wildlife Agencies  
May 28, 1993

The IAFWA appreciates the opportunity to submit a statement for the record on a subject of long-standing concern to the Association -- the Nation's vitally important wetlands. Wetlands conservation, and its implications to wetland-dependent fish and wildlife, is a subject in which fish and wildlife professionals have years of experience and expertise. The Association has taken a leadership role in several key wetland initiatives, including the North American Waterfowl Management Plan and measures to increase the cost of the Federal Duck Stamp; all to further wetland protection. The current controversy surrounding wetlands, and the resultant potential for weakening the protection of these significant and vitally important habitats, is of grave concern to the Association.

The International Association of Fish and Wildlife Agencies, founded in 1902, is a quasi-governmental organization of public agencies charged with the protection and management of North America's fish and wildlife resources. The Association's governmental members include the fish and wildlife agencies of the states, provinces, and federal governments of the U.S., Canada, and Mexico. All 50 states are members. The Association has been a key organization in promoting sound resource management and strengthening federal, state, and private cooperation in protecting and managing fish and wildlife and their habitats in the public interest.

I will first discuss some key general issues and observations about wetlands and Section 404 of the Clean Water Act (CWA). Following that, I will share with you the Association's concerns about some of the Section 404 legislative proposals on the table.

The Association concurs with the focus of applying the Clean Water Act from a watershed perspective to more comprehensively address the conservation of water reliant and water influenced ecosystems, and also to address remedies at prevention rather than "end of the pipe" regulation of pollution. Wetland protection should thus be integrated with other water related resource management programs such as flood control, water supply, point and non-point source pollution control, and fish and wildlife habitat conservation. An ecosystem or watershed-based approach also allows for more prudent use of the flexibility in the Clean Water Act rather than as it may have been applied over the history of the Act.

The Association maintains that, generally, existing federal laws are effective in protecting wetlands when implemented and supported by good information, incentives, regulations, effective administration and effective enforcement. The current Clean Water Act's Section 404 jurisdictional umbrella, supported by state, local and private efforts, best addresses the needs of wetland-dependent fish and wildlife resources.

The Section 404 program thus represents an important tool for stemming loss of wetlands and the benefits they provide. We stress that it will be absolutely essential to retain the current 404 program in place and strengthen it where appropriate.

The Association and its member states are particularly concerned about the impacts and implications of wetlands regulation and management on living resources (fisheries, shellfish, wildlife and plants). These functions and values related to living resources must be given at least co-equal consideration with other wetlands functions and values, such as flood control, water supply, sediment abatement, etc.

The Association strongly advocates that any mitigation, restoration, and replacement of wetlands should replace all the significant functions and values of wetlands, rather than one specific function such as flood control, for example. Significant inter-functional trade-offs should not be allowed, e.g. flood abatement and sediment trap functions can be physically achieved without replacing wetland fish and wildlife values. The entire bundle of functions and values should be replicated as closely as possible in mitigation, restoration and replacement.

State fish and wildlife agencies have legal responsibility for the stewardship of resident fish and wildlife and share responsibility with the U.S. Fish and Wildlife Service for migratory birds. In addition to their benefits to migratory birds, wetlands are home to many non-migratory species such as fish, shellfish, reptiles and amphibians, small mammals, gallinaceous birds and plants. Therefore, any decisions regarding impacts on wetlands must include state fish and wildlife agencies in the process.

The states have been most effective in utilizing the Section 404 program when they are able to operate as full partners with federal agencies in the Program's federal regulatory overview, complemented with effective state laws. The Association believes that legislative recognition of the state fish and wildlife agency role and comments in permit decisions is necessary. The utility of the Fish and Wildlife Coordination Act lends itself to this recognition, but can be improved and enhanced. Currently, some comments from State fish and wildlife agencies are given serious consideration, while others are not. Providing only for the discretionary use of these comments must be changed.

The Association supports existing exemptions for normal farming and silviculture where operations are ongoing on former or prior converted wetlands. We recognize that there may need to be some clarification of the definitions of normal agricultural or normal silvicultural practices. However, the Association also supports retaining the permit requirement for a land-use change from normal agricultural or silvicultural use to another land use.

#### Problems with 404

Overall, the Association believes there has been a general decline in the strength of the program. Staffing in the Corps' District regulatory sections has been reduced, with a consequent reduction in emphasis upon the thoroughness of the individual permit program and an increasing reliance upon nationwide permits (NWP) and general permits. We have no objection to streamlining the 404 permit process so that projects, or classes of projects, which would have no significant impact upon wetlands or other waters of the United States, may be permitted with little delay. However, there are certain project authorizations contained within this program which would clearly result in impacts which are both individually and cumulatively adversely impacting wetlands.

As an example, the nationwide authorization of fill deposition to isolated waters of the United States is, we believe, in conflict with the stated rationale of the Nationwide Permit Program, i.e. that projects or classes of projects authorized in waters of the United States by Nationwide Permit shall not result in impacts which are, or could be, individually or cumulatively significant.

When those affected by 404 agree to work with the Corps of Engineers and wildlife agencies through early consultation, make a legitimate effort to avoid and minimize impacts, and to compensate for the effects of unavoidable impacts, the Section 404 program generally works efficiently and without delay.

However, when permittees are recalcitrant or unwilling to cooperate or side-step early consultation, refuse to minimize impacts, and/or refuse to effectively compensate for unavoidable impacts to public resources, the permit process becomes time consuming and often extremely confrontational. Such situations generally result in delays or outright refusal to grant permits. It is imperative that delays and confrontations such as this not be viewed as a failing of the Section 404 Permit Program. Rather, they are a natural outgrowth of the national concern for the maintenance of the "physical, chemical and biological integrity of the waters of the United States;" which is the basic rationale of the Federal Clean Water Act and its 404 Program. They are the very reason for the 404 Program and a full consultation process.

States Role in 404: Recommendations

As I indicated, state fish and wildlife agencies must be allowed to become full participants under Section 404 to ensure fish and wildlife needs are met. It is essential that the Corps of Engineers and EPA place "great weight" upon the recommendations of state fish and wildlife agencies with regard to 404-regulated activities affecting wetlands. This requirement would remove much of the expensive, time-consuming controversy surrounding many proposals adversely affecting wetlands. Given the resources to do the job, many states will be in a position to assume a greater responsibility in the implementation of the Clean Water Act.

There have been a number of suggestions that state agencies assume a greater role in the Section 404 Program. Such proposals have merit; however, any state assumption of the 404 Program must be subject to the following conditions:

1. In their role as co-equal partners with the Federal government in administration of Section 404, it is imperative that the states be involved at the front-end of the process: scoping, planning, drafting, and critiquing; not handed a product with instructions to implement. Under the latter scenario, the states become a testing ground for sometimes incompletely thought out programs. Under the former scenario, the states are true, participating, co-equal partners.
2. The states must be allowed to work cooperatively and collectively to assure that the needs of migratory waterfowl and resident wetland-dependent fish and wildlife resources are met;
3. Given the resources, states can work towards maintaining federal standards for permit approvals and conservation of the wetlands as intended by the Federal Clean Water Act. States may be authorized to implement additional state-authorized wetlands protection and restoration measures provided they meet the minimum standards and provisions of the Federal Act;
4. Costs to individual states for assumption of any part of the 404 Program must be fully covered by fees (e.g. by applicants for 404 permits) and other federal funds as necessary to provide full funding for state assumption. Funding must be adequate to ensure full compliance with all aspects of the program; and
5. There must be in place an effective federal oversight capability able to assure that state programs meet the minimum federal standards of Section 404.

### Legislative Proposals

The Association supports Section 404 as currently written in existing law, but recognizes that legislative improvements could be applied both to strengthen it and to improve its application and administration. In particular, the Association would support expansion of the application of Section 404 to other activities which degrade or destroy wetlands, such as draining, channelization, and excavation. These changes would strengthen the Act as the national means of protecting our invaluable and irreplaceable wetland resources.

The Association would also support legislative remedies to improve the administration of Section 404. We recognize that one of the major contributing factors to the public perception that the 404 program is in disarray is the uncertainties and confusion surrounding the permit process. A legislative articulation of the process, and the respective agencies' roles, along with a decision-making timetable, could serve a valid and useful purpose. We concur also that there may be some need for an administrative appeal process, but suggest that this proposal needs further deliberation before a process is codified.

Finally, there has to be adequate administrative support for the agencies involved in the permitting process. Staff levels and funding need to be realistically assessed, and remedies appropriately applied. A functioning, well-understood, public supported permitting program is absolutely vital to the success of Section 404.

Having said that, the Association would like to share its concerns over one of the leading House proposals regarding Section 404, i.e. H.R. 1330 by Congressman Hayes. This proposal would significantly weaken the wetland protection provisions of Section 404, and the Association urges you to resist any proposal that weakens important wetland protection.

As you are aware, H.R. 1330 does the following:

- 1) requires categorization of wetlands into three types;
- 2) declares the highest value (type A) to be a taking, and requires, at the discretion of the landowner, government acquisition in order to protect these wetlands;
- 3) it allows for no more than 20% of a political subdivision to be type A;

- 4) it provides for altering types B & C wetlands with the provision of compensatory mitigation, and eliminates the requirement for sequencing (avoid, minimize, then mitigate) consideration;
- 5) it requires the establishment of mitigation banking;
- 6) it narrows the definition of wetlands; and
- 7) removes the Environmental Protection Agency from the 404 Program.

While categorization of wetlands into types could serve several valid scientific purposes, the Association is seriously concerned that a ranking protocol will inevitably lead to a loss of "lesser value" wetlands. Indeed, the implications of H.R. 1330 are that, as a national policy, the United States espouses a continued loss of "low value" wetlands as long as compensatory mitigation is satisfied.

The Association wishes to point out several shortcomings of the categorization thesis. First, while we agree that not all wetlands are created equal, all wetlands do serve some function and have some value, although not always immediately apparent or readily discernible. An artificial values scheme, superimposed by legislative mandate, whether based on size, relative scarcity, function, or any or all of the above, may ignore the contribution of the subject wetland to the local ecosystem it is part of. Small, scarce wetlands can be just as critical to local populations of reptiles and amphibians, as are vast flooded areas to migratory waterfowl. And, the cumulative incremental loss of these small wetlands can be as devastating. Also, as a practical matter, it is not feasible to inventory and delineate wetlands by value categories.

The Association supports the development of an improved, efficient wetland evaluation protocol, based on value and function, to assist the professional biologist in the field, to aid in the decision making process, and to facilitate permit review and administration. We commend to you for consideration the Habitat Evaluation Procedures developed by the U.S. Fish and Wildlife Service, as a starting point in this endeavor. However, the Association remains concerned about simple legislative categories for regulatory purposes if it is applied by legislative fiat and absent the judgment of the professional biologist in the field.

Further, it should be pointed out that wetland mitigation is still as much an art as it is a science. As we stated previously, mitigation should replicate, as nearly as possible, all the functions and values of wetlands, including habitat for fish and wildlife. While it may, for example, be relatively easy to physically re-create flood abatement or sediment trap functions, these projects may have minimal value to fish and wildlife. Mitigation must not be a carte blanche license to alter, degrade or destroy existing natural wetlands.

Therefore, we conclude that, rather than eliminating the requirement for sequencing (avoid, minimize, then mitigate) as does H.R. 1330, the sequencing requirement should be legislatively assured.

Further, the Association is strongly opposed to a mandatory declaration that protecting the "highest value" wetlands is a constitutional taking, and requiring, at the discretion of the landowner, acquisition by the Federal Government. The Association is a strong supporter of private property owners and their rights. However, we also contend that the Constitution has protected private landowners from regulatory takings for over 200 years. The Association knows of no compelling reason to legislatively recognize this protection of private property clause of the U.S. Constitution. Additionally, the budget ramifications of such a measure would significantly frustrate the characterization of wetlands as Type A.

While the Association has not taken a formal position yet on mitigation banking, we continue to have serious reservations about the application of this concept. While we concur that there needs to be economic overtures to private landowners to facilitate stewardship of wetlands, and support landowner incentives (easements, tax incentive programs, transfer of development rights, etc.), we urge extreme caution in the assessment and development of a market-based mitigation banking program. There are many unanswered questions surrounding this proposal, all of which should be addressed prior to implementation. For example, could wetlands loss in Florida be mitigated in Texas? We believe mitigation can only be effective if it is done near where the loss occurs. Some states have developed mitigation banking programs already, and the Association urges Congress to examine those carefully and thoughtfully before advancing a legislatively mandated national program.

Finally, the Association supports the continuing role of the U.S. EPA in the permitting process, including limited veto authority. Veto authority has been used sparingly and judiciously in only 11 cases in the history of the program thus far. While we agree that administration of the process could use some improvements, radical surgery is not warranted.

The Association has also reviewed HR 350 from Congressman Edwards, and concludes that, of the extant legislative proposals relating to Section 404, this bill contains those features most likely to improve the use of Section 404 as a means of conserving the fish and wildlife resources supported by this nation's wetlands. It also addresses many of the Association's concerns as articulated herein in this statement.

The Association finds the section in HR 350 providing tax incentives to private landowners particularly attractive. We fully recognize the role of the private landowner in the conservation of fish and wildlife resources, and appreciate the fact that conservation objectives for fish and wildlife and their habitats cannot be met without the active involvement of the private landowner in this country.

On the issue of the National Academy of Sciences review of the wetlands delineation manual, the Association suggests that the NAS study will certainly contribute to our knowledge about wetlands and what may be necessary to conserve them. However, the issue of the regulation of jurisdictional wetlands remains one of public policy. Therefore, while the results of the NAS study will be useful, the deliberations over where to specifically delineate, and what are the implications of delineating wetlands for regulatory purposes, must remain in the arena of public debate.

In conclusion, the Association supports a legislative strengthening of Section 404 to include, under the permit umbrella, other activities which degrade or destroy wetlands. Further, we concur with clarifying and codifying the administrative process to improve the understanding of Section 404 implementation to the regulated community and the private landowner, and enhance its support among the general public.

#### Conclusion

The Section 404 program is one which has become a modern-day lightning rod, as those opposed to development feel it should be strengthened considerably and those in development feel it should be weakened. We maintain this speaks to the overall health of the Section 404 program.

While some improvements can be made to strengthen the program, Section 404 is the best protection of this Nation's valuable and vital wetland resources, and the fish and wildlife species they sustain. One also needs to remember the role of wetlands in boosting the economy of this country, from their contribution to commercial fishing and shellfishing, sport hunting, fishing, resident and non-resident tourism trade from birdwatchers, photographers, etc.

Undeniably, there are problems and weaknesses with the 404 program; to deny this would be naive and untruthful. However, it still represents the most effective and powerful tool that state fish and wildlife agencies have for the protection of our wetlands. These problems can be resolved. We believe the Congress is aware of 404's contribution to the maintenance of important wetlands and urge you to continue and strengthen this essential program for our nation's wetlands resources.

Dear Congressman Applegate:

Enclosed is the written statement of the Large Public Power Council. We request that it be included on the record of the Clean Water Act hearings that have been conducted by the Subcommittee on Water Resources and Environment.

Thank you for the opportunity to participate in this process.

TESTIMONY OF THE LARGE PUBLIC POWER COUNCIL  
BEFORE THE  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
OF THE  
PUBLIC WORKS AND TRANSPORTATION COMMITTEE  
OF THE U.S. HOUSE OF REPRESENTATIVES

May 28, 1993

The Large Public Power Council (LPPC) thanks the Members of the Committee for the opportunity to provide testimony regarding the Clean Water Act. LPPC is an association consisting of 18 of the largest non-federal, publicly owned electric utilities in the nation.<sup>1/</sup> LPPC members are located in various states and the combined population within the LPPC service territory totals nearly 15 million consumers. Since member utilities are governed at the local level, their public policy concerns directly reflect the interests of the local community and ratepayers. LPPC members are committed to providing electrical power at a reasonable rate to the public in an environmentally sound and cost-effective manner.

LPPC formed an Environmental Task Force to help its members participate constructively in important federal environmental policy debates. LPPC members, as public entities, believe that they have a special responsibility to conduct their operations in an environmentally sound manner and to address effectively any environmental problems that may be associated with their facilities and operations. Recently, LPPC has contributed to the development of revisions to the Clean Air Act and LPPC desires to continue to work cooperatively with Congress as it reauthorizes the Clean Water Act.

The Clean Water Act is "considered by many experts to be one of the best federal environmental statutes."<sup>2/</sup> LPPC believes that the current program, especially as it relates

---

<sup>1/</sup> LPPC members include: Jacksonville Electric Authority; Memphis Light, Gas and Water Division; Knoxville Utilities Board; Municipal Electric Authority of Georgia; Lower Colorado River Authority; Sacramento Municipal Utility District; Tacoma Public Utilities; Los Angeles Department of Water and Power; New York Power Authority; Omaha Public Power District; Nebraska Public Power District; Public Utilities District #1, Snohomish County, Washington; Salt River Project; Seattle City Light; Orlando Utilities Commission; South Carolina Public Service Authority; City of Austin; and Puerto Rico Electric Power.

<sup>2/</sup> Testimony of Carol M. Browner, Administrator, U.S. Environmental Protection Agency, Before the Subcommittee on Water Resources and Environment of the Committee

(continued...)

to the control of thermal discharges, has worked well. For this reason, LPPC will not broadly address all the relevant reauthorization issues in this testimony. Instead, LPPC will limit these comments to the issue of thermal discharges which was raised in the Senate during the 102nd Congress. LPPC will address other relevant issues in response to future proposals as they arise during the reauthorization process.

In the last Congress, Senator Baucus introduced S.1081, a comprehensive bill reforming many provisions of the Clean Water Act (CWA). S.1081 and the subsequent majority staff draft would have repealed Section 316(a) which allows for site-specific alternative effluent limitations regulating thermal discharge where state or Environmental Protection Agency (EPA) effluent limitations are more stringent than necessary to assure the protection and propagation of a balanced, indigenous population of shellfish, fish and wildlife in and on the receiving water body. It is LPPC's position that such a repeal is not justified. Studies conducted thus far show little evidence of environmental costs associated with thermal discharges currently regulated under Section 316(a) of the Clean Water Act.<sup>3/</sup> LPPC is concerned that the questionable benefits of repealing Section 316(a) do not justify the resulting burdensome costs.

Thermal effluent results from the production of electricity. Approximately 80% of the electricity generated in the United States is produced by steam-driven turbine generators.<sup>4/</sup> Typically, nuclear or fossil fuel is used to heat water and create steam which is converted to mechanical energy in turbines that drive the electrical generators. The exhaust steam from the turbines passes through a condenser where it is cooled by cooling

<sup>2/</sup> (...continued)

on Public Works and Transportation, U.S. House of Representatives, May 5, 1993 at p. 2 [EPA Testimony].

<sup>3/</sup> EPA found that information provided by EPA Regions and permitted facilities did not reveal widespread environmental problems resulting from the discharge of thermal effluent from power plants. Review of Water Quality Standards, Permit Limitations, and Variances for Thermal Discharges at Power Plants, prepared by the Enforcement Division of the Office of Wastewater Enforcement & Compliance and Wade Miller Associates, Inc., for the U.S. Environmental Protection Agency (October, 1992) [EPA Study]. EPA concluded from it's study that "there is only a small likelihood of significant thermal impacts occurring at the nation's power plants operating under Section 316(a) variances." Id. at p. 8.

<sup>4/</sup> Evaluation of the Potential Costs and Environmental Impacts of Retrofitting Cooling Towers on Existing Steam Electric Power Plants that Have Obtained Variances Under § 316(a) of the Clean Water Act, prepared by Stone & Webster for the Edison Electric Institute (1992) at p. 6 [Stone and Webster Study]. The discussion of electricity generation is taken from this study.

water. The waste heat that must be removed from the steam during the condensation process is an unavoidable by-product of the plant's thermodynamic cycle.

The condensing cooling water may be returned to the receiving water source. This method is called the open-cycle or "once-through" cooling method. In a closed-cycle system, the condensing cooling water is treated in a cooling tower, lake or pond and then routed back to the condensers. The temperature of the water returning to the condenser in closed-cycle systems is usually warmer than the water withdrawn for once-through cooling. This results in increased turbine backpressure and, consequently, in less efficient generation because more fuel is required to produce the same amount of power.<sup>51</sup> Depending on site-specific needs, LPPC members use both "once-through" cooling as well as cooling towers and cooling ponds at their facilities.

#### The Section 316(a) Program for Regulating Thermal Discharge

Section 316(a)<sup>61</sup> of the CWA does not provide for a waiver of control requirements. Rather, it provides for case-by-case determinations of site-specific alternative effluent limitations regulating thermal discharges where applicants can demonstrate that state or EPA effluent limitations for the control of thermal discharges are more stringent than necessary to protect the indigenous species in and on the receiving body of water.

Thermal discharges are subject to the more stringent of either technology- or water quality-based effluent limitations. In 1974, EPA established a "no discharge" best available technology requirement for new steam electric power plant generated heat and required certain existing generating plants to backfit closed-cycle cooling systems.<sup>71</sup> However, the technology-based thermal effluent limitations guidelines were remanded back to EPA in Appalachian Power Co. v. Train.<sup>81</sup> Ever since the Appalachian Power case, the EPA has

<sup>51</sup> Impact on the Steam Electric Power Industry of Deletion of § 316(a) of the Clean Water Act, prepared by John A. Veil of the Argonne National Laboratory for the Office of Environmental Analysis, United States Department of Justice (July 1992) [Argonne Study] at p. 9 of Phase I.

<sup>61</sup> 33 U.S.C. § 1326.

<sup>71</sup> 40 C.F.R. Part 423, 39 Fed. Reg. 36186 et seq. (1974) as amended at 40 Fed. Reg. 7095 (1975), 40 C.F.R. Part 122, 39 Fed. Reg. 36176 et seq. (1974). There were limited exemptions based on land availability, salt drift impacts and interference with commercial aviation.

<sup>81</sup> 545 F.2d 1351 (4th Cir. 1976), modified by Appalachian Power Co. v. Train, 9 Env't Rep. Cas. (BNA) 1274 (4th Cir. 1976) petit. den. Appalachian Power Co. v. Train, 620

(continued...)

abandoned its efforts to promulgate national best available technology regulations for steam electric power plants and has provided electric utilities with flexibility by addressing the issue on a case-by-case basis, according to the state or EPA permit writer's best professional judgment. This has resulted in unique thermal effluent limitations which are applicable to each individual facility and are based upon the particular circumstances of that facility and the receiving water body. Thermal limitations are generally developed based on water quality standards which have been designated by the state to preserve and protect its water bodies. The actual thermal limitations and monitoring requirements are specified in individual National Pollution Discharge Elimination System Program (NPDES) permits.

The history of Section 316(a) indicates that no significant environmental harm has resulted from its implementation.<sup>97</sup> According to an independent study prepared for the Department of Energy, the Argonne Study,<sup>100</sup> there is no evidence that the national program for granting Section 316(a) alternative limitations has resulted in significant environmental problems. However, recent studies conclude that a repeal of Section 316(a) would not only have severe economic impacts but would also have negative impacts on the environment.

While little evidence has been generated to substantiate that the 316(a) alternative effluent limitation program has caused environmental harm, there has been much documentation to support continuance of the alternative limitations. During the permit review period, the applicant must demonstrate that alternative thermal limitations will provide the necessary protection for a balanced, indigenous population of shellfish, fish and wildlife in and on the body of receiving water. The demonstration must be approved by the

---

<sup>97</sup> (...continued)

F 2d 1040 (4th Cir. 1980). The decision found the regulations flawed because of a failure to explain technological limitations and a failure to conduct an incremental cost-benefit analysis relating expected benefits to costs of control.

<sup>99</sup> The EPA Study found that for the vast majority of facilities with alternative effluent limitations under Section 316(a), impacts from thermal effluent have not been large or permanent. EPA Study at p. 18. EPA also found that the few isolated problems it identified were largely a result of administrative error on the part of the permitting agency. LPPC submits that it would be counterproductive to repeal Section 316(a) as a response to a small number of problems that are not reflective of the general success of the program. Any isolated problems should be dealt with on a case-by-case basis and LPPC supports EPA's recommendation calling for the provision of training to EPA regional and state permit writers.

<sup>100</sup> Impact on the Steam Electric Power Industry of Deletion of Section 316(a) of the Clean Water Act, prepared by John A. Veil of the Argonne National Laboratory for the Office of Environmental Analysis, United States Department of Energy (July 1992) [Argonne Study]. All cost estimates cited here are taken from this study unless otherwise noted.

regulatory agencies. Typically, information is gathered relating to the physical, thermal and biological characteristics of the receiving water (including data on plankton, plants, microinvertebrates and fish).<sup>11/</sup> Alternative limitations must be renewed every five years.

The procedures discussed above adequately test the merits of the alternative limitations. An additional benefit of the extensive and costly studies that are required to be performed is that the aquatic populations in the local water bodies are better understood. Because of Section 316(a), there is abundant site-specific data that has been gathered for more than two decades.

LPPC members who have obtained Section 316(a) alternative effluent limitations have had temperature limitations and mixing zone restrictions imposed upon their permits. Additionally, these members have gathered data and performed site specific studies in support of such limitations and have performed the monitoring studies required by their permits. The studies performed involved thermal mixing zones, ecological impacts, impacts on aquatic life, plume modeling and thermal impact assessment. The results of these studies indicate no significant adverse impacts.<sup>12/</sup>

LPPC is not opposed to review of the Clean Water Act provisions which regulate point sources and the operations of utilities. LPPC members are prepared to make any cost-effective change in operations that is found to be necessary and appropriate. Thus far, however, studies concerning the issue of a repeal of the provision for thermal alternative effluent limitations do not support a change in current Section 316(a) procedures.

---

<sup>11/</sup> EPA Study at p. 14.

<sup>12/</sup> For example, the Jacksonville Electric Authority performed monitoring studies as a requirement of its NPDES permits for its Northside Generating Station. Northside Generating Station NPDES Permit Biomonitoring Program Final Report, prepared by EnviroSphere Company for the Jacksonville Electric Authority (November 1981). The two year study resulted in a finding of no significant effect of the thermal discharge of the Northside Generating Station on the ecological community of the St. Johns River. The Department of Water and Power of the City of Los Angeles also conducted monitoring studies required by its NPDES permit. National Pollutant Discharge Elimination System 1992 Receiving Water Monitoring Report, Harbor Generating Station, Los Angeles County, California, prepared by MBC Applied Environmental Sciences for the Department of Water and Power, Los Angeles (1992 Survey). The results of the 1992 studies indicated that the beneficial uses of the receiving waters in Los Angeles Harbor near the Harbor Generating Station are being protected.

### Economic Consequences of the Repeal of Section 316(a)

Approximately 32% of the total U.S. steam electric generating capacity (including nuclear or fossil fueled utilities) would be affected if Section 316(a) were repealed.<sup>13/</sup> While there is no clear evidence of the benefits that would result if Section 316(a) were repealed, there is clear evidence indicating that removal of thermal alternative limitations will have adverse economic and environmental costs.<sup>14/</sup>

The Argonne Study, performed for the Department of Energy, examined the impact on the power industry of losing the 316(a) alternative effluent limitation provision. Cost estimates were generated by obtaining estimates from a number of power companies in different areas of the country, subjecting the results to a regression analysis, and multiplying the cost rates by the total affected kilowatts in order to arrive at a national estimate. Phase I of the Argonne Study examined the alternatives that would be available to power plants currently operating under Section 316(a) if the Section were repealed. It found that the vast majority of affected plants would retrofit existing once-through cooling systems with cooling towers. The national capital costs alone for retrofitting cooling towers was estimated to be in the range of \$22.7 billion to \$24.4 billion in 1992 dollars.

Phase II of the Argonne Study estimated the cost for conversion to cooling towers in terms of lost energy. It found that conversion to cooling towers would lower energy output due to increased turbine backpressure and increased auxiliary power demands and would create an "energy penalty." The energy penalty for fossil-fuel plants would range from 1.1 to 4.6% and for nuclear plants would range from 1.0 to 5.8%. The power industry would need to replace an estimated 14.7 to 23.7 billion kilowatt hours of power. The Argonne Study estimated that the national cost of replacing this lost capacity would be \$420 million to \$670 million annually. Over a twenty year period the national cost would be \$11.4 billion to \$18.4 billion. In addition, some power companies would need to construct replacement generating capacity. The national estimated cost for this new capacity would be \$1.4 to \$5.3 billion in 1992 dollars.

The Argonne Study concluded that, if Section 316(a) were stricken from a reauthorized Clean Water Act, the total estimated national costs to the power industry would be in the range of \$32.5 billion to \$52.6 billion in 1992 dollars. This range represents the

---

<sup>13/</sup> The Stone and Webster Study found that approximately 32% of the U.S. generating capacity, with a total output of 189,000 MW, has applied for and received alternative limitations under Section 316(a). Stone and Webster Study at p. 5. EPA found that approximately one third of the U.S. power plants have alternative effluent limitations under Section 316(a). EPA Study at p. ES-1.

<sup>14/</sup> Stone and Webster found that the national cost of repealing Section 316(a) would be \$41 billion in 1992 dollars. Stone and Webster Study at p. 3.

sum of the capital costs for retrofitting cooling towers, building new generating units and the increased fuel costs for a twenty year period. These huge cost increases would be passed on to the ratepayers. In some cases, the high cost of replacing cooling systems would force some utilities to close down their generating stations.

LPPC has recently gathered data relating to the members of the Large Public Power Council in an effort to assess the potential impact of a repeal of Section 316(a) on its membership. This information indicates that a majority of LPPC members would be substantially affected if their site-specific alternative effluent limitations for thermal discharges under Section 316(a) were eliminated. As predicted by the Argonne Study, LPPC members indicated that, if Section 316(a) were repealed, they would be likely to install a recycling system using a mechanical or natural draft wet cooling tower.

The estimated costs associated with retrofitting cooling towers were substantial. One LPPC member, the Jacksonville Electric Authority, estimated that retrofit capital and life of the unit operating and maintenance costs at its plants would be approximately \$130 million. Most LPPC members estimated initial capital costs for installation of cooling towers to be in the range of \$10,000,000 to \$161,894,000, depending largely on the number and size of facilities that would require retrofitting. Estimated operating and maintenance costs ranged from \$2.0 million to \$5.1 million annually. Estimated annual costs of lost generation ranged from \$1,126,286 in one instance to \$4,000,000.<sup>15/</sup>

#### Environmental and Other Consequences Resulting from a Repeal of Section 316(a)

The Argonne Study stated that the Section 316(a) alternative thermal effluent limitations program has not caused significant environmental degradation. In fact, the study did not find any significant benefit associated with the repeal of Section 316(a). Instead, it found that repeal of Section 316(a) would result in potential adverse environmental impacts associated both with the operation and installation of cooling towers. As discussed above, repealing 316(a) would force utilities to retrofit cooling towers, thus creating an "energy penalty." Consequently, the power industry would need to consume more fuel, resulting in an estimated 9 million tons per year of increased carbon dioxide emissions. LPPC members listed additional emissions of air pollutants as well as water treatment chemicals as resulting environmental costs of replacement of the once-through cooling method.

---

<sup>15/</sup> The \$4 million figure was calculated by estimating the lost generation caused by forced outages every two months which would be necessary to manually clean cooling water tunnels that would otherwise have received heat treatment to control macro invertebrate growth. A similar figure was arrived at by a member who calculated the lost steam turbine capability due to the higher backpressure resulting from the warmer cooling water.

The Argonne Study found that cooling towers would result in increased evaporation of water at an estimated loss of 1.5 million to 2.8 million gallons of water per minute. 1.5 million gallons per minute is enough water to supply the daily domestic needs of approximately 25 million people. LPPC members also anticipated that use of a cooling tower would increase their consumption of water. One member estimated that an additional 20,700 gallons per minute would be used. The increased consumption of water would be especially problematic for states experiencing water shortages.

The Argonne Study found that construction of new generating units could impact the environment through changing land use, runoff characteristics and wildlife habitat. Land use restrictions may preclude the building of cooling towers because of the location of nearby wetlands or natural areas. Land may not be available near the facility because of the proximity of airports, highways or residential areas that could be disturbed by the cooling towers. Cooling towers can cause fogging or freezing plumes (which can cause visibility and safety problems), salt drift, noise and generally disagreeable aesthetics. LPPC members also mentioned land use restrictions and land availability as additional potential obstacles to the installation of cooling towers.

Another obstacle to replacing the current cooling system mentioned by LPPC members included the age of the facility. Several members indicated that the cost of retrofitting older facilities with cooling towers may not be cost-effective and, as a result, some of these facilities would be put out of service.

#### **Conclusion**

Repeal of Section 316(a) of the Clean Water Act would result in severe economic costs to utilities and ratepayers with no corresponding benefit. Not only has there been a lack of historical environmental problems associated with the granting of alternative limitations under Section 316(a), but the Argonne Study has found that removal of Section 316(a) would be likely to have negative environmental impacts. An additional 9 million tons per year of carbon dioxide emissions would result from increased fuel consumption caused by the operation of cooling towers. Cooling towers would increase the consumption of water by at least 1.5 million gallons of water per minute, enough water to supply the daily domestic needs of approximately 25 million people. Certainly, any action that serves to further pollute our nation's air and deplete our water resources is not beneficial to our environment.

If the Committee finds that improvements to the Section 316(a) program are called for, LPPC members, as responsible utilities and water resources managers, would like to assist the Committee in finding the appropriate solutions. However, in light of all the reasons set forth above, LPPC urges the Committee not to recommend the repeal of Section 316(a) of the Clean Water Act.

*For Record***NATIONAL ASSOCIATION OF ATTORNEYS GENERAL****Adopted****Spring Meeting  
March 28-30  
Washington, D.C.****RESOLUTION****URGING THE CONGRESS TO CLARIFY THE WAIVER OF FEDERAL SOVEREIGN IMMUNITY UNDER THE CLEAN WATER ACT**

**WHEREAS**, a significant number of the most dangerous sources of water pollution in the United States that pose a significant threat to public health and the environment are located at federal facilities; and

**WHEREAS**, federal facilities are among the worst violators of federal and state water pollution laws; and

**WHEREAS**, Executive Order 12088 requires all federal agencies to comply with all applicable pollution control standards; and

**WHEREAS**, the states have experienced significant problems in bringing federal facilities into compliance with federal and state water pollution laws because the federal facilities refuse to acknowledge state regulatory authority over their facilities; and

**WHEREAS**, disputes over state environmental authority at federal facilities has caused costly, time-consuming and acrimonious litigation between the states and the federal agencies; and

**WHEREAS**, the U.S. Environmental Protection Agency's and the states' lack of clear enforcement authority has eroded the public confidence in the federal government's willingness and ability to address the serious water pollution problems at the federal facilities; and

**WHEREAS**, the states' role in enforcing federal and state water pollution laws against recalcitrant federal agencies has become more important because of the U.S. Department of Justice contention that the Constitution prohibits EPA from enforcing water pollution laws at federal facilities and from imposing sanctions against federal agencies; and

**WHEREAS**, federal agencies must be subject to the same sanctions as private industry, states, and local governments for violations of federal and state water pollution laws to deter violations of and ensure compliance with these laws; and

**WHEREAS**, the U.S. House of Representatives is considering HR 340, which would clarify the federal sovereign immunity waiver under the Clean Water Act;

**NOW, THEREFORE, BE IT RESOLVED THAT THE NATIONAL ASSOCIATION OF ATTORNEYS GENERAL:**

1) urges Congress to adopt H.R. 340 or similar legislation which would:

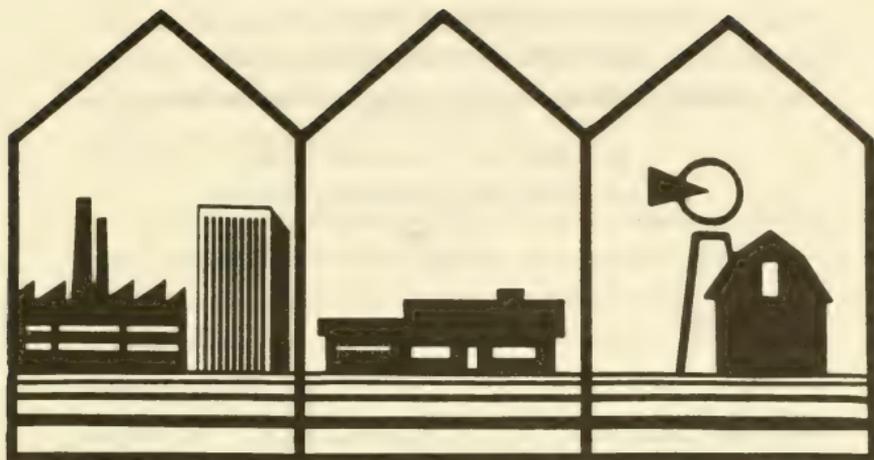

a) provide clear authority to federal, state and local officials, to enforce water pollution programs at federal facilities;

b) subject federal agencies and federal facilities to the same accountability, procedural, and substantive enforcement provisions and reasonable service charges that apply to state and local governments and private industry; and

c) enhance proper water pollution control practices at federal facilities in the future by ensuring that federal agencies comply with federal, state and local water pollution laws; and

2) authorizes the NAAG Environment Legislative Subcommittee to represent the views of the Association on this matter before the Congress and federal agencies.

3) authorizes the Executive Director and General Counsel to transmit this resolution to the President and EPA Administrator Carol Browner and appropriate members of her staff; Secretary Les Aspin of the Department of Defense; Secretary Hazel O'Leary of the Department of Energy; Congress; and other interested associations.

Statement of the  
NATIONAL ASSOCIATION OF REALTORS®

STATEMENT OF  
THE NATIONAL ASSOCIATION OF REALTORS®  
SUBMITTED TO THE HOUSE COMMITTEE ON PUBLIC WORKS AND  
TRANSPORTATION  
SUBCOMMITTEE ON WATER RESOURCES  
THE REAUTHORIZATION OF THE CLEAN WATER ACT  
MAY, 1993

INTRODUCTION

Thank you for the opportunity to submit the NATIONAL ASSOCIATION OF REALTORS® comments for the record, on the federal Clean Water Act. The NATIONAL ASSOCIATION OF REALTORS®, comprised of nearly 750,000 members involved in all aspects of the real estate industry, has a keen interest in the Clean Water Act.

The association believes that development should be encouraged, as it is a stimulus to the economy, increases the tax base, provides places to live and work, and offers quality of life opportunities that would not otherwise exist. However, we also realize the responsibility we have to educate and work with local, state, and federal government officials to develop responsible growth planning that is equitable and considers the divergent needs of transportation, housing, agriculture, commercial, industrial, and environmental concerns. With that in mind, it is very important to note that our nation will not grow without the proper highway and water infrastructure.

From the start, we cannot stress enough the need to rectify the current wetlands dilemma. The association strongly supports, H.R. 1330, introduced by Reps. James Hayes, (D-LA) and Tom Ridge (R-PA), which would provide for classification of wetlands prioritized by function and value.

set up a "one-stop shopping" permit system, allow for mitigation banking and provide for public comment and notification of wetlands designations to affected property owners. And most importantly, it provides for just compensation to property owners when their land is taken as the result of a wetlands permit denial.

The NATIONAL ASSOCIATION OF REALTORS® supports passage of legislation which includes: a standardized wetlands definition applicable to all federal agencies and which requires reasonable and sufficient evidence of each wetland indicator (hydrophytic vegetation, hydric soils and hydrology); a clearly defined, expeditious and streamlined permitting process which allows those seeking permits to make application to and receive a response from a single federal agency; the creation of a priority wetlands ranking system, which provides for protection of ecologically significant wetlands but allows permits to be issued in the case of wetlands of lesser environmental importance; a requirement that all local authorities and affected property owners be notified of wetlands inventories to be conducted in their states and of proposed wetland jurisdictional determinations; and the use of wetlands mitigation banking as an alternative to the prohibition of use of wetlands.

Similarly, water resource management which seeks to protect and enhance recreation and aquatic life must also consider residential, commercial, industrial, agricultural and municipal usage. Federal water pollution control programs must balance the need to preserve the ecological integrity of water bodies with the economic interests of landowners and industry and with existing state law and interstate water compacts which have traditionally regulated water usage.

NAR COMMENTS AS THEY RELATE TO IDENTIFYING AND DELINEATING  
JURISDICTIONAL WETLANDS

The NATIONAL ASSOCIATION OF REALTORS® understands that both the U.S. Corps of Engineers and the U.S. Environmental Protection Agency, (EPA) are currently using the 1987 Manual to identify and delineate wetlands. With that in mind, the following comments are directed toward implementation of a program that will address our nation's environmental and economic needs with regard to wetlands, as defined by the National Academy of Sciences study.

As the industry which assists in making the American dream of owning a home become a reality, we are aware of the critical role of environment in preserving America's quality of life, and we want to make certain that those lands that are truly wetlands continue to remain as such. Wetlands not only play a major role in our environment, but they are also an incentive utilized by our membership because they increase property values and encourage and enhance both the ownership of environmentally sensitive lands as well as stewardship of these important lands for our nation.

NAR RECOMMENDS THAT HYDROPHYTIC VEGETATION, HYDRIC SOILS  
AND HYDROLOGY BE UTILIZED WHEN DELINEATING A WETLAND

The association supports a policy of adoption of a standardized definition for wetlands identification that would require the affirmative presence of all three customary

parameters (hydrophytic vegetation, hydric soils and hydrology) in delineation of a wetland. While these parameters have been listed in the past, wetlands have often been identified by identifying the presence of one of the three parameters and inferring the presence of the other two.

NAR BELIEVES THAT LAND MUST NOT BE PRESUMED TO BE A WETLAND. IT MUST BE PROVEN TO BE A WETLAND

Previously, wetlands delineations were made using the presumption that land is a wetland, unless it can be proven otherwise. With that in mind, we believe that the 1987 Manual, is correct in that, it requires that the land is presumed to be a non-wetland until it is proven that the land in question is indeed a wetland.

NAR IS SUPPORTIVE OF WATER BEING PRESENT IN ORDER TO DELINEATE A WETLAND

It is imperative that if land is to be delineated as a wetland, strong evidence of water must be present.

NAR CONSIDERS PUBLIC INPUT AND AN APPEAL PROCESS IMPERATIVE IN DETERMINING THE PROPER WAY TO DELINEATE A WETLAND

It is crucial that public input be gathered on any and all issues that determine the overall land use policy for the nation. In addition to comments, we would recommend

that the government seek public input through public meetings, open forums, and utilizing groups that may have had first hand knowledge in the development of projects having to do with the issue at hand. The manual which will determine the way land is delineated is a major concern of the REALTORS®.

**GENERAL COMMENTS AND RECOMMENDATIONS NEEDED FOR A SOLUTION TO THE WETLANDS DILEMMA**

o NAR is supportive of a clearly defined permitting process. To achieve this we urge adoption of a "one-stop shopping" concept, allowing property to owners to apply to and receive a permit to use wetlands from a single, federal agency. While the proposed changes have made great strides to correct the problems associated with the 1989 Manual, we are still supportive of allowing one agency to administer the program. Regardless of whether or not our recommendation is adopted, we would urge that the government consider developing a checklist or booklet from the approving governmental authority outlining what permits are necessary, what the purposes are, who does the processing, what the processing time is and the estimated fee schedule.

o NAR supports a policy which will provide for a classification system for wetlands. We agree that the most environmentally sensitive and useful wetlands should be protected because they serve vital ecological functions, such as flood control, habitat spawning areas. . . and the like. However, the current federal policy lacks the flexibility to differentiate between vital ecological wetlands and lands which serve a

- marginal environmental purpose.
- o NAR is supportive of a legislative/regulatory solution which would include some form of prioritization or ranking so that we can protect the most valuable of our wetlands, while allowing private landowners of less ecologically sensitive properties the right to develop lands as they see fit, within local planning and zoning parameters.
  - o NAR believes that man-made wet areas, such as ditches, culverts, ponds, waste lagoons, and the like that were intentionally or accidentally created where non-wetlands once existed should be exempt from wetlands regulation.
  - o NAR recommends that all governmental entities involved and private property owners be notified of any wetlands delineations. In addition, we believe that a regulatory process needs to be implemented allowing citizens the right to challenge the appropriateness of wetlands delineations.
  - o NAR recognizes the vital necessity of professional competency to meet the challenges of real estate practice in an increasingly sophisticated and complex society. Professionalism in real estate through education and training is one of the primary objectives of the association. We encourage the government to work with our association to promote public awareness of the value of wetlands. In turn, with our many local boards and state associations, the REALTORS® can provide the government with information as to how the regulation will impact real property owners. With that in mind, we would also like to recommend that the government,

as well as the EPA and the U.S. Army Corps of Engineers, perform field testing in areas of the country where our membership can be of service to the government.

#### PRIVATE PROPERTY RIGHTS

NAR's concerns extend beyond the immediate interests of the real estate industry. Because over seventy percent of our nation's wetlands are owned by private citizens, we also wish to direct attention to the larger issue of protecting private property rights.

The NATIONAL ASSOCIATION OF REALTORS® has worked for years to encourage a balanced approach to environmental protection that accommodates the important needs for both conservation as well as economic opportunity and vitality. To balance the efforts of government to serve the public well being by controlling pollution and protecting natural resources with the economic and property rights secured by the Constitution, we believe that the cost of the benefits to the general public achieved by such regulation should be borne by the beneficiaries--the general public. We oppose those aspects of environmental and natural resource legislation that amount to uncompensated condemnation of private property through government action. It is essential that the rights of private property owners be fully recognized in local, state, and federal programs and laws.

In this context, the NATIONAL ASSOCIATION OF REALTORS® believes that Federal wetlands regulation should expressly recognize that the application of wetlands permitting requirements may result in a "taking" of property within the meaning of the Fifth Amendment's Just Compensation clause, which requires compensation to be paid to the affected property owner. This is evident from decisions of the United States Claims Court in Loveladies Harbor Inc. v. the United

States, Florida Rock Industries v. United States, and Formanek v. United States. In each of these cases the court held the Army Corps of Engineers' denial of a permit to place fill on wetlands so affected the owner's property interest as to result in a "taking", and awarded the just compensation mandated by the Fifth Amendment. Indeed, the plaintiff in the Loveladies case has been involved in litigation for eleven years, and his travails continue as that case awaits decision by the Court of Appeals for the Federal Circuit. Moreover, the Supreme Court's recent decision in Lucas v. South Carolina Coastal Council reaffirmed the vitality of the protection of property rights provided by the Fifth Amendment by establishing what the Court termed a "categorical" rule requiring compensation when all economically viable use of a property is eliminated. The Court also made it clear that compensation is a Constitutional requirement except in those rare cases where regulation merely implements limitations on use of the property already imposed by the common law of nuisance or property.

To prevent other property owners from similarly becoming embroiled in years of litigation and spending the huge sums of money necessary to do so, federal wetlands regulation should require the regulating agency to expressly consider the implications of permit denials on private property rights. In particular, the law should require that any wholesale denial of use be carefully analyzed to determine the extent of compensation to be provided to the affected property owner. In a few cases, such analysis may determine that the action falls within the very narrowly conscribed circumstances suggested by Lucas, where the government need not provide compensation because the proposed use would constitute a common law nuisance. Perhaps just as importantly, federal wetlands regulatory legislation should require that complete denials of use be clearly justified and imposed only where the affected area is of such extreme ecological significance and vulnerability as to justify such draconian action. Regulation should require the regulator to permit beneficial uses of wetlands which

do not present a real and significant threat to substantial public interests. Preservation of important wetlands can also be accomplished by providing financial incentives for property owners to leave wetlands on their land undisturbed. This would also relieve builders, for example, from unfairly bearing the cost of environmental improvement or protection, which cost is in any event generally passed on to homebuyers.

The NATIONAL ASSOCIATION OF REALTORS® strongly believes that federal wetlands regulation of this nature is necessary to preserve the fundamental right of all private property owners, working through local governments, to determine and enjoy the highest and best use of their land. To be sure, NAR recognizes that the application of some restrictions on property use serves the interests of all, but NAR believe that all citizens have the right to acquire and use real property with the confidence and certainty that the value of their property will not be unduly diminished or jeopardized by governmental action at any level without the owner's express consent.

It is important to note that our Association supports H.R. 385, which was introduced by Rep. Gerald Solomon. This legislation requires federal agencies to establish procedures to assess whether a pending rule or regulation may result in the taking of private property. It would also require agencies to avoid takings wherever possible.

#### WATER RIGHTS

The central question to a debate of this issue is simply stated: What is the proper federal role in water resource management? The NATIONAL ASSOCIATION OF REALTORS® opposes water allocation legislation at the federal level which supersedes state law and interstate

water compacts and which may result in "takings" of water property rights without compensation.

Water demands vary from state to state. Congress has traditionally deferred to the responsibility and expertise of the states for the allocation, administration, and use of water for residential, commercial, industrial, agricultural, municipal, recreational and aquatic life purposes. As a result, states have chosen their own water law systems in order to secure a stable and clean water supply to provide for sufficient food, drinking water, economic productivity, recreation and aquatic life. An extensive intrastate and interstate water supply infrastructure has been established based upon these state water law principles.

We are concerned that federal initiatives to expand existing water pollution control programs in order to protect the ecological integrity of water bodies may go far beyond what is necessary to meet water quality needs. Overly restrictive requirements might impose economic burdens on landowners and industry - perhaps without significantly improving water quality - and in the process erode traditional state authority to determine land and water usage.

We are also concerned about excessive federal regulatory enforcement of the Clean Water Act which goes beyond the spirit and intent of the law. Overzealousness by the EPA with regard to more stringent standards and enforcement have made it increasingly difficult for utility providers (i.e., towns and private utility companies) to reach the required standards, leading to excessively high water, sewer and impact fees and a general "no growth" climate. Farmers are prohibited from using and tending their land with proper farming, draining, and - in some cases - dredging procedures. Property owners are prevented from reclaiming land that is washed away by storms. Regulatory standards and enforcement must be reasonable in order to

accommodate economic growth and allow property owners to reasonably use their land.

### INFRASTRUCTURE

Throughout his campaign, President Clinton stressed the need to increase spending on infrastructure as a means to stimulate the economy and help improve the productivity of the American worker. In recent years, the EPA has been tightening water quality standards at a time when financing for state and local governments to comply with the tightened regulations has been cut. Local communities have increasingly been raising the water bills of existing customers and imposing impact fees on developers, making them foot the bill for new water/sewer hookups. The developers, in turn, tack the fees on to the cost of new housing, making it less affordable. The president recognized this dilemma and has proposed a new Safe Drinking Water revolving fund to help communities address these fundamental public health needs.

The EPA has estimated that we would have to spend over \$150 billion over the next twenty years just to meet current requirements. Yet, as you know, federal funding of sewer construction is scheduled to expire completely in FY1994. At that time, all funding of new sewer construction will have to come from states and local governments, many of which are in worse financial shape than the federal government. Unavailability of financing for construction of new systems or rehabilitation of older sewer systems to expand their capacity will have a serious impact on new home construction and on the affordability of existing housing.

The NATIONAL ASSOCIATION OF REALTORS® supports the resuscitation of the federal construction grants program for sewer construction and continued federal capitalization of

existing State Revolving Loan Funds (SRFs) for sewer construction beyond the proposed expiration of funding in fiscal year 1994. We also support the easing of tax and regulatory barriers to facilitate the use of public/private partnerships to fund water supply and sewer construction projects.

### CONCLUSION

NAR believes properly conducted programs of land preservation and historic preservation which attempt to protect aquifers, agricultural lands, wetlands, scenic vistas, natural areas, historic properties and open space may have a positive effect on the quality of life in towns, counties and municipalities. However, in establishing land use laws and regulations for the purpose of protecting these resources, the cost of the benefits of these programs to enhance our nation's resources should be paid for by the general public. Therefore, we believe that financial incentives should be developed for the protection of wetlands.

Current government real property acquisition practices have resulted in excessive amounts of private property being placed in the government estate. Federal property acquisition agencies have been authorized by Congress to acquire private property for parks, national forests, refuges and for other purposes, but have not been provided with the resources to promptly compensate landowners or adequately manage acquired lands.

The Fifth Amendment of the United States Constitution states that private property [shall not] be taken for public use without just compensation. This premise was one of the fundamental building tenets of our nation and, it should remain so today. However, as a result of federal agencies' interpretations of the Federal Manual for Identifying and Delineating Jurisdictional Wetlands, many

lands that are of marginal ecologic value have been incorporated into the wetlands system, often eliminating or seriously impacting the economic viability of any uses of such lands. This, in turn, is having a negative impact upon housing affordability and the economy.

The NATIONAL ASSOCIATION OF REALTORS® and the nation support a wetlands policy that is environmentally sensitive, yet allows our nation to be economically competitive. The Comprehensive Wetlands Conservation and Management Act of 1991, H.R. 1330 will provide this nation with a law that protects those lands that need to be protected, while allowing our citizens to retain their Fifth Amendment rights of just compensation, under the Constitution. We urge your support of this legislation and the concepts it embodies.

Thank you for the opportunity to express our views.

**STATEMENT OF THE NATIONAL REALTY COMMITTEE  
TO THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
U.S. HOUSE OF REPRESENTATIVES  
REGARDING  
REAUTHORIZATION OF THE CLEAN WATER ACT**

May 12, 1993

The National Realty Committee appreciates this opportunity to provide written comments on the reauthorization of the Clean Water Act. The National Realty Committee serves as Real Estate's Roundtable for national issues of vital interest to the real estate industry. NRC members are America's leading real estate owners, advisors, builders, investors, lenders, and managers.

The National Realty Committee supports the continued improvement of water quality throughout the nation's water bodies. Over the past twenty years, the Clean Water Act has facilitated significant progress in controlling water pollution, primarily from point source discharges. EPA is now focusing on nonpoint source discharges. Because nonpoint source discharges are based upon specific watershed conditions and precipitation, they are difficult to predict and assess. Although studies have been conducted, the extent and nature of stormwater pollution is unknown. However, it is known that the cost of stormwater pollution control can easily eclipse total expenditures made over the past 20 years to control point sources. Amendments to the Clean Water Act should ensure that the nation's resources are applied to known and valid nonpoint sources water quality problems. They should recognize the need to address these problems on a regional and watershed basis.

Of the many priorities being discussed during the Clean Water Act debate, the municipal stormwater control program and wetland protection program are the National Realty Committee's primary concerns.

## STORMWATER

Section 402(p) of the Clean Water Act established a separate NPDES permit program for municipal storm sewer discharges. In 1987 Congress required a simplified permit program applicable only to cities larger than 100,000 in population. The experience gained during this program was to determine a more comprehensive program to be developed when Congress again reauthorized the Act. However, EPA was late promulgating regulations, which are arguably much broader than originally intended by Congress, including the requirement that construction activities be regulated as an industrial activity. These factors have made it difficult to objectively review the program and determine the best course of action for this reauthorization process.

Our major concerns with the stormwater program are: a general lack of understanding of the specific water quality problems associated with stormwater, and the cost of addressing this undefined problem which will easily eclipse the total expenditures of the past 20 years to control point source discharges.

1. The extent and nature of stormwater pollution is unknown: Despite congressional intent to evaluate a limited stormwater program over the past five years and devise a reasonable program for the future based upon that experience, few communities have actually even obtained a permit. Therefore, Congress will have no history of experience to consider when amending the stormwater control program during reauthorization of the Clean Water Act. Even the Environmental Protection Agency (EPA) admits that the degree to which stormwater discharges are currently regulated in relation to the level of impairment reported is not readily apparent. EPA bases its assertion that stormwater is a major contributor to the remaining water quality problems, on data collected as long as 20 years ago. Since that time, secondary treatment and pretreatment controls have been imposed and illicit hookups have been identified and prohibited. In addition, EPA has taken separate action to control other pollutants affecting stormwater. Lead, which has been banned in gasoline, will certainly result in reductions of lead levels in stormwater.
2. Cost: The cost of stormwater pollution control can easily eclipse total expenditures made over the past 20 years to control point source discharges. The current program is divided into two parts, with permitted communities currently undertaking Part 1. Activities under Part 1 include describing current circumstances, conducting field screening, and developing a control program for Part 2. The American Public Works Association (APWA) of Southern California completed a study in May 1992 entitled "A Study of Nationwide Costs to Implement Municipal Stormwater Best Management Practices." This study surveyed 100 communities and found that the average cost for a Part 1 application was \$332,000. (EPA estimated a maximum cost of \$77,000.) Part 2 costs will be significantly higher as specific programs to control discharges to the maximum extent practicable are implemented. APWA estimates that those costs could range nationwide, depending on the level of control required, from a minimum of \$147 million for capital expenditures and \$1 billion in annual operation and maintenance to over \$406 billion in capital expenditures and \$542 billion for annual operation and maintenance.

Considering the lack of accurate data, the enormous potential cost, and the ambiguous objectives of the current program, the National Realty Committee urges the Committee to adopt the following concepts in amendments to Section 402(p):

1. Regulate stormwater discharges under new nonpoint source provisions rather than under the National Pollutant Discharge Elimination System (NPDES). Stormwater discharges should be removed from NPDES where attainment of water quality standards is mandated. The nature of stormwater discharges is significantly different from point source discharges. For point source discharges attaining numeric effluent limits is possible because flows can be predicted and loadings captured and treated. Stormwater flows, on the other hand, vary with each storm event and by geographic location. This requires a technology-based standard rather than the water-quality based standard of NPDES. Stormwater permits should be permanent, allowing for necessary modification, rather than renewable every five years as is required for NPDES permits.
2. Establish that stormwater permit requirements will be reasonable and technology-based. This is consistent with control strategies employed for other pollutants and will ensure the most cost-effective application of scarce financial resources. This would require that best management practices be applied only to the maximum extent practicable (MEP). MEP should be defined in the statute in terms of technical feasibility, cost/performance, and economically achievable measures:
  - The "cost/performance" relationships should evaluate the increment of pollution reduction achieved as compared to the increase in capital and operation costs. This type of analysis has been used by EPA and individual states for over 15 years in the development of point source treatment requirements and effluent limitation for wet weather flows. The cost/performance relationship also should consider the aggregate water quality improvement and associated costs for all water quality projects implemented within a watershed. The cumulative costs can be significant as programs are implemented by industries, municipal wastewater treatment agencies, mining companies, agricultural enterprises, and other entities that may affect water quality.
  - The "maximum extent practicable" test should consider economically achievable measures. The test for "economically achievable measures" should consider stormwater project costs per household and the cumulative impact on the household when the stormwater project cost is combined with debt service, operation costs, and user fees for other public services. EPA has employed similar tests in CSO guidance and in the CERCLA program.

3. Establish a watershed master plan approach rather than a project-by-project approach to nonpoint source water pollution. Require identification of specific nonpoint source water quality problems and a watershed application of BMPs to address those problems. Some states have already established regional water quality control boards based on watersheds and are in a position to effectively address these problems on a watershed basis.
4. Establish an interactive stormwater control program which requires that "obvious" problems will be addressed first. This will ensure that resources and efforts are expended on the most immediate problems. Initial controls should be limited to level one BMPs identified in the APWA study:

- Illicit discharge monitoring and control programs
- Litter control ordinances
- Animal waste control ordinances
- Chemical use and spill prevention ordinances
- Vacant lot cleanup ordinances
- Recycling programs
- Public education programs
- Street sweeping programs
- Increased maintenance of existing storm drains
- Erosion and sediment control programs
- Removal of abandoned vehicles

Second, the existing water quality database should be updated to represent more recent data since implementation of other programs, such as secondary treatment and elimination of illicit discharges. Third, using the new database, the range of stormwater pollution control measures should be evaluated to determine the technically and economically feasible methods that would lead to cost-effective water quality improvements. Fourth, the stormwater pollution controls should be implemented in phases to ensure coordination with other water quality objectives and implementation of reasonable and cost-effective controls.

5. Municipalities should be able to combine all industrial permits for sites owned and/or operated by the municipality into the jurisdiction-wide program. In addition, construction activities should be excluded from consideration as an "industrial activity." Construction should be regulated as part of the jurisdiction-wide program. This minimizes duplication of efforts and integrates construction activities into the community's comprehensive strategy to control stormwater.
6. Clarify that the prohibition of non-stormwater discharges into a system is intended to prohibit illicit connections and does not include flows that are normally associated with storm drainage systems, such as runoff from landscape irrigation, groundwater seepage, and fire hydrant flushing. This clarification will eliminate the need to develop a separate permit program for these flows which are inherent to all storm drainage systems.

## **WETLANDS**

Federal government efforts to protect the nation's wetlands have become increasingly controversial as "wetlands" have been defined to include areas not previously considered as wetlands, and the regulatory process has grown more complex and subjective. Of particular concern to the real estate community are seasonal "isolated wetlands," those which are not "adjacent" to another "water of the United States" such as a lake or river. Isolated wetlands create problems for real estate developments throughout the nation since they are much more difficult to avoid in the land planning process than adjacent wetlands, which are frequently within floodplains. To be specific, NRC strongly supports the conservation and protection of ecologically valuable land, including wetlands. However, we question both the environmental and economic wisdom of aggressively protecting areas that have minimal or no wetland characteristics or value.

The problems associated with seasonal isolated wetlands are often exacerbated by their relative "dryness" compared to perennial wetlands. Detection is often difficult, and investments are frequently made without knowledge of the extent of such wetlands. Further, regulations regarding isolated wetlands were not promulgated until late 1984, and many landowners have already unwittingly invested in land constrained by such features. We request that any legislation put forth by the Committee address this concern.

The National Realty Committee recommends the following changes in the Section 404 program to protect valuable wetlands while more effectively administering the regulatory program:

1. Allow for replacement and enhancement of wetlands. Clearly, many wetland areas should not be altered at all. However, others can be responsibly altered and the impact mitigated by replacement or enhancement of wetlands. Such actions can actually result in increased environmental values. Mitigation banking should be encouraged in legislation to promote comprehensive wetland protection and enhancement instead of piecemeal avoidance of wetland areas regardless of their quality and environmental value. Recent projects demonstrate that wetlands can be successfully created, and we will be happy to provide specific examples to the Committee.
2. Eliminate the "sequencing" requirement which prohibits the Corps from considering mitigation until avoidance of all impacts and all "practicable alternatives" have been exhausted. This requirement is unnecessarily costly, time consuming, and prevents the consideration of mitigation projects which would provide a net increase in wetland area and values.
3. Definite mitigation standards should be established to replace the subjective mitigation requirements currently employed. Permit applicants must have greater certainty in understanding their obligations to mitigate wetland losses. A reasonable standard should be expressly provided. This would eliminate the excessive demands of resource agencies which are frequently required in the absence of any criteria or standards.

4. Evaluate wetlands by region and value. Differences in regional climatic and habitat conditions require different criteria for determining what is a wetland and what habitat objectives should be pursued. The current use of a uniform nationwide wetland delineation program should be discontinued in favor of a regional approach. Wetlands should be categorized according to value with respect to an overall habitat and the degree of regulation should vary according to that habitat's value. Wetlands of marginal benefit to habitat conservation should not be subject to the same level of review as pristine wetland areas which provide great benefit.
5. The regulatory framework of the Section 404 program should be revised to avoid duplication with state regulations and unnecessary commitment of regulatory resources on minor permits. Delegation of the program to state governments should be encouraged.
6. The present multiple agency approach with conflicting policies and authority should be eliminated and replaced with a program comparable to the Coastal Zone Management Act which will lead to state certification and administration of the program.

#### LAND-USE AUTHORITY

NRC strongly believes that the Clean Water Act in general should preserve the authority of local governments to determine land use. The intent of the Clean Water Act is to provide guidance for controlling water pollution, not to empower federal agencies or the states to conduct project-specific reviews of land uses. The Clean Air Act contains a provision expressly clarifying that nothing in the Act constitutes an infringement on local land use authority. This language specifically prohibits the use of federal environmental regulation as a mechanism by special interests to influence local land use decisions. Because of the potential for such infringement, particularly with a more aggressive control program for nonpoint sources, the Clean Water Act should include such a provision.

We appreciate this opportunity to comment and look forward to working with the Committee to develop balanced and effective programs for stormwater control and wetland protection.

April 29, 1993

RECEIVED

93 APR 30 AM 11: 08

COMMITTEE ON PUBLIC WORKS  
AND TRANSPORTATION

The Honorable Douglas Applegate  
Committee on Public Works and Transportation  
Rayburn House Office Building  
U.S. House of Representatives  
Washington, D.C. 20515

Representative Applegate,

As representatives of faith groups who share a concern for the care of creation, we write to you to formally comment on the pending reauthorization of the Clean Water Act (CWA). We ask that these comments be made part of the formal hearing record on the CWA reauthorization.

As you know, in 1972 the Congress enacted the Federal Water Pollution Control Act which stated: "The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters (Section 101 (a))." In order to accomplish this objective the Act set six major goals, including the prohibition of "the discharge of toxic pollutants in toxic amounts" and the goal of "water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water."

More than twenty years later, these goals have yet to be realized. By the Environmental Protection Agency's own assessment (1990 National Water Quality Inventory), one-third of the rivers, half the estuaries, and more than one-half of the lakes in the nation do not meet their designated uses, which range from recreation to habitat protection.

There are many reasons why we support a stronger Clean Water Act. Our varied faith traditions all support the belief that the earth is God's and that we are stewards of God's creation. Stemming from this understanding, we embrace the concepts of sustainability and justice for all of God's creation. Thus, we support legislation that will promote sustainable use of creation and legislation that provides for the health and welfare of all beings.

There is much to be done before we can meet these goals, but a strengthened Clean Water Act is one step in that direction. A strong Clean Water Act would:

- provide adequate protection for the remaining wetlands, which 43% of all species that are currently listed by the federal government as threatened or endangered depend upon for at least a portion of their lifecycle (Endangered Species Endangered Wetlands: Life on the Edge, National Wildlife Federation, September, 1992);
- clean unsafe swimming areas and would provide adequate information to people when it is unsafe to enter the water;
- help maintain declining stocks of Pacific Northwest salmonids, where 86 stocks are currently considered at risk of extinction (Willa Nelson, et al., Pacific Salmon at the Crossroads: Stocks at Risk from California, Oregon, Idaho, and Washington, Fisheries, March-April 1991);
- protect our water supplies and help ensure that such outbreaks as the recent cryptosporidia-caused diseases in Milwaukee are not recurring events (The Centers for Disease Control have identified 525 disease outbreaks during the first 16 years after the enactment of the Clean Water Act. The most recent outbreak in Milwaukee is estimated to have affected at least 183,000 people and may be linked to as many as six deaths.);

- reduce the threats from floods in a cost-effective manner by reducing the causes of those floods while at the same time providing riparian habitat, green space, and recreational value;
- safeguard the nation's rich shellfish and seafood ecosystems, which support large commercial, tribal, and recreational values;
- extend protection to subsistence fishers, whether tribes who historically rely on fisheries resources or low-income people who harvest seafood from polluted waters in order to provide a food source;
- and provide jobs for unemployed workers and youth in rural areas such as formerly timber-dependent towns in the Pacific Northwest and urban areas such as Washington D.C. and Los Angeles through the design and construction of treatment works, reforestation of riparian habitat, removing migration barriers, protecting and restoring wetland areas, installing recreational access points and pathways, and replacing large engineered projects with natural flood control mechanisms which also provide ecological value.

These are a number of the reasons why we support reauthorizing and strengthening the Clean Water Act during the 103rd Congress.

Thank you for allowing us the opportunity to provide input into the reauthorization process. We look forward to working with you and the committee to ensure that the many values our water bodies provide are protected in a strong Clean Water Act.

Sincerely,

American Baptist Churches, USA

Homeland Ministries, Christian Churches (Disciples of Christ)

General Manager**

**SANTA CLARA VALLEY WATER DISTRICT**

**June 4, 1993**

**Before the**

**UNITED STATES HOUSE OF REPRESENTATIVES  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT OF THE  
PUBLIC WORKS AND TRANSPORTATION COMMITTEE**

**THE HONORABLE DOUGLAS APPEGATE  
CHAIRMAN**

**Regarding**

**REAUTHORIZATION OF THE FEDERAL  
WATER POLLUTION CONTROL ACT**

**STATEMENT****OF****Ronald R. Esau  
General Manager  
Santa Clara Valley Water District****June 4, 1993**

On behalf of the Santa Clara Valley Water District, I want to thank the Subcommittee for this opportunity to present our testimony. The District and the City of San Jose are the local sponsors for a wastewater reuse and treatment technology program in San Jose, California, which this Committee included for authorization in the Water Resources Development Act of 1992 (P.L. 102-580). Specifically, we are looking to build on that authorization by including funding authority for the rest of the San Jose wastewater reuse and treatment technology program.

**INTRODUCTION**

The Santa Clara Valley Water District (District) is located in San Jose, California, and has responsibilities for both water supply and flood control for all of Santa Clara County. The District was formed in 1929 and currently supplies water to more than one and one-half million residents, numerous businesses, industries, and agricultural interests of Santa Clara County. The highly urbanized northern portion of the County is known as "Silicon Valley" because of the vast computer industry that has developed there and provides employment for over 6 percent of the state's work force. In contrast, the southern portion of the County is primarily agricultural but is rapidly becoming urbanized and increasing in population. The District, in addition to managing three large groundwater subbasins and ten local reservoirs, holds contracts for the importation of water from the California State Water Project (SWP) and the San Felipe Division of the Federal Central Valley Project (CVP). Imported water from the City and County of San Francisco's Hetch Hetchy System also serves a portion of the District.

California, and Santa Clara County in particular, is now recovering from six consecutive years of drought. Nothing in recent history has reminded us more dramatically of the vulnerability of our water supply reliability than this event. The District has been severely impacted over the last several years by significantly reduced local water supplies, by deficiencies in its imported water supply entitlements from the CVP, and by reductions in its imported water supply from the SWP, and other imported water resources as well. Water conservation was first placed in effect in Santa Clara County in 1988 on a voluntary basis but became mandatory in 1989 and continued in place through 1992. With the recent rains, snow, and above-normal runoff, water conservation has once again become voluntary. Even with mandatory conservation levels, the District was required to supplement its limited imported supplies by purchasing over 125,000 acre-feet from the water market during the drought period. However, we believe that future drought conditions, coupled with new federal and state regulatory constraints on our imported supplies, will degrade our area's water supply reliability over the long term. With the passage of the 1992 Central Valley Project Improvement Act and pending San Francisco Bay-Sacramento-San Joaquin Delta water quality standards, the District is faced with significant long-term reductions in its contractual entitlement for imported water. Thus, we must aggressively develop and maximize the availability of our local water resources toward enhanced water supply reliability. This challenge in the Santa Clara Valley area is bolstered by the threat of potential loss of jobs associated with lost business

opportunities and reduction in industrial production associated with long-term water supply shortages of 30 percent or more.

As part of the District's 1992 Water Supply Overview Study, wastewater reclamation was identified as a potential highly reliable source of supply. The anticipated supply of reclaimed water, which has now been estimated to be 32,000 acre-feet per year countywide, has essentially not yet been developed. Less than 1,000 acre-feet per year is currently being used, much of which is being delivered by trucks. While the District contemplates alternatives for long-term water supply options, the City of San Jose (City) is also being requested by the San Francisco Bay Regional Water Quality Control Board to limit the effluent discharging from its San Jose/Santa Clara Water Pollution Control Plant into San Francisco Bay because of the loss and degradation of habitat for federally designated endangered species, and degradation of the Bay's water quality due to heavy metal discharges, as defined in the federal Clean Water Act. Accordingly, the District and the City have joined forces to initiate a wastewater and treatment technology program for the County, which was authorized by Congress through this Committee for federal assistance last year in the Water Resources Development Act of 1992. The joint program between the local sponsors (the District and the City) and United States Environmental Protection Agency (USEPA) will fulfill two objectives: to reduce wastewater discharge into San Francisco Bay and to provide an additional long-term water supply.

### WASTEWATER REUSE PROGRAM

We believe, and Congress has agreed, that the San Francisco Bay is a resource which must be protected and for which there is a federal interest in maintaining in order to protect the fragile ecosystem in the Bay. In addition to national interest and recognition, local efforts are proceeding to maintain the integrity of the Bay, and we in Santa Clara County have made strong commitments to develop programs which not only protect the Bay by reducing wastewater discharge but will assist in improving long-term water supply reliability while not increasing dependence on importation of fresh water from the Bay's Delta estuary. Specifically, the District and the City have entered into a \$2 million cost-sharing agreement to develop a wastewater reuse and treatment program in cooperation with USEPA, which is divided into two distinct areas—a nonpotable water reuse program and a potable water reuse program. The principal reason for these distinctions are the different regulatory requirements and technical issues associated with the two uses proposed. The two areas have further been divided into phases. The agreement between the District and the City is for Phase I work on both the nonpotable and potable programs.

For Phase I of the nonpotable water program a facility plan has been completed. The facility plan consists of a market survey, analysis of the water quality requirements, and the predesign and the treatment processes and distribution system to deliver up to approximately 40-45 million gallons per day (MGD) of reclaimed water.

Last year, Congress recognized the federal interest in proceeding with the local sponsors in developing a water reuse and treatment technology program in an effort to maintain the integrity balance of San Francisco Bay, and as a result this Committee authorized this program at Section 218 of the Water Resources Development Act of 1992 (P.L. 102-580) for San Jose. The authorization provides a partnership between the federal government, the District, and the City in having USEPA provide design and construction assistance directly to the local sponsors in the development of wastewater reuse and treatment facilities for the protection of fish and wildlife in the San Francisco Bay and for critical water supply purposes. This program will have the dual benefit of providing critical environment protection to San Francisco Bay by diverting effluent to be discharged into the Bay, and reclaiming such water for public and private use while providing reclaimed water as a long-term water supply supplement. The

legislation calls for the development of an innovative nonpotable wastewater reuse treatment facility with distribution pipelines, and the development of an innovative potable water pilot plant along with a health study on the performance of the potable plant as a first step. Under a phased-in approach, once the pilot plant is operational, should USEPA and local health agencies determine that the public health requirements, water quality goals and objectives are met, and the community is not at risk by the operation of the pilot plant, USEPA would assist in the development of a potable wastewater reuse facility through design and construction assistance and the extension of distribution systems to groundwater recharge areas.

#### **REQUESTED ACTION**

What we are seeking is to complete the funding authority for the wastewater reuse and treatment program within the reauthorization of the Federal Water Pollution Control Act. The funding authority we are seeking will allow the project to proceed beyond final design and initial construction of the nonpotable reclamation facility and distribution system through completion of construction for this project. The design and construction of the program will be conducted by the local sponsors and funded through USEPA in accordance with the original authorizing legislation. The final design is based on the prior work accomplished by the sponsors including the nonpotable facility plan, the final Environmental Impact Review, and public hearing held during the process.

This funding authority will allow the design and construction for the plan to move forward on schedule bringing the project to completion as a model for other coastal areas who suffer from the twin problems of coastal water degradation and critical water supply needs. Construction of the overall program will also provide needed stimulus to stagnant local employment market. While we have dealt with these issues separately in the past, the truth is that the water quality and water quantity are interrelated and all can benefit by approaching these problems in an integrated fashion.

We urgently request that this funding authority be included in the reauthorization of the Clean Water Act, and we thank you in advance for your consideration.

# IMPLEMENTATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

## (Managing Wastewater in Coastal Urban Areas)

WEDNESDAY, JUNE 30, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER  
RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC  
WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to call, at 9:30 a.m., in room 2253, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. I guess we can get our subcommittee meeting rolling here.

And let me just say that the Congress and the Environmental Protection Agency have expressed, over some time, some frustration with the lack of progress in improving the quality of estuarine and coastal waters.

In 1989, the Congress directed the National Academy of Sciences to undertake a study to advise the EPA on opportunities to improve wastewater management policies for coastal urban areas. The study was to consider: environmental objectives, policies, and regulations; technology and management techniques; and systems analyses and design, including environmental modeling.

The National Academy of Sciences recently prepared its report. As our committee prepares to reauthorize the Clean Water Act, we are hopeful that the work of this distinguished group of engineers, scientists, and environmental policy specialists will be of assistance in our deliberations.

Our committee is especially looking forward to discussing with the witness the "Integrated Coastal Management" approach recommended in the study. This report recommends shifting the Federal role in coastal management from prescriptive mandates to partnerships with regional authorities in developing a more efficient coastal management system.

I believe our Members would rather use a partnership approach than a proscriptive approach, but our concern is finding such an alternative approach that will work.

There is likely to be some comment from the Members of the subcommittee on the EPA's implementation of the Section 301(h) of the Clean Water Act which allowed for waivers from secondary treatment. The study's view on this point will also be of interest to the committee.

And normally at this point in time we would yield to our Ranking Member; but, unfortunately, he has been called to the White House. And so we are without a Ranking Member or a Member of the other party here at all.

At this point I would like to insert Mr. Mineta's statement into the record.

[Mr. Mineta's prepared statement follows:]

STATEMENT OF HON. NORMAN MINETA, CHAIR, COMMITTEE ON PUBLIC WORKS AND  
TRANSPORTATION

Thank you Mr. Chairman.

Today, I would like to welcome the witness, William Eichbaum of the World Wildlife Fund, who is testifying on behalf of the National Academy of Sciences.

The Clean Water Act has made significant progress in improving our surface water quality. Although we should all be proud of the improvements to date, there are several areas where improvements are still critically needed. One of those areas and the subject of today's hearings is our coastal marine waters. We are looking forward to the views of the National Academy of Sciences on possible amendments to the Clean Water Act that would lead to a more effective marine protection program.

The history of the Water Pollution Control Programs in the United States should be kept in mind. Before 1972, water pollution controls were water quality based. However, this became unmanageable as our science of monitoring and identifying sources of pollution was too inadequate, too immature, and subject to endless controversy.

In 1972, Congress, believing that the water quality-based pollution control had failed to work, developed a new approach to pollution control. As a first step, the law established a technology-based standard for all municipal treatment facilities known as secondary treatment.

It was acknowledged that in some cases, secondary treatment would be too stringent and in others too weak. But there had been widespread concern that industries would shop around for locations with less stringent standards and lower compliance costs. A set technology standard for all municipalities created a level playing field to discourage shopping for pollution-friendly venues. Only in 1977, did Congress allow a narrow window for waivers under very strict conditions.

Today, there are over 9,000 secondary treatment plants, over 3,000 plants with greater than secondary treatment and almost 2,000 plants with no discharge. Only 868 communities, mostly small, do not have secondary treatment.

I am interested in the witnesses view of the secondary treatment requirement and whether waivers are appropriate again.

We look forward to your comments on this and other marine pollution issues.

Thank you.

Mr. APPELEGATE. At this time, if he so desires, I would recognize the gentleman from California, Mr. Filner.

Mr. FILNER. Thank you, Mr. Chairman. I guess it is good to be a Member of the Minority Party today and get to the White House. I want to thank you for allowing us to have this hearing. I know you had hoped to wind up the hearings earlier. And another day, I know, is an imposition on you and the staff; and I greatly appreciated the ability to consider this report and to see what relevance it has as we authorize the Clean Water Act.

I have a statement that I will just submit for the record, but let me just summarize very briefly.

From the perspective of an urban district which sits on the ocean—I come from San Diego, California—we look at the Clean Water Act as having very impressive results over the Nation but having some problems when applied directly, especially in mandates for wastewater treatment to the particular situation we and other coastal cities find ourselves in.

The Clean Water Act, for example, prescribes a very uniform and technology-based requirement for wastewater treatment. And although that might have been applicable 20 years ago, we have new advances and new understanding which would allow us, I think, to be more flexible but based on the environmental conditions and situations that each area finds itself.

For example, a key standard in defining wastewater treatment goals is BOD, Biochemical Oxygen Demand. Yet when I read the report—and I guess the witness will comment on it—when dealing with open coastal waters, the report says that the depletion of dissolved oxygen is generally not of ecological concern; and yet we are looking at that as one of the standards to judge wastewater treatment facilities.

So it is in that context in which the ICM, the Integrated Coastal Management, approach is so important because it gives us a scientific basis for moving away from the technology-based regulations to an environmental quality and flexible approach.

As the Chairman stated, it allows a partnership between Federal and regional bodies and approaches.

I do not think that the current law is flexible enough to handle situations such as that in San Diego.

I think the recommendations in the study that we are going to hear about today allows us to move in a better direction. One that is not only environmentally sound but more cost-effective and to give local communities flexibility.

No community that I know of—and that includes San Diego—wants to get around the requirements of the Clean Water Act. We don't want to waive the standards. We don't want to lower the standards. We want flexibility in meeting the standards. And I think this ICM gives us a scientific base in which to do that.

I am looking forward to hearing the testimony. And, again, I very much appreciate your providing us with this opportunity.

[Mr. Filner's prepared statement follows:]

#### STATEMENT OF CONGRESSMAN BOB FILNER

I would like to first thank the Chairman of the Water Resources Subcommittee, Congressman Applegate, for convening this hearing to discuss the recently completed National Research Council report: Managing Wastewater in Coastal Urban Areas. The Subcommittee has already held several hearings on the Clean Water Act and I appreciate his willingness to hear today's important testimony.

I think this long-awaited study will provide invaluable assistance to this Committee as we continue the process of reauthorizing the Clean Water Act.

Since its original enactment 20 years ago, the Clean Water Act has been a cornerstone in the Nation's efforts to improve water quality.

The results have been impressive, especially in our lakes and rivers. However, the results in coastal areas are more mixed. As the report states, current law does not address regional variations or allow us to respond to changing needs and improved technology.

The Clean Water Act prescribes uniform technology-based standards—regardless of their applicability to the local environmental situation. A key standard, for example, is Biochemical Oxygen Demand (BOD). Yet, when dealing with open coastal waters, the report states that "the depletion of dissolved oxygen is generally not of ecological concern."

It is in this context that the National Research Council's report and its advocacy of an Integrated Coastal Management (ICM) approach to wastewater treatment is so important. ICM gives us a scientific basis for moving away from technology-based regulations to an environmental quality-based approach. Under the ICM process, "the federal role shifts from that of prescriptive mandate to a partnership with re-

gional authorities in developing a management system that meets coastal-quality objectives."

The increase in population in coastal regions, the changing mix of land use activities, increased environmental awareness, demands for cleaner, more diverse coastal environments and significant advances in scientific understanding of coastal processes—not to mention severe budgetary constraints—all argue for a new approach to coastal environmental management. Current law does not allow us to keep pace with increasing pressures on coastal environments let alone rehabilitate already degraded environments.

I believe the recommendations of this important study provide the basis for amending the Clean Water Act in order to take into account the unique situation of coastal cities. Communities must be given the flexibility to address legitimate environmental problems in a fiscally sound manner.

I am very pleased to be a part of this hearing today and look forward to hearing the testimony.

Mr. APPLGATE. Thank you very much, Mr. Filner.

Mr. Poshard is with us. Do you have anything you would like to say, Glenn?

Mr. POSHARD. I have no opening statement, Mr. Chairman.

Mr. APPLGATE. Okay. Well, in that event, then, we will invite, to the witness table, Mr. William Eichbaum, fresh from a fishing trip. In which you caught what?

Mr. EICHBAUM. A few trout. And returned them all to the water.

Mr. APPLGATE. A few trout. Okay.

#### TESTIMONY OF WILLIAM M. EICHBAUM, ATTORNEY, WORLD WILDLIFE FUND, NATIONAL ACADEMY OF SCIENCES

Mr. EICHBAUM. Thank you very much, Mr. Chairman, Members.

I am delighted to be here today to talk about the committee's report and particularly about some of the ideas and issues that the concept of Integrated Coastal Management raises.

I won't read my prepared statement. You have that. I will just highlight a few points, just say a few words about my background because that really is important to my thinking about these issues.

I have been with the World Wildlife Fund as the Vice President for International Environmental Quality for about three-and-a-half years. But prior to that, I spent about 20 years working in government and environmental protection efforts. And as you were speaking, Mr. Chairman, I was embarrassed to think I actually go back to before there was a Clean Water Act, in its modern form at least.

In that 20 years, I have spent two, 1987 to 1989, working in Massachusetts, the Executive Office of Environmental Affairs, which is fairly directly involved with some of the Boston Harbor issues.

Before that, I spent seven years as the Assistant Secretary for Environmental Programs in Maryland, very involved with all of the work on the Chesapeake Bay. And a lot of that experience is what informs some of the ideas about Integrated Coastal Management.

Prior to that, I worked at the Department of Interior for a few years and then for seven years, from 1970 to 1977, as the Deputy Secretary for Enforcement in the Pennsylvania Department of Environmental Resources.

So I have wrestled personally and professionally and firsthand with a lot of these issues of how do we get clean water; and we aren't there yet, as our committee's report concludes.

The committee's report was focused on coastal problems, and it was focused on those which arise out of urban settings. But many

of the conclusions are more widely applicable. And I think that is important to the consideration that this committee and the Congress is giving now to the reauthorization of the Clean Water Act.

I want to say a few things about what Integrated Coastal Management is. Then I want to say a few things about why it might work now and essentially its analog prior to 1972 did not work. And then I would be happy to answer any questions and get into greater detail.

The concept of Integrated Coastal Management basically is an iterative, continuing planning process. The idea is that it is useful in complex situations where there are perhaps a great—there is a great deal of uncertainty and there are perhaps very expensive choices that need to be made about control strategies.

It is a process which is based on the idea of trying to understand the ecological setting in which problems are being addressed, the ecological importance of sources, and of effects of pollutants and activities, and then understanding cost-effective and implementable management options with respect to those sources and effects of pollutants.

It basically is an iterative, step-wise process which begins with problem definition, taking into account both scientific information as well as human values and expectations. I think that is an important point. We believe what people want is an important factor in the planning process.

It then suggests that that analysis of problems will begin to define an area of concern. And this is an important concept. I think too often we tend to manage our ecological resources by some, either political or arbitrary, definition of a geographic area of concern.

I am always amused that the coastal zone tends to end at the county boundary line that lies along the coast. Or I remember defining, would we draw the line at Interstate-95? Those kinds of considerations have nothing to do with the environment. And so you, based on problem definition, begin to get into an ecological definition of your area of concern. And that, generally speaking—but not always—will be a watershed approach. And I think this is one of the reasons why what we have written about Integrated Coastal Management may be useful in thinking generally about watershed issues.

Having done that, then it is important within that area to look at those problems and sources of those problems which you can understand to be important. Some things are more important than others. Some risks are more significant than others. And it is not useful to spend time on unimportant problems and conversely, where there is a particular issue, such as, let's assume depletion of fisheries resource, if one is going to address restoration of that fisheries resource, you need to address all of the problems which are significant to the decline of the resource.

In Chesapeake Bay, we were concerned about the decline of rock fish, striped bass, not just in the Bay but along the entire east coast of the United States. We did a number of things to address that problem. We worried about pollution issues that might be affecting the spawning reaches for rock fish. We also worried about the fisheries effect on rock fish. As you probably are well aware,

we actually imposed a ban on the possession of any rock fish for about five years. But imposing the ban or just worrying about the pollution or habitat protection—in many cases a single approach is not adequate.

Once one understands those important issues and the things that are important to do to address the issues, it is then important to look at management options. Usually there is more than one way to solve a problem; and it is important to pick the way to solve the problem which is cost-effective, which is technically implementable, and is politically doable.

Right now, in society, we are worrying a great deal about what to do about agricultural sources of water pollution. The agricultural problem is a great deal more complicated than simply dealing with industries or dealing with municipalities, many more sources, much more complex way of introducing the pollutant into the environment, and people that have a much different economic setting than a municipality that can look to a tax or rate base, sometimes not as large as one might like, or an industry that can look to a pricing mechanism for developing the resources.

So picking solutions which can be implemented from a variety of factors is very important. Then, of course, there is the process of implementation and sort of what I view as often the second part of this process that many people forget about, which is to see if what you are doing is working, basically monitoring, evaluation; and this is where this becomes an iterative process. You learn new things. You feed that back into the beginning of the exercise and hopefully make modifications if they are required so that further improvement can be obtained based on what you learn, both from monitoring the environment and its response to your strategies as well as from new science and research.

Now, why is this—first of all, this is not a system or an approach that needs to be used everywhere. As I said at the beginning, it is for complex situations. It is not for simple situations. That is the first point.

Second point, why is this likely to work today when, essentially, the water quality-based approach, which this is, didn't work? That was the reason in 1972 the Congress said let's go to a technology-based approach. And that ended up being secondary treatment in the case of most sewage treatment plants.

Prior to 1972, the water quality-based approach, which was used most places, if anything was used to clean up the water, failed in most places for a couple of reasons, in my judgment. And this is reflected on the committee's discussion.

First of all, before 1972 there was, in most places, a permitting system. There really was not a mechanism by which to implement the results after complex the planning process. That really became—that problem was also corrected by the 1972 act.

Secondly, there were very few mechanisms for enforcement or compliance activity. So there was no inducement from that regulatory commanding control kind of approach to comply with requirements. That was changed with the 1972 act.

Thirdly, there really wasn't very much public interest with grappling with these tough issues prior to 1970 so that the constituency and the consensus for, if you have political decision-making in

water quality control, just didn't exist. And there was finally, probably, not the scientific or the information-management bases to work a complex water quality system in most settings.

Now, there are examples of success. The Delaware River Basin Commission and the restoration of dissolved oxygen levels in the Delaware is a classic example. But they are few and far between.

Well, since 1972, almost all of those deficiencies have been corrected. We now have a strong permit system. We now have a strong compliance and inspection and monitoring system. We now have strong public concern and interest and political leadership on these issues. And the science has evolved a great deal both in terms of its understanding of these systems as well as the capacity to manage the scientific information in a way that is useful for policy decision-making.

So we think that today there is the possibility of adding to—not replacing—of adding to the existing system a dimension which does, in complex situations, build on a water-quality and environmental-standards and ecological-analysis basis. This is very similar to what EPA is talking about with risk-based decision-making and ecological decision-making in the watershed context and elsewhere. And I think it is what a great many of our States insist, one way or another, are already moving to.

With that, I will say nothing further and be happy to address any questions, go into greater detail as the committee wishes.

Mr. APPLGATE. Thank you very much, Mr. Eichbaum.

I just had a couple of questions here, and I wanted to ask you how much funding did the National Academy receive from non-Federal sources as far as this study was concerned.

Mr. EICHBAUM. I have to confess, I don't know the details of the budget for this study. There was support from other sources, as I recall; but I don't have the details. But we can certainly get that for you, Mr. Chairman, with no trouble.

Mr. APPLGATE. Well, I knew that there was—I think, the source of funds came from a number of different directions, as I understand.

Mr. EICHBAUM. In other words, an appropriation from the Congress. I believe San Diego contributed some money. But what the amount was and whether there were others, I just don't have that detail.

Mr. APPLGATE. Okay. The process of Integrated Coastal Management you describe is interesting. Can you take a representative, or even an imaginary, estuary and explain how the process may actually work when the various interests sit down and try to implement a plan to clean up an estuary?

Mr. EICHBAUM. Maybe I can use my own experience as an example and just reflect a little bit on the Chesapeake Bay.

We didn't call what we were doing from 1978 or 1979 through, really today, Integrated Coastal Management; but when you look back that is, in effect, what it was. We did a several-step process.

We, first of all, in a fairly, policy and politically, publicly driven way, made a judgment about what we thought were the most significant problems affecting the Bay. And those emerged as the problems of toxics in the Bay system, the problems of the depletion of oxygen and the disappearance of Bay grasses. And we basically

initiated a period of scientific study of those issues. And in doing that, we developed further the body of information from a science base.

We then integrated that science. And there is a report out of that process which is called the Synthesis Report which was several of the principal scientific investigators with some of the principal policy people involved with the Bay trying to think through what does the scientific material that ends up in the journals that no one ever reads really mean in terms of those three problems?

Now, what we concluded was that, first of all, toxics did not appear to be a very significant problem in Chesapeake Bay upon which to immediately expend a lot of effort. It appeared that the problem of Bay grasses and depletion of oxygen were, in fact, related and that the major issue in the Bay was excessive nutrient loadings to the system, with a whole range of problems that I won't go into.

Now, there were a number of other issues, as I indicated earlier—fisheries issues, land-use problems—because of the pattern of land-use contributing nutrients to the Bay system. But what we did once we got focused on nutrients, we then designed, as I indicated, a set of management options with respect to all of those problems, and we made choices about things to do and things not to do. And I will give you an example of the choice process in the Bay system.

We decided that many of the sewage treatment plants had to go to advanced wastewater treatment, tertiary treatment. Removal of phosphorous and, in selected areas, removal of nitrogen, which was not accepted by EPA anywhere as a cost-effective strategy for water quality improvement. We could only make the case for that based on the science that we had done through an integrated approach looking at the whole system. So the fact of the integrated approach, the watershed approach, drove through a bureaucratic and even a congressionally mandated barrier to a decision to be able to fund sewage treatment plant construction.

We decided not to do a phosphate ban in the first year of the actions on the Bay. We did do that subsequently, but we made a choice that the most significant thing we needed to do was to move for the funding of advanced wastewater treatment. And we didn't want the phosphate ban to be a red herring, if you will, for the funding decision. We subsequently added that to our actions.

Thirdly, we put into place a significant—but I think not yet effective—set of programs with respect to agriculture, including a very substantially increased technical assistance program as well as a financial assistance program to the farm community.

So we made choices about what to do, and we then—there has been a process very extensively of monitoring and evaluating and modifying those requirements. And as you may be aware, in 1987 a decision was made to, in fact, go from a selective reduction at sewage treatment plants and other sources of nutrients to a 40 percent reduction across the board based on what monitoring showed about how we were doing and what more sophisticated models showed about what was required. Again, this capacity to manage this information that we have is so much more powerful today than it was 20 years ago.

And that process is ongoing, and I think that is probably the final lesson. You don't do this, put things into place, and it ends. It is a constant task to restore and then protect.

We have got a situation in which the Bay population is 13 million. It will be 15 million, 18 million, over the next several decades. And if you think about the reality, not only does every new person moving into the Bay have to contribute, intellectually, zero pollution, the existing people have to reduce.

Mr. APPLEGATE. What is the principal source of the phosphorus and the nitrogen?

Mr. EICHBAUM. That is going to vary a great deal from system to system. And that is why in complex situations it is important to take a look.

In the Bay, generally speaking, about 50 percent comes from agriculture and about 50 percent from sewage treatment plants.

Mr. APPLEGATE. Both of them equal?

Mr. EICHBAUM. No. That will change seasonally. It will change annually depending on rainfall. It will vary from watershed to watershed depending upon the degree of urbanization as compared with agricultural activity.

Also there is nitrogen, now a growing appreciation that maybe 25, 20 percent of that in many systems comes from the atmosphere, from sources far removed from the immediate watershed. So it is quite variable.

You need to go through that process, and I will give you a comparison. In the Bay we know that controlling nitrogen coming out of the Susquehanna River is very, very important. If you take a look at Long Island Sound and you look to the Connecticut River flowing into Long Island Sound, you might think that nitrogen is important in the Susquehanna. It is probably important for the Connecticut River because that is the major river flowing into the Long Island Sound.

It turns out it isn't important. The nitrogen coming from the sewage plants in the greater New York area is at a critical control point. So making the same judgment in those two systems—

Mr. APPLEGATE. What kind of plants are those you are talking about?

Mr. EICHBAUM. Sewage treatment plants.

Mr. APPLEGATE. I mean the source of nitrogen. Outside of agriculture if you get into plants—

Mr. EICHBAUM. Automobiles and power plants, fossil.

Mr. APPLEGATE. Nitrogen and phosphorous both?

Mr. EICHBAUM. Nitrogen. There is a small atmospheric contribution of phosphorus which the studies which I have seen, which are several years old now, puts it at less than 10 percent. And when I last looked and asked, air pollution experts people didn't have a guess as to the source. So that is—maybe somebody knows now, but I can't speculate on it.

Mr. APPLEGATE. Well, I have some other questions here, and maybe I will get around to them; but I think at this time I am going to recognize our sit-in Ranking Member, Mr. Horn for whatever it is he wishes to say and to ask.

Mr. HORN. Thank you, Mr. Chairman.

I, just briefly, have one basic question. It obviously is a very thorough report, a very credible organization. You have had a lot of advice.

What I am curious on is: How does that process work within the National Research Council in terms of committee input? The degree to which, say, the basic graph that you and others might have prepared was changed in committee.

What type of a dialogue and corrections goes on, because you did have quite a few experts with whom to consult?

Mr. EICHBAUM. This is the, I guess, third or fourth committee that—fourth committee I have served on of the Academy. I am also a member of the Marine Board, which is one of the management structures. And so I am involved, somewhat, in the oversight of that process that you described.

It varies. But in general, as you point out, there was a committee, I guess, about 14 members, quite diverse, quite different experiences. The committee—typically the committees will meet over a two-, three-year period, anywhere from 4 or 5 to perhaps 10 times. This committee broke into subcommittees early on on three different areas. And we brought in other experts to participate with that subcommittee process.

At the end of that, basically the committee began to divide up responsibility for writing particular parts of the report amongst its members. For example, I wrote Chapter 3 which is the Integrated Coastal Management chapter. And other members wrote either whole or parts of other chapters. I also contributed to other parts of the report.

We basically developed a full draft which was then argued over by members of the committee. And that full draft was essentially completed in the fall of last year. And I can say there were some vigorous debates amongst the members of the committee.

It then goes out for a peer review. And in the case of this committee, I think there were maybe seven or eight or nine reviewers. That review is done. Those comments come back, and the committee really has little responsibility of responding. We either have to say the reviewer didn't know what they were talking about or we didn't know what we were talking about, and we changed our report to reflect that comment.

And, for example, I think in all of the reviewers, there was generally favorable comment on the basic idea of Integrated Coastal Management. But a lot of them said: Why is there any reason to believe it will work now when it didn't work back in pre-1972 or the 208 process in 1972? And there is some language that has been added to the report that suggests some of the differences I outlined initially.

So that process does change and I think usually strengthens a report.

Mr. HORN. So you feel none of your particular sections in Chapter 3, Integrated Coastal Management, were censored in any way? It is simply honing and sharpening some? Perceptions and options available?

Mr. EICHBAUM. Yes.

Mr. HORN. Your chapter ran from page 59 to 69 in the report.

Mr. Chairman, I am going to leave to my colleague from California who lives with this situation daily and reserve time I might have because I am due in another committee meeting at this time.

Thank you very much.

Mr. APPLGATE. We will transfer that time. Thank you very much Mr. Horn.

And at this time, we will extend what balance that you have and whatever time he feels would be necessary to get his points across and ask some questions, Mr. Filner.

Mr. FILNER. Thank you. Both Mr. Horn and I have previously been college professors, so I think each of us have 50 minutes by those rules.

Mr. HORN. So you have got 45 coming, Bob.

Mr. FILNER. Right.

It is going to be brief, and I appreciate your comments and your written statement.

In the preface of the report, Mr. Chairman, by the way, is the outline of who provided the support for this study: from EPA to NSF to NOAA to the National Academy of Engineering and also the City of San Diego and the Boston Society of Civil Engineers.

I know under the terms of the City of San Diego's contribution, after the check was given, there was no further input allowed into the process. And what we were looking for was a scientific analysis of the situation, which I think we got.

Just let me ask you three questions. I will do it all at once and then you can—

Mr. EICHBAUM. Let's see if I can remember them.

Mr. FILNER. And if any assumptions in my questions are wrong, just correct me because you are the expert here.

The Clean Water Act mandates what we have been calling here technology-based requirements for treatment. Secondary treatment is mandated for all sources of discharge.

It seems to me that, the implications of your recommendations is that such mandates do not make sense given our new levels of understanding, and we ought to change that. And I would just like you to confirm—is that correct? Should we change, especially in the coastal areas, the mandate for secondary treatment?

If so, what would a legislative change look like? I note the Chairman was trying to get to this. ICM is a process. What would a legislative mandate look like involving ICM?

I mean, do you say all wastewater treatment have to have an ICM, which does or should be submitted to the EPA to do the following. I am not clear how a legislative proposal dealing with ICMs would look like.

And, third, if you want to get into this at all, from my short time in the Congress, it looks like any attempt even on environmental grounds, to begin to look at amending the Clean Water Act is interpreted as an attack on the Act and weakening of environmental progress.

Is there a way in which we can say we are recommending an amendment without being interpreted as being "political"—where we can use your science and use your analysis in a way in which the political atmosphere is not taken as an attack on environmental progress that has been made over the last 20 years.

So that is my question—if you might respond.

Mr. EICHBAUM. Those are the tough questions. Let me try. And part of this will be my own view, not necessarily the committee's view. These were some of the questions we didn't get to.

First of all, on the question of, are we recommending changing the existing mandate for secondary treatment. That is not recommended specifically in the committee's report. The committee's report does say treatment requirement should be established through an integrated process on the basis of environmental quality as described rather than by technology-based regulations.

Now, the question that begs—and that is on page 8 in the report. The question that that begs is that is good from a science viewpoint; that is good from a technology viewpoint. But looking at the national perspective and legislating a Clean Water Act from these halls, are there still other factors that make sense to have some national system that is a minimum basis?

And we don't address that, but certainly the view back in 1972 and beyond, you needed to make progress on water quality. Where there were issues, the issue of equity amongst communities, the question was just ease of administration and enforcement.

If you had to do Integrated Coastal Management everywhere, we would go backwards. I think that is obvious. So that is not what we are recommending. And some implementable minimum system does seem to me to have to exist. A technology or some other minimum national system is easy to understand. You don't have to go out and hire an engineer or a consulting firm to do a lot of fancy studies. You know what you have to do.

Mr. FILNER. Would you disagree with—

Mr. EICHBAUM. And in the old day this was accompanied by Federal funding.

Excuse me.

Mr. FILNER. Would you disagree with what I said in the opening? For example, one of the minimal standards has to do with BOD and yet the report says it is not relevant to the ocean situations.

Why shouldn't that be changed? Why should we be requiring things that have no relevance environmentally?

The Witness. No, I don't disagree with your opening statement or with that follow-up comment. And I think that that is why we have concluded in the coastal area particularly in complex situations and high-cost situations and situations where there are multiple sources and perhaps things more important than what we are now controlling that we aren't controlling very well that Integrated Coastal Management ought to be done. And if it shows that there are more important things to control to improve the environment, those ought to be done and that there ought to be trade-offs. Those decisions are being made.

Now, again, to look at the Chesapeake Bay, is it most effective to spend a dollar to remove nutrients from a farm or from a sewage treatment plant? And you have the flexibility to do that because it is not—all of those choices are not mandated by the existing Clean Water Act.

So we do think that that is important. How would you—how would it look if you were to try to do it? I don't think it would look like a return to the old 301(h) process.

One of the things that was wrong from the this report with the 301(h) process was it was focused on one pipe. It was not focused on a large ecological system. I don't think it would look like that. I think it would look more like a return to a watershed planning process as was set forth in Section 208 but with some additional requirements which at least would be mandating that the permitting process, the funding process, whatever it was, was tied to the results of the planning process.

One of the things wrong with 208 planning in the 1972 act was that neither permitting nor funding was tied to that process. They were independent. So there was no reason to follow the 208 planning process, and it was not, in most settings, followed. It was done, put on shelves, and that was it.

How do you avoid the problem of looking like you are weakening the act if you do try to do something that provides for more flexibility?

I think this is probably the crucial issue both from the political process of enacting something but also from the implementation perspective. And my—I guess my view is that people have got—if you were going to plan on a watershed or ecological basis and if you are serious about implementing the results of that planning process, then the consequence is probably going to be that some sources will have to be controlled more rigorously than they now are; and some may not have been controlled as rigorously as is now the case.

And if people are not able to intellectually and emotionally make that leap, then it is not even worth doing; it is not even worth putting the language in. We are just fooling ourselves, and we will go through another exercise that spends a lot of time and energy and doesn't get anywhere.

The kinds of choices it seems to me that then become, perhaps, explicit ones that recognize the willingness to make that shift would be to get serious about things like combined sewer overflows, to get serious about the effects of non-point source pollution, go beyond where we are now.

The Pennsylvania General Assembly is considering mandating nutrient management plans for many of its major farms. That is a radical change to the management of nutrients on farmland. It is being made by Pennsylvania for the Chesapeake Bay, which it doesn't even border.

Now, there are a lot of other benefits perhaps for agriculture, so it is doable politically. But those kind of choices have got to be embedded in the decision process to go with watershed or integrated-management approach.

Mr. FILNER. Thank you.

And just one final sentence, since I see our distinguished Chair of the full committee here; I appreciate his support of having this hearing.

The present Clean Water Act, in the view of many communities around the country, mandates secondary treatment which is both very costly and does not seem to make sense environmentally. And if there is a way not to retreat from any of the standards or any of the progress made for cleaning up our waters of this country, that communities such as San Diego can get flexibility in meeting

those standards or making environmental progress but without doing stupid things that are required just because in 1972 we only knew one way to do it, then that is what I am searching for.

And I would hope that somehow we could get that out of the Clean Water Act reauthorization. That in many communities that we don't bankrupt them but we also do things that make more environmental sense than we are doing now, and that is my intention. And if it can be done, I am going to try to do it. I appreciate, again, very much the support of at least giving us a chance to try this, from Chairman Mineta and Chairman Applegate.

Mr. APPLGATE. Well, I thank you, Mr. Filner. And I hope that we can sit down and work together. Whether that is doable and whether we can achieve, that remains to be seen. But you know that we will do our best to work with you. We know that you have an exceptional problem and one that is severe enough, and you have really been at the forefront, and you have doggedly been after both the Chairman and myself to hold these hearings and try to do something to correct that problem. So I give you a great deal of credit for that. And, yes, we will work with you to see if there is any possibility of that.

We are very fortunate, of course, of having our very distinguished Chairman of the full committee with us, as he always shows up in support and always happy to have him here.

Mr. MINETA.

The CHAIR. Thank you very much, Mr. Chairman, for your leadership on this issue and with the involvement of this subcommittee on this very important matter.

I would like to ask unanimous consent to file my statement.

It seems to me, maybe we ought to go back to the original act and have an amendment on there that says fishable, swimmable, and doable. The doable maybe got left out of this whole thing. We have a template in terms of the law.

There is a waiver provision. And even in your study on the side bar, as I can understand it, it really speaks to San Diego's situation. But it doesn't say that San Diego ought to get a waiver.

Would you say that the study concludes that any particular city that does not have a waiver should be granted one?

Mr. EICHBAUM. No, Mr. Chairman. And the reason is the committee really felt that it would—it was beyond its capacity to actually go in and carry out the integrated-management process for a case and actually reach a conclusion. It was probably inappropriate in the case of San Diego and Boston since they were helping to pay.

Whatever we would have said, people probably would have questioned if we had recommended weakening. And, on the other hand, it seemed to be just beyond our ability. So we did not specifically do that.

My own judgment would be that if you might well—and as I said, this is my own judgment; and this is going back again to your question why this is very difficult. I think if you were to go through this process, say, for San Diego and Boston, I think you might well find that, in fact, the requirements at San Diego for the sewage treatment plant might be lower, that there might be other things that do need to be controlled that are not being controlled. And I think in Boston, you would find that you might well have to be

doing more than secondary treatment because of the—and it is because of the very different nature of the circulation systems for those coastal areas.

So a solution that perhaps provides some relief, a statutory solution for San Diego may well—and it is not intellectually honest unless it drives other systems that had not yet achieved water quality objectives which is the problem generally that we have to more strict standards than we are now achieving.

So this is probably not a panacea for doing less. This is probably a panacea or a mechanism for doing more, generally speaking, because we haven't achieved quality objectives.

The CHAIR. But that would only be if we have the available resources to do that. It seems to me we would have to go beyond the \$2 billion in the SRF program in order to do the very thing you are driving at.

Mr. EICHBAUM. Well, I have two comments on that.

One is that, in spite of how poor we like to think of ourselves, we are a very rich country; and it is not a question of whether—it is a question of choices. And if we want to have these resources, we—the water quality and the living resources associated with it, I think we have the wherewithal to choose to do it. But that is a public, slash, political decision-making process.

But the second point I wanted to make, and I think this is—we are continuing to look at these issues in a variety of processes of the committee; and we just held a meeting last month at Stony Brook for three days on the eutrophication part of it, which we are really talking about eutrophication of coastal areas.

Number one, we concluded this is the most serious problem in our coastal areas.

Number two, there probably are a lot of things that can be done about it that are more cost-effective and have other benefits than we have yet thoroughly explored. I mentioned the agricultural issue. If you don't put nutrients on the farm, you save money. If you put them on wisely, only enough for the crops to take up, you are more efficient as a farmer.

I was actually astounded we had an expert from a consulting firm come and talk about benefits and costs. And it was news to me that there were maybe some options here we are not creatively looking at yet. We need to push that envelope.

Mr. FILNER. Would the Chairman yield for a question.

The CHAIR. Surely.

Mr. FILNER. The implication of your question was that if we move in this direction, somehow the costs would even be higher.

In San Diego's case, we believe that the reverse would be the case. Because the requirement for secondary treatment decreases capacity, you have to build additional plants which are very expensive which would prevent us from doing, for example, reclamation, tertiary treatment in some other places.

So we are trading off a demand, a very expensive demand for secondary treatment—if we do that, we cannot do something that is worth probably more in our area, which is reclamation which turns out to be cheaper because of associated other costs with going to secondary. We believe that there are certain situations—and

each case is different—where the environmentally progressive thing also is cheaper.

The CHAIR. Let's say, what do we do with some communities—I don't want to characterize, let's say, Boston and San Diego, in terms of just focusing on those two—but we have a lot of communities across the country that have taken the 1972 law very seriously, and they have bellied up to the bar and made investments in their own plants.

If I were to take Boston and say they dragged their feet during the time the grants were available and now that the grants program is gone, we get into the SRF program; and now their problem is so big, all their costs, water costs, everything are going up. The question is how do you make sure that there was compliance with the law and that is very costly?

Or we have to give them relief in some way by either administration action or by making the pot bigger so that they can now come forward to be able to do the necessary treatment.

It seems to me those communities that have taken the 1972 law seriously, in effect, feel holy cow, you know, now the laggards are the ones who are getting rewarded. And it seems to me it puts us in a very difficult position.

How do we make sure there is compliance without—giving you an example, on the other hand, when I was mayor of San Jose, one of the things I wanted to do was to go to an advanced secondary and went from roughly 90 MGD to about 120. Subsequent mayors took it up to 145 I understand. Then we went to tertiary. So today we are at about 150 MGD. I know in 1971, as mayor, I had to go to the community for sewage treatment, airport development, water and sewer, neighborhood parks, branch libraries, and went with the \$287 million bond issue; got the two-thirds vote in the community; and got the bond measure passed.

Now we have a tertiary plant, and the San Francisco Bay Regional Water Quality Control Board is saying to San Jose, what you are discharging into San Francisco Bay is too clean, and you are now turning the salt water brackish. Hello? And so now we are going—now what are we going to do?

And this is really a good solution, I think, in terms of industrial cooling and in terms of agriculture—not agriculture, but in terms of irrigation and for groundwater recharge using the water from the tertiary plant. But that plant is also going to cost around \$350 million to do that.

You know, I see this where a community like San Jose has really bellied up to the bar to do what it thinks is right for its own citizens in cleaning up the environment.

Then there are others who have been dragged to the starting line kicking and screaming. And I just wonder, what is it that we can continue doing in the law that keeps people moving forward, including if they purposely tried to drag their feet?

And frankly I am not sure I have much sympathy. And so I think what we are trying to do now in the new law is to say watershed is the way to go. Ten years ago you couldn't even get a discussion on watershed as a definable or an approach. But now we seem to be using watershed as the approach. This whole issue of non-point source is going to be a very big, I think, emphasis that we are

going to find this time. And this thing about nutrient management on farms probably fits right in with that. But it seems to me we just can't back away from pushing people, communities, in that forward position.

If, let's say, the kelp beds are being affected, if that is the case, I suppose the question is, should we allow, at this point, then, for new applications for waivers; or should old cases be reopened for waivers?

Is that an issue that we ought to be dealing with today?

Mr. EICHBAUM. Well, in our judgment, we felt that we would not recommend that the 301(h) waiver process be reopened.

And I said earlier, perhaps before you were here, that the 301(h) waiver focused on an out fall, a point, and what was happening around that point. It didn't look at the ecological system. Whether that the watershed or the defined coastal area and look at the entire set of issues and problems there and reach a conclusion that based a holistic and integrated approach to the collection.

We wouldn't say go back to the old 301(h) process. We might well conclude if you went into the Integrated Coastal Management that you might make different choices that are being mandated today without it.

But I think you are right, the problem of appearing to reward the laggards is a serious one. And in some ways—but I think the way around that is what I said earlier. We have to—if we look at why is our water quality not improving as rapidly as we would like it to even though we made tremendous progress in 20 years at sewage treatment plants nationwide, at industrial sources—I mean metals are down by 90 percent, but the responses are not coming back generally in response to that.

What are the other things that we are missing? And does an integrated or watershed approach give us a vehicle to get at those other things more efficiently, more effectively, like as you pointed out, agriculture, like the development process?

I mean, I always think—you know, we all—I mean, think about where you live and how close is the newest body of water? It is probably a quarter of a mile away or closer. And what kind of shape is it in? It probably isn't in very good shape. I mean, this is a system that built arteries and connectivity and the fragilest part of it up in the watersheds we are destroying. We haven't changed that.

And if we begin to make some sort of real commitment to that part of the problem, as a Nation, I think then people might be willing to say, well, all right you don't have to spend the last buck to get the last drop of this at this point source because we know that is really not as important as some of the other things we are doing; and now we are going to address those. That is my view.

The CHAIR. Well, thank you very, very much, really, for your contributions that you have made in the past. I know that we will continue trying to pick your brain on this issue. So thank you very, very much.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Chairman.

Mr. MENENDEZ.

Mr. MENENDEZ. Thank you, Mr. Chairman.

I'm sorry I got here a little late. But I did read your whole testimony, and this six subject matter is of interest to me.

I represent a district in New Jersey that goes along the northern New Jersey coast along the Hudson River waterfront immediately in front of midtown Manhattan. It has the Arthur Kill, Newark Bay, and is probably one of the most active industrial waterways in the Nation.

Before I came to Congress, similar to our committee chairman, I was a mayor. One of the things that we faced with the Clean Water Act was—and we were one of those who did belly up to the bar—was the rate shock. Part of that rate shock undermined the public support which we fully had before.

The issues that you raise in terms of source control, and Integrated Control Management are very important because this uniform threshold does not give recognition to the diversity that obviously exists throughout the country which is a problem.

You know some of the rigidity that we saw, for example, when originally our plan was approved—and this was prior to me being involved—which called for sludge incineration. Since that point, we found better reuse opportunities. But, we had a hell of a time convincing the EPA of that. In fact, we could still live within the time frame they wanted for completion but by moving away from incineration into some form of beneficial reuse. Pelletization or something like that.

Rigidity is a problem. A regional consortium was created at one of these sewage plants because several older communities didn't have their own individual plants. One of the managers was telling me that, based upon the effluents that were going in to reach the levels of attainment, they would be better off further polluting the water to reach the percentages. This was truly ironic because the proper process that had been approved by EPA would not have met the attainment levels. In such an area you would think that source issues would be a very major point of concentration, but we really don't have that flexibility right now under the law.

I think what you suggest is of great importance, and the Chairman was talking about giving people some type of relief. Here is a bill out there, introduced by Mr. Studds, which would allow people to deduct sewer and water fees and eliminate the ability of large companies who pollute the environment to write it off as a cost of doing business.

I think that is an excellent way to provide relief to the middle class taxpayer. We should let our citizens who have supported cleaning up the environment and improving water standards be the ones to get some relief from the rate shock. The major companies who don't reach out for source control and other initiatives that would produce it, do not deserve relief.

I commend your work, and hopefully the committee will look at some of the issues you have raised as some viable options in a re-authorization plan.

Mr. EICHBAUM. If I could just make one comment on that. I think your—I am aware of the proposal that Chairman Studds is working on. And while it may not be the precise solution, I think the Federal Government has to get back in the business of providing financial support to this process because if, for no other reason, the rate

shock question—the psychology of the rate shock, not the reality in that sense, and I think looking at creative mechanisms which Chairman Studds is trying to do to fund that.

So it comes from some source other than the general revenues is important. And my view would be tying that to the integrated approach you then begin to build a fairly powerful kind of management tool that can help these communities move forward, doing the right thing efficiently.

Mr. MENENDEZ. Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you very much.

And the Chair can certainly appreciate the problem that Mr. Menendez speaks of. And we certainly will be talking with you and working with you on these problems and certainly with Mr. Eichbaum who has been an excellent witness. And as the chairman said, we will be picking your brain for a lot of various reasons.

Mr. EICHBAUM. It would be delightful to be any help we can be.

Mr. APPLGATE. I am sure that you will.

Mr. Filner.

Mr. FILNER. Just briefly Mr. Chairman.

Thank you again. Thank you for your expressions of help at least to try to look at all this. Chairman Mineta, I think, gave a very frank and moving description of some of the resistance to opening up this process. And I wanted to certainly make no defense for any past actions for the City of San Diego which, of course, I had nothing to do with.

The present governor of California, by the way, was the mayor who was dragging his feet on this thing. But I don't think that past problems or the fact that other cities did have to belly up should mean that things don't make sense are imposed on others.

And, financially speaking, I think the ratepayers of my city assumed that they were going to pick up the cost of this, that there is no more Federal grants or loans. And the question is: Are they going to pick up the bill for a \$10 billion project including financing costs? Or can we get it to \$5 billion?

And that is the issue, not that someone is going to bail us out for past foot dragging. We take the responsibility. And the ratepayers, I think, understand that. And the question is for us, as Representatives, is can we at least make that a justifiable expense instead of not a justifiable expense.

Again, thank you for this morning, Mr. Applegate.

Thank you, sir. And we will be looking forward to further discussions.

Mr. APPLGATE. Thank you very much, Mr. Filner.

And I know you have a very serious problem, and you are certainly not trying to shirk it. Not trying to circumvent any part of it; but to meet your responsibilities, at least San Diego, is—and I am sure, as I am also a believer in perseverance always pays off. Somehow or other we are going to get this worked out. Maybe not necessarily to your total satisfaction. We are going to get something worked out.

And as I said before we will be working with you on this. And thank you very much, Mr. Eichbaum, again, for being with us. And we will be looking forward to meeting with you again.

Mr. EICHBAUM. Thank you.

Mr. APPLGATE. With that, the meeting is adjourned.  
[Whereupon, at 10:47 a.m., the subcommittee was adjourned.]

PREPARED STATEMENT SUBMITTED BY WITNESS

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATIONSUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENTSTATEMENT OFWILLIAM M. EICHBAUMJUNE 30, 1993

My name is William Eichbaum and I am an environmental attorney and public policy expert, currently with the World Wildlife Fund. Previously, I held executive positions, managing environmental programs in both the Commonwealth of Massachusetts and State of Maryland. I was recently involved as a member of a committee of the Water Science and Technology Board of the National Research Council (NRC) that studied ways to more efficiently manage wastewater entering our coastal environment. The result of that effort, Managing Wastewater in Coastal Urban Areas, has recently been released. At Chairman Applegate's invitation, I am here to present some of the findings and recommendations contained in the report.

More than a third of all Americans live along a coast, usually in urban areas. Every day, more than 1,400 wastewater treatment plants in U.S. coastal cities discharge 10 billion gallons of treated effluent. Annual treatment costs are between \$1.1 billion and \$1.8 billion. Another 11.3 billion gallons of treated industrial wastewater and spent cooling water is discharged by approximately 1,300 industrial facilities.

In addition, non-point sources of pollution, including urban and agricultural runoff, are a growing problem. Pollution can also come from outside the coastal region--from towns, farms and factories adjacent to rivers flowing to the coast. There are other human activities that can affect coastal marine systems. For example, increased irrigation by farmers can reduce the amount of freshwater flowing into estuaries and over fishing can alter the ecological balance in marine waters.

Current wastewater and stormwater management policies are rooted in the 1972 amendments to the Federal Water Pollution Control Act, reauthorized in 1977 and 1987 as the Clean Water Act. The 1972 legislation asserted authority over the quality of

navigable waters such as rivers, lakes and coastal waters. It required establishment of uniform minimum standards for municipal and industrial wastewater treatment, set strict deadlines for compliance, and provided federal funds to help pay for newly required projects.

Under the statute, efforts to protect coastal water quality have focused mainly on regulating city sewer systems and other single-point sources of pollution such as industrial plants. This approach has produced rapid and effective improvements in water quality in many areas, particularly lakes and rivers. However, the law's uniform requirements have not allowed a process that adequately addresses regional variations in environmental systems around the country, or that respond well to changing needs, improved science and more complete information.

To more effectively protect coastal waters from pollution, the nation must begin moving towards a more flexible integrated management approach that takes into account the full range of factors that affect coastal pollution and efforts to control it. The recently released NRC report recommended a more comprehensive approach to managing coastal waters called, "Integrated Coastal Management" (ICM). Broadly speaking, ICM aims to protect coastal ecosystems while recognizing the importance of human activities such as boating and commercial fishing. Under this approach, the report says, ". . . the federal role in integrated coastal management shifts from that of prescriptive mandates to a partnership with regional authorities in developing a management system that meets coastal-quality objectives."

The authors of ICM suggest several modifications to the Clean Water Act and the Coastal Zone Management Act, including establishing a "National Coastal Quality Program" as a supplement to the National Estuaries Program. The coastal program should include an integrated planning and permitting process, as well as an "Iterative Action Plan" to supplant Comprehensive Conservation and Management Plans.

The study identifies several key issues that both planners and legislators must consider when thinking about wastewater management. Many of these issues are not effectively addressed by current clean water strategies and point to the need for an

integration of functions among many agencies including storm and wastewater agencies, water supply agencies and agricultural agencies:

**Treatment Levels.** The cost and complexity of treatment are major factors that can vary greatly from area to area. Regional environmental and health concerns also vary. Wastewater treatment levels and related management concerns need to be guided by water quality needs rather than by technology-based regulations.

**Excess Nutrient Enrichment.** Nitrogen and phosphorus, from both point and non-point sources can deplete dissolved oxygen, resulting in fish kills, algal blooms, and other environmental problems. Secondary treatment of wastewater does not remove significant amounts of nitrogen.

**Source Control.** These efforts can supplement treatment, avoiding problems before they occur. Source control of pollutants, which is an effective tool for managing both point and diffuse pollution sources, should be strongly encouraged by incentives and regulations. In some cases, for example, tactics such as erosion control may be more effective and cheaper than wastewater treatment of reducing the particulate level of waters flowing into a coastal region.

**Stormwater and Combined Sewer Overflows.** In many cities, combined collection systems that carry both stormwater and city sewage may overflow. Building new facilities, however, is expensive, and conclusive scientific data on the overflow problem is lacking. Without more research, proposals to legislate technology-based requirements for systems are likely to fail.

**Evaluation and Feedback.** Management plans must be flexible enough to allow for changes and improvement.

Our ability to manage wastewater in coastal areas has improved greatly over the past decade because of advances in science and engineering. The authors of Managing Wastewater in Coastal Urban Areas believe that the concepts set forth in "Integrated Coastal Management" take advantage of our more advanced and creative technical capabilities and offer a better way to both use and protect our coastal environment.
